LOGOS, λογος, Gr. מימרא, Chald. (*memra*), or *word*, Eng. in *Philoſophy* and *Theology*, a term very differently underſtood and applied by both ancient and modern writers. Thoſe who believe that the logos was the perſonification of the divine intellect, or of the divine attributes of wiſdom, power, &c. trace this doctrine to the ancient Platoniſts, from whom, as they conceive, it was adopted by the Chriſtian fathers. It muſt be acknowledged, however, that Plato expreſſes himſelf with a conſiderable degree of obſcurity on this ſubject. Whilſt he aſcribes the origin of the univerſe to the Supreme God, whom he denominates αγαθος, or the good, without the inſtrumentality of any ſubordinate being whatever, and who is repreſented as having formed it according to a pattern previouſly formed in his own mind; he ſometimes leads us to conceive that he regarded this pattern or idea of the divine mind as a *ſecond principle* of things, and the world itſelf, which was produced from thoſe ideas, as a *third principle*. But it does not ſatisfactorily appear that he made the divine mind, *i. e.* νους (*nous*) or λογος (*logos*) a diſtinct intelligent being. His Demiurgus, or immediate maker of the world, ſeems to have been the Supreme Being himſelf, and not any ſubordinate agent or principle whatever. The reaſon, or logos, which, according to him, comes from God, and by which he made the univerſe, ſeems, in his view of it, to have been ſynonimous with διανοια and επιστημη, of his underſtanding, and not any other proper perſon or agent. In the writings of Plato, logos has only two acceptations, *viz.* thoſe of *ſpeech*, and of *reaſon*, ſuch as is found in man. But when this philoſopher ſpeaks of νους, or λογος, as ſomething diſtinct from the Divine Being himſelf, as a power or property belonging to him, and all divine power and properties being *ſubſtance*, it would be very natural and eaſy to transform this divine power into a ſubſtantial perſon; and this we ſhall find to have been the caſe with reſpect to the later Platoniſts, agreeably to one of the Platonic maxims, *viz.* that *being* and *energy* are the ſame thing. Philo, a learned Jew of Alexandria, and contemporary with the apoſtles, approached more nearly to a real perſonification of the logos than Plato himſelf, or his immediate followers. Although he did not proceed ſo far as ſome of the Platonizing Chriſtians, and make a permanent intelligent perſon of the divine logos, he made of it an occaſional one, repreſenting it as the viſible medium of all the communications of God to man, and of the inſtrument by which he both made the world and maintained an intercourſe with the patriarchs of the Old Teſtament. Philo dignifies this logos with the appellation of God; but in order to diſtinguiſh him from the Supreme God, he ſays, that the latter is known by the term God with the article prefixed to it, *the God;* whereas the logos, like other inferior gods, is only called *God*, without the article. Whilſt he aſcribes proper *creation* to God the father only, he attributes the *forming* of created matter to the logos. The Jews did not, in general, uſe the term logos, or מימרא (*memra*) which correſponds to it in the Platonic ſenſe, but as ſynonimous to God, or the mere token, or ſymbol, of the divine preſence. Inſtances occur in various paſſages of the Old Teſtament, and a ſimilar phraſeology may be found in the "Wiſdom of Solomon," which ſome have aſcribed to Philo. The Chriſtian Platoniſts, deriving their notions from the ſchool of Alexandria, and the reſemblance diſcernible in ſome of the doctrines of Plato to thoſe of the ſacred ſcriptures, could not help thinking, that he had actually borrowed them from the writings of Moſes, with which, as they thought, he might have been acquainted during his reſidence in Egypt, or on his travels in the Eaſt. This opinion is frequently expreſſed and inculcated by Juſtin Martyr, and others of the fathers. A modern writer (ſee Prieſtley's Early Opinions) affirms, that Juſtin was the firſt, or one of the firſt, who advanced the doctrine of the permanent perſonality of the logos; of whom he ſays, "Jeſus Chriſt is the only proper ſon of God, being his logos, firſt born and powerful." Many of the Chriſtian fathers, however, maintained that the logos was an *attribute* of the Father, and that this attribute became the perſon of the Son, and was afterwards united to Jeſus Chriſt. But we ſhould enlarge this article far beyond its proper limits, if we cited more authorities in relation to this ſubject. We muſt therefore content ourſelves with preſenting to our readers a brief account of the ſentiments of modern divines with regard to the logos. It has been very generally allowed that this name belongs, in a peculiar and appropriate ſenſe, to Jeſus Chriſt; of whoſe nature and rank of being different notions have been entertained. (See ARIANS, SABELLIANS, SOCINIANS, TRINITARIANS, and UNITARIANS. See alſo PRE-EXISTENCE *of Chriſt* and TRINITY.) We ſhall here ſubjoin a brief abſtract of theſe opinions from ſome of the principal writers on this ſubject. The Pſeudo-Athanaſians, as they are denominated by the author of "The Apology of Ben Mordecai &c." ſeem to maintain, that the logos, or word of God, and that God, with whom he was in the beginning, and whoſe ſon he is, and the Holy Spirit, who proceeds from them both, are each of them, *ſingly*, the one Supreme God; and yet the three all *together* are the ſame Supreme God. To this purpoſe Dr. Clarke, in his "Scripture Doctrine of the Trinity," mentions the interpretation which ſome have given of the phraſe, "the word was God" (John i. 1.) The *logos*, or *word*, is conceived by ſuch perſons to be another ſelf-exiſtent, underived, independent perſon, co-ordinate in eſſential ſupreme authority and dominion with the Father Almighty: and this, ſays Dr. Clarke, whatever metaphyſical union may be imagined of two ſuch co-ordinate perſons, will always and neceſſarily, in the religious and moral ſenſe, be real polytheiſm; ſubverting that firſt and great foundation of all religion, both natural and revealed, the monarchical unity of the great King and God of the univerſe; and directly contrary to that firſt and great commandment in both Teſtaments (Deut. vi. 4. and Mark xii. 29.) "Hear, O Iſrael, the Lord our God is one Lord, &c."

Another opinion with reſpect to the logos, is that which ſuppoſes the appellation to deſignate a pre-exiſtent ſpirit, of inconceivably exalted rank, and poſſeſſing ſupereminent power and perfection, which derives being from an immediate act of the power and will of God, in contradiſtinction to exiſtence by mere neceſſity of nature, and called only begotten becauſe it is thus derived from the Father in a ſingular and inconceivable manner, and ſo as to be thus diſtinguiſhed from all other beings. This pre-exiſtent ſpirit, or logos, according to the doctrine of Apollinarius about the year 370, and the Arians, deſcended from heaven, and ſupplied the place of a ſoul in Chriſt. To this purpoſe Mr. Whiſton ſays, "the ſcripture, and earlieſt antiquity, never affirm, that Chriſt took a human rational ſoul; they never ſay, he took a whole human nature; they never ſay, that he was in that ſenſe a true and perfect man; but that he was made fleſh; had a body prepared for him; was the Word, or a God incarnate; was made in the likeneſs of man; was found in faſhion as a man, while he was God the word. Nay, Ignatius directly affirms, that it was the Word, and not a human ſoul, which inhabited in that body; and almoſt all the ancients agree in the ſame doctrine; even Athanaſius himſelf, before the council of Nice." It is ſaid by Ben Mordecai, that notwithſtanding the pains that were taken to diſcourage this opinion, it appeared again, in different ſhapes, in the Chriſtian church in the doctrine of the Monothelites; who held, that Chriſt had only one will, which, without doubt, is ſufficient for one perſon. Agreeably to this ſame uſe of the appellation logos, Dr. Clarke interprets the ſeveral paſſages that pertain to it in the 1ſt chapter of the goſpel of St. John. In this ſenſe "the word was with God;" not εν τω θεω, in God, as reaſon or underſtanding is *in* the mind, but προς τον θεον, with God, as one perſon is preſent with another; and "the word was God;" not θεος εστι, is God, but θεος ην, was God, or that viſible perſon, who under the Old Teſtament appeared from the beginning εν μορφη θεου, the viſible image of the inviſible God, in whom the name of God was, the angel of the Lord, &c. Phil. ii. 6. Col. i. 15. Exod. xxiii. 21. Zech. xii. 8. &c. &c. If this be the right interpretation of the text, then the words, εν αρχη ην ο λογος, in the beginning was the word, and ο λογος σαρξ εγενετο, the word was made fleſh, mean, that the ſame perſon who in the fulneſs of the time was made man and dwelt with us, did before dwell with God, and acted in the capacity of a divine perſon, as the viſible image of the inviſible God, by whom God made all things, and by whom all things were from the beginning tranſacted between God and the creature; and as he is ſtyled (1 Cor. i. 24.) the Power of God, and the Wiſdom of God, upon account of the wiſdom and power of God being manifeſted in and by him; ſo here he is ſtyled (ο λογος) the Word, becauſe he does λεγειν; he does, as Revealer, Lawgiver, and Judge, declare the will, the laws, the ſentence of his Father. Thoſe who adopt this opinion alſo maintain, that Chriſt was the perſon, by whom God created and governs the world, and that in and by him the Deity appeared to men under the Old Teſtament by the name of Jehovah, the Angel of the covenant, and ſimilar appellations. The apoſtle tells us (Heb. i. 2. xi. 3.) that it was by Chriſt God made the world, αἰῶνας, the ages or diſpenſations; *i. e.* by whom, ſays Ben Mordecai, God formerly diſpoſed and ordered thoſe eminent and remarkable periods of time: the Antediluvian, the Patriarchal, the Moſaic, and the Preſent, being put under his government, according to the will of the Father. Now the ages or diſpenſations before Chriſt, we know from our own ſcriptures, were ordered by the angel Jehovah; and if he were not the Chriſt, the Old and New Teſtament contradict one another; by aſcribing the ſame government to two different beings. St. Paul therefore could mean no other perſon by Chriſt, than the ſame logos or word of God; whom Philo, and all of that age, underſtood to be the angel of the covenant, or the angel Jehovah. The ſame truth is confirmed by many other references in the goſpels and epiſtles; in which the ſenſe is defective, upon any other principle.

There is another opinion concerning the logos, which has had many advocates among modern divines, and eſpecially among thoſe who are denominated Unitarians. Perſons of this deſcription underſtand by the logos, either not a real perſon, or God himſelf. Accordingly ſome of them interpret the paſſage above cited in the following manner: "In the beginning was Reaſon, and Reaſon was with God, and Reaſon was God." But the ſenſe of theſe propoſitions amounts to nothing more, as Dr. Clarke has ſtated it, than that God always was a rational being; or if we underſtand by logos, the wiſdom, or power, or any of the attributes of God, the concluſion will be much the ſame. This, we muſt allow, is in itſelf a certain truth; and, as to the manner of the expreſſion, it might perhaps in ſome ſenſe, by a figurative way of ſpeaking, be affirmed, that the reaſon of God, or any one of his attributes, is God; yet this is nothing to the purpoſe of (what St. John is here treating of) the incarnation of Chriſt. For the reaſon of God is no otherwiſe God, than the reaſon of a man is the man himſelf. According to this interpretation, therefore, all thoſe declarations of ſcripture, in which it is affirmed that "the word was made fleſh and dwelt among us (John i. 14.), that Chriſt "came forth from the Father (John xvi. 28.), that "he came down from heaven (John iii. 13.), that "he came down from heaven, not to do his own will, but the will of him that ſent him (John vi. 18.), that he "took part of fleſh and blood (Heb. ii. 14.), that, having been "in the form of God," he did (κενωσαι εαυτον) *empty himſelf* of that form, "and was made in the likeneſs of man," and "found in faſhion as a man," (Phil. ii. 6, 7, 8.) :—All theſe expreſſions (according to this laſt interpretation of the words, θεος ην ο λογος), will in reality mean nothing more than that "the wiſdom of the Father dwelt in the "Man Chriſt Jeſus;" that is, that Chriſt was only in a more perfect and continued manner than other prophets, "an inſpired *man*." Nothing, ſays Dr. Clarke, can be more forced and unnatural than this interpretation. It is reducing the whole doctrine of the humiliation and incarnation of the ſon of God to a mere figure of ſpeech; and under the appearance of ſpeaking of Chriſt as the Supreme God, making him really nothing but a mere man. This, however, would ſerve the purpoſe of thoſe who are advocates for the ſimple humanity of Chriſt.

Dr. Lardner, in his "Letter on the Logos, written in the year 1730," profeſſes, that he was once favourable to the ſuppoſition, that the logos was the ſoul of our Saviour; but being at a loſs to conceive how that high being, the firſt and only immediately derived being by whom God made the world, ſhould gain any exaltation by receiving after his reſurrection and aſcenſion, a bright reſplendent human body, and being made the king and lord of all good men in this world, and the judge of mankind, and being made higher than the angels, to whom he was vaſtly ſuperior before, abandoned this hypotheſis, as throughout inconceivable, and irreconcileable to reaſon. Having ſtated ſome difficulties, which have been ſince repeatedly urged by Unitarians, and which thoſe who are advocates for the pre-exiſtent dignity of Chriſt are far from thinking to be incapable of a ſatiſfactory ſolution, and having given interpretations of the paſſages that ſeem to intimate and to expreſs the doctrine of our Saviour's pre-exiſtence, he proceeds to explain the introduction to St. John's goſpel. "In the beginning was the Word." By beginning he underſtands not the beginning of the goſpel, as others of ſimilar ſentiments have underſtood it, but of the creation, or rather always from eternity "was the Word." "And the word was with God;" that is, always with God, though not fully manifeſted, till theſe laſt days of the world. "And the word was God," ſometimes rendered, though not correctly, "And God was the word." Notwithſtanding the ſeeming tautology, he is of opinion, that God here is the ſame God that was mentioned before; and that St. John intends the one true God, not any inferior deity.

Theſe paſſages ſtill remain unſatiſfactorily interpreted, whatever be the hypotheſis concerning the logos that is admitted; but this is not the place to purſue more at large the diſcuſſion of this point. Our theological readers will be led by this article to ſeek further information from thoſe commentators and critics, who have expreſsly written on this ſubject.

LOGOTHETA, an officer under the emperors of the Eaſt, who kept an account of the various branches of public and private expence.

There were ſeveral kinds of them diſtinguiſhed by the particular branch they ſuperintended, as the *logotheta* τȣ δρομȣ, or *poſt-maſter general*; *logotheta* των οικειακων, or *maſter of the houſhold*, &c.

LOGRONO, in *Geography*, a town of Spain, in Old Caſtile, on the Ebro; containing a court of inquiſition, five pariſhes, eight convents, and about 5000 inhabitants. The environs produce fruit, legume, flax, hemp, excellent wine, oil, and ſilk: 20 miles N.W. of Calahorra. N. lat. 42° 23′. W. long. 3° 24′.—Alſo, a town of South America, in the province of Quito; 40 miles E.S.E. of Cuenza.

LOGSTOR, or Lixtoer, a town of Denmark, in North Jutland, on Lymford gulf; 21 miles W. of Aalborg. N. lat. 57°. E. long. 9° 15′.

LOGSTOWN, a town of America, on the W. ſide of the Ohio; 18 miles from Pittſburg.

LOGUR, a town of Hindooſtan; 20 miles W.N.W. of Poonah.

LOGWOOD, in *Botany*, the wood of a tree; for the botanical characters of which, ſee Hæmatoxylum. The wood of this tree is brought in logs of about three feet in length, to Europe, where it is uſed for dyeing purples, and for the fineſt blacks; and therefore it is a very valuable commodity.

The uſe of logwood in dyeing was eſtabliſhed in this country by 13 & 14 Car. II. cap. 11. before which time it was prohibited as a pernicious material. A conſiderable part of the ſoluble portion of the wood is taken up both by water and alcohol, but much more by the latter, and theſe menſtrua become tinged by it of a deep purple-red or brown. If acids be added to the watery decoction, it is turned yellow, but alkalies give a very deep purple colour, without yielding any precipitate. Alum, added to the decoction of logwood, cauſes a violet precipitate or lake, and the ſupernatant liquor alſo remains violet, and gives a freſh portion of lake on the effuſion of an alkali. The ſalts of iron give an inky black with all the ſolutions of logwood, under the ſame circumſtances as with galls, whence the preſence of gallic acid in logwood is evinced. The ſolutions of tin form a very fine violet-coloured lake with the decoction of logwood, and wholly precipitate the colouring matter, ſo that the ſupernatant liquor is quite clear and colourleſs. In dyeing, logwood gives its own natural purple, with ſhades or variations according to the mordant uſed, or it heightens and improves the common black with iron and galls. In this latter way it gives a peculiar gloſs and luſtre, on which account it is a very valuable dyeing material.

Logwood is uſed in miniature painting to make a purple waſh; which may be varied to a more red or blue colour by the addition or omiſſion of Brazil wood. The waſh may be prepared by boiling an ounce of ground logwood in a pint of water, till one-half of the fluid be waſted; ſtrain it then through flannel, while of a boiling heat; and add to it, when ſtrained, about ten grains of pearl-aſhes. To make it more red, add half an ounce of Brazil wood, or in proportion as the colour wanted may require; uſing in this caſe the pearl-aſhes very ſparingly. This wood has a ſweetiſh ſubaſtringent taſte, but a remarkable ſmell. It gives a purpliſh-red tincture to watery and ſpirituous infuſions, and tinges the ſtools, and ſometimes the urine, of the ſame colour; but it does not appear to colour the bones of animals.

Beſides its uſe among dyers, it is employed medicinally as an aſtringent and corroborant. In diarrhœas it has been found peculiarly efficacious; alſo in the latter ſtages of dyſentery, when the obſtructing cauſes are removed, it ſerves to obviate that extreme laxity of the inteſtines uſually ſuperinduced by repeated dejections. Extractum ligni campechenſis is ordered in the pharmacopeias, and may be given in the doſe of one ſcruple or two, repeated according to the urgency of the ſymptoms. The extract is obtained by inſpiſſating the decoctions. To promote the extraction, the wood ſhould be reduced into a fine powder, which is to be boiled in the water, in the proportion of a pound to a gallon, till half the liquor is waſted. Some digeſt the powdered wood in as much ſpirit as will cover it to the height of about four inches, and afterwards boil it in water; the matters taken up by the watery and ſpirituous menſtrua may be united into one extract, by inſpiſſating the watery decoction to the conſiſtence of honey, and then gradually ſtirring in the ſpirituous tincture.

Logwood *Country*, in *Geography*, a diſtrict of America, that lies N.W. of the Moſquito ſhore, at the head of the bay of Honduras, and extends from Vera Paz to Yucatan, from 15° to 18° N. lat. The whole coaſt is overſpread with iſlets, keys, and ſhoals, and the navigation is intricate.

Logwood *Lagoon*, a bay or gulf on the N.E. coaſt of Yucatan. N. lat. 20° 57′. W. long. 88° 20′.

Logwood *Mill*, in the *Manufactures*, is a machine for reducing logwood, or other dyeing woods, to ſmall chips or raſpings, that the colouring matter may be more readily extracted from them by the dyer. Theſe machines are of two kinds: one, by means of knives fixed to a large wheel, chips the wood acroſs the grain into ſmall fragments, which are afterwards reduced to a fine powder, by grinding them beneath a pair of rolling ſtones: this is called a chipping engine. The other kind operates by ſteel bars, with a great number of notches in the edge, which raſps and cuts the end of the wood into powder; this is called the raſping engine. Both machines require an immenſe power to actuate them, and are generally worked by water-wheels or by ſteam-engines. A plan and elevation of a raſping engine is given in *Plate* XXXI. *Mechanics*, *figs.* 1 and 2, where A is an iron cog-wheel, turned round by the large cog-wheel of a water-mill or ſteam-engine; its axis has an iron cylinder B fixed upon it, and this has a number of ſteel bars or knives *a* fixed in its circumference. The pieces of wood to be raſped are placed in a ſtrong wooden trough, D D, in which an iron bar, E, ſlides, and forces the wood down to the cylinder, being moved by two racks, F, F, turned by pinions on an axis, G. At one end of this is a handle, *g*, and at the other a wheel, *h*, which is turned by a pinion, *k*, at the extremity of a long ſpindle, H I, which is turned by a wheel, K, whoſe teeth are engaged by threads of a worm or endleſs ſcrew, *l*, cut on the end of the main axis. By this means the pinions are conſtantly turning round with a very ſlow motion, and advance the wood towards the cylinder, which is at the ſame time in motion, and its raſps cut the wood into powder. A ſection of the raſp cylinder is ſhewn in *fig.* 3, where the ſame letters are uſed. In this *m* is the groove in which tenants at the ends of the bar, E, ſlide. This bar has many large ſpikes in it, which faſten into the wood. At *n* is a ſtrong iron plate at the end of the trough, to defend it from wearing away by the great preſſure of the wood down upon it. The wood is kept down in the trough by the croſs-bar, L, *fig.* 2, fixed down over them. The iron cylinder, B, is caſt with 24 grooves in it lengthways, and in theſe are laid as many ſteel bars, Y, Z, *fig.* 3, the ſection of which is X. The angle, *r*, being ground to a ſharp edge, and the ſide, *r s*, cut with teeth, as ſeen at Z, ſo that the edge is ſerrated, as ſhewn by Y; the knives are held in their grooves by a ſtrong hoop, *n*, *fig.* 2, driven on the ends of the cylinder over the knives, and they are wedged in faſt by ſmall iron wedges. When the wood in the engine is all raſped, and it needs a freſh ſupply, the pinion, *k*, is diſengaged from the wheel *h*, and then the winch, *g*, being turned by a man, the racks are withdrawn. To diſengage the pinion, *k*, its bearing is fixed in a beam, O, which ſwings on a hinge at the upper end, and the lower end has a rod, *p*, jointed to it, which is engaged by a catch, *r*, when the handle, *t*, at the extremity of the rod, is moved away from the cylinder, ſo as to engage the pinion, *k*, with its wheel, *h*. But on moving the end of the rod towards the cylinder, it is relieved from the catch, and the pinion is diſengaged from the wheel; and to prevent the bar, E, going ſo far as to endanger its teeth meeting the raſps, a pin is fixed into a particular part of one of the racks, *f*, which takes hold of the rod, *p*, when it has got as far as intended, and removes the rod from the catch, *r*, and then the racks do not advance any farther to the raſps. The wheel at R S, joining in the axes H and I, is called a friction box: it conſiſts of an iron box, R, fixed on the end of the axis, I; its cavity receives a conical plug, S, fitted upon the end of the other axis, H, and preſſed into the box by a lever, T, loaded with a weight. By this means, if the wood does not raſp away ſo faſt as the motion of the racks would advance it, the cone, S, ſlips round in the box, R, and allows for the difference of the movements, which would otherwiſe break the machine. The cylinders of raſping engines generally turn round from 15 to 20 times per minute, and will reduce a great quantity of wood to a powder in a ſhort time. *Figs.* 4 and 5 are two elevations of a *chipping engine:* here A is part of a ſtrong iron axis, turned with a conſiderable velocity by water or ſteam: upon the end is a ſmall circular flanch, B, to which is bolted a circular iron-plate, D, in which four knives are fixed, ſo that their edges project a very ſmall quantity before the ſurface of the wheel in the manner of a plane iron. E is an iron frame containing the bearing for the pivot of the wheel; it has a ſmall trough, F, caſt all in one piece with it. All this iron work is ſcrewed down to the wood framing, G G. The wood, H, is in this machine preſented to the knives in the wheel by a man who holds it in the trough, and advances it as the knives cut away the end. Theſe chips are cut acroſs the grain but obliquely, as is evident from *fig.* 4: they are afterwards ground to a fine powder by a rolling ſtone, or runner upon edge. A large and heavy fly-wheel is uſually fixed on the axis, A, of the chipping wheel to regulate its movement. A method of reducing logwood has been lately introduced by ſawing it with a circular ſaw (ſee SAW), which cuts off a flake from the end of a piece of wood *x*, ſo that the jar of the ſaw ſhatters the flake all into powder. By this means, at every cut the ſaw cuts away as much wood as its thickneſs in ſaw duſt and the flake, which is as much more, is reduced at the ſame time, ſo that all the wood is reduced, though only one-half is cut, whereas, in the raſping engine, every particle muſt be cut by the machine. This improvement merits the attention of the woollen manufacturers, whoſe numerous logwood mills would be much improved by the adoption of this method.

LOHA, a town of Algiers; 28 miles E. of El Callah.

LOHARCANA, a town of Nepaul; 10 miles S. of Batgao.

LOHARINAPAUL, a town of Nepaul; 15 miles S. of Catmandu.

LOHAROO, a town of Hindooſtan, in Dooab; 10 miles N.W. of Pattiary.

LOHE, a town of Auſtria; 12 miles W.S.W. of Crems.

LOHEIA, a town of Arabia, in the province of Yemen, on the coaſt of the Red ſea, founded, about three centuries ago, by a Mahometan ſaint, who built a hut on the ſhore where the town now ſtands, and ſpent the reſt of his days there as a hermit. After his death, a "Kabbat," or houſe of prayer, was erected over his tomb, and it was afterwards gradually embelliſhed and endowed. Some devout perſons reſorted hither, and built huts for themſelves about his tomb. The harbour of Macabra, a neighbouring town, being about this time filled up, the inhabitants who deſerted it ſettled at Loheia, and transferred the ſeat of government to this place. The territory of Loheia is arid and barren; and the harbour is indifferent, ſo that at ebb-tide, laden boats cannot approach near it; but, notwithſtanding this diſadvantage, a conſiderable trade in coffee, brought from the neighbouring hills, is carried on in this town. The coffee is not ſo good as that which is procured by way of Mocha and Hodeida from Beit el Fakih, but it is purchaſed on more reaſonable terms, and the carriage to Jidda is leſs expenſive. On this account ſeveral merchants from Cairo reſide at Loheia, and others annually reſort hither for the purchaſe of coffee. In this town are alſo 40 poor Banians, who are employed in different trades. Loheia has no walls, but is defended by 12 towers garriſoned by ſoldiers, and placed at equal diſtances round it. The height of their gates render it neceſſary to aſcend them by means of ladders. It is but one of theſe towers that admits of being defended by cannons. Thus expoſed to the depredations of the Arabs, the inhabitants have been ſometimes reduced to the neceſſity of leaving the town, and of taking refuge in a ſmall iſland, whither they carry with them their moſt valuable effects. Several of the houſes in Loheia are built of ſtone; but they are generally huts, conſtructed after the Arabian faſhion; the walls conſiſting of mud mixed with dung, and the roof thatched with a ſort of graſs which is common here. Around theſe walls is a range of beds made of ſtraw, affording convenience for ſitting or lying. Theſe houſes are not large enough to admit of being divided into ſeparate apartments; they have ſeldom any windows, and the door is only a ſtraw-mat. When an Arab has a family and cattle, he builds for their accommodation ſeveral ſuch huts, and incloſes the whole with a ſtrong wooden fence. Lime is prepared in the neighbourhood of the town, by the calcination of coral from the ſea in the open air, and without a furnace. The water at Loheia is very bad, and therefore they are ſupplied from the diſtance of 2½ leagues, which is brought to them in earthen jars upon camels or aſſes. Within two leagues of the town is a ſmall hill which affords conſiderable quantities of mineral ſalt. The inhabitants are curious, intelligent, and poliſhed in their manners. The women wear large veils in the ſtreets, and yet they have no objection to throw them aſide before ſtrangers. One of theſe females, who preſented herſelf to view, had her brow, cheeks, and chin, ornamented with black ſpots, impreſſed into the ſkin, and her eyes were alſo artificially blackened. In this town they have all the inſtruments neceſſary for diſtilling brandy; they have alſo a ſort of wine, prepared from an infuſion of dry grapes in water, in a pot which is buried in the ground in order to make the liquor ferment. They have alſo a thick, white liquor, called "Buſa," prepared from meal mixed with water, and brought into a ſtate of fermentation. Niebuhr.

LOHMEN, a town of Saxony, in the margravate of Meiſſen; 10 miles E.S.E. of Dreſden.

LOHNIN, a town of Brandenburg; 10 miles S.E. of Brandenburg.

LOHOCK. See Loch.

LOHORPOUR, in *Geography*, a town of Hindooſtan, in Oude; 20 miles S. of Mahomdy.

LOHR, a town of Germany, in the county of Rieneck, on the Maine; 21 miles N.W. of Wurzburg.

Lohr *Hampton*, a town of Germany, in the county of Hanau-Munzenburg; 22 miles E. of Hanau.

LOHRY, a town of Hindooſtan, in Behker, on the Sinde; 15 miles S. of Behker.

LOHTO, a town of Sweden, in the government of Waſa; 18 miles N.E. of Gamla Karleby.

LOHURDEGA, a town of Bengal, in the circar of Nagpour; 22 miles N.N.W. of Doeſa. N. lat. 23° 20′. E. long. 84° 51′.

LOHURSEY, a town of Bengal, at which is a paſs acroſs the mountains; 18 miles N.N.E. of Pelamow.

LOIBERSTORFF, a town of Auſtria; 14 miles S. of Vienna.—Alſo, a town of Auſtria; 10 miles S.W. of St. Polten.

LOIHL, a range of mountains between Carinthia and Carniola.

LOIMAJOKI, a town of Sweden, in the government of Abo; 32 miles N.N.E. of Abo.

LOINS, in *Anatomy*, the lower and poſterior part of the trunk of the body, or the ſpace ſituated between the upper edge of the pelvis, and the laſt ribs. The inferior end of the vertebral column occupies the middle of this region; it is called the lumbar portion of the ſpine, and the vertebræ compoſing it are the lumbar vertebræ. (See Spine.) The loweſt of theſe reſts on the upper ſurface of the ſacrum, and thus joins the cheſt to the pelvis. This part of the ſpine is the centre of the reciprocal motions of the cheſt and pelvis; it is covered on each ſide, towards the back, by a thick maſs of muſcle, forming two convex prominences, with a hollow between them, correſponding to the ſpinous proceſſes. Theſe muſcles are the great powers concerned in extending the ſpine, and maintaining it erect. (See Dorsi *longiſſimus*, and Sacrolumbalis.) They are affected in ſtrains of the trunk, and in lumbago, in which caſes all motions of the loins are performed with great difficulty and pain. The ſides of the lumbar region of the ſpine are covered by the pſoæ muſcles, which belong to the hip-joint. The collections of matter forming ſerous abſceſſes are found in the cellular ſubſtance about theſe muſcles. Cloſe to the ſide of the ſpine, the interval between the criſta of the os innominatum and the laſt rib is occupied by the quadratus lumborum muſcle. (See Lumborum.) In front of this muſcle, and of the pſoas, the kidney lies, ſurrounded by looſe cellular ſubſtance, which ſeparates it from the peritoneum. (See Kidney.) The loins in front form a part of the poſterior ſurface of the abdomen; and this is called the lumbar region.

LOJO, in *Geography*, a town of Sweden, in the province of Nyland; 30 miles W. of Helſingfors.

LOJOBI, a town of Servia; 16 miles S.S.E. of Paſſarovitz.

LOIR and Cher, one of the nine departments of the central region of France, ſo called from the names of the rivers which traverſe it, the former in the ſouthern part, the other in the north, and compoſed of Bleſois and Sologne, diſtricts of Orleanais, is ſituated in 47° 40′ N. lat., S.E. of Sarthe, and bounded on the N. by the department of the Eure and Loire, on the N.E. by the Loiret, on the E. and S.E. by the Cher, on the S. by the Indre, and on the W. by the Indre and Loire, and Sarthe. It is 34 French leagues in length, and 23 broad, and contains 6717½ kiliometres, or about 339 ſquare leagues, and 211,152 inhabitants. It is divided into three diſtricts or circles, 24 cantons, and 309 communes; the circles are Vendome, containing 68,330, Blois, including 103,268, and Romorantin, comprehending 39,554 inhabitants. Its contributions amount to 2,432,733 francs, and its expences to 210,286 fr. and 19 cents. Its capital is Blois. The ſoil of this department is partly ſandy and partly fertile; yielding grain, wine, fruits, and paſtures. It abounds in lakes, marſhes, and heaths, with conſiderable foreſts, iron-mines, &c.

Loire, one of the 11 departments of the eaſtern region of France, formerly Forez, ſituated in 45° 30′ N. lat., weſt of the Rhone, 24 French leagues long and 12 broad, contains 5135 kiliometres, or 259 ſquare leagues, and 292,588 inhabitants. It is divided into three circles, 48 cantons, and 327 communes. The circles are Roanne, containing 95,668, Montbriſon, 97,659, and St. Etienne, 99,261 inhabitants. The contributions amount to 2,745,417 fr. and its expences to 244,800 fr. and 66 cents. Its capital is Montbriſon. This department is diverſified with plains, hills, and mountains. Both banks of the river Loire, from which it derives its appellation, are level, yielding grain, hemp, and paſtures. The gentle eminences near Roanne are covered with vines. Mont-Pilat, a ridge of high mountains, is ſituated at the S.E. extremity of the department, near the confines of Ardêche. Here are foreſts and mines of iron, lead, and coal.

Loire, *Upper*, one of the 12 departments of the ſouth-eaſt region of France, compoſed of Vevay and Cevennes, ſituated in 45° N. lat., ſouth of Loire and Puy de Dôme, 26 Fr. leagues long and 17 broad, contains 5282½ kiliometres, or 264 ſquare leagues, and 237,901 inhabitants. It is divided into three circles, 28 cantons, and 272 communes. The circles are Brioude, containing 70,596, Le Puy 103,068, and Yſſengeaux, 64,237 inhabitants. The capital is Le Puy. The contributions amount to 1,509,642 fr. and the expences to 219,838 fr. 23 cents. This territory, though mountainous and covered with ſnow ſix months in the year, yields grain, fruits, &c. ſufficient for the inhabitants, with good paſtures, mines of antimony, &c.

Loire, *Lower*, one of the nine departments of the weſtern region of France, formerly Upper Bretagne, a maritime territory on either hand of the Loire, is ſituated in 47° 15′ N. lat., is 30 Fr. leagues long and 27 broad, and contains 7660 kiliometres, or 382 ſquare leagues, and 368,506 inhabitants. It is divided into five circles, 45 cantons, and 209 communes. The circles are Savenay, comprehending 91,132, Chateau-Briant, 50,244, Ancenis, 36,949, Nantes, 157,940, and Paimboeuf, 32,241 inhabitants. Its capital is Nantes. Its contributions amount to 2,900,662 fr. and its expences to 345,171 fr. This department produces wheat, rye, flax, wine, and excellent paſtures, with mines of iron, coal, quarries of marble, &c. Savenay yields cyder and wine of an inferior quality. The ſecond circle is almoſt one continued foreſt. Nantes is agreeably diverſified and fertile. From the marſhes of Paimboeuf much ſalt is extracted.

LOIRET, one of the nine departments of the central region of France, a portion of Orleanais, E. of Loir and Cher, is ſituated in 47° 50′ N. lat., is 30 Fr. leagues long, and 24 broad; and contains 7047½ kiliometres, or 356 ſquare leagues, and 289,728 inhabitants. It is divided into four circles, 31 cantons, and 363 communes. The circles are Pithiviers, containing 55,061, Montargis, 61,912, Gien, 37,395, and Orleans, 135,360 inhabitants. Its capital is Orleans. Its contributions amount to 3,778,705 fr. and its expences to 337,821 fr. 52 cents. The ſoil of the ſecond circle is ſandy, yielding little grain. The products of the other diſtricts are grain, wine, hemp, ſaffron, fruits, and paſtures.

LOIRON, a town of France, in the department of the Mayenne, and chief place of a canton, in the diſtrict of Laval; ſix miles W. of Laval. The place contains 1559, and the canton 13,810 inhabitants, on a territory of 280 kiliometres, in 15 communes.

LOITSCH, or Logatez, a town of Upper Carniola; 15 miles W. of Laybach.

LOITZ, a town of Anterior Pomerania; 24 miles S. of Stralſund. N. lat. 53° 56′. E. long. 13° 5′.

LOKACZ, a town of Poland, in Volhynia; 30 miles W.S.W. of Lucko.

LOKALAX, a town of Sweden, in the government of Abo; 27 miles N.W. of Abo.

LOKE, in *Mythology*, the name of one of the deities of the northern nations, anſwering to the Arimanes among the Perſians, whom they repreſent as at enmity both with gods and men, and the author of all the evils which deſolate the univerſe. Loke is deſcribed in the Edda as producing the great ſerpent which incircles the world; which ſeems to have been intended as an emblem of corruption or ſin: he alſo gives birth to Hela or death, the queen of the infernal regions; and alſo to the wolf Fenris, that monſter who is to encounter the gods and deſtroy the world. North. Ant. vol. ii. p. 85, &c.

Loke, in *Rural Economy*, a provincial word uſed in Norfolk for a cloſe narrow lane.

LOKMAN, in *Biography*, ſurnamed *Al-Hakim*, or the *Wiſe*, a philoſopher in conſiderable eſtimation among the eaſtern nations, to whom is attributed a collection of maxims and fables, which are calculated to diſplay the moral doctrines of the ancient Arabians. There have been many hypotheſes concerning the country in which he lived, and the period at which he flouriſhed, but the greater part of the Muſſulman doctors make him contemporary with David and Solomon. It has been ſuppoſed that he was a native of Ethiopia or Nubia, and in rather a ſervile condition; that he had been a ſlave in different countries, and that he was at length ſold among the Iſraelites. His wiſdom has been aſcribed to divine inſpiration, which he received in the following manner; while aſleep at noon-day, angels came to the place where he was repoſing, ſaluted him, without rendering themſelves viſible, and declaring that God would make him a monarch and his lieutenant on earth. He ſignified his ſubmiſſion to the will of his maker, but would rather have preferred to remain in a low condition. On account of this anſwer, God beſtowed upon him wiſdom in ſo eminent a degree that he was enabled to inſtruct mankind by a great variety of maxims, ſentences, and parables, amounting to ten thouſand in number. The anecdotes which are recorded concerning the life of Lokman are found ſcattered in the writings of ſeveral of the orientals; of theſe we ſhall notice only a few. As he was once ſeated in the midſt of a circle of auditors, a man of high rank aſked if he was not that black ſlave whom he had before ſeen attending upon the flocks in the field; he replied, he was; how then, ſaid the other, have you attained to ſuch wiſdom and ſo high a reputation; "By following exactly," ſaid Lokman, "theſe three precepts; always to ſpeak the truth; to keep inviolably the promiſes made; and never to meddle with what does not concern me." It was Lokman who ſaid that "the tongue and the heart, were both the beſt and the worſt parts of men." Mahomet frequently refers to the authority of Lokman in ſupport of his own opinions and doctrines, and he is ſtill regarded by the followers of the Mahometan religion as a ſaint and a prophet. They repreſent him to have been as virtuous and pious as he was wiſe, and on that account was peculiarly bleſſed of God. Some writers aſſert that he embraced the Jewiſh religion, and entered into the ſervice of king David, who entertained a high eſteem for him, and that he died at a very advanced age. The ſcanty relics of the fables of Lokman were publiſhed by Erpenius, in Arabic and Latin, and Tannaquil Faber gave an edition of them in elegant Latin verſe. Gen. Biog.

Lokman, in *Geography*, a town of the Arabian Irak, on the Tigris; 16 miles N. of Bagdad.

LOKO, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 60° 51′. E. long. 20° 59′.

LOKOHAR, a town of Hindooſtan, in Bahar; 36 miles N.E. of Durbunga.

LOKTEVA, a town of Ruſſia, in the government of Kolivan; 36 miles S.W. of Kuznetzk.

LOLBAZAR, a town of Bengal; 37 miles S.W. of Beyhar.

LOLBINIERE, a town of Canada, on the river St. Lawrence; 25 miles S.W. of Quebec.

LOLDONG, a town and fortreſs of Almora; 85 miles N.N.E. of Delhi. N. lat. 29 47′. E. long. 78° 36′.

LOLGUNGE, a town of Hindooſtan, in Oude; 16 miles N. of Manickpour.—Alſo, a town of Hindooſtan, in Benares; 22 miles S.W. of Mitzapour.—Alſo, a town of Hindooſtan, in Oude; 20 miles S. of Azemgur.

LOLICHMIUM, in *Greek Muſic*, according to Pauſanias, was the name given to the gymnaſium at Olympia, which was always open for thoſe who wiſhed to contend in literature, poetry, or muſic; and Ælian tells us, that in the 91ſt olympiad, Euripides and Xenocles diſputed the prize in dramatic poeſy at the Olympic games; at which time they were accompanied by inſtruments.

LOLIUM, in *Agriculture*, the name of a kind of graſſes, of which there are ſeveral ſpecies, ſome of which are highly uſeful to the farmer, as the lolium perenne.

Lolium, in *Botany*, a Latin word of unknown origin.—Darnel, or Darnel-graſs. Virgil calls it "*infelix lolium*," not only as being a weed amongſt corn, but probably alluding to an idea, long prevalent, that corn was transformed into it. This opinion of the change of one kind of gramineous plant into another, as wheat into rye, rye into barley, barley into darnel, darnel into brome-graſs; and of the latter by becoming oats or rye, in a fertile ſoil, returning again to a more improved ſtate; all this, however abſurd, was ſo generally believed, that Linnæus thought proper to write a diſſertation againſt it. See *Tranſmutatio Frumentorum*, Amoen. Acad. v. 5. 106—Linn. Gen. 38. Schreb. 53. Willd. Sp. Pl. v. 1. 461. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 148. Ait. Hort. Kew. ed. 2. v. 1. 174. Juſſ. 31. Lamarck Illuſtr. t. 48.—Claſs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Common receptacle elongated into a ſpike, the flowers, which are diſpoſed in two ranks, being preſſed cloſe to an angle of the ſtalk. Glume of one valve, awl-ſhaped, permanent, fixed, oppoſite to the ſtalk. *Cor.* of two valves; the lowermoſt lanceolate, narrow, convoluted, pointed, the length of the calyx; the uppermoſt ſhorter, linear, blunter, concave above. Nectary of two ſmall, ovate, obtuſe leaflets, gibbous at their baſe. *Stam.* Filaments three, capillary, ſhorter than the corolla; anthers oblong. *Piſt.* Germen turbinate; ſtyles two, capillary, reflexed; ſtigmas feathery. *Peric.* none; the corolla embracing the ſeed, and finally opening to let it fall. *Seed* one, oblong, convex beneath, with a broad ſhallow furrow above, compreſſed.

Obſ. The ſeſſile ſpikelets ſtand in the ſame plane with the ſtalk, ſo that the latter ſupplies the place of an inner valve to the calyx, which nevertheleſs is ſometimes preſent, though diminutive.

Eſſ. Ch. Calyx of one valve, fixed, many-flowered. Florets two-ranked.

1. L. *perenne.* Perennial Darnel; Red Darnel; or Ray-graſs. Linn. Sp. Pl. 122. Engl. Bot. t. 315. Mart. Ruſt. t. 4. Knapp. t. 100.—Spike awnleſs. Spikelets longer than the calyx. Florets lanceolate.—A common European graſs, in rather fertile ground, about the borders of fields, road ſides, paſtures, &c. flowering in June.—The *root* is fibrous, downy, perennial. *Stem* a foot high, erect or aſcending, bent at the bottom, jointed, leafy, round in the upper part, ſtriated, ſmooth. *Leaves* linear, keeled, ſmooth, dark green, with ſmooth, ſtriated ſheaths, and a ſhort obtuſe ſtipula. *Spike* nearly erect, very flat, often a little twiſted.

A variety with a compound ſpike is figured by Leers, t. 12. f. 1; and another with a remarkably ſhort broad and denſe ſpike, in Scheuchz. Prodr. t. 2. Vaillant's t. 17. f. 3, with long awns, cited by Willdenow after Reichard, ſurely cannot belong to this ſpecies.

β. L. tenue; Linn. Sp. Pl. 122. Willd. n. 2, appears to be only a ſtarved variety of *perenne*, with very few florets in each calyx.

2. L. *temulentum.* Bearded Darnel. Linn. Sp. Pl. 122. Fl. Dan. t. 160. Leers. 48. t. 12. f. 2. Engl. Bot. t. 1124. Knapp. t. 104. Hoſt. Gram. Auſtr. v. 1. t. 26. Schreb. Gram. t. 36.—Spike awned. Spikelets ſhorter than the calyx. Florets elliptical. Stem rough in the upper part.—Native of European corn-fields, among barley, wheat, or flax, flowering in July.—*Root* annual, of a few downy fibres. *Stem* nearly ſolitary, twice as tall and ſtout as the former, erect, firm, of about three knots; very ſmooth and ſhining in the lower part; rough above. *Leaves* lanceolate, ſpreading, ribbed, rough, of a lighter green than in *perenne*. *Sheaths* roughiſh. *Stipula* very ſhort, crenate. *Spike* erect, larger and more turgid than in the former. *Calyx* without awns; in the lower ſpikelets often furniſhed with a minute, elliptical, inner valve. *Florets* numerous, ovate, ſwelling, ſlightly ribbed, rough, each tipped with an awl-ſhaped, whitiſh, rough, erect awn, twice its own length, from a little below the top.—The ſeeds are ſaid to be intoxicating to men, beaſts and birds, and even to bring on convulſions and death. We know of no miſchiefs from it in this country, where it is far from common.

3. L. *arvenſe.* Annual Beardleſs Darnel. Withering 168. Engl. Bot. t. 1125. Knapp. t. 102. (L. temulentum; Hudſ. 55.)—Spike almoſt beardleſs. Spikelets about the length of the calyx. Florets elliptical. Stem very ſmooth.—Native of fields in England and Scotland, as well as other parts of Europe. Willdenow indicates it as a variety of the laſt. It differs however, not only in being not at all, or very ſhortly, awned, but in the total ſmoothneſs of its *ſtem* and *ſpike*. The *leaves* are occaſionally rough, but on their upper ſide only. Dr. Withering, who firſt defined this ſpecies, ſays the *calyx* has two valves; but we uſually find only one. The *awns* are too large in the plate of *Engliſh Botany*.

4. L. *maximum.* Great Weſt-Indian Darnel. Willd. n. 4.—"Calyx as long as the many-flowered compreſſed ſpikelet; of which the upper florets are awned."—Native of Jamaica. *Root* annual. Whole graſs twice as large as *L. temulentum*, from which alſo it differs in having the *calyx* equal in length to the *ſpikelet*; and while the upper *florets* have long awns, the reſt are beardleſs. Yet Willdenow, from whoſe work we adopt this ſpecies, ſuſpects it may be but a variety of the ſecond.

5. L. *diſtachyon.* Double-ſpiked Indian Darnel.—Linn. Mant. 187.—Spikes in pairs. Calyx ſingle-flowered. Corolla fringed.—Sent by Koenig from the coaſt of Malabar.—*Stems* partly decumbent, ſlender, branched, ſmooth. *Leaves* ſhort, narrow, with long, ſmooth, rather tumid ſheaths. *Spikes* in pairs, terminal, equal, ſlender, two or three inches long. *Flowers* in two ranks, but directed to one ſide. *Calyx* of one valve, ſingle-flowered. *Corolla* ovate, denſely fringed with fine, long, white hairs. A ſingular graſs, whoſe genus is at leaſt doubtful. In ſome points it reſembles a *Panicum*.

Lolium *Perenne*, the botanical name of the graſs uſually known to the farmers by the name of ray-graſs: it has a perennial fibrous creeping root. The ſtems, ſeveral from the ſame root, proſtrate or oblique at the baſe, but the flowering ſtem upright, ſmooth, from ſix inches to eighteen, twenty and twenty-four inches in height, according to the ſoil: they have ſeveral joints near the baſe, at a ſmall diſtance from each other, but on the upper part only one or two. On a great number of plants of a middling ſize three joints, and never more than four, were counted by Miller, the flowering-ſtem running up from eleven to fourteen inches above the laſt joint. They are frequently ruſſet-coloured at the joints; the leaves are four or five inches long, and from two to four lines wide, lengthened out into a point; the leaf on the ſtem above twice as broad as thoſe next the root and on the runners. The ſheath covers the ſtem for ſeveral inches above the upper joint; both that and the leaves are ſmooth. The flowers are in a ſpike, which is from four to ſix or ſeven, and even nine inches in length, compoſed of many (ten to eighteen) ſpikelets, ranged at a little diſtance from each other, in two rows alternately along the rachis or common receptacle. The ſpike is generally flat, but ſometimes nearly cylindrical; and it ſometimes ſhews a diſpoſition to become branched, particularly towards the bottom. The rachis is flexuous, or changes its direction in a curve line from one ſpikelet to another; and each ſpikelet being lodged at the baſe in a hollow of it, has no occaſion for an inner valve to the calyx for protection, and therefore is not provided with one. The number of flowers in each ſpikelet varies from three or four to ſix, ſeven or eight, and even ſometimes nine, ten, or eleven; but ſix or ſeven is the moſt common number. The valve of the calyx tapers to a point; and the terminating calyx is two-leaved. The two inner huſks, which are the valves of the corolla, are both of the ſame length, or nearly ſo. The germ is placed between the upper of theſe, and two ſmall white ſemitranſparent ſubſtances, which Linnæus terms the nectaries: the ſeed eaſily quits the chaff or covering.

This is a graſs which is called in Engliſh a *ray-graſs*, from the French *ivarie*, which is their name for another ſpecies, this being termed *Fauſſe ivarie*. It is corruptly termed by farmers rie, or rye-graſs, but it bears no reſemblance to rie, or rye, that being a name appropriated to a very different graſs (Hordeum pratenſe). It has, likewiſe, by Ray been diſtinguiſhed by the title of *Red Darnel-graſs*; and in ſome places it is called *Crap*; in Devonſhire, *Eaver*; in Norfolk, *White Noneſuch*.

There are ſeveral varieties of this graſs which differ chiefly in the ſize or colour of the ſtem and ſpike, as well as the number of flowers in each ſpikelet. Alſo the flowers are now and then found with awns or beards; and the ſpikelets are alſo ſometimes cluſtered, and ſometimes branched, or divided.

It is a ſort of graſs that has been long in cultivation as an early paſture and hay graſs. See ARTIFICIAL *Graſs*, and RAY-GRASS.

LOLLARDS, in *Eccleſiaſtical Hiſtory*, a religious ſect, differing in many religious points from the church of Rome, which aroſe in Germany about the beginning of the fourteenth century; ſo called, as many writers have erroneouſly imagined, from Walter Lollard, who began to dogmatize in 1315, and was burnt at Cologn: but it is evident that Lollard was no ſurname, but merely a term of reproach applied to all heretics who concealed the poiſon of error under the appearance of piety.

The monk of Canterbury derives the origin of the word Lollard, among us, from *lolium, a tare*; as if the Lollards were the tares ſown in Chriſt's vineyard. Abelly ſays, that the word Lollard ſignifies *praiſing God*, from the German *loben, to praiſe*, and *herr, Lord*; becauſe the Lollards employed themſelves in travelling about from place to place, ſinging pſalms and hymns.

Others, much to the ſame purpoſe, derive *lollhard, lullhard*, or *lollert, lullert*, as it was written by the ancient Germans, from the old German word *lullen, lollen*, or *lallen*, and the termination *hard*, with which many of the High Dutch words end. *Lollen* ſignifies to ſing with a low voice, and, therefore, *lollhard* is a ſinger, or one who frequently ſings; and in the vulgar tongue of the Germans, it denotes a perſon who is continually praiſing God with a ſong, or ſinging hymns to his honour. The Alexians or Cellites were called Lollards, becauſe they were public ſingers who made it their buſineſs to inter the bodies of thoſe who died of the plague, and ſang a dirge over them in a mournful and indiſtinct tone as they carried them to the grave. The name was afterwards aſſumed by perſons that diſhonoured it; for we find, among thoſe Lollards who made extraordinary pretences to piety and religion, and ſpent the greateſt part of their time in meditation, prayer, and ſuch acts of piety, there were many abominable hypocrites, who entertained the moſt ridiculous opinions and concealed the moſt enormous vices under the ſpecious mark of this extraordinary profeſſion. And many injurious aſperſions were propagated againſt thoſe who aſſumed this name, by the prieſts and monks; ſo that by degrees, any perſon who covered hereſies or crimes under the appearance of piety, was called a Lollard. Thus the name was not uſed to denote any one particular ſect, but was formerly common to all perſons and all ſects, who were ſuppoſed to be guilty of impiety towards God or the church, under an external profeſſion of extraordinary piety. However, many ſocieties, conſiſting both of men and women, under the name of Lollards, were formed in moſt parts of Germany and Flanders, and were ſupported partly by their manual labours, and partly by the charitable donations of pious perſons. The magiſtrates and inhabitants of the towns, where theſe brethren and ſiſters reſided, gave them particular marks of favour and protection, on account of their great uſefulneſs to the ſick and needy. They were thus ſupported againſt their malignant rivals, and obtained many papal conſtitutions, by which their inſtitute was confirmed, their perſons exempted from the cognizance of the inquiſitors, and ſubjected entirely to the juriſdiction of the biſhops; but as theſe meaſures were inſufficient to ſecure them from moleſtation, Charles, duke of Burgundy, in the year 1472, obtained a ſolemn bull from pope Sixtus IV. ordering that the Cellites, or Lollards, ſhould be ranked among the religious orders, and delivered from the juriſdiction of the biſhops; and pope Julius II. granted them yet greater privileges in the year 1506. Moſheim informs us that many ſocieties of this kind are ſtill ſubſiſting at Cologn, and in the cities of Flanders, though they have evidently departed from their ancient rules. Eccl. Hiſt. vol. iii. 8vo.

Lollard and his followers rejected the ſacrifice of the maſs, extreme unction, and penances for ſin; arguing, that Chriſt's ſufferings were ſufficient. He is likewiſe ſaid to have ſet aſide baptiſm as a thing of no effect; and repentance, as not abſolutely neceſſary, &c. In England, the followers of Wickliffe were called, by way of reproach, Lollards, from ſome affinity there was between ſome of their tenets; though others are of opinion, that the Engliſh Lollards came from Germany.

They were ſolemnly condemned by the archbiſhop of Canterbury and the council of Oxford.

LOLLGUNGE, in *Geography*, a town of Bengal; 20 miles E.N.E. of Purneah.

LOLLI, in *Biography*, a performer on the violin of great celebrity, who came into England at the beginning of 1785; but by a caprice in his conduct equal to his performance, he was ſeldom heard. And then ſo eccentric was his ſtyle of compoſition and execution, that he was regarded as a madman by moſt of his hearers. And yet we are convinced, that in his lucid intervals he was, in a ſerious ſtyle, a very great, expreſſive, and admirable performer. In his freaks nothing can be imagined ſo wild, difficult, groteſque, and even ridiculous as his compoſitions and performance. After playing at the oratorio, and making the grave and ignorant laugh at very ſerious difficulties upon which he had, perhaps, but ill beſtowed his time, he ſuddenly left the kingdom, *à la ſourdine*; perhaps, at laſt, to ſhun difficulties of another kind.

LOLLIEI, in *Geography*, a town of Thibet; 110 miles N. of Goreah. N. lat. 30° 15′. E. long. 84° 28′.

LOLLONADO, a town of the iſland of Cuba; 146 miles S.W. of Havanna.

LO-LOS, the name of a particular people diſperſed through the province of Yun-nan, in China, diſtinct from the Chineſe. They were formerly governed by their own ſovereigns, but upon ſubmitting to the emperor of China they obtained peculiar privileges. Theſe people are well made, and inured to labour. They have a peculiar language of their own, and a mode of writing which ſeems to be the ſame with that of the bonzes of Pegu and Ava. Theſe cunning prieſts have acquired an influence over the Lo-los in the weſtern part of Yun-nan, and have introduced among them the worſhip and religious ceremonies of their country; and they have even induced them to build large temples of a different architecture from that of the Chineſe. The princes of the Lo-los are abſolute maſters of their ſubjects, and have a right of puniſhing them, even by death, without waiting for the anſwer of the viceroy. Theſe princes have many officers and men under their command; and their militia is compoſed of cavalry and infantry, who are armed with bows and lances, and ſometimes muſkets. The iron and copper mines which are lodged in their mountains, enable them to make their own armour. Theſe mountains alſo abound with mines of gold and ſilver. The dreſs of the Lo-los conſiſts of plain drawers; a veſt of cotton hanging to their knees, and a ſtraw hat; their legs are bare, and they wear only ſandals. The women have a long robe, covering the whole body down to the feet, above which they tie a ſmall cloak that reaches no further than the girdle. In this dreſs they appear on horſeback, at marriage ceremonies, or when they pay viſits, accompanied by the females in their train, who are alſo on horſeback, and by ſeveral domeſtics. Groſier.

LOLPOUR, a town of Hindooſtan, in the circar of Jyenagur; 15 miles S.S.E. of Jyepour.

LOM, a town on the E. coaſt of the iſland of Gilolo. S. lat. 0° 16′. E. long. 128°.

LOMABLEM, or LOMBLEM, an iſland in the Eaſt Indian ſea, about 120 miles in circumference. S. lat. 8° 18′. E. long. 123° 56′.

LOMATIA, in *Botany*, from λωμα, *a border*, becauſe the ſeeds are terminated by a bordered ring. Brown Tr. of Linn. Soc. v. 10. 199. Prodr. Nov. Holl. v. 1. 389. Ait. Hort. Kew. ed. 2. v. 1. 212.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Proteaceæ*, Juſſ. Brown.

Gen. Ch. *Cal.* none. *Cor.* Petals four, irregular, diſtinct, oblong, obliquely twiſted toward one ſide; their ſummits dilated, concave, bearing the ſtamens. Nectary three glands at one ſide of the baſe of the ſtalk ſupporting the germen. *Stam.* Filaments four, extremely ſhort, in the hollows of the petals; anthers roundiſh, ſunk in the ſaid hollows. *Piſt.* Germen ſuperior, ſtalked, half-ovate, erect; ſtyle permanent, incurved; ſtigma oblique, dilated, roundiſh, nearly flat. *Peric.* Follicle ſtalked, half-ovate, coriaceous, crowned with the ſtyle of one cell. *Seeds* many, imbricated in two rows, elliptical, compreſſed, with a terminal bordered wing, whoſe diſk is without veins.

Eſſ. Ch. Petals four, irregular. Stamens ſunk in the cavities of the limb. Three glands, on one ſide, at the baſe of the ſtalk of the germen. Stigma oblique, flattiſh. Follicle coriaceous, of one cell. Seeds many, with a terminal bordered wing.

Eight ſpecies of this genus, ſome found in New Holland, others in South America, are defined by Mr. Brown. They are "ſhrubs, with alternate leaves, which are in many caſes divided or toothed, rarely entire, ſometimes various on the ſame individual plant. Cluſters terminal, ſometimes axillary, elongated, looſe, occaſionally ſhort and corymboſe; their partial ſtalks in pairs, with one common bractea to each pair. Flowers yellowiſh-white. Involucrum none. Nucleus of the ſeed beſprinkled with ſulphur-coloured powder." *Brown.*

1. L. *ſilaifolia.* Cut-leaved Lomatia. Sims in Curt. Mag. t. 1272. (Embothrium ſilaifolium; Sm. Bot. of New Holl. 23. t. 8. E. herbaceum; Cavan. Ic. v. 4. 58. t. 384.) —Leaves doubly pinnatifid, very ſmooth; ſegments linear-wedge-ſhaped, or lanceolate, acute, pointed, reticulated with veins. Cluſters very ſmooth, elongated, ſimple or divided. —Native of light ſandy fields and heaths, on the eaſt coaſt of New Holland, near Port Jackſon. It is ſaid to have been ſent to Kew garden, by ſir Joſeph Banks, in 1792. We firſt ſaw it in flower at Meſſrs. Grimwood's, Kenſington, in the ſummer of 1793, where it was kept in the ſtove; but the ſhelter of a greenhouſe is ſufficient. It is propagated either by ſeeeds or layers. The whole *plant* is very rigid and ſmooth, three or four feet high, but little branched. *Leaves* dark green, with various, more or leſs compound, decurrent ſegments, much reſembling ſome of the umbelliferous tribe. *Flowers* white, inodorous, in long, terminal cluſters, whoſe ſtalks have occaſionally a reddiſh tinge. *Fruit* about an inch long. Every part turns quite black in drying. See EMBOTHRIUM.

2. L. *tinctoria.* Colouring Lomatia. Labill. Nov. Holl. v. 1. 31. t. 42, 43.—Leaves once or twice pinnatifid, or undivided, ſmooth; ſegments pectinate, ſingle-ribbed, almoſt veinleſs, bluntiſh, pointed. Cluſters elongated, ſmooth, unbranched.—Gathered by Labillardiere and Brown in hilly places and fields at Van Diemen's land. The *ſtem* is ſix feet high. *Leaves* very various, uſually very neatly pinnatifid, with numerous, parallel, linear-lanceolate, ſometimes ſubdivided, ſegments; more rarely undivided, ſlightly notched at the tip. *Cluſters* looſe, with fewer flowers, on longer ſtalks than the former. The ſulphur-coloured powder which covers the *ſeeds*, is ſaid by Labillardiere to give out a roſe-coloured dye to water.

3. L. *ferruginea.* Ruſty Lomatia. (Embothrium ferrugineum; Cavan. Ic. v. 4. 59. t. 385.)—Leaves doubly pinnatifid, downy; ſegments ovate or lanceolate. Cluſters ſhorter than the leaves.—Gathered by Louis Née at St. Carlos de Chiloe, South America, in places occaſionally overflowed by the ſea, flowering in February. The *ſtem* is ten or twelve feet high, rarely ſtraight; its branches downy. *Leaves* doubly pinnatifid, acute; the down of the young ones ruſty, of the old ones grey. *Petals* red within; yellowiſh-green without.

4. L. *polymorpha.* Various-leaved Lomatia.—Leaves linear-lanceolate; entire, toothed, or pinnatifid; downy, like the branches and flower-ſtalks, beneath. Cluſters corymboſe, terminal. Corolla ſomewhat hairy. Piſtil very ſmooth.—Gathered on the ſouthern hills of Van Diemen's land, by Mr. Brown, who conceives this ſpecies to have been confounded by Labillardiere under our ſecond, when he ſays "the leaves of that are ſometimes beſprinkled at their back with ſhort rufous down." Two varieties of L. *polymorpha* are indicated; one whoſe leaves are undivided, their downineſs grey, and their ſeed-veſſels but half an inch long; the other with generally cut or pinnatifid leaves, ruſty underneath, and their ſeed-veſſels near an inch in length.

5. L. *ilicifolia.* Ilex-leaved Lomatia.—"Leaves oblong-ovate, acute, with fine ſpinous teeth, reticulated, quite ſmooth, as well as their footſtalks. Cluſters elongated, terminal."—Native of barren fields at the ſides of hills on the ſouthern coaſt of New Holland, near port Phillip, where Mr. Brown gathered it, after the flowers were fallen.

6. L. *longifolia.* Long-leaved Lomatia. (Embothrium myricoides; Gærtn. v. 3. 215. t. 218? *Br.*)—Leaves li-

near-lanceolate, elongated, ſmooth, diſtantly ſerrated. Cluſters axillary. Flower-ſtalks and corolla rather hairy. Piſtil very ſmooth.—Gathered by Mr. David Burton, as well as Mr. Brown, on the ſtony banks of rivers and rivulets near Port Jackſon. This is a branched buſhy *ſhrub*, with angular young *branches*, clothed with ruſty hairs, as are alſo the *flower-ſtalks*, *bracteas*, and in ſome degree the *flowers*. The *leaves* are numerous, alternate, on ſhort broadiſh ſtalks, lanceolate, acute, veiny, three or four inches long, about half an inch broad, ſmooth except the lower portion of their rib at the upper ſide; ſharply and diſtantly ſerrated upwards, tapering and moſtly entire in their lower half. *Cluſters* axillary, ſolitary, ſimple or branched, about as long as the leaves. *Stigma* very broad, with a ſmall point. *Follicle* ſmooth, above an inch long, ſemiovate.

7. L. *dentata*. Toothed Lomatia. (Embothrium dentatum; Fl. Peruv. et Chil. v. 1. 62. t. 94, a. *Br.*)—Leaves oval, with tooth-like ſerratures, ſmooth, as well as their footſtalks. Cluſters lateral, ſhort. Corolla hairy. Germen downy.—Native of woods and groves in Chili.

8. L. *obliqua*. Oblique Lomatia. (Embothrium obliquum; Fl. Peruv. et Chil. v. 63. t. 97. E. hirſutum; Lamarck Dict. v. 2. 355.)—Leaves ovate, ſerrated, ſmooth. Cluſters axillary. Flower-ſtalks and corolla hairy. Stigma deciduous.—Found on hills in the provinces of the Conception of Chili and Puchacay.

Mr. Brown mentions that the wings of the ſeed in theſe two laſt ſpecies, which have not been ſeen by him, require examination.

LOMAZY, in *Geography*, a town of Lithuania, in the palatinate of Brzeſc; 36 miles S.S.W. of Brzeſc.

LOMAZZO, Giovanni Paolo, in *Biography*, an hiſtorical painter, born at Milan in 1538, and pupil of Gio. Battiſta Cerva. Before he became blind, which happened about the 33d year of his age, he painted much, with more whim than originality. He afterwards wrote ſeveral treatiſes on painting, in which, with the moſt tedious prolixity, he interweaves anecdote and uſeful precept, with chemic and aſtrologic nonſenſe. Fuſeli's Pilkington.

LOMBARD, Peter, a biſhop of Paris, who flouriſhed in the twelfth century, and known under the title of "Maſter of the Sentences," was a native of Novara in Lombardy, from which he derived his ſurname. He received his education at Bologna, celebrated at that time for its univerſity, and its very eminent profeſſors of the civil law. His mind was bent on theological purſuits, and he was encouraged to devote himſelf to them by the biſhop of Lucca, who recommended him to St. Bernard, by whoſe aſſiſtance he was enabled to proſecute his ſtudies at Rheims. He afterwards removed to Paris, and from his reputation for learning, obtained a profeſſorſhip in the univerſity, and was preſented with the canonry of Chartres, which was followed by his elevation to the epiſcopal dignity, for which he was indebted to the regard entertained for him by his pupil, Philip, ſon of Lewis le Gros. This prince was educated for the church, and in 1159 was elected biſhop, an honour which he declined in favour of his old maſter, as a mark of perſonal regard for him. Lombard did not long enjoy the dignity; he died in the year 1164. His celebrity in the ſchools was derived from his work entitled "Sententiarum, lib. iv." in which he endeavoured to illuſtrate the doctrines of the church by a collection of ſentences and paſſages drawn from the fathers whoſe contradictions he attempted to reconcile. This work was received with univerſal applauſe, and acquired ſo high an authority among the ſchoolmen, that the moſt learned doctors were employed in illuſtrating and expounding it. The abbè Fleury makes the number of commentators on it amount to two hundred and forty-four. It was firſt printed at Venice in 1477, and has undergone a multitude of impreſſions at different times and in different places. Moreri.

LOMBARDS, or rather Langobards, which was their original name, deduced from the peculiar length and faſhion of their beards, *lang* ſignifying *long*, and *baert*, *beard*, whereas the corrupt appellation of *Lombards* was diffuſed in the 13th century by the merchants and bankers, who were the Italian poſterity of the ſavage warriors to whom the name originally belonged, denote a tribe of people who aroſe from an obſcure and ſmall beginning to occupy the moſt conſiderable rank in Europe. The Scandinavian origin of theſe people is maintained by Paul the Deacon, conteſted by Cluverius, and defended by Grotius. It would be tedious, and alſo unſatisfactory to the reader, if we were to make an attempt at purſuing the migrations of the Lombards through unknown regions and marvellous adventures. About the time of Auguſtus and Trajan theſe fierce people were diſcovered between the Elbe and the Oder. They were fierce beyond the example of the Germans, and they took pleaſure in propagating the tremendous belief, that their heads were formed like the heads of dogs, and that they drank the blood of their enemies whom they vanquiſhed in battle. From the north they gradually deſcended towards the ſouth and the Danube; and after an interval of 400 years, they again appear with their ancient valour and renown. Their manners were not leſs ferocious. The aſſaſſination of a royal gueſt was executed in the preſence, and by the command, of the king's daughter, who had been provoked by ſome words of inſult, and diſappointed by his diminutive ſtature. The victories of the Lombards recommended them to the friendſhip of the emperors; and at the ſolicitation of Juſtinian, they paſſed the Danube, to reduce, according to their treaty, the cities of Noricum and the fortreſſes of Pannonia. But urged onward by a ſpirit of rapine, they wandered along the coaſts of the Adriatic as far as the Dyrrachium, and preſumed, as the hiſtorian ſays, with familiar rudeneſs, to enter the towns and houſes of their Roman allies, and to ſeize the captives who had eſcaped from their audacious hands. Theſe acts of hoſtility, charged upon ſome looſe adventurers, were diſowned by the nation, and excuſed by the emperor: but the arms of the Lombards were more ſeriouſly engaged by a conteſt of 30 years, which was terminated only by the extirpation of the Gepidæ. Of the cauſe and event of the quarrel between the Lombards and the Gepidæ we have already given an account under the biographical article *Alboin*. In conſequence of the victory gained by the Lombards, aſſiſted by the Avari, a Scythian horde, over the Gepidæ, A.D. 566, no further obſtacle could impede the progreſs of the confederates, and they faithfully executed the terms of their agreement. Having captured Milan, the capital of Liguria, the Lombards, with joyful acclamations, proclaimed and ſaluted Alboin king of Italy; raiſing him upon a ſhield in the midſt of the army according to the cuſtom of their nation, and preſenting him with a lance, which among them was the enſign of royalty. From this time, A.D. 570, hiſtorians date the beginning of the kingdom of Lombards in Italy, which laſted above 200 years. After this event he extended his conqueſts, and his progreſs was rapid in the reduction of the greateſt part of Italy. Pavia held out for more than three years; but it was at length conſtrained to ſurrender to the arms of Alboin; and as it was a city of great ſtrength, and conveniently ſituated, this ſovereign and his ſucceſſors choſe it for the place of their reſidence; and thus it became the metropolis of the kingdom of the Lombards. After his death (ſee ALBOIN,) Clepho, one of the nobleſt

Lombard chiefs, was unanimouſly elected as his ſucceſſor: his reign was terminated before the expiration of eighteen months by the hand of an aſſaſſin, and during the minority of his ſon Autharis, Italy was divided and oppreſſed by a ducal ariſtocracy of 30 tyrants. After an interval of diſtraction, which laſted 10 years, Autharis attained the ſtrength and reputation of a warrior. Under the ſtandard of their new king, the conquerors of Italy withſtood their ſucceſſive invaſions; and the victorious Autharis aſſerted his claim to the dominion of Italy. However, he allowed the dukes, who for 10 years had exerciſed abſolute authority in their reſpective dukedoms, to continue in their governments; but he obliged them to contribute one moiety of their revenue to the maintenance and ſupport of his royal dignity. He alſo bound them, by an oath, to aſſiſt him in time of war to the utmoſt of their power. As he did not deprive them of their dukedoms, except in caſes of treaſon, he did not transfer them to others, but when their male iſſue failed: and this was the origin of fiefs in Italy. Some, indeed, have imagined that fiefs were firſt introduced by the Lombards, and from them adopted by other nations. But it appears, that fiefs had been introduced into Gaul by the Franks ſome years before the reign of Autharis, who firſt eſtabliſhed them in Italy. All the cuſtoms and laws which were afterwards introduced and publiſhed concerning fiefs, are owing to the Lombards, who gave them a certain and regular form; ſo that, among all other nations, ſucceſſions, acquiſitions, inveſtitures, and every thing elſe relating to fiefs, were regulated by the cuſtoms and laws of the Lombards. Hereupon a new body of laws ſprung up, which were called feudal laws, and which continued in ſome provinces of Italy, and particularly in the kingdom of Naples, to be the chief part of the juriſprudence.

Autharis, having ſettled matters with the dukes in the manner now mentioned, enacted ſeveral reaſonable and ſalutary laws againſt theft, rapine, murder, adultery, and other crimes which at that time prevailed among his ſubjects. He was alſo the firſt of the Lombard kings, who, renouncing Paganiſm, embraced the Chriſtian religion, and his example was followed by moſt of his ſubjects.

At the foot of the Rhætian Alps, Autharis ſubdued the reſiſtance, and rifled the hidden treaſures of a ſequeſtered iſland in the lake of Comum; and at the extreme point of Calabria, he touched with his ſpear a column on the ſea-ſhore of Rhegium, proclaiming that ancient landmark to ſtand the immoveable boundary of his kingdom. Autharis cloſed his life and reign at Pavia, A.D. 590. Agilulf, his ſucceſſor, renounced the opinions of Arius, which had been countenanced by Autharis, and embraced the Catholic faith. Agilulf was ſucceeded A.D. 615, by his ſon Adaluald, who being depoſed, had for his ſucceſſor Ariovald, under whoſe government the Lombards enjoyed tranquillity both at home and abroad. Upon his death, A.D. 636, Rotharis aſcended the throne, who is the firſt who gave written laws to the Lombards. From the year 638 to the reign of Luitprand, no acts of hoſtility occurred between the exarchs and the kings of the Lombards: the latter being ſatisfied with their new conqueſts, and the former being glad to enjoy unmoleſted the territories that remained under the dominion of the emperor. Luitprand, who aſcended the throne A.D. 711, may be accounted, next to Rotharis, the chief lawgiver of the Lombards: but influenced by ambition he undertook to drive the Romans out of Italy, and this enterpriſe occaſioned the ruin of the kingdom of the Lombards in that country. Luitprand invaded the exarchate, and reduced Ravenna, and ſeveral other cities of the exarchate, which he formed into a dukedom. Ravenna was afterwards recovered by the exarchate: but taken again by Aſtulphus, who changed it into a dukedom. The popes had been alarmed, and made application to Pepin, king of France, for aſſiſtance and protection. Accordingly Pepin was perſuaded to make war upon the Lombards: and, in the year 754, entered Italy, and beſieged Aſtulphus in his metropolis. Rome was twice reſcued from the attacks of the Lombards, A.D. 754. At length the paſſes of the Alps, and the walls of Pavia, were their only defence: the former were ſurpriſed, and the latter were inveſted by Charlemagne, the ſon of Pepin; and after a blockade of two years, Deſiderius, the laſt of their native princes, ſurrendered his ſceptre and his capital, A.D. 774. Thus ended the kingdom of the Lombards in Italy, after they had poſſeſſed that country for 206 years. Under the dominion of a foreign king, but in the poſſeſſion of their national laws, the Lombards became the brethren, rather than the ſubjects, of the Franks; who derived their blood, and manners and language, from the ſame Germanic origin. Anc. Univ. Hiſt. vol. 17. Gibbon.

During a period of 200 years Italy was unequally divided between the kingdom of the Lombards and the exarchate of Ravenna. (See Exarch.) From Pavia, the royal ſeat, the kingdom of the Lombards was extended to the eaſt, the north, and the weſt, as far as the confines of the Avari, the Bavarians, and the Franks of Auſtraſia and Burgundy. In the language of modern geography it is now repreſented by the Terra firma of the Venetian republic, Tyrol, the Milaneſe, Piedmont, the coaſt of Genoa, Mantua, Parma, and Modena, the grand duchy of Tuſcany, and a large portion of the eccleſiaſtical ſtate from Perugia to the Adriatic. The dukes, and at length the princes of Beneventum, ſurvived the monarchy and propagated the name of the Lombards. From Capua to Tarentum, they reigned near 500 years over the greateſt part of the preſent kingdom of Naples. In proceſs of time, the diſpoſition and manners of the Lombards underwent a very important change. So rapid, indeed, was the influence of climate and example, that the Lombards of the fourth generation ſurveyed with curioſity and affright the portraits of their ſavage forefathers. The government of the Lombards was an elective monarchy: and the public revenues aroſe from the produce of land and the profits of juſtice. The Lombards were at firſt a cruel and barbarous people; but diveſting themſelves, by degrees, of their native ferocity and barbarity, eſpecially after they had embraced the Chriſtian religion, they governed with ſuch equity and mildneſs, that moſt other nations envied the happineſs of thoſe who lived under their adminiſtration.

As they had no other kingdom, nor dominions, Italy became their own country; whence the natives eſteemed their kings as their natural princes, not thinking themſelves governed, much leſs kept in ſlavery, by a foreign nation, as it happened to them afterwards, when, by frequent changes, they groaned under the heavy yoke, ſometimes of one nation, and ſometimes of another. Under the government of the Lombards, ſays Paulus Diaconus, no violence was committed, no one unjuſtly diſpoſſeſſed of his property, none oppreſſed with taxes; theft, robberies, murder, and adultery, were ſeldom heard of; every one went, without the leaſt apprehenſion of danger, whither he pleaſed: and indeed their many wholeſome laws, reſtraining and ſeverely puniſhing all ſorts of crimes; the magnificent churches, and rich monaſteries, with which they filled that part of Italy which was ſubject to them; the many biſhoprics which they erected; the towns and cities which they either built, or repaired, in moſt provinces of Italy; their generoſity even to the biſhop of Rome, their avowed enemy; and, ſinally, the great number of perſons among them, whoſe ſanctity and eminent virtues have been acknowledged by the popes themſelves, muſt convince every impartial reader, that the Lombards were not ſuch a ſavage, barbarous, and inhuman nation, as they are deſcribed by ſome of the popes, eſpecially by Adrian, the chief author of the ruin of their kingdom. They were the only power in Italy capable of defeating the ambitious views of the biſhops of Rome; whom they would not ſuffer to enrich themſelves with the ſpoils of the emperors, but conſidered them as their own by right of conqueſt; and hence aroſe the inveterate hatred which the popes bore them, and could not help betraying in all their writings. But their laws are convincing proofs of their juſtice, humanity, and wiſdom, and, at the ſame time, a full confutation of the many calumnies, with which the popes, and their partiſans, have endeavoured to aſperſe them. Their laws were found ſo juſt and equitable, that they were retained in Italy, and obſerved ſome ages after their kingdom was at an end.

Lombards, a name given in the Netherlands, France, and England, to lending-houſes. (See Loan-*banks*.) It is well known that in the thirteenth and following centuries many opulent merchants of Italy, which at thoſe periods was almoſt the only part of Europe that carried on an extenſive trade, were invited to theſe countries, where there were few mercantile people able to engage deeply in commerce. For this reaſon they were favoured by governments in moſt of the large cities; but in the courſe of time they became objects of univerſal hatred, becauſe they exerciſed the moſt oppreſſive uſury, by lending at intereſt and on pledges. They were called *Longobardi* or *Lombardi*, as whole nations are often named after a part of their country, in the ſame manner as all the Helvetians are called Swiſs, and the Ruſſians ſometimes Moſcovites. They were, however, called frequently alſo Caorcini, Caturcini, Caurſini, Cawarſini, Cawartini, Bardi, and Amanati; names which, in all probability, aroſe from ſome of their greateſt houſes or banks. We know, at any rate, that about thoſe periods the family of the Corſini were in great conſideration at Florence. They had banks in the principal towns for lending money; they demanded exorbitant intereſt; and they received pledges at a low value, and retained them as their own property if not redeemed at the ſtated time. They eluded the prohibition of the church againſt intereſt when they found it neceſſary, by cauſing the intereſt to be previouſly paid as a preſent or premium; and it appears that ſome ſovereigns borrowed money from them on theſe conditions. In this manner did Edward III., king of England, when travelling through France, in the year 1329, receive 5000 marks from the bank of the Bardi, and give them in return, by way of acknowledgment, a bond for 7000. When complaints againſt the uſurious practices of theſe Chriſtian Jews became too loud to be diſregarded, they were threatened with expulſion from the country, and thoſe who had rendered themſelves moſt obnoxious on that account, were often baniſhed, ſo that thoſe who remained were obliged to conduct their employment with more prudence and moderation. It is probable that the commerce of theſe countries was then in too infant a ſtate to diſpenſe altogether with the aſſiſtance of theſe foreigners. In this manner were they treated by Louis IX. in 1268, and likewiſe by Philip the Bold; and ſometimes the popes, who would not authoriſe intereſt, lent their aſſiſtance by prohibitions, as was the caſe in regard to Henry III. of England in 1240.

In the fourteenth century, the Lombards, in the Netherlands, paid to government rent for the houſes in which they carried on their money tranſactions, and ſomething beſides for a permiſſion. Of this we have inſtances at Delft in 1313, and at Dordrecht in 1342. As in the courſe of time the original Lombards became extinct, theſe houſes were let, with the ſame permiſſion, for the like employment; but governments at length fixed the rate of intereſt which they ought to receive, and eſtabliſhed regulations for them, by which uſurious practices were reſtrained. Of leaſes granted on ſuch conditions, an inſtance occurs at Delft in the year 1655. In 1578, William prince of Orange recommended to the magiſtrates of Amſterdam Francis Maſaſia, one of the Lombards, as they were then called, in order that he might obtain for him permiſſion to eſtabliſh a lending-houſe; as many obtained permiſſion to keep billiard-tables, and Jews letters of protection. In the year 1611, the proprietor of ſuch a houſe at Amſterdam, who in the latter years of his leaſe had gained by his capital at leaſt thirty-three and a half per cent. offered a very large ſum for a renewal of his permiſſion; but, in 1614, the city reſolved to take the lombard or lending-houſe into their own hands, or to eſtabliſh one of the ſame kind. However deteſted this plan might be, a diſpute aroſe reſpecting the legality of it, which Marets and Claude Saumaiſe endeavoured to ſupport. The public lending-houſe or lombard at Bruſſels was eſtabliſhed in 1619; that at Antwerp in 1620, and that at Ghent in 1622. All theſe were eſtabliſhed by the archduke Albert, when he entered on the governorſhip, with the advice of the archbiſhop of Mechlin; and on this occaſion the architect Wenceſlaus Coberger was employed, and appointed inſpector-general of all the lending-houſes in the Spaniſh Netherlands. Some Italians aſſert, that the Flemings were the firſt people who borrowed money on intereſt for their lending-houſes; and they tell us that this practice began in the year 1619. We are aſſured alſo, that, after long deliberation at Bruſſels, it was at length reſolved to receive money on intereſt at the lending-houſes. It however appears certain, that in Italy this was never done, or at leaſt not done till a late period, and that the capitals of the lending-houſes there were amaſſed without giving intereſt.

This beneficial inſtitution was always oppoſed in France; chiefly, becauſe the doctors of the Sorbonne could not diveſt themſelves of the prejudice againſt intereſt; and ſome in modern times who undertook there to accommodate people with money on the like terms, were puniſhed by government. A lending-houſe, however, was eſtabliſhed at Paris, under Louis XIII., in 1626; but the managers next year were obliged to abandon it. In 1695, ſome perſons formed a capital at Marſeilles for the purpoſe of eſtabliſhing one there according to the plan of thoſe in Italy. The *mont de pieté* at Paris, which has had ſometimes in its poſſeſſion forty caſks filled with gold watches that have been pledged, was, by royal command, firſt eſtabliſhed in 1777. Beckmann's Hiſt. of Inventions, vol. iii.

LOMBARDY, in *Geography*, a country in the northern part of Italy, very much correſponding with the Ciſalpine Gaul of the Romans. It derived its name from the Lombards, (ſee the article Lombards,) who founded the kingdom in the middle of the ſixth century. This country was divided into ſeveral ſtates, ſubject to the houſe of Auſtria, the republic of Venice, and the king of Sardinia; ſuch as the duchies of Milan and Mantua, called Auſtrian Lombardy; the Paduan, Veroneſe, Vicentin, Breſſan, Comaſco, Bergamaſco, belonging to Venice:—Montſerrat and Nice, annexed to Piedmont, ſubject to the king of Sardinia;—together with many others, as the duchies of Modena, Reggio, Parma, Piacenza, Mirandola, and ſeveral ſmaller principalities and ſtates. The viciſſitudes which Lombardy has undergone, and more eſpecially thoſe which have occurred to it ſince the French revolution, are briefly detailed under Cisalpine *Republic*, and Italy. See likewiſe each of the above enumerated articles.

LOMBE'S, a town of France, and principal place of a diſtrict in the department of the Gers, the ſee of a biſhop before the revolution; 16 miles S.E. of Auch. The place contains 1443, and the canton 12,145 inhabitants, on a territory of 290 kiliometres, in 39 communes.

LOMBOK, an iſland in the Eaſt Indian ſea, about 40 miles from N. to S. and from 18 to 30 broad, chiefly inhabited by Gentoos; between which and Cumbava is a paſſage, called the "Straits of Lombok."—Alſo, a town on the E. coaſt of the ſame iſland. S. lat. 8° 42′. E. long. 116 2′.

LOMBUZSKOI, a ſmall iſland in the Frozen ocean; near the coaſt of Ruſſia; 180 miles E. of Kola. N. lat. 67° 55′. E. long 40° 14′.

LOMBY, a town of Hindooſtan, in the Carnatic; 20 miles N.W. of Tiagar.

LOMEIR, John, in *Biography*, a learned Dutch Proteſtant divine, paſtor of the church of Dotekum in Zutphen, was author of a curious little work abounding in erudition and deep reſearch, in which he has undertaken to give hiſtorical and critical notices of the moſt celebrated libraries in ancient and modern times. It is entitled "De Bibliothecis Liber Singularis;" 12mo. The author's plan gave riſe to a larger work on the ſame ſubject, by Maderus, a learned German, who publiſhed at Helmſtadt a treatiſe "De Bibliothecis," in two vols. 4to., in which he has inſerted Lomeir's piece.

LOMENTACEÆ, in *Botany*, a natural order of plants, the 33d among the *Fragmenta* of Linnæus, named, as it ſhould ſeem, from *lomentum*, the meal of beans, in alluſion to the pulſe-like nature of the plants in queſtion, ſo as to keep in view their analogy with the *Papilionaceæ*. They are included in the three firſt ſections of Juſſieu's *Leguminoſæ*, or nearly ſo; ſee that article. *Polygala* indeed, placed here by Linnæus, is referred by Juſſieu to the *Pediculares*.

LOMENTUM, a word uſed by the old writers on medicine to expreſs a meal made of beans, or bread made of this meal, and uſed as a waſh. See Detersorium.

Others have applied it to the French chalk, or morochthus, uſed by the ſcowerers of clothes, which is brought over in large cakes, reſembling loaves or cakes of bread.

LOMGRAD, in *Geography*, a town of Bulgaria, at the conflux of the river Lom with the Danube; 20 miles S.S.E. of Viddin.

LOMI, a town of Ruſſia, in the government of Irkutſh, on the Amul; 16 miles N. of Stretenſk.

LOMMETSCH, or Lumtszch, a town of Saxony, in the margravate of Meiſſen; ſeven miles N.W. of Meiſſen. N. lat. 51 11′. E. long. 13° 13′.

LOMMIUS, Jodocus, (Van Lom, in his native language,) in *Biography*, a medical writer of reputation, was born at Buren, in Guelderland, about the commencement of the ſixteenth century. His father, who was town-clerk of that place, took great care of his education. He was already well verſed in the Latin and Greek languages, when he turned his attention to medicine, which he ſtudied principally at Paris, where his talents and aſſiduity obtained him the friendſhip of Fernel. It is not known where he took his degree; but he practiſed for a conſiderable time at Tournay, to which city he was penſionary-phyſician in 1557; and he removed to Bruſſels, at an advanced period of life, about the year 1560. He was living in this city in 1562, beyond which period there is no record of him. He left three ſmall works, which are ſtill held in eſtimation in conſequence of the purity and elegance of the Latinity in which they are written: theſe are "Commentarii de Sanitate tuenda in primum librum C. Celſi," Louvain, 1558, 12mo. This is an ample commentary upon Celſus, taken entirely from the ancients. "Obſervationum Medicinalium Libri tres," Antwerp, 1560. This work has paſſed through many editions: it conſiſts of hiſtories of diſeaſe, related with the ſimple perſpicuity of Celſus, and containing many uſeful and valuable obſervations on the diagnoſtics, prognoſtics, and cure. "De curandis Febribus continuis Liber," Antwerp, 1563. This little treatiſe, like the foregoing, has been ſeveral times printed and tranſlated. Theſe works were publiſhed together at Amſterdam, in 1745, in three vols. 12mo., under the title of "Opera omnia." Eloy Dict. Hiſt.

LOMNITZ, in *Geography*, a town of Bohemia, in the circle of Konigingratz; ſix miles N. of Gitſchin.—Alſo, a town of Moravia, in the circle of Brunn; 15 miles N.N.W. of Brunn. N. lat. 49° 24′. E. long. 16° 18′.

Lomnitz *Peak*. See Carpathian *Mountains*.

LOMOND, Loch, a lake ſituated in the county of Dunbarton, Scotland. It is the fineſt and moſt beautiful expanſe of water in that country, and not ſurpaſſed, in variety and magnificence of ſcenery, by any in Great Britain. This lake extends about twenty-ſix miles in length from north to ſouth, and varies from one to eight miles in breadth. The broadeſt portion is towards the ſouth. As it approaches the north, it gradually contracts. Here it is much deeper than in the broader parts. At the foot of Benlomond the depth is about 120 fathoms, but in the ſouth diviſion it is not generally much above 14 fathoms. The northern and deeper part of this lake is never covered with ice even in the ſevereſt froſts, but ſouth from Luſs, it is often frozen over ſo completely, that not only men but loaded horſes can paſs over it to the different iſlands in perfect ſafety.

Loch Lomond is ſupplied with water from ſeveral rivers, beſides ſmaller ſtreams from the mountains. It has, however, but one way of diſcharging itſelf; and this is the reaſon why it ſwells in wet ſeaſons even ſo high as ſix feet above its uſual level. Fiſh are caught here in great abundance, particularly ſalmon trout, eels, and pearches, as likewiſe a ſpecies called pollocks, which reſemble in appearance and flavour the large herrings.

The beauties of this lake have often been the ſubject of deſcription, both in poetry and proſe. Theſe ſeem chiefly to ariſe from the woods in its vicinity, the number and variety of its iſlands, and the near approach of the terrific Grampians, which afford a ſtriking contraſt to the more placid ſcenery immediately adjacent. At the houſe of Cameron, placed at the ſouthern extremity of the lake, the whole charms of this delightful expanſe are in full view. After paſſing this manſion, the road ſkirts along the weſtern bank, ſometimes loſing itſelf among the natural foliage that clothes the brow of the mountains, and at other times emerging into a more free ſpace; thereby preſenting in ſucceſſion a variety of views of the lake, iſlands, and neighbourhood, highly captivating and delightful.

The iſlands in Loch Lomond, ſmall and great, are uſualy reckoned to be thirty in number. Moſt of them are finely wooded, but not above ten are of any conſiderable ſize. The principal ones are the property of the duke of Montroſe and ſir James Colquhoun of Luſs. Inchcailloch, or the iſland of old women, ſo called from a nunnery formerly there, was at one time the ſcite of the church of Buchanan in Stirlingſhire. Inchmurin is the moſt valuable iſland in the lake, and has a deer park belonging to the duke of Montroſe. The iſland of Inch-tavanach, *i. e.* the iſland of the monk's-houſe, derives its name from the circumſtance of a monk having fixed his reſidence here at a very remote period. The other iſlands are not deſerving of particular notice, except as all contributing, by the beauty of their verdure, to render the whole ſcenery more intereſting and varied than it otherwiſe would be.

Loch Lomond has long been celebrated for three wonders, "fiſh without fins, waves without wind, and a floating iſland." The fiſh without fins are manifeſtly vipers, which abound here in great plenty, and ſometimes ſwim from one iſland to another. Waves without wind are common to this lake, with all extenſive deep waters, when a calm immediately ſucceeds a ſtorm. The floating iſland is now fixed near the weſt ſhore of the iſle of Inchconagan, and if it ever did float, muſt be conſidered as a moſſy fragment bound together by the matted roots of coarſe graſſes, willows, Dutch myrtles, &c.

The waters of this lake are ſuppoſed to be riſing in height. Acroſs the channel of a ſtream called Falloch, at the northern extremity, there are a number of ſtones fixed regularly, and evidently intended for enabling paſſengers to croſs from one ſide to the other, which are now however covered with at leaſt five feet of water. Near the middle of the bay of Camſtraddan, when the water is low, there is a heap of ſtones viſible, which is ſaid to have formerly compoſed the reſidence of the Colquhouns of Camſtraddan. Camden, in his Atlas Britannica, mentions an iſland exiſting here in his day, with a houſe and garden upon it. About five miles to the ſouth of this heap of ſtones there is another, ſaid to be the ruins of an ancient church: the field oppoſite to it is ſtill called Church-field.

The village of Luſs is delightfully ſeated on the weſtern bank of the lake, and on the poſt road from Glaſgow to Inverary. In the immediate vicinity of this village, Roſedoe, the manſion houſe of ſir James Colquhoun of Luſs, is placed on a rich peninſula, projecting ſo far into the lake as to appear inſulated. The ground is finely wooded, and a tower of the ancient caſtle, or habitation of the family, forms an excellent contraſt to the modern houſe. Some very bold and rugged mountains compoſe the back ground of this charming ſcenery. Between Luſs and Tarbet the road diminiſhes in breadth very rapidly. Paſſing the water of Uglas, which diſcharges itſelf into the lake, it aſcends a lofty promontory, projecting conſiderably in the lake, which is called the point of Firkin. The aſcent to the ſummit of this eminence is abrupt, difficult, and tedious, but the view which diſplays itſelf from it amply repays the admirer of nature for the labour attending it. Nearly oppoſite to this point Benlomond rears his lofty head on the eaſtern ſide. For a deſcription of this mountain and its ſcenery, ſee the article BENLOMOND.

LOMOND *Hills*, two beautiful conical hills ſituated in the county of Fife, Scotland. The eaſtern one is by far the moſt beautiful, and riſes 1650 feet above the level of the town of Falkland, which is placed at a ſhort diſtance from its baſe. It appears to have been the ſeat of a fort in ancient times. On the very ſummit is a ſmall lake, which has probably been the *crater* of an extinct volcano. On this hill a mine of lead has been lately opened with good proſpects of ſucceſs to the proprietors. It likewiſe contains coal and limeſtone in conſiderable abundance, but neither of them are wrought. The other hill, which is called Weſtern Lomond, from its ſituation with reſpect to the former, is much higher than it, and perhaps commands a more extenſive view. On the top is one of thoſe heaps or tumuli of ſtones which are denominated cairns.

LOMONOZOF, in *Biography*, accounted the father of Ruſſian poetry, was born at Kolmogori in 1711, where his father was a dealer in fiſh. He poſſeſſed the rare advantage of perſons in his ſtation, of learning to read his native language, and caught a flame of poetical inſpiration by peruſing a tranſlation of Solomon's ſong into rude verſe. His love of learning induced him to leave his father, and take refuge in a monaſtery at Moſcow, where he laid a good foundation in the learned languages, and diſplayed ſuch talents, that he was ſent by the Imperial Academy for improvement to the German univerſity of Marpurg. He ſtudied under Wolf and the other celebrated profeſſors. On his return to his native country he was elected adjunct, and then member of the Imperial Academy, and profeſſor of chemiſtry, in which ſcience he was a conſiderable adept, having ſtudied it under Kunckel at Freyburg in Saxony. In 1764 he was honoured with the title of counſellor of ſtate. He died in the ſame year. His reputation as a literary man is founded on his poetical compoſitions, which are numerous and various in their kinds. His odes are admired for their ſpirit and ſublimity, in which he is ſaid to rival Pindar. In theſe, and in his other poems, he was the creator of various meaſures new to Ruſſian verſe, ſo that he ranks as its greateſt benefactor. He was author likewiſe of tragedies, idylls, and epiſtles, and he left a fragment of an epic poem on Peter the Great. He publiſhed ſome chemical and philoſophical tracts, and two ſhort pieces on the hiſtory of Ruſſia, and he enriched the language of his country with ſome tranſlations from the Greek and Latin.

LOMPAR, in *Geography*, a ſmall iſland in the Baltic, near the S.E. coaſt of Aland. N. lat. 60° 10′. E. long. 20° 9′.

LOMWIA, in *Ornithology*, the name of a web-footed water-fowl common on the Engliſh ſhores, and called in different places the *guillem*, *guillemot*, *ſea-hen*, *kiddaw*, and *ſkout*: the laſt name, however, is ſomewhat equivocal, as the Scotch call the common *razor-bill* by this name. See COLYMBUS *Troile*.

LOMZA, in *Geography*, a town of the duchy of Warſaw, ſituated on the Narew; 80 miles N.E. of Warſaw. N. lat. 53°. E. long. 22° 40′.

LONAS, in *Botany*, Adanſ. Fam. v. 2 118. Gærtn. v. 2. 396. t. 165, a genus eſtabliſhed by thoſe authors upon the *Achillea inodora*, Linn. Sp. Pl. 1265, *Athanaſia annua*, Syſt. Veg. ed. 14. 741.

LONATO, or LONADO, in *Geography*, a town of Italy, in the department of the Benaco; 12 miles E.S.E. of Breſcia.

LONCHITIS, in *Botany*, a name derived from λογχη, *a ſpear*, borrowed from the Greeks, and applied by Tournefort to what he eſteemed a diſtinct genus of ferns, characterized by having auricled leaflets. Linnæus has retained it for one of the ſame family, better defined by the fructification, of which we are now to ſpeak. The λογχῖτις of Dioſcorides has always been a ſubject of diſpute, though his deſcription is more full and preciſe than uſual. Some have thought it *Iris tuberoſa*, others *Serapias Lingua*. His λογχῖτις ἑτέρα however does appear to be a fern.—Linn. Gen. 560. Schreb. 757. Mart. Mill. Dict. v. 3. Sm. Mem. de l'Acad. de Turin. v. 5. 413. Tracts 244. Swartz. Syn. Fil. 93. Sprengel. Crypt. 127. t. 4. f. 27. Juſſ. 15. Lamarck Illuſtr. t. 868.—Claſs and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, Linn. Juſſ.

Gen. Ch. *Capſules* annulated, numerouſly aſſembled in creſcent-ſhaped, ſhort, when young often divided, lines, in the margin of each ſinus of the leaves. *Involucrum* membranous, proceeding from the margin of the leaf, inflexed, often divided in the middle.

Eſſ. Ch. Fructification in creſcent-ſhaped ſpots, in the ſinuſes of the leaves. Involucrum from the inflexed margin of the leaf, ſeparating inwards.

1. L. *aurita.* Linn. Sp. Pl. 1536. (Filix latifolia, ſpinulis mollibus et nigris aculeata; Plum. Fil. 14. t. 17. Petiv. Fil. t. 4. f. 4.—Frond pinnate; pinnatifid; the lower pair of leaflets divided; lobes obtuſe, ſmooth, wavy, toothed at the ſummit. Stalk prickly.—This ſpecies, which Plumier only appears to have ſeen, was gathered by him in the courſe of a valley, in a diſtrict of Martinico, commonly called *le Preſcheur.* The *root* conſiſts of numerous, black, entangled fibres. *Fronds* five or ſix, erect, about a foot and a half high; their ſtalks browniſh, poliſhed, clothed with numerous, horizontal, black, pliant prickles. The upper half of the plant conſiſts of a few nearly oppoſite pairs of long and broadiſh, pinnatifid, pointed *leaves,* or *pinnæ,* very thin, membranous, ſmooth, delicate, and finely veined, of a bright green. Their ſegments are ſeparated rather more than half way to the rib, broadiſh, wavy at the edges, toothed at their blunt apex, and bearing at their ſinuſes, between each other, a creſcent-ſhaped thick maſs of *fructification,* which ſeems not to be cloven or divided.

2. L. *hirſuta.* Linn. Sp. Pl. 1536. (Filix villoſa, pinnulis quercinis; Plum. Fil. 16. t. 20. Petiv. Fil. t. 4. f. 5.)—Frond hairy, doubly pinnate; deeply pinnatifid; lobes ſinuated, obtuſe, wavy, many-flowered.—Gathered by Plumier by rivers in Martinico; by R. Shakeſpear in Jamaica. We have alſo ſpecimens from J. V. Thompſon, eſq. collected by him in ſome part of the Weſt Indies; yet this ſpecies is very rare. It differs widely from the former in its hairineſs and much greater ſize, being five or ſix feet high, and the *ſtalks* near an inch thick. The *frond* moreover is doubly pinnate, either in an alternate or oppoſite manner; its *leaves* very deeply pinnatifid, pointed, their obtuſe ſegments alſo pinnatifid, or at leaſt deeply ſinuated, each ſinus bearing a creſcent-ſhaped maſs of ſeeds, or rather two ſeparate maſſes, each with its own roundiſh *involucrum,* not unlike that of an *Adiantum,* though they finally, for the moſt part, coaleſce.

3. L. *javanica.* Lamarck Dict. v. 3. 594. Swartz Syn. Fil. 94.—Frond hairy, once or twice pinnate; deeply pinnatifid; lobes ſinuated, pointed, crenate, many-flowered. Involucrum ſimple.—Gathered by Commerſon in Java, according to Lamarck, though the ſpecimen given to the younger Linnæus by Thouin is marked as coming from the Mauritius. It ſeems at any rate to be of Eaſt, not Weſt, Indian origin, and differs eſſentially from the foregoing. How often the *frond* is decompounded, we have not materials to determine. Our ſpecimen has two oppoſite *pinnæ* only, each above a foot long, pointed, very deeply pinnatifid, clothed with fine ſoft pubeſcence, beautifully reticulated with veins; dark-green above, brighter beneath. The ſegments are likewiſe ſharp-pointed, about fifteen pair, deeply ſinuated, crenate. One thick, brown, ſemilunar maſs of *fructification,* ſtands in each ſinus, and is, as far as we can diſcern, ſimple and undivided, as well as its *involucrum.*

4. L. *glabra.* Swartz. n. 3. Bory de St. Vincent Voy. v. 1. 321.—"Frond doubly compound, ſmooth; leaves ſomewhat pinnate; their diviſions deeply crenate."—Native of the iſle de Bourbon. We know nothing of this ſpecies but the above character, which, except as to ſmoothneſs, gives no very preciſe information.

5. L. *repens.* Linn. Sp. Pl. 1536. (Filix aculeata repens; Plum. Fil. 11. t. 12. Petiv. Fil. t. 4. f. 6.)—Frond thrice pinnate; leaves deeply pinnatifid; lobes ſinuated, obtuſe, crenate. Stalks prickly. Root creeping.—Gathered by Plumier in Martinico. He deſcribed the *root* as extremely long, creeping like couchgraſs, half the thickneſs of the finger, black both within and without. *Fronds* ſpreading horizontally and very widely. Their general and partial ſtalks prickly, twice pinnate, in an alternate order. *Leaves* about ſix inches long, pointed, very deeply pinnatifid, if not pinnate; their ſegments oblong, obtuſe, deeply ſinuated. *Fructification* ſmall, apparently ſolitary in each ſinus. We know not on what grounds Linnæus fixed the genus of this ſpecies, which no other botaniſt than Plumier appears to have ſeen. As far as his figure goes, it may belong to *Dickſonia,* or *Cyathea,* as probably as to *Lonchitis.*

The L. *pedata* of Linnæus, *Sp. Pl.* 1536, like a few others named or publiſhed by different botaniſts, belong rather to *Pteris,* betwixt which genus and the preſent, it is not always eaſy to draw a line.

LONCHIURUS, in *Natural Hiſtory,* a genus of fiſhes of the order thoracici: pectoral fins ſeparate; tail lanceolate. There is only one ſpecies, *viz.* the *barbatus,* brown, with two cirri under the chin, which is about ten inches long, and inhabits the rivers of Surinam.

LONDINIARES, in *Geography,* a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Neufchâtel; 7 miles N. of Neufchatel. The place contains 764, and the canton 5691 inhabitants, on a territory of 225 kiliometres in 32 communes.

LONDON, the metropolis of the Britiſh empire, the moſt wealthy, moſt extenſive, and probably the moſt populous and powerful city in the world, is ſeated in a fertile and ſalubrious plain or valley, on the banks of the river Thames, which divides the town into two irregular parts, and paſſes through it, from the weſt to the eaſt, in its progreſs to the ſea. Many cities and towns of antiquity have been famous in the annals of nations: Nineveh was noted for its towers and walls of vaſt circumference, height, and breadth; Babylon, for the hanging gardens, and other objects of human labour; Perſepolis, for its natural fortifications; Palmyra and Balbeck, for ſumptuous buildings; and Athens and Rome, for the civilization, refinement, and high accompliſhment of their inhabitants. But London may be denominated the modern wonder of the world. The prodigious increaſe of houſes, inhabitants, trade, commerce, and wealth, with the refinement and luxury which now prevail, render it ſuperior to all the cities of modern Europe; and muſt excite the aſtoniſhment of ſuch foreigners and Engliſhmen as have ſtudied the local and comparative hiſtories of places of note. It may be regarded as the focus of the Britiſh empire; for within its juriſdiction are concentrated the royal, legiſlative, juridical, civil, commercial, ſcientific, and literary concerns of Great Britain. Many writers have been employed, at different periods, to narrate the annals of this great town; and ſeveral volumes in folio, quarto, octavo, &c. have been excluſively devoted to the topographical hiſtory of London: but all are imperfect and unſatisfactory: the largeſt works being moſtly tedious, trivial, and prolix; and the ſmaller publications are very ſuperficial and inaccurate. At the end of this account will be given a liſt of ſeveral of theſe works; to point out the ſources of the preſent eſſay, and to furniſh the reader, who may require more circumſtantial information, with a guide to facilitate his reſearches. The following article will comprehend a general view of the hiſtory and local characteriſtics of this metropolis, with ſome particular deſcriptions; but for detailed accounts of many buildings, places, and objects, the reader is refered to the following heads, in different parts of this work: BANK *of England*, BRIDEWELL, BRIDGES, COMPANY, liſt of 91 in London, and accounts of the principal; COLLEGE *of Civilians*, or *Doctors-Commons*, COLLEGE *of Heralds*, COLLEGE *of Phyſicians*, COLLEGE, *Sion*, COLLEGE *of Surgeons*, COLLEGE, *Veterinary*, ROYAL EXCHANGE, CUSTOM *of London*, DOCKS *of London*, EXCISE, FLEET-*Priſon*, *Greſham* COLLEGE, GUILDHALL, HOSPITALS *of Bethlehem*, *Bridewell*, *Chriſt*, and *Foundling*, INNS *of Court*, INSURANCE *Companies*, ISLINGTON, LAMBETH, HACKNEY, MARY-LE-BONE, PADDINGTON, MIDDLESEX, SURRY, NEWINGTON-BUTTS, THAMES, POLICE, PARLIAMENT, NEW-RIVER, LIMEHOUSE, STRATFORD-LE-BOW, SOUTHWARK, WESTMINSTER.

The centre of London, or St. Paul's church, is aſcertained to be in latitude 51° 31′ N., and in longitude 5′ 37″ W. of Greenwich, where the royal national obſervatory is eſtabliſhed. The diſtance of London from the principal cities of Europe is as follows: from Edinburgh 395 miles S.; from Dublin 338 S.E.; from Amſterdam 190 miles W.; from Paris 225 miles N.N.W.; from Copenhagen 610 miles S.W.; from Vienna 820 miles N.W.; from Madrid 860 miles N.E. by E.; from Rome 950 miles N.N.W.; from Conſtantinople 1660 miles; from Moſcow 1660 miles E.S.E.; from Stockholm 750 miles; from Peterſburgh 1140 miles; from Berlin 540 miles; and from Liſbon 850 miles.

London, as conſidered in the aggregate, compriſes the city and its liberties, with the city and liberties of Weſtminſter, the borough of Southwark, and nearly thirty of the contiguous villages of Middleſex and Surry. The greateſt portion is built on the northern bank of the Thames, or in Middleſex; whilſt Southwark, with Lambeth, and ſeveral connecting villages, extend along the ſouthern ſhore of the ſame river, in the county of Surry. The extent of London, from weſt to eaſt, or from Knightſbridge to Poplar, is full ſeven miles and a half; whilſt its breadth, from north to ſouth, or from Newington Butts to Iſlington, is nearly five miles. The circumference of the whole, allowing for various inequalities in the extenſion of ſtreets, &c. at the extremities, cannot be leſs than thirty miles. Hence it may be fairly eſtimated, that the buildings of this metropolis cover at leaſt eighteen ſquare miles, or 11,520 ſquare acres. Out of this muſt be deducted the ſpace occupied by the river Thames, which extends about ſeven miles, or 12,320 yards in length, by one quarter of a mile, or 400 yards in width; making 1120 ſquare acres.

Independently of various local and civil diviſions, London may be ſaid to conſiſt of five diſtinguiſhing parts, or popular portions; *viz.* the weſt end of the town, the city, the eaſt end of the town, Weſtminſter, and the Borough. The "weſt end of the town," extending from Charing-Croſs to Hyde-park, and from St. James's park to Paddington, is conſidered the beſt and moſt faſhionable part of the town, and is laid out in the two great thoroughfares, called Oxford road and Piccadilly, with various handſome ſquares and ſtreets, which are chiefly occupied by the town-houſes of the nobility and gentry, and the moſt faſhionable ſhops. The "city" includes the central part, and moſt ancient diviſion of the metropolis. This is the emporium of commerce, trade, and buſineſs; and is occupied by ſhops, warehouſes, public offices, and houſes of tradeſmen and others connected with buſineſs. The "eaſt end of the town," and its inhabitants, are devoted to commerce, to ſhip-building, and to every collateral branch connected with merchandize. This diviſion of London has aſſumed a novel character ſince the commencement of the preſent century, by the vaſt commercial docks and warehouſes that have been formed and conſtructed here. The ſouthern bank of the Thames, from Deptford to Lambeth, bears ſome reſemblance to the eaſt end of the town; being occupied by perſons engaged in commercial and maritime concerns; docks, wharfs, and warehouſes being abundant. But this part of London has one diſtinguiſhing feature from any other, as it abounds with numerous and various manufactories; iron-founderies, glaſs-houſes, ſoap-boilers, dye-houſes, boat-builders, ſhot and hat manufactories, &c. and many other ſimilar eſtabliſhments. From the great number of fires employed in theſe houſes, and offenſive effluvia ariſing from ſome of the works, this diſtrict is rendered extremely unpleaſant, if not unhealthful, for human reſidence. It is therefore moſtly inhabited by workmen, labourers, and the lower claſſes of ſociety. Many improvements have lately been made, and ſeveral reſpectable houſes erected on St. George's fields. In Weſtminſter are the houſes of lords and commons, the courts of juſtice, and many offices belonging to government. Another part of the metropolis, not hitherto noticed, but which may be conſidered as the laſt enlargement, and the moſt regular and ſyſtematic in its arrangement of ſquares, ſtreets, &c. is the northern ſide of the town; comprehending a large maſs of new buildings between Holborn and Somers-town, and in the pariſhes of Mary-le-bone and Paddington. Nothing ſhews the increaſed and increaſing growth of the Engliſh metropolis more deciſively than the vaſt number of new ſquares, ſtreets, rows, and places, that have been recently erected, and are now in the progreſs of building, all round the metropolis. London is computed to contain nearly 70 ſquares, and 8000 ſtreets, lanes, rows, courts, &c. According to a cenſus obtained in the year 1811, the population of London, Weſtminſter, and their ſuburbs, was 1,099,104 perſons; being an increaſe of 133,139 within the courſe of ten years. Well might Cowper exclaim,

> "Opulent, enlarged, and ſtill increaſing London."

It would be both amuſing and intereſting to trace the progreſſive growth or expanſion of London; to deſcribe it at different and remote periods; and delineate, with a careful and accurate pencil, the natural and artificial, the political and civil, the moral and commercial characteriſtics of the Britiſh metropolis, at different epochs. Some of theſe features will be noticed in the progreſs of our ſurvey; but many muſt neceſſarily be omitted, from the peculiar nature of the preſent publication.

Ancient Hiſtory and Antiquities of London.—It is generally admitted by topographers, that the preſent ſcite of London was occupied as a Britiſh town before the arrival of the Romans. Of this, however, there is no evidence: for Geoffrey of Monmouth is not to be truſted, nor is his aſſertion entitled to reſpect. We are informed by Tacitus, that about the year 61, Londinium, or Colonia-Auguſta, "was the chief reſidence of merchants, and the great mart of trade and commerce, though not dignified with the name of a colony." (Ann. lib. xiv. c. 33.) Boadicea, the amazonian queen of the Britons, headed a large body of natives, and, after conquering Camalodunum and Verulam, took poſſeſſion of Londinium. At this time, it appears that Londinium was not fortified in the Roman manner, and was inferior to either of the other places juſt named. In a few years afterwards, the Romans made it a permanent ſtation; ſurrounded it with a fortified wall of ſtone and brick, and governed the inhabitants by Roman laws. The courſe and extent of the walls were as follows: commencing at a fort, near the preſent tower of London, the wall was carried in a line directly north to Ald-gate; thence it made a curve to the ſouth-weſt, to Biſhops-gate, from which it continued in a ſtraight line to Cripple-gate and Alders-gate; here it turned to the ſouth, and proceeded to New-gate, where it made almoſt a right angle, turning to the ſouth, to Lud-gate, and on to the banks of the Thames. The circuit of this part of the boundary, according to Stow, was nearly two miles and one furlong. Another wall, of about one mile in length, extended along the northern bank of the Thames, from the fort near the Tower to another fort near the preſent Black-friars bridge. Theſe walls were defended, at different diſtances, by ſtrong towers and baſtions. The height of the wall is ſaid to have been 22 feet, and the towers 40 feet. The ſuperficial contents of the area thus encloſed have been computed at about 400 acres. Nearly through the middle of this ſtation paſſed a ſtream, ſince called Wallbrooke. Dr. Stukeley, in his "Itinerarium Curioſum," has given a plan of Londinium, ſhewing the extent and form of the ſtation, with the number of gates in the walls, and the military roads that branched off from it. The burial-places were without the walls, on the north and eaſtern ſides of the town. Londinium was advanced from a *præfecture*, *i. e.* a town governed by a Roman præfect, to the rank of a colony. It alſo became the ſeat of the vicarius Britanniarum, and of the commiſſioners of the treaſury under the Roman emperors. To enter into accounts of all the various remains of the Romans, which have been diſcovered at different times within the limits of London, would lead us into a long diſſertation: it muſt ſuffice to ſtate, that teſſellated pavements, urns, coins, pottery, foundations of buildings, and other evident relics of the Romans, have been frequently found beneath the preſent ſurface. At the Bank, near the India houſe, and in Lombard ſtreet, ſome pavements have been taken up; and in various other parts of the city have been found evident traces of Roman habitations, and Roman cuſtoms. The London ſtone in Cannon ſtreet is conſidered, by moſt antiquaries, as part of a Roman milliary. Theſe are all particularly deſcribed in Brayley's Survey of London and Middleſex, vol. i. 1810.

Very little is known of London during the Anglo-Saxon dynaſty; nor do we know of any buildings, or other local antiquities, which may be referred to that period. Under the Saxons, London, then called Lunden, Lundone, Lundenburg, Lundenes, Lundenceaſter, gradually increaſed in extent and affluence; and, according to Bede, it then became the "emporium of many nations." Religious edifices were erected in the ſeventh century, on the ſcites of St. Paul's and Weſtminſter Abbey. It is preſumed there was a bridge acroſs the Thames, near Weſtminſter, previous to the year 994: as William of Malmſbury, when ſpeaking of the repulſe of the Danes under Sweyn and Olaf, ſays that "part of them were drowned in the river, becauſe, in their haſty rage, they took no heed of the bridge." In the time of king Athelſtan, a law was paſſed reſpecting coinage, by which it is ſpecified that London was allowed eight minters, whilſt only ſeven were appointed for the cities of Canterbury and Wincheſter.

Soon after the Roman conqueſt, a fortreſs or caſtle was built on the banks of the Thames; and this was enlarged by Gundulph, biſhop of Rocheſter, who erected the White tower, within the Tower of London. In the ſame reign St. Paul's church was commenced; and the ſtrong caſtles of Baynard and Montfichet, both of them ſtanding on the banks of the Thames within the city walls, were erected by two of the Norman king's officers, named Baynard and Montfichet. During this and ſeveral ſucceeding reigns, the public buildings of London were greatly augmented in number, by the erection of ſeveral religious edifices, abbatial and epiſcopal reſidences. The royal palace at Weſtminſter, which had been founded by Edward the Confeſſor, was conſiderably enlarged; and a large hall was built there by William Rufus. The reign of Henry I. was diſtinguiſhed by the foundation and conſtruction of many monaſtic houſes; and ſeveral others were eſtabliſhed during the Anglo-Norman and Plantagenet dynaſties.

A liſt of the religious houſes, with the time of their different foundations, will afford a tolerable idea of the gradual increaſe of the city, with reſpect to ſuch eſtabliſhmeets, and of the difference between ancient and modern London. The town appears to have contained no leſs than fifty-four monaſtic houſes, ſuch as abbies, priories, nunneries, hoſpitals, colleges, &c.

St. Paul's cathedral was firſt founded by Ethelbert, king of Kent; church rebuilt in 961; again in the time of William Rufus. The preſent church commenced in 1675.

The priory of St. Martin-le-Grand, founded by Withred, king of Kent, in the year 700; was given, in 1502, by Henry VII. to Weſtminſter Abbey; the ſtreet of St. Martin-le-Grand is ſtill annexed to Weſtminſter.

The nunnery in Clerkenwell, founded in 1100, by ſir Jordan Briſet.

The hoſpital of St. John of Jeruſalem, in Clerkenwell, was founded in 1100, by the ſame.

The Holy Trinity, or Chriſt-church, within Ald-gate, was founded by the empreſs Maud, in 1108, for Auſtin canons.

The priory of St. Bartholomew in Weſt Smithfield was begun by Rahere, in 1123; the hoſpital ſoon afterwards.

A Benedictine nunnery of Haliwell, by Robert Fitz-Gelran, before 1127.

St. Katherine near the Tower, by the empreſs, before 1148.

The Old Temple of Holborn, in 1118; and the new one near Fleet-ſtreet, by the order, in 1185.

St. Mary Spittle, by Walter Brune, in 1197.

St. Thomas of Acre, in the end of Henry II.'s reign, by Thomas Fitz-Theobald.

The college of Allhallows Barking, by Richard I.

The nunnery of St. Helen's, in Biſhopſgate-ſtreet, was founded by William Fitz-William, in 1210.

The Black Friars had a houſe near Chancery-lane, but afterwards begged or bought the ground near Caſtle Baynard, ſoon after 1221.

The Grey Friars, about 1224; afterwards in Newgate ſtreet.

The White Friars, by ſir Rich Grey, in 1241.

A priory for Auſtin Friars was eſtabliſhed in Broad-ſtreet, by Humphry Bohun, earl of Hereford, in 1253.

The Friars of the Sack, Old Jewry, 1257. Order diſſolved, 1307.

The Croſſed or Crutched Friars, by Ralph Hoſier and William Saberns, in 1298.

The Rolls, or Domus Converſorum, by Henry III. in 1231, for the converſion of Jews.

St. Mary Rouncivall in the Strand, about the ſame period.

The hoſpital or priory of St. Mary of Bethelem or Bedlam, was granted by Simon Fitz-Mary, in 1247.

The convent of St. Clare, in the Minories, by Edmund earl of Lancaſter, in 1293.

A college and hoſpital, called Elſing Spittle, were founded by William Elſing, a citizen, in 1329.

Sir John Pountney founded a college in Cannon-ſtreet, in 1332.

St. Mary of Graces, or Eaſt-Minſter, a Ciſtertian abbey, was founded by king Edward III. in 1350.

The Charter-Houſe, before 1370, by ſir Walter de Manny, and Michael de Northburgh, biſhop of London. See CHARTREUSE.

The hoſpital of the Savoy, in 1505, by Henry VII.

Beſides theſe, the guilds or fraternities of London were very numerous. There was a brotherhood and chapel of the Holy Trinity in Leadenhall, and ſeveral others were founded in moſt churches. The grand ſuppreſſion of the whole commenced in 1537. Excluſive of the religious houſes, the biſhops and parliamentary abbots had each a town reſidence of ſtate.

The abbot of St. Auſtin's, Canterbury, houſe was in the pariſh of St. Olave's, Southwark.

The abbot of Eveſham's, in the pariſh of St. Catherine Cree.

The abbot of Reading's, at Baynard caſtle, in the pariſh of St. Andrew Wardrobe.

The abbot of St. Mary's, York, at St. Peter's Place, Paul's Wharf.

The abbot of Glaſtonbury, in Weſt Smithfield.

The abbot of Hyde, in the pariſh of St. Mary at Hill.

The abbot of Ramſey, in Whitecroſs-ſtreet.

The abbot of Bury St. Edmund's, in St. Mary-ſtreet, Aldgate.

The abbot of St. Alban's, in Lothbury.

The abbot of Peterborough, in the pariſh of St. Gregory.

The abbot of Salop, near St. Bartholomew's, Weſt Smithfield.

The abbot of Leiceſter, in the pariſh of St. Sepulchre.

One inſtance of the ſervice which was rendered to the public, even in London, by the monaſtic inſtitutions, is worthy of note: the priory of St. Mary Spittle contained, at its diſſolution about the year 1536, no leſs than 180 beds for the reception of ſick perſons and travellers. The hoſpitals which were ſuffered to remain, owed their continuance to ſir Richard Greſham, mayor of London, in 1537, who petitioned the king to beſtow the lands belonging to this, St. Bartholomew's, St. Thomas's, and the new abbey on Tower-hill, on the corporation, for the relief and uſe of the poor, the ſick, and the vagrant.

Annals of London, from the Departure of the Romans to the Acceſſion of Edward I.—When the Romans, from the diſtracted ſtate of the empire, found it neceſſary, in the early part of the fifth century, to withdraw their troops from the diſtant provinces, London again became a Britiſh town, and is mentioned in the Saxon chronicle in the year 457, when the Britons fled hither on their defeat by the Saxons under Hengiſt, who, about twenty years afterwards, made himſelf maſter of London; but on his death, in 498, it was retaken by Ambroſius, and retained by the Britons during a conſiderable part of the next century. It afterwards became ſubjected to the newly-eſtabliſhed Saxon kingdom of Eſſex. On the converſion of the Eaſt Saxons to Chriſtianity, London was nominated as the biſhop's ſee, Melitus being appointed the firſt biſhop in the year 604: a cathedral church was erected in 610, on the ſcite of the preſent St. Paul's. During the period of the Saxon heptarchy, but few notices of London appear to have been recorded. In 664 it was ravaged by the plague; and in 764, 798, and 801, it ſuffered ſeverely by fires; in that of 798 it was almoſt wholly conſumed, and great numbers of the inhabitants periſhed. On the union of the Saxon kingdom under Egbert, London, though not the royal reſidence, or ſeat of government, as has been erroneouſly ſtated, was advancing in conſequence, as appears from a Wittenagemot having been held here in 833, to conſult on proper means to repel the Danes. By theſe invaders London was repeatedly pillaged and laid waſte. In 925 king Athelſtan had a palace here; the city increaſed in importance under the Daniſh ſovereigns, and under Edward the Confeſſor; and on the ſucceſsful invaſion of William the Conqueror, the magiſtrates of London, conjointly with the prelates and nobility, invited him to accept the title of king of England. From this period London may be conſidered as the metropolis of the kingdom.

William, at the commencement of his reign, granted a charter to the citizens, which is beautifully written in the Saxon characters, and is ſtill preſerved among the city archives: it conſiſts of only five lines on a ſlip of parchment, ſix inches long and one broad. In the year 1077 the greateſt part of the city was deſtroyed by fire. In the following year the king founded the fortreſs, now called the White Tower, for the purpoſe of keeping the citizens in awe, as he had reaſon to ſuſpect their fidelity. In 1086 another fire conſumed the principal part of the city, together with the church of St. Paul. Maurice, then biſhop of London, laid the foundation of the new church: "a worke," Stow obſerves, "that men of that time judged would never have been finiſhed, it was then ſo wonderful." It is remarkable that Domeſday book, though ſo minute in regard to other cities and towns, does not contain any notice of London. A vineyard is mentioned in Holborn belonging to the crown, and ten acres of land near Biſhopſgate (now the manor of Norton-Falgate) belonging to the dean and chapter of St. Paul's. In November, 1090, above 600 houſes and ſeveral churches were blown down by a tremendous hurricane, and Stow ſays, "the Tower of London was alſo broken." About two years afterwards another deſtructive fire happened. In the ſucceeding years William Rufus repaired the Tower, and ſtrengthened it by additional works; and in 1097 he built a great hall at Weſtminſter. Henry I., as a reward for the ready ſubmiſſion of the Londoners to his uſurped authority, granted to the city an extenſive charter of privileges, among which was the perpetual ſheriffwick of Middleſex. On the death of Henry, the Londoners took a decided part in favour of Stephen in his conteſt with the empreſs, and greatly contributed to his eſtabliſhment on the throne. In the firſt year of his reign a fire, beginning near London Stone, conſumed all the houſes eaſtward to Aldgate, and weſtward to St. Paul's, together with London bridge, which was then of wood. Henry II. does not appear to have held the citizens in any great degree of favour, probably reſenting their attachment to Stephen: and we find that large ſums of money were extorted from them under the ſpecious name of Free-gifts. In 1176 the building of a new bridge of ſtone was commenced at London, but was not completed till the year 1209. On the coronation of Richard I. a dreadful maſſacre of the Jews, who were ſettled in London, was made by the brutal and ignorant populace. At the coronation-dinner, the chief magiſtrate of London, who at that time had the title of bailiff, acted as chief butler. Early in this reign the appellation was changed to that of mayor, in the perſon of Henry Fitz Alwyn. Richard granted the city a new charter, confirming all its liberties, with additional privileges; and four years afterwards, on payment of 1500*l.* he granted another, providing for the removal of all weirs that had been erected on the river Thames; on this charter the corporation of London found their claim to the conſervatorſhip of that noble ſtream. In 1196, a ſedition aroſe in London, headed by William Fitz Oſbert, who excited the common people to oppoſe the government, and gained aſſociates to the amount of 50,000; but the leader being taken and executed, the commotion ſubſided. This is one of the firſt inſtances upon record of a tumultuous aſſemblage in defence of popular rights. In the reign of king John the civic importance of London was greatly increaſed; and its corporation finally aſſumed that form and predominancy, which, with a few alterations, it has maintained till the preſent time. John granted the city ſeveral charters; by one he empowered the "barons of the city of London" to chooſe a mayor annually, or to continue the ſame perſon from year to year, at their own pleaſure. In 1212 a dreadful calamity took place, through a fire which commenced at the bridge end in Southwark, and occaſioned a deſtruction almoſt unparalleled from ſuch a cauſe: Stow relates that about 3000 perſons periſhed. During the conteſt between the king and pope Innocent III. London ſeverely felt the conſequences of the interdict which was laid upon the kingdom. In the civil feuds, which marked the latter years of John, the Londoners ſided with the barons; and when the humbled monarch was compelled to ſign Magna Charta, it was therein expreſsly ſtipulated that the "city of London ſhould have all its ancient privileges and free cuſtoms as well by land as by water." The long reign of Henry III. affords but few events worthy of notice reſpecting London: its growing proſperity was checked by a ſeries of extortions and oppreſſions. In 1258, the price of corn was ſo exceſſive, that a famine enſued, and according to the chronicles of Eveſham, 20,000 perſons died of hunger in London only. In 1264 another maſſacre of the Jews took place; on a plea that one of that perſecuted race had taken more than legal intereſt, and upwards of 500 Jews were put to death by the populace, and their houſes and ſynagogues deſtroyed.

Annals of London from the Acceſſion of Edward I. *to that of Henry* IV.—In the year 1279 all the Jews in England were apprehended in one day, on a charge of their being the authors of the great mutilations which had taken place in the coin during the preceding reign: 280 perſons of both ſexes were executed in London, beſides many others in various parts of the kingdom. Between the years 1314 and 1317 the city, in common with the reſt of the kingdom, ſuffered greatly from a ſcarcity of proviſions, which eventually produced a complete famine. King Edward III., on the commencement of his reign, granted to the city two charters: by the firſt all the ancient privileges were confirmed and additional ones beſtowed; by the other, the village of Southwark was granted to the citizens in perpetuity. In 1348, the terrible peſtilence, which, breaking out in India, ſpread itſelf weſtward through every country on the globe, reached England. Its ravages in London were ſo great, that the common cemeteries were not ſufficiently capacious for the interment of the dead; and various pieces of ground without the walls were aſſigned for burial places: amongſt theſe was the waſte land now forming the precinct of the Charter-houſe, where upwards of 50,000 bodies were then depoſited. This deſtructive diſorder did not entirely ſubſide till 1357. The public entry of Edward the Black Prince into London, May 24, 1356, after the victory he obtained at Poictiers, was celebrated with an unparalleled degree of ſplendour; and every ſtreet through which the cavalcade paſſed, exhibited an extraordinary diſplay of riches and magnificence. The captive king of France, dreſſed in regal robes, was mounted on a white courſer, while the victorious prince rode by his ſide on a ſmall black horſe, and appeared more like an attendant than a conqueror. In 1361, the plague having again broke out in France, every precaution was taken to prevent its ſpreading into England, but without effect; the peſtilence reached London, and its ravages were ſo deſtructive, that upwards of 2000 perſons fell victims in two days. In 1363, a ſumptuous entertainment was given in the city by Henry Picard, alderman, to the kings of England, France, Scotland, and Cyprus, to Edward the Black Prince, and to a great number of nobility and gentry. The year 1378 is memorable in the city annals for the expedition fitted out by an individual, John Philpot, againſt Mercer, the Scottiſh pirate, who taking advantage of the inattention of government to naval affairs, carried off all the ſhipping from the port of Scarborough; and continuing to infeſt the northern coaſt, frequently made conſiderable prizes. The complaints of the merchants were but little regarded by the council; when Philpot prepared a fleet at his own expence, with a thouſand men well armed, went himſelf on board as commander-in-chief, and ſailed in purſuit of the pirate. A long and deſperate engagement enſued; but Philpot obtained the victory, and obliged the pirate to ſurrender, with moſt of his ſhips, among which were fifteen Spaniſh veſſels richly laden. In November 1380, the fourth year of Richard II. an act of parliament was paſſed for levying a poll-tax on every perſon in the kingdom, male or female, above the age of fifteen years. This act was the occaſion of producing, in the following year, one of the moſt dangerous inſurrections that ever threatened the monarchy of this kingdom; and in which the metropolis particularly ſuffered. The tax was exacted with great rigour; and the inſolence of the collectors was an additional cauſe of irritation, and kindled the ſparks of ſedition which ſoon after burſt into an open flame. The inſurrection began in Eſſex, but quickly ſpread through the neighbouring counties, and particularly in Kent, where the daughter of Wat Tyler, ſo called from his trade, having been indecently treated by a collector, the father killed him, and being ſupported by the inſurgents, placed himſelf at their head. To his ſtandard incredible numbers flocked from all parts of the kingdom; and on the 10th of June, 1381, having muſtered on Blackheath a hundred thouſand ſtrong, they entered Southwark, where they ſet at liberty the priſoners from the King's Bench and Marſhalſea priſons, and levelled the houſes of all lawyers. They burnt the archbiſhop's palace at Lambeth, with the rich furniture, books, and regiſters, and deſtroyed the public ſtews which were then tolerated on Bankſide. For one day the bridge gate was ſhut againſt them; but they were afterwards, from prudential motives, admitted into the city. They then proceeded to the palace of the Savoy, which was one of the moſt magnificent ſtructures in the kingdom. Having ſet fire to it in ſeveral places, they cauſed proclamation to be made, that no perſon ſhould convert any part of the rich effects to his own uſe, and actually threw into the fire one of their companions who had reſerved a piece of plate. They alſo burnt the Temple and the other inns of court. Dividing into three parties, one advanced to the rich priory of St. John of Jeruſalem, near Smithfield, which they burned; a ſecond diviſion marched to the Tower, where they ſeized ſir Robert Hales, lord treaſurer, and Simon

Sudbury, archbiſhop of Canterbury, and lord chancellor (though guarded by 1200 ſoldiers), and hurrying them to the adjacent hill, beheaded them; the third diviſion proceeded to Mile End, where the king met them, and promiſed to redreſs their ſuppoſed grievances, on which they diſperſed. But Wat Tyler, with his party, under the pretence of reforming abuſes, continued their ravages in London, liberated the priſoners from the Fleet and Newgate, plundered the houſes of the Lombards who reſided in the ſtreet, which yet retains their name, and dragging the merchants from the churches, whither they had fled for refuge, beheaded them in the ſtreets. Not content with murdering many of the moſt eminent citizens, they made proclamation for beheading all lawyers and perſons connected with the Exchequer, and even all who, in thoſe days of ignorance, were capable of writing. The king made another effort for negociation: attended only by forty horſe, he met Tyler with 20,000 of his adherents in Smithfield. The behaviour of Tyler was ſo inſolent, that the king ordered the mayor, ſir William Walworth, to arreſt him; on his reſiſtance, ſir William felled him to the ground with his ſword, and the attendants diſpatched him. The rebels prepared to revenge their leader's death; but Richard, though only fifteen years of age, with a prudence and bravery which did him more credit than any other action of his life, rode forward, exclaiming, "My friends, will you kill your king? Be not troubled for the loſs of your leader; I will be your captain, and grant what you deſire." They then marched under his direction to St. George's Fields, where, finding a thouſand citizens completely armed to oppoſe them, they threw down their weapons, obtained their pardon, and immediately diſperſed. Thus ended an inſurrection unparalleled in the annals of this kingdom, and which for three weeks ſeemed to threaten a total ſubverſion of the government. In 1390, the king appointed a tournament to be held in London, and ſent heralds to proclaim his intention to all the principal courts of Europe, whence many princes and nobles came to attend the ſpectacle, which was continued with the greateſt ſplendour for four days; open houſe being kept at the king's expence for all perſons of diſtinction. The vaſt expenditure which this and ſimilar feſtivities occaſioned, frequently reduced Richard to great pecuniary difficulties; his enormous profuſion led him to a ſyſtem of oppreſſion and extortion, which eventually cauſed his depoſition and death.

Annals of London from the Acceſſion of Henry IV. *to that of Elizabeth.*—At the coronation of the new king, the mayor, as uſual, officiated as chief butler. The citizens were gratified by the repeal of ſome obnoxious ſtatutes, and an extenſion of their privileges. In 1401, an act was paſſed for "burning obſtinate heretics," entirely aimed at the Lollards, or followers of Wickliffe. The firſt victim was William Santree, pariſh prieſt of St. Oſyth, in Syth-lane, London. In 1407, the Plague again ravaged the kingdom, and ſwept away more than 30,000 of the inhabitants of the metropolis. In 1409, "a great play, of Matter from the Creation of the World," was acted at Skinner's-Well, near Clerkenwell. The exhibition laſted eight days; at which were preſent the king and moſt of the nobility and gentry of the realm. In the following year, John Bradley was condemned as a Wickliffite, and burnt in Smithfield, with circumſtances of peculiar cruelty. In this year Guildhall was erected; the city hall before being a mean cottage in Aldermanbury. The return of king Henry V. after the glorious victory obtained at Agincourt in 1415, was celebrated in London with great magnificence. Neither this reign nor the following produced any events of peculiar import to the city, till the year 1450, when a new inſurrection aroſe, of ſo formidable a nature, that for ſome weeks all the power of the crown was inſufficient to quell it. This tumult is ſuppoſed to have been raiſed by the inſtigation of the duke of York, in order to ſound the inclination of the people, and prepare the nation for his deſign of ſeizing that ſceptre which Henry ſwayed ſo feebly. By the ſecret inſtructions of the duke, Jack Cade, who had ſerved under him in the French wars, aſſumed the name of Mortimer, and collected a ſtrong body of malcontents, under the popular pretext of redreſs of grievances. They entered the city in triumph, and for ſome time bore down all oppoſition; and beheaded the lord treaſurer, lord Say, and ſeveral other perſons of note. The inſurgents at length loſing ground, a general pardon was proclaimed, and Cade, finding himſelf deſerted by his followers, fled: but a reward being offered for his apprehenſion, he was diſcovered, and refuſing to ſurrender, was killed. The remainder of this reign was filled up with the dreadful conteſt between the Lancaſtrians and Yorkiſts, which ended in the depoſition of Henry and the eſtabliſhment of Edward IV. on the throne. The year 1472 will ever be memorable in the annals of the metropolis, for the introduction of printing into this country by William Caxton, citizen and mercer. The hiſtory of the kingdom during this reign and that of Richard III. does not in any particular manner affect the concerns of the city. Soon after the acceſſion of Henry VII. in 1485, an epidemical diſorder of a very ſingular nature, called the *ſweating ſickneſs*, raged with great violence in London. Thoſe attacked by it were thrown into a violent perſpiration, which generally occaſioned their death within twenty-four hours. It appears from Hall's Chronicle, that two mayors and ſix aldermen died of this complaint in one week. This reign was particularly marked by oppreſſion and extortion on the part of the king; and the tumults and inſurrections occaſioned thereby, particularly that in ſupport of Perkin Warbeck, who was aſſerted to be Richard, duke of York, and the heir to the throne. In this event, though highly intereſting to the kingdom, the city was not immediately concerned. In 1500 the kingdom was again viſited by the Plague, of which 30,000 perſons died in the metropolis and its vicinity. In the reign of Henry VIII. when he attempted to raiſe money without the aid of parliament, the citizens made ſuch determined oppoſition to the meaſure, and their example had ſuch an influence through the kingdom, that the king, in full council, abandoned his deſign, and granted a pardon to all who had oppoſed him. On the king's marriage with Anne Boleyn, in 1533, ſhe was conveyed from Greenwich to the Tower, and thence through the city to Weſtminſter, with all the magnificence and pageantry which unbounded prodigality could deviſe. The remainder of this reign was notorious for the tyranny and cruelty of the king, who, having thrown off the pope's ſupremacy, ſacrificed all who adhered to it: yet profeſſing a zealous attachment to the doctrines of the church of Rome, he put to death thoſe perſons who preſumed to differ from him. Hence the promoters of reformation, and its oppoſers, periſhed in the ſame flames; the blood of the Catholic and Proteſtant was ſhed upon the ſame block; and Henry, whilſt vehemently contending againſt the pope's infallibility, ſupported his own with the moſt vindictive cruelty. In theſe ſanguinary ſcenes, London had its full ſhare; great numbers, of all ranks, were continually executed, either for hereſy or treaſon. The ſuppreſſion of the monaſteries now took place: oppoſition to the king's will was fatal; and the partial inſurrections which broke out in conſequence, only ſerved to forward his meaſures, by giving the colour of neceſſity to the vengeance that was inflicted. Many improvements were made during this reign in the city and its ſuburbs. The police was better regulated; nuiſances were removed; the ſtreets and avenues were amended and paved; and various regulations were carried into effect for ſupplying the metropolis with proviſions, to anſwer the demands of an increaſing population. In the ſhort reign of Edward VI. the reformation proceeded with ſteadineſs and regularity: but on the acceſſion of Mary the church of Rome again gained the aſcendency. On the projected union between the queen and the king of Spain, a formidable inſurrection enſued, in which the city was particularly affected: the ſuppreſſion of this revolt was followed by a dreadful ſcene of ſanguinary triumph. The ſtatutes againſt heretics were now alſo enforced with great ſeverity. A number of perſons were burnt in Smithfield: in the whole kingdom upwards of 200 were brought to the ſtake.

Annals of London from the Acceſſion of Elizabeth to the Revolution in 1688.—Elizabeth ſucceeded her ſiſter amidſt the acclamations of all ranks of people. Reformation again reared its head, and was in a ſhort time firmly eſtabliſhed. In 1561 the ſpire of St. Paul's cathedral was ſtruck by lightning, and great part of the building conſumed. In 1563 the Plague again made dreadful ravages, to which 20,000 perſons fell victims in the city. In July 1566, the foundations of the Royal Exchange were laid by ſir Thomas Greſham, and the ſtructure was completed in the following year. The year 1569 exhibited a novelty in London of moſt pernicious example. The firſt public lottery was then drawn at the weſt door of St. Paul's cathedral, and the drawing continued, without interruption, from January 11 to May 6. The prizes were of plate, and the profits were appropriated to the repair of the ſea-ports. In 1586 a conſpiracy was ſet on foot to aſſaſſinate Elizabeth, and free the queen of Scots from the captivity in which ſhe had paſſed almoſt eighteen years. The plot was ſoon diſcovered, and the conſpirators, fourteen in number, were executed in Lincoln's-inn-Fields. Mary was ſaid to be implicated in the conſpiracy; and this, whether true or falſe, furniſhed a plauſible pretext for thoſe proceedings, which ſoon after condemned her to the block. The ſentence againſt her was proclaimed with great ſolemnity at different places in London and Weſtminſter. In the preparations made to repel the threatened attack of the boaſted Spaniſh Armada, London took a moſt diſtinguiſhed ſhare, in furniſhing large ſupplies of money, men, and ſhips. The preparations for the coronation of king James were interrupted by a dreadful Plague, which ravaged the city with greater violence than any ſimilar viſitation ſince the time of Edward III. In 1604, the horrible conſpiracy, known in hiſtory by the name of the "Gunpowder Plot," the grand object of which was to prepare the way for the reſtoration of the Catholic religion, was commenced by its daring contrivers, with every poſſible precaution that ſeemed neceſſary to enſure its ſucceſs. The deſtruction of the king and parliament was the preliminary meaſure through which the conſpirators thought to accompliſh their deſign; and the blowing up of the parliament-houſe with gunpowder at the moment when the ſovereign ſhould be commencing the buſineſs of the ſeſſion by the accuſtomed ſpeech from the throne, was the dreadful means by which the deſtruction was intended to be accompliſhed. All the principal conſpirators were bigotted Catholics, who had for many years been plotting the downfall of Proteſtantiſm in this country, and had even applied for aid to Spain and Flanders. Being diſappointed of the aſſiſtance they required, they reſolved to depend on their own efforts, and about Eaſter 1604, formed the idea of the gunpowder plot, to be carried into effect on the meeting of parliament in February following. Accordingly Percy, one of the conſpirators, hired a houſe immediately adjoining to the houſe of lords, and the operations commenced by digging through the foundation-wall, which was nine feet in thickneſs. Juſt at this juncture, a vault under the parliament-houſe, uſed as a depoſitory for coals, was to be let, and the coals to be ſold. As nothing could have happened more favourable for their purpoſe, Percy hired the cellar, and bought the coals, as if for domeſtic uſe, and without any appearance of concealment. The prorogation of parliament from February to October gave the conſpirators ſufficient leiſure to further their deſign; and, at convenient opportunities, thirty barrels and four hogſheads of gunpowder, which had been procured from Holland, were conveyed into the cellar by night, and covered with billets, faggots, iron-bars, and ſtones. This was done without exciting any ſuſpicion: parliament had again been prorogued to November 5th; and the conſpiracy wore every aſpect of ſucceſs. It had now been on foot eighteen months, and confided to more than twenty perſons; yet nothing had led a ſingle ſtep towards diſcovery; when the plan was happily fruſtrated by a circumſtance apparently trivial. One of the conſpirators, wiſhing to ſave lord Monteagle, ſent him a letter, adviſing him, in ambiguous terms, to abſent himſelf from parliament, on account of a ſudden danger to which he would be expoſed. This notice Monteagle carried to the ſecretary of ſtate, who laid it before the privy-council. A ſecret ſearch was determined on, but, to prevent ſuſpicion, was delayed till the eve of the meeting of parliament, and then made only by the lord chamberlain, as if in a formal diſcharge of his office. When he entered the cellar, and ſaw the great ſtore of coals and wood, he enquired to whom it belonged, and was informed the cellar was let to Mr. Percy, and the fuel was for his conſumption. The chamberlain heard this with ſeeming careleſsneſs, and left the cellar with apparent negligence. But at midnight a further ſearch was made; Guy Fawkes, a principal conſpirator, to whom the final execution of the plot was aſſigned, was apprehended in the cellar: the fuel was removed, and the gunpowder diſcovered. Fawkes gloried in the plot, but refuſed to diſcover his accomplices; the ſight of the rack, however, ſubdued him, and he made a full diſcloſure of the whole conſpiracy. His aſſociates fled into Warwickſhire, where they endeavoured to excite a riſing of the Catholics, but without effect. A proper force was ſent againt them, four were killed in reſiſtance, and the reſt were taken and brought to London, where, with Fawkes, they ſuffered the juſt puniſhment of their guilt. In the year 1609, the city acquired a conſiderable acceſſion of power and property: almoſt the whole province of Ulſter, in Ireland, having fallen to the crown, the king made an offer of the eſcheated lands to the city, on condition they would eſtabliſh an Engliſh colony there. The propoſal was accepted; and ſo rapid was the colonization forwarded, that within ſeven years aroſe the two capital towns of Londonderry and Coleraine. The commencement of Charles I.'s reign was marked by the return of the plague, which carried off in the metropolis 35,000 perſons. To advert to all the important tranſactions that took place in London during the eventful ſtruggle between Charles and his people would far exceed our limits. The exceſſive oppreſſions to which the nation was ſubjected, were more particularly felt in the metropolis than in other parts of the kingdom, from its being more directly within the vortex of the ſtar-chamber and high-commiſſion courts, and from the effects of the monopolies, which had a moſt pernicious influence on trade and commerce. For the particulars of this important period, we refer our readers to Clarendon's Hiſtory of the Great Rebellion.

The year 1665 became memorable in London by the dreadful ravages of the great Plague, which firſt made its appearance in December 1664, and had not entirely ceaſed till January 1666. Its progreſs, the firſt two or three months, was comparatively ſmall, but continued to advance, notwithſtanding every precaution was uſed to abate its fury: from May to October 1665, it raged with the greateſt violence; the deaths progreſſively increaſed from five hundred to eight thouſand weekly. The peſtilence was now at its height: its ravages, which commenced in Weſtminſter and the weſtern ſuburbs, extended through the city to Southwark, and to all the pariſhes eaſtward of the Tower. The digging of ſingle graves had long been diſcontinued, and large pits had been excavated, in which the dead were depoſited with ſome little regularity and decent attention: but now all regard to ceremony became impoſſible. Deeper and more extenſive pits were dug, and the rich and the poor, the young and the aged, the adult and the infant, were all promiſcuouſly thrown together into one common receptacle. Whole families, and even whole ſtreets of families, were ſwept away together. By day, the ſtreets preſented a moſt frightful aſpect of deſolation and miſery; and at night the dead carts, moving with ſlow pace by torch-light, and with the appalling cry, "Bring out your Dead," thrilled horror through every heart that was not by ſuffering hardened to calamity. The ſtoppage of public buſineſs was ſo complete, that graſs grew within the area of the Royal Exchange, and even in the principal ſtreets of the city: all the inns of court were ſhut up, and all law proceedings ſuſpended. The entire number returned in the bills of mortality, as having died of the plague within the year, was 68,950; yet there can be no doubt that this total fell ſhort, by many thouſands, of thoſe who actually fell by the infection, but whoſe deaths were not officially recorded. The aggregate is eſtimated at about 100,000. The whole number of deaths within that year, as given in the bills, was 97,306. Since this dreadful period, the plague has entirely ceaſed in London: a circumſtance that muſt be regarded as the more remarkable, when it is conſidered how frequent had been its ravages for ages paſt, and when reference is had to the bills of mortality for the preceding part of this very century, when ſcarcely a year paſſed without ſome perſons falling victims to the infection. For further particulars, ſee Plague.

The moſt important event that ever happened in this metropolis, whether it be conſidered in reference to its immediate effects, or to its remote conſequences, was the great Fire, which broke out in the morning of Sunday, September 2, 1666, and, being impelled by ſtrong winds, raged with irreſiſtible fury nearly four days and nights, nor was it entirely maſtered till the fifth morning. The deſtructive extent of this conflagration was, perhaps, never exceeded in any part of the world, by any fire originating in accident. Within the walls it conſumed almoſt five-ſixths of the whole city; and without the walls, it cleared a ſpace nearly as extenſive as the one-ſixth part left unburnt within. Scarcely a ſingle building, that came within the range of the flames, was left ſtanding. Public buildings, churches, and dwelling-houſes were alike involved in one common fate; and, making a proper allowance for irregularities, it may fairly be ſtated, that the fire extended its ravages over a ſpace of ground equal to an oblong ſquare, meaſuring upwards of a mile in length, and half a mile in breadth. In the ſummary account of this vaſt devaſtation given in one of the inſcriptions on the monument, and which was drawn up from the reports of the ſurveyors appointed after the fire, it is ſtated, that "the ruins of the city were 436 acres, *viz.* 373 acres within the walls, and 63 in the liberties of the city; that of the ſix-and-twenty wards it utterly deſtroyed fifteen, and left eight others ſhattered and half burnt; and that it conſumed 400 ſtreets, 13,200 dwelling-houſes, 89 churches, beſides chapels; four of the city gates, Guildhall, many public ſtructures, hoſpitals, ſchools, libraries, and a vaſt number of ſtately edifices." The immenſe property deſtroyed in this dreadful conflagration could never be calculated with any tolerable degree of exactneſs; but according to the beſt eſtimations that have been made, the total value muſt have amounted to the immenſe ſum of ten millions of pounds ſterling. As ſoon as the general conſternation had ſubſided, the rebuilding of the city became the firſt object of conſideration; an act of parliament was paſſed for that purpoſe; and though all was not done that might have been, the city was principally rebuilt within little more than four years, and that in a ſtyle of far greater expence and regularity, and infinitely more commodious and healthful, than the ancient capital. In the ſyſtem of tyranny and oppreſſion which marked the reign of Charles II. the city largely participated; having its ancient liberties and privileges invaded, and magiſtrates arbitrarily forced on the citizen at the pleaſure of the king. Every principle of law and juſtice was violated; and in this humiliating ſtate London continued till the revolution.

Annals of London from the Revolution in 1688, *to the preſent Time.*—In the firſt year of William and Mary, an act was paſſed, by which all proceedings of former reigns againſt the city charters were reverſed, and all the rights and privileges of the citizens were fully re-eſtabliſhed. In 1692, during the king's abſence in Holland, the queen borrowed 200,000*l.* of the city for the exigencies of government. In 1694, an infamous ſyſtem of bribery was inveſtigated by the houſe of commons, when it was proved, that a thouſand guineas had been demanded and taken from the chamberlain of London by ſir John Trevor the ſpeaker, for forwarding the Orphan bill; in conſequence of which he was expelled the houſe. In 1697, an act of parliament was paſſed for the ſuppreſſion of the much abuſed privilege of ſanctuary, heretofore attached to the following places, *viz.* the ſanctuary in the Minories, Saliſbury-court, White-friars, Ram-alley, and Mitre-court in Fleet-ſtreet; Fulwoods-rents in Holborn; Baldwin's-gardens in Gray's-inn-lane; the Savoy in the Strand; and Montague-cloſe, Deadman's-place, the Clink, and the Mint, in Southwark. The year 1703 was remarkable for a dreadful ſtorm of wind, which raged through the night of the 26th of November. The damage ſuſtained by the city alone was eſtimated at two millions ſterling; and in the ſuburbs the damage was proportionably great: the lead on the tops of ſeveral churches was rolled up like ſkins of parchment; and at Weſtminſter-abbey, Chriſt's-hoſpital, St. Andrew's Holborn, and many other places, it was carried off from the buildings. The ſhips in the river were driven from their moorings; four hundred wherries were loſt; more than ſixty barges were driven foul of London-bridge, and as many more were ſunk or ſtaved above the bridge. At ſea the deſtruction was immenſe; twelve men of war, with more than eighteen hundred men on board, were loſt within ſight of their own ſhore. The year 1709 was marked by a circumſtance highly creditable to the humanity of the nation. The cruel depredations of the French in the palatinate compelled the inhabitants to deſert their country; twelve thouſand, in the moſt forlorn condition, ſought refuge in London: the queen, for ſome time, ſupported them out of her privy purſe; ſhe was afterwards aſſiſted by the benevolence of her ſubjects, and 22,038*l.* was paid into the chamber of the city for the relief of theſe diſtreſſed fugitives, who were finally diſpoſed of as coloniſts to Ireland and North America.

The increaſe in the population of the metropolis having occaſioned a great inſufficiency in places for divine worſhip, an act of parliament was paſſed in 1711 for erecting fifty new churches in and about London: the expence of which was defrayed by a ſmall duty on coals brought into the port of London for about eight years. The year 1720 will ever be famous in the annals of London, from the deſtructive ſyſtem of ſpeculation and fraud which hiſtory has denominated the South Sea bubble; and which ſo completely infatuated the people, that they became the dupes of the moſt barefaced impoſitions. (See Bubble, in *Commerce*.) The directors of the South Sea Company, encouraged by the prevalent ſpirit of avaricious enterpriſe, propoſed to the government to take into their fund all the debts of the nation, under the plauſible pretext of a ſpeedier redemption. The amount of the debts was 31,664,551*l.*; for the liberty of adding the whole of which to their capital ſtock, they offered to pay to the public the immenſe ſum of 7,723,809*l.* This bait was too tempting to be refuſed; the plan received the ſanction of parliament, and the directors were empowered to raiſe the ready money neceſſary for ſo great an undertaking, "by opening books of ſubſcription, and granting annuities to ſuch public creditors as were willing to exchange the ſecurity of the crown for that of the South Sea Company, with the advantage of ſharing in the emoluments that might ariſe from their commerce." So much was the public mind impreſſed with the idea of rapid gain, that before the act received the royal aſſent, the company's ſtock roſe to 319*l. per cent.*: it advanced ſo amazingly for three months, that books were then opened for a freſh ſubſcription of four millions at 1000 *per cent.*; and ſuch was the popular frenzy, that within a fortnight the new ſubſcription was at 200 *per cent.* premium. Some alarm now prevailed: it had been whiſpered, that the directors and their friends had diſpoſed of their own ſtock while the price was at the higheſt; and all confidence in the ſtability of their credit was deſtroyed. The confuſion became general; every one was willing to ſell, but no purchaſers could be found, except at a vaſt reduction. Diſtraction and diſmay ſpread through the city; the ſtock fell rapidly, and, before the end of the year, was reduced to 86 *per cent.* which was about its real value. The deſtruction to public and private credit, thus produced, was exceſſive: all trade was at a ſtand; and many of the moſt reſpectable merchants, goldſmiths, and bankers of London, who had unwiſely lent large ſums to the company, were obliged to abſcond. A parliamentary inveſtigation enſued; and the knavery of the directors was ſo apparent, that the greater part of their eſtates was confiſcated for the benefit of thoſe whom their villainy had ruined. The ſum thus obtained amounted to 2,014,000*l.*

During the continuance of the infatuation which the South Sea deluſion inſpired into all claſſes of people, many other viſionary projects were ſet on foot by ſpeculators and gamblers; even chartered companies of eſtabliſhed credit lent their countenance to ſchemes of impoſſible accompliſhment: nearly two hundred ſubſcription projects were afloat at one time. When the public confidence in the South Sea ſcheme was on the decline, the ſuperior ſtability of the bank of England, Eaſt India, and African companies, was at once ſeen: Bank ſtock roſe from 100 to 260; Eaſt India ſtock from 100 to 405; and African ſtock from 100 to 200. The ſhares in the London and Royal Exchange Aſſurance Companies alſo experienced a prodigious riſe. See Insurance.

The cloſe of the year 1729 was attended by a great mortality in London; the deaths within the bills of mortality in the courſe of the year amounting to almoſt 30,000. The pernicious habit of dram-drinking had become ſo general, and ſo many diſorders had been occaſioned, and crimes commited in conſequence of it, that in the year 1736 the legiſlature found it neceſſary to prohibit the ſelling of Geneva, except under certain reſtrictions. Previous to this, the magiſtrates had aſcertained that the number of gin-ſhops in London and Weſtminſter was 7044, beſides garrets and cellars where the baneful liquor was ſold privately. So determined were the retailers to carry on their trade, that the utmoſt exertions of the police were required to enforce the act; and within two years, 12,000 perſons were convicted and fined under its proviſions.

The winter of 1739—40 was memorable from the occurrence of one of the moſt intenſe froſts ever known in this country, and which is recorded in our annals by the appellation of the Great Froſt; it commenced on Chriſtmas-day, and laſted till the 17th of February: above bridge the Thames was completely frozen over, and numerous booths were erected on it for ſelling liquors, &c. to the multitudes who daily flocked thither. Great improvements were now made in different parts of the metropolis; and convenience, health, and ſafety, were more generally attended to than they had previouſly been. Weſtminſter bridge was finiſhed and opened for public uſe in the year 1750; the houſes upon London bridge were pulled down in 1756; and in the two ſucceeding years the bridge was put into a courſe of repair. In 1760 Black-friars' bridge was commenced; moſt of the city gates were taken down; and an act of parliament was obtained for making alterations in the avenues of the city and its liberties; ſome of which have been carried into effect at different periods, yet many others remain to be executed. In the year 1763, the recent peace with France, the reſignation of Mr. Pitt, afterwards earl of Chatham, as premier, and other political occurrences, ſet the metropolis into a complete ferment. The conduct of adminiſtration was ſuch, as to augment rather than obviate the prevailing diſcontents. Hence the miniſtry were aſſailed with political publications; in particular by a periodical paper called "The North Briton;" the writers of which, the principal of whom was John Wilkes, were determined to expoſe the meaſures of the then adminiſtration to the contempt they deſerved. The forty-fifth number of this paper contained ſuch ſevere reflections on the king's ſpeech to parliament, that the miniſtry thought they had an opportunity to cruſh their avowed enemy. Mr. Wilkes was apprehended and committed to the Tower under an illegal warrant, ſigned by the principal ſecretary of ſtate; but the caſe being argued in the court of Common Pleas, before lord chief juſtice Pratt, the court directed him to be diſcharged. Mr. Wilkes brought actions againſt the earl of Halifax, ſecretary of ſtate, for iſſuing the warrant, and againſt Mr. Wood, under-ſecretary, and obtained verdicts with damages; 4000*l.* from the former, and 1000*l.* from the latter. Shortly after his releaſe, Mr. Wilkes eſtabliſhed a printing-preſs in his own houſe, and republiſhed all the numbers of the obnoxious paper. This provoked the miniſtry ſo highly, that an information was filed againſt him. The "North Briton, No. 45," was voted by the houſe of commons to be a ſeditious libel, and ordered to be burnt by the common hangman. Mr. Wilkes was expelled the houſe;

and though he retired to France, his trial was brought on in his abſence, when he was found guilty of republiſhing the libel, and was conſequently outlawed. Four years afterwards he returned to England, his outlawry was reverſed, and he was ſentenced to two years impriſonment; during which he was elected an alderman of London, and knight of the ſhire for Middleſex.

In the year 1780, from a cauſe apparently harmleſs, a petition to parliament from the Proteſtant Aſſociation, aroſe an inſurrection, compoſed chiefly of the loweſt of the people, which for a week bore the moſt alarming appearance; the priſons of Newgate, the King's Bench, and the Fleet were burnt and the priſoners ſet at liberty, and moſt of them joined the inſurgents. The Popiſh chapels, and a great number of private houſes of Catholics, were ſet on fire: and thirty ſix fires were ſeen blazing at one time in various parts of the metropolis. Military interference became abſolutely neceſſary, when many of the rioters were killed; 135 were brought to trial, of whom 59 were convicted, and upwards of 20 of the moſt active were executed in various parts of the town, but immediately contiguous to the ſcenes of their reſpective depredations.

During the year 1792, and the two following years, the metropolis was greatly agitated by political contention; many aſſociations were formed for the purpoſe of obtaining a more pure and equal repreſentation of the people. The two principal of theſe aſſociations, *viz.* the Friends of the People, and the Correſponding Society, held their meetings in London. Their avowed object was parliamentary reform; but they were ſtigmatized by their enemies with the appellations of Republicans and Levellers. Some of the moſt active and powerful leaders of theſe aſſociations were at length arreſted, and tried for high treaſon, but after a long inveſtigation all were acquitted. Other perſons, among whom was Thomas Paine, were proſecuted for ſedition, and ſome were impriſoned. Paine was pronounced guilty of writing and publiſhing the ſecond part of the Rights of Man, which was declared ſeditious, and the author having left the kingdom, was outlawed. The numerous clubs, debating ſocieties, and political aſſociations formed in the metropolis ſoon after the revolution in France, and during the early ſtages of the war againſt that country, conſtitute a prominent epoch in the hiſtory of the metropolis. The country was hurried on to the very brink of revolution; but this great criſis was prevented by the vigilant, powerful, and determined conduct of the Pitt adminiſtration. An Alien act was paſſed in 1793, the Habeas Corpus act was ſuſpended in the next year; and various arbitrary and oppreſſive meaſures were adopted by the miniſtry to preſerve public tranquillity, but at the ſame time abridge the rights of the Britiſh ſubjects.

The year 1797 was diſtinguiſhed by the ſtoppage of bank payments in ſpecie, as the government had employed nearly all the current coin in remittances to the emperor of Germany and to other foreign powers. An act of parliament was now paſſed to allow the bank to iſſue notes under five pounds. At the commencement of 1798 a numerous meeting of the bankers, merchants, and traders of London, was held in the Royal Exchange for the purpoſe of raiſing a voluntary ſubſcription for the public ſervice. In the courſe of four days the common council alone ſubſcribed 10,000*l.*, 200,000*l.* was ſubſcribed by the bank, conſiderable ſums were given by other public companies, and 20,000*l.* was advanced by his majeſty. The miniſter eſtimated this ſubſcription at one million and a half, but the total amount was more than two millions of money. Continued threats of invaſion from France induced the miniſter to adopt ſome new mode of defence; and ſeveral armed aſſociations were formed by different pariſhes and companies in the metropolis. On the 4th of June, 1799, all theſe volunteers were aſſembled in Hyde Park, and reviewed by his majeſty, the princes, &c. The total number under arms was 8989, of which 1008 were cavalry. On the 21ſt of the ſame month, a ſtill greater number of volunteers was diſperſed through the ſtreets, ſquares, and ſuburbs of the metropolis, to be inſpected again by the king, and a numerous retinue of princes, dukes, &c. It is ſtated, that 12,208 volunteers were then drawn out under arms. A ſimilar review of the volunteers to the former, took place on the 4th of June 1800. On the ratification of preliminaries of peace in October, 1801, the metropolis was brilliantly illuminated, and all claſſes of people teſtified great joy at the event. The definitive treaty was ſigned on the 27th of the following month, and the illuminations throughout London were now ſingularly ſplendid and general. A war again broke out, and an act of parliament was paſſed to enable his majeſty to arm the people *en maſſe*. Other acts for increaſing the military force of the country were alſo paſſed. The cities of London and Weſtminſter, and pariſhes immediately adjacent, raiſed a volunteer force amounting to 27,077 men. A patriotic fund was eſtabliſhed in London in July 1803, and before the end of Auguſt more than 152,000*l.* were ſubſcribed; towards which the city, in its corporate capacity, gave 2500*l.* The ſucceſſive deaths of lord Nelſon, Mr. Pitt, and Mr. Fox, produced great ſenſation in the metropolis, and many changes in the legiſlative officers. Covent Garden theatre and ſeveral contiguous houſes were conſumed by fire in September 1808; another fire in January 1809, deſtroyed part of the king's palace at St. James's, and a third fire, in February of the ſame year, conſumed the whole of Drury-lane theatre. The October of 1809 is memorable in the annals of London, for the circumſtance of his majeſty's entrance into the fiftieth year of his reign, and the loyal rejoicings, or public manifeſtations of loyalty that were diſplayed on the occaſion. The memorable and unpropitious expedition to Walcheren, the theatrical riots at Covent Garden theatre, the inveſtigation, before the houſe of commons, relating to the duke of York and a noted proſtitute of the name of Clarke, the arreſt and impriſonment of ſir Francis Burdett, a member of the houſe of commons, are all memorable events in the local hiſtory of London, and are entitled to particular narration and expoſition in a publication devoted to the topography of the metropolis. In Brayley's Survey, already referred to, theſe ſubjects are particularized and elucidated. It is conjectured that within the laſt forty years, 40,000 new houſes at leaſt have been erected in London and its connected environs, and that theſe afford habitation for nearly 200,000 new inhabitants. In July, 1794, a fire broke out in Radcliffe highway, and conſumed 630 houſes, with much other property. Many of the inhabitants fixed tents in the open fields, where they lived for ſeveral weeks till new houſes were erected.

Hiſtory of the Commerce of London.—

> "Then COMMERCE brought into the public walk
> The buſy Merchant; the big Warehouſe built;
> Rais'd the ſtrong Crane; choak'd up the loaded Street
> With foreign Plenty; and thy Stream, O Thames,
> Large, gentle, deep, majeſtic king of floods!
> Choſe for his grand reſort." Thomſon.

London is univerſally acknowledged to be the firſt commercial, as well as the firſt manufacturing city in the world. Conſidering, therefore, the intimate connection that ſubſiſts between its trading proſperity and the general intereſts of the empire; the ſubject of this ſection cannot fail to be highly intereſting and important. To trace the ſteps by which London has riſen to its preſent opulence and grandeur, is in fact to develope the ſources of that diſtinguiſhed rank which England now holds among the nations of the earth.

London was, doubtleſs, a place of conſiderable trade at a very early period. Tacitus ſpeaks of it as the *nobile emporium* of his time; the great reſort of merchants, and though not a colony, famous for its commercial intercourſe. After this, little is known of it, in reſpect to trade, until the cloſe of the ſecond century of the Chriſtian era, when it is again mentioned as having become “a great and wealthy city.” In the year 359, it is ſaid of England, that its “commerce was ſo extended, that 800 veſſels were employed in the port of London for exportation of corn only.” Three centuries afterwards Bede ſtyles it “an emporium for many nations repairing to it by land and ſea.” Fitz-Stephen, who lived in the reign of Henry II. ſays, that “no city in the world exports its merchandize to ſuch a diſtance as London;” but does not inform us what goods were exported, or to what countries they were carried. Among the imports, however, he enumerates gold, ſpices, and frankincenſe from Arabia; precious ſtones from India; and palm-oil from Bagdad. But it ſeems more reaſonable to ſuppoſe theſe were obtained through the medium of the trading cities of Italy, than by direct commerce to the reſpective places. William of Malmſbury, who likewiſe lived about this period, calls “London a noble city, renowned for the opulence of its citizens,” and “filled with merchandize brought by the merchants of all countries.” The ſame author adds, “that in caſe of ſcarcity of corn in other parts of England, it is a granary, where it may be bought cheaper than any where elſe.” Thus it will be perceived, that even in the infancy of European commerce, and at a time when ignorance and barbariſm clouded almoſt every portion of the world, this city had made no inconſiderable progreſs towards its preſent celebrity and importance.

In the year 1220, the merchants of Cologne, in Germany, probably in conſequence of an invitation from king John in 1203, eſtabliſhed a hall or factory in London, which ſhortly after became the general factory of all the German merchants reſident in the city. Not long ſubſequent to this period, *viz.* in 1245, ſea coal “carbone maris,” is mentioned among the articles of inquiſition into treſpaſſes committed in the king's foreſts. Hence it may reaſonably be inferred, that coal was not only known and wrought before this time, but actually formed a part of the imports of London. Sea-coal lane, in this city, was certainly ſo named as early as the year 1253, and according to Stow, received this appellation from lime being burnt there with ſea-coal.

The cloſe of the thirteenth century appears to have been a remarkable era in the commercial hiſtory of London. In 1296, the company of merchant-adventurers was firſt incorporated by Edward I. The Hanſards, or Hanſe merchants, alſo received conſiderable privileges about the ſame time. In the year 1498, when all direct commerce with the Netherlands was ſuſpended, this body obtained very great advantages over the merchant adventurers by importation of vaſt quantities of thoſe articles, through the medium of the Hanſe towns, which before had come directly from the Netherlands, where the trade of the latter company had been chiefly eſtabliſhed. In conſequence of theſe circumſtances, the warehouſes of the merchants were attacked and rifled by the mob; but the offenders were ſoon ſuppreſſed, and many of them puniſhed.

In the year 1504, all the ancient privileges of the Hanſe, or as they were likewiſe called, Steel-yard merchants, were confirmed to them by ſtatute, and all the previous acts which had been made in derogation of them were annulled. A ſimilar charter was alſo obtained by the Engliſh merchants “trading in woollen cloths of all kinds to the Netherlands,” in which they are for the firſt time ſtyled the “Fellowſhip of merchant-adventurers of England.” This act ſtrictly prohibited the Steel-yard aſſociation from interfering with their trade, by carrying cloths to any of their ſettlements in the Low Countries. Notwithſtanding theſe unfavourable clauſes, however, the Hanſe-merchants ſeem to have engroſſed the chief trade of the city. Grievous accuſations were conſequently made againſt them, for their proceedings were conſidered as tending to ruin the commerce of the native Engliſh. The city of London at length inſtituted an action, in the Star-chamber, againſt them, the object of which was to deprive them of their privileges as a body. Accordingly, in the year 1597, a decree was obtained, annulling their aſſociation, and ordering them, under ſevere penalties, to quit the kingdom. See HANSE *Towns*.

But to return: it may be proper to remark, that during the contentions between the houſes of York and Lancaſter, the commerce of London was very conſiderably retarded. In the reign of Henry VII. it again began to make rapid progreſs. Still, however, if credit is to be given to Wheeler's “Treatiſe on Commerce,” publiſhed in 1601, the trade of this city muſt have been very low indeed, even as late as the year 1539; for that author expreſsly avers, that ſixty years before he wrote, there were not above four merchant veſſels exceeding 120 tons burthen in the river Thames. Nor would it appear that they had increaſed much in the next reign, if we are to believe the report of a London merchant, who, in a letter to ſir William Cecil ſays, that there is not a city in Europe “having the occupying that London hath, ſo ſlenderly provided with ſhips.”

Notwithſtanding theſe complaints, however, it is undoubtedly a fact, that a ſpirit of enterpriſe was very general among the merchants about this period. For, in 1553, we find a great geographical and mercantile diſcovery made by a company, conſiſting of 240 ſhareholders, inſtituted for the purpoſe of proſecuting diſcoveries under the direction of Sebaſtian Cabot, a merchant of Briſtol. (See CABOT, SEBASTIAN.) This aſſociation having fitted out three ſhips, one of them accidentally fell into the bay of St. Nicholas, in the White ſeas, and landing at Archangel, obtained from the czar of Ruſſia peculiar privileges of trade with the ſubjects of his dominions. Within a few years after, the London merchants had alſo factors ſettled at the Canaries. The Ruſſia or Muſcovy merchants were incorporated in the reign of Philip and Mary, and had their charter ſubſequently confirmed by Elizabeth, in her eighth year. This princeſs, likewiſe, obtained an excluſive grant to the Engliſh of the whole foreign commerce of that extenſive empire, which they continued to enjoy for a conſiderable period. About this time the civil diſſentions in Flanders began, upon which a vaſt number of families from the Netherlands flocked to London, and brought over with them their trade and riches. This great addition to the population of the city, and the conſequent increaſe of its commerce ſoon after, led to the erection of the Royal Exchange, by the celebrated ſir Thomas Greſham, in the years 1566 and 1567. (See ROYAL *Exchange*.) Previous to this the merchants were accuſtomed to meet twice every day in Lombard-ſtreet, without any other refuge from the ſeverities of the weather but what the neighbouring ſhops might occaſionally afford. In 1579, the Levant, or Turkey Company, was eſtabliſhed, as was alſo the Eaſtland Company; both of which ſtill exiſt, but the former only retains any degree of importance. On the

31ſt of December, 1600, the queen granted the firſt patent to the Eaſt India Company. Their ſtock then amounted to 72.000*l.* and with this ſum the company was enabled to fit out four ſhips under the command of James Lancaſter. The adventure proving ſucceſsful, the company continued its exertions, and hence has ariſen the moſt ſplendid and powerful mercantile aſſociation that probably ever exiſted in the world. (See Company, *Eaſt India.*) Aſſurance and inſurance companies were now eſtabliſhed in London. An act was paſſed in 1601 for regulating the buſineſs of aſſurance, and a ſtanding commiſſion of merchants appointed to meet weekly "at the office of inſurance on the weſt ſide of the Royal Exchange." (See Insurance *Companies.*) The company of Spaniſh merchants were likewiſe among the number of thoſe incorporated by Elizabeth, ſo that the reign of that princeſs may be juſtly ſaid to form a grand era in the commercial hiſtory of this metropolis.

In the reign of James I. the progreſs of the foreign trade was rapidly increaſed. Tobacco, which had firſt been introduced in 1565, now became a conſiderable article of import. (See Tobacco.) The tonnage and number of the ſhipping in the port of London were greatly augmented about this time. Many of the patents granted by Elizabeth were annulled, and the trade thrown open. Howe, ſpeaking of the foreign commerce of this city in the year 1614, ſays, "London, at this day, is one of the beſt governed, moſt richeſt, and flouriſhing cities in Europe; plenteouſly abounding in free trade and commerce with all nations; richly ſtored with gold, ſilver, pearl, ſpice, pepper, and many other *ſtrange* commodities from both Indies; oyles from Candy, Cyprus, and other places under the Turk's dominion; ſtrong wines, ſweet fruits, ſugar, and ſpice, from Grecia, Venice, Spayne, Barbaria, the iſlands and other places lately diſcovered and known; drugs from Egypt, Arabia, India, and divers other places; ſilks from Perſia, Spayne, China, Italy, &c.; fine linen from Germany, Flanders, Holland, Artois, and Hanault; wax, flax, pitch, tarre, maſtes, cables, and honey, from Denmark, Poland, Swethland, Ruſſia, and other northern countries; and the ſuperfluity in abundance of French and Rheniſh wines, the immeaſurable and incomparable increaſe of all which coming into this city, and the encreaſe of houſes and inhabitants within the terme and compaſſe of fifty years, is ſuch and ſo great, as were there not now two-thirds of the people yet living, having been eye-witneſſes of the premiſes and bookes of the cuſtom-houſe, which remain extant, the truth and difference of all things afore-mentioned were not to be juſtified and believed." Howe's edition of Stow's Annals of England, p. 868.

Among the circumſtances which occaſioned the vaſt increaſe of trade during this reign, may be reckoned the colonization of America and the Weſt India iſlands. The new diſcoveries, likewiſe, which were every day made in different quarters of the world, no doubt had a powerful effect in ſtimulating numbers of ſpeculating perſons to commercial exertion and adventure.

During the peaceful years of Charles I. the commerce of this metropolis ſtill continued to make rapid progreſs; and though the civil wars, for a time, had a very contrary operation, yet in the end they certainly proved beneficial. The energies of the mind were more awakened; the habits of thinking and modes of action, which then became general, taught man to feel his dignity as an individual; the different ranks of ſociety were more cloſely drawn together; the exertions of induſtry were better directed; and the means of acquiring wealth greatly augmented. The injurious tendency of monopolies was eminently counteracted; for, though never aboliſhed by any direct ſtatute, men, regardleſs of the prerogative whence they were derived, gradually invaded the privileges they conferred, and commerce was increaſed by the increaſe of liberty.

The augmented commerce of the port of London, in this reign, may in ſome meaſure be eſtimated by the quota of ſhip-money, which Charles I. impoſed on the city in 1634. By one writ, the citizens were ordered to fit out and equip, at their own charge, for 26 weeks, one ſhip of 900 tons and 930 men, one of 800 tons and 260 men, four of 500 tons each and 200 men, and one of 300 tons and 150 men. Next year they were commanded to provide two ſhips of 800 tons and 320 men each. About this time, or at leaſt very ſhortly before, prices-current were firſt printed. In 1635, an order was iſſued by the king in council to the "poſtmaſter of England for foreign parts," requiring him to open a regular communication, by running poſt between the metropolis and Edinburgh, Ireland, and a variety of other places.

Previous to the year 1640, it was uſual for the merchants to depoſit their caſh in the Tower mint; but this depoſit now loſt all its credit by the ill-adviſed meaſure of a forced loan, which the king thought proper to make. The merchants, in conſequence, found themſelves obliged to truſt their money to their apprentices and clerks. The circumſtances of the times and opportunity holding forth great inducements to frauds, many maſters loſt at once both their ſervants and their money. Some remedy became neceſſary; and the merchants now began to lodge caſh in the hands of the goldſmiths, whom they alſo commiſſioned to receive and to pay for them. Thus originated the practice of banking: for the goldſmiths, ſoon perceiving the advantages that might be derived from diſpoſable capital, began to allow a regular intereſt for all ſums committed to their care; and, at the ſame time, they commenced the diſcounting of merchants' bills at a yet ſuperior intereſt than what they paid. (See Bank and Banking.) In 1651 the celebrated navigation act was paſſed, the wiſe proviſions of which have no doubt contributed much to promote our naval and commercial greatneſs. This ſame year, coffee was introduced into London by a Turkey merchant named Edwards. (See Coffee.) The ſugar trade was now likewiſe eſtabliſhed; and upwards of 20,000 cloths were ſent annually to Turkey, in return for the commodities of that country.

The plague, which made ſuch dreadful havoc among the citizens in 1665, almoſt wholly ſuſpended the commerce of London; inſomuch that ſcarcely a ſingle foreign veſſel entered the port for the ſpace of three years. The great fire, which happened in 1666, likewiſe occaſioned incalculable loſs to numbers of the moſt opulent merchants in the city. Notwithſtanding theſe diſaſtrous events, however, the ſpirit of the ſurvivors, ſo far from ſinking, was rouſed to uncommon exertions. In the courſe of a few years, the city roſe from its aſhes with greater magnificence and ſplendour. India muſlins were firſt worn in 1670, and ſoon became prevalent. In this year alſo was the Hudſon's Bay Company eſtabliſhed, with very extenſive powers. The Greenland Fiſhing Company was incorporated in the year 1693; and the inſtitution of the Bank of England rendered the ſucceeding one juſtly memorable in the commercial annals of London. See Company.

The commerce to the Eaſt Indies having become vaſtly enlarged, and many diſputes ariſing relative to excluſive trade, a new joint ſtock company was incorporated in London, in the year 1698, by the name of "The Engliſh Company trading to the Eaſt Indies." The exiſtence of two rival companies having the ſame privileges, however, ſoon gave birth to numerous abſurdities and contradictory queſtions of right. Theſe circumſtances, and ſome others which it is unneceſſary to detail in this place, eventually produced the conſolidation of both into one, in the firſt and ſeventh years of queen Anne, by the title of "The United Company of Merchants trading to the Eaſt Indies." See COMPANIES, *Engliſh*, the *Eaſt India*, vol. ix. for a full account of this eſtabliſhment.

The number of veſſels belonging to the port of London, as appears from returns made to circular letters from the commiſſioners of the cuſtoms, amounted, in 1701, to 560; carrying 84,882 tons and 10,065 men. In 1710 the cuſtoms of this city are ſtated at 1,268,095*l.*, and thoſe of all the out-ports only at 346,081*l.*, which is more than three and a half to one. The following year beheld the incorporation of the South Sea Company, afterwards ſo baneful in its effects to numerous individuals, and ſo generally hurtful to the commercial enterpriſe of the country at large. The Royal Exchange Aſſurance and the London Aſſurance Companies were chartered about the ſame time.

During the reign of George I. the trade of London made very little, if any, progreſs. The failure of the South Sea ſcheme, the rebellion in Scotland, and the Spaniſh war, were the combined cauſes which operated to produce its retardation. In the year 1732, however, commerce began again to revive; but its advances continued comparatively ſlow, till the peace of Aix-la-Chapelle in 1748, after which it extended with uncommon rapidity. The next conſiderable check it ſuſtained was the reſult of the American war. No ſooner, however, was peace ſigned than it proceeded with renewed vigour. The grievous conſequences which many perſons apprehended to our trade, from the declaration of the independance of the United States, were only imaginary. For, even ſo ſoon after that event as the year 1784, the value of exports to America only had increaſed to 3,397,500*l.*, ſomewhat more than 332,000*l.* above the greateſt amount in any one year before the war. The net ſum of duties levied in the port of London, and paid into the exchequer this year, aroſe to the vaſt ſum of 4,472,091*l.* 13*s.* 3*d.* From this period to 1793, when the French revolution began, the commerce of London continued uniformly increaſing. In that year, however, the value of exports was upwards of two millions leſs than in the preceding year; though the imports ſcarcely ſuffered any diminution. Numerous bankruptcies conſequently took place; but the timely interference of the legiſlature, and the voting of exchequer bills to the amount of 5,000,000*l.* for the uſe of ſuch perſons as could give ſufficient ſecurity, ſoon checked the growing diſtreſs.

In the courſe of the three ſucceeding years, the appearance of things was entirely altered. In 1796 the exports of London amounted in value to 18,410,499*l.* 17*s.* 9*d.*, and the imports to 14,719,466*l.* 15*s.* 7*d.* The number of Britiſh ſhips that entered the port amounted to 2007, carrying 436,843 tons; and 2169 foreign veſſels, carrying 287,142 tons. The total entering coaſtwiſe was 11,176, including repeated voyages, which made a tonnage of 1,059,915. The following year, ſome alarm was ſpread among the merchants by the ſtoppage of the bank payments *in ſpecie*; but, through the intervention of parliament, confidence was ſoon reſtored. The net amount of the cuſtoms was 3,950,608*l.* In 1798 the importations of ſugars and rum far exceeded thoſe of any preceding year, as did likewiſe the revenue of the cuſtoms, which amounted to the ſum of 5,321,187*l.* 7*s.* 3*d.* In 1799 it had increaſed to 7,226,353*l.* 0*s.* 1*d.*, Weſt India 4½ *per cent.* duty included; but next year fell to 6,468,655*l.* 13*s.* 7*d.* The *official* value of the imports, in 1800, was 18,843,172*l.* 2*s.* 10*d.*; and of the exports, 25,428,922*l.* 16*s.* 7*d.* Their *real* value amounted in all to 68,000,000*l.*, nearly two-thirds of the value of the whole trade of the kingdom. The number of veſſels belonging to the port in that year appeared, from official documents laid before parliament, to be 2666, carrying 568,262 tons, and 41,402 men. Comparing this number with the number returned in the beginning of the laſt century, the increaſe will be ſeen to be aſtoniſhing. On the quantity of tonnage, it is nearly in the proportion of ſix to one; and on the amount of men and ſhips, as upwards of four to one. The Eaſt India Company's ſhips alone carry more burthen, by 21,166 tons, than all the veſſels of London did a hundred years ago. The average number of ſhips in the Thames and docks is 1100, together with 3000 barges employed in lading and unlading them, 2288 ſmall craft engaged in the inland trade, and 3000 wherries for the accommodation of paſſengers; 12,000 revenue officers are conſtantly on duty in different parts of the river; 4000 labourers are employed in lading and unlading, and 8000 watermen navigate the wherries and craft. See DOCKS and COMPANIES.

The *Port of London*, as actually occupied by ſhipping, extends from London bridge to Deptford, being a diſtance of nearly four miles, and from four to five hundred yards in average breadth. It may be deſcribed as conſiſting of four diviſions, called the Upper, Middle, and Lower Pools, and the ſpace between Limehouſe and Deptford: the Upper Pool extends from London bridge to Union Hole, about 1600 yards; the Middle Pool, from thence to Wapping New Stairs, 700 yards; the Lower Pool from the latter place to Horſe-ferry Tier, near Limehouſe, 1800 yards; and the ſpace below to Deptford about 2700 yards. When the houſe of commons commenced an inveſtigation reſpecting the port of London, the land accommodations were found to conſiſt of only the legal quays and the ſufferance wharfs. The former were appointed in the year 1558, under a commiſſion from the court of exchequer, authorized by an act of the firſt year of Elizabeth, for the excluſive landing of goods, ſubject to duty: they occupy the north bank of the river Thames, with ſome interruptions, from London bridge to the weſtern extremity of Tower ditch; the whole frontage meaſuring about 1464 feet. Till of late years theſe quays conſtituted the whole legal accommodation for the prodigious ſhipping trade of London; though from the increaſed ſize and tonnage of merchant veſſels, &c. the depth of the river in this part was found too ſhallow to admit of that ſpeedy clearance which the trading and mercantile intereſts require. The commiſſioners of the cuſtoms, therefore, occaſionally permitted the uſe of other landing places, which were thence called Sufferance wharfs, and of which five were ſituated on the north ſide of the river, between the Tower and Hermitage Dock, and eighteen on the oppoſite ſide: the whole having a frontage of 3676 feet. Notwithſtanding theſe additional conveniences, the whole number of quays was ſtill very far from poſſeſſing ſufficient accommodation for the increaſed trade; and more eſpecially in times of war, when large fleets of merchantmen arrive at once. The numerous evils ariſing from this want of a ſufficient ſpace for ſhipping and landing goods, and among which, the monopoly thrown into the hands of the few legal quays was not the leaſt, were for many years ſubjects of vexation and complaint. So long ago as 1674, the merchants of London petitioned the houſe of commons for redreſs againſt a combination, which the whole body of wharfingers had entered into; and in the year 1711, when the tonnage of the veſſels belonging to London did not amount to one-third part of what it does now, the commiſſioners of the cuſtoms recommended to government to make a legal quay at Bridge yard, on the ſouth ſide of the river; but it was never executed. About the year 1762, the court of exchequer directed a part of the Tower wharf to be converted into a legal quay; but this plan was relinquiſhed. The conſtruction of Wet docks had been recommended as the beſt expedient for obviating the vaſt loſs and embarraſſment ariſing from the encumbered ſtate of the quays and wharfs, and from the immenſe crowding of the veſſels on the river; and through the various ſchemes which were about this time offered for the purpoſe, &c. the houſe of commons was induced to appoint a committee; the buſineſs of which has been to inquire into the beſt mode of improving the port, and render it completely adequate to the preſent and probable commerce of London. The moſt ſkilful engineers and ſurveyors have been employed; whoſe reports, plans, &c. with the opinions and ſtatements of various merchants and other perſons, have been printed by order of the houſe of commons. Theſe reports conſtitute ſeveral volumes in folio; and are peculiarly intereſting and curious. Sir Frederic Eden publiſhed a pamphlet on the ſame ſubject, entitled "Porto-Bello, or a plan for the improvement of the port and city of London; illuſtrated by plates," 8vo. 1798. For a particular account of the various branches of commerce, commercial companies, and other objects connected with the ſame, the reader is referred to the words DOCKS, COMPANIES, EAST INDIA *Trade*, WEST INDIA *Trade*.

Cuſtom Houſe.—On the north bank of the Thames, weſt of the Tower, is a large building, appropriated to ſuch officers, clerks, tide-waiters, &c. as are immediately concerned in received the king's duties on the exports and imports of commerce. The preſent building was erected in 1718, on the ſcite of another which had been deſtroyed by fire. It is 260 feet in front; and when erected was deemed amply ſufficient for its deſtination. It has proved, however, very inadequate to the increaſed cuſtoms and buſineſs of the port; and to the vaſt commerce of London. After various ſurveys and reports made on the ſubject, it has been recently determined by the commiſſioners of the cuſtoms, that a new cuſtom-houſe ſhall be erected, upon ſuch a ſcale, and provided with ſuch numerous and various accommodations, as to meet the exigencies and demands of government. Mr. David Laing, architect to the cuſtoms, having furniſhed deſigns for a new edifice, and the ſame being approved, it is intended to proceed with the building immediately. The ſcite is from the weſtern ſide of the preſent edifice to Billingſgate quay; and its whole extent will conſtitute a range of 480 by 96 feet. In the centre is to be the long room, of 190 feet by 67. The whole building will accommodate 650 officers and clerks, the number employed here; alſo 1050 tide-waiters, and other inferior ſervants. The lower floor is to conſiſt of bondage vaults, over which are to be numerous apartments for officers and offices; and above theſe are to be ſeveral others, with the long room already noticed. The water front is to be of ſtone, with Ionic columns at each wing, and the centre will be crowned with a large dome over the long room, with ſky-lights and ventilators. It is but juſtice to ſay that the deſigns are creditable to the taſte and ſcience of the architect. The quay in front of the building is to be enlarged by filling up a part of the river. A new wall and quay are to be formed from the Tower to Billingſgate wharf, and numerous improvements will be made in the contiguous ſtreets and lanes. The river, at this place, is about 20 feet deep at high water mark. The buſineſs of the cuſtoms is managed by nine commiſſioners, whoſe juriſdiction extends over all the ports of England.

Manufactures of London.—London has long been celebrated for its manufactures as well as for its commerce. In the year 1327 the Skinners were a very numerous and rich claſs of citizens, manufacturing "ſables, lucerns, and other rich furs." Cloth-workers of different kinds were alſo noted for the excellence of their goods. In 1556 a manufactory for the finer ſort of glaſſes was eſtabliſhed in Crutched Friars, and flint glaſs, not exceeded by that of Venice, was at the ſame time made at the Savoy. About five years ſubſequent the manufacture of knit ſtockings was introduced by one William Rider, an apprentice in London, who happening to ſee a pair from Mantua at the houſe of an Italian, made another exactly ſimilar to them, which he preſented to William earl of Pembroke. (See HOSE and STOCKINGS.) A manufacture of knives was ſhortly after begun by Thomas Matthews of Fleet-ſtreet, and this has ever ſince been a flouriſhing trade. Silk ſtockings were firſt made in England in the reign of queen Elizabeth. In the fourth year of that princeſs, "John Roſe, dwelling in Bridewell, deviſed and made an inſtrument with wyer ſtringes, called the Bandora, and he left a ſon far excelling him in making bandoras, viol de gamboles, and other inſtruments." Coaches were introduced in 1564, and in leſs than 20 years became an article of great manufacture. The following year the manufacture of pins was eſtabliſhed, and ſhortly after that of needles. The making of "earthen furnaces, earthen fire-pots, and earthen ovens, tranſportable," began about the tenth year of Elizabeth, one Richard Dyer, an Engliſhman, having brought the art from Spain. Women's maſks, buſks, muffs, fans, bodkins, and periwigs were introduced and made in London ſhortly after the maſſacre at Paris in the year 1572, and in 1577 pocket watches were brought from Nuremberg in Germany, and the manufacture of them almoſt immediately commenced. In the reign of Charles I. ſaltpetre was made in ſuch quantity, as not only to ſupply all England, but the greater part of the continent. The manufactures of ſilk had likewiſe become extremely prevalent, as well as the manufacture of various ſilver articles. The printing of calicoes commenced here in 1676, and about the ſame time the weavers' loom was introduced from Holland. The revocation of the edict of Nantes in 1685, having driven many induſtrious Frenchmen from their native land, a conſiderable number came over to England and ſettled in Spitalfields. By them ſeveral of our manufactures, but particularly that of ſilk, were greatly improved, and many others introduced. Since then the productions of London have greatly increaſed both in extent and value. They now conſiſt chiefly of fine goods, and articles of elegant uſe, brought to the greateſt perfection, ſuch as cutlery, jewellery, articles of gold and ſilver, japan ware, cut glaſs, books, cabinet work, and gentlemen's carriages; together with ſuch particular articles as require a metropolis, or a port, or great mart for their conſumption, export, or ſale; *viz.* porter, Engliſh wines, vinegar, refined ſugar, ſoap, &c. The ſilk manufactories of Spitalfields, Shoreditch, and Bethnal-green pariſhes, alone employ upwards of 7000 perſons. In Clerkenwell a like number are engaged in the different branches of watch-making. Coach builders and harneſs makers are very numerous, and have brought their reſpective works to a higher degree of perfection and elegance than any in the world. Intimately connected with this ſubject is the

Trade of London, which is vaſt, various, and of extenſive effect. It may be divided into the wholeſale and retail buſineſs; for theſe are different, and under different ſyſtems of management. The great number and variety of ſhops that are diſperſed over the metropolis, the diverſity, richneſs, and multitude of articles diſplayed for ſale, and the great concourſe

courſe of perſons immediately and collaterally dependent on, and intimately connected with the ſame, are calculated to excite the aſtoniſhment of foreigners, and of perſons who have not made inquiries into the ſubject. The wholeſale trade is moſtly carried on in the city, and in the vicinity of the river, where large warehouſes and counting-houſes are eſtabliſhed. The retail trade is diſperſed through all the public ſtreets: where ſpacious and handſome ſhops are opened for the diſplay of all the neceſſaries, as well as all the luxuries of life. The ſhop-keepers of London are moſtly an active, induſtrious, and reſpectable claſs of ſociety: many of them are wealthy, and frequently retire from buſineſs in advanced age, with competence, or fortunes. Among the moſt modern ſhop eſtabliſhments upon a large ſcale, are thoſe appropriated to books and prints. Within the laſt 50 years, theſe have been prodigiouſly increaſed: and it would greatly aſtoniſh Addiſon, Johnſon, or ſir Joſhua Reynolds, could they reviſit London in 1812, and take a review of the change that has been produced ſince the time they lived, in the quantity and quality of literary productions, and in works of art. The regular, continued and perpetual intercourſe that ſubſiſts between London and all parts of the kingdom, by coaches, waggons, barges, &c. conſtitutes another and ſtrongly marked feature.

Proviſions, &c. uſed in London.—An immenſe population will require a large and ſyſtematic ſupply of proviſions; and in this reſpect, no city in the world can be better accommodated; laws, cuſtom, and open competition are all conducive to public advantage.

Animal Food.—The number of oxen annually conſumed in London is eſtimated at 110,000; of ſheep, 770,000; of lambs, 250,000; of calves, 250,000; of hogs and pigs, 200,000; beſides animals of other kinds. In ſpeaking of the conſumption of animal food in London, it is not ſufficient to notice merely the number of animals brought to market; for their ſize and fine condition ſhould alſo be conſidered in forming a proper criterion. The increaſed conſumption of the metropolis, from its accumulating population, may be eſtimated from the following average of the number ſold annually in Smithfield.

				Oxen.	Sheep.
From	1750	to	1758	75,331	623,091
	1759	—	1767	83,432	615,328
	1768	—	1776	89,362	627,805
	1777	—	1785	99,285	687,588
	1786	—	1794	108,075	707,456

It is not only in number but in weight that there has been an aſtoniſhing increaſe; this has ariſen from the improvements in breeding that have taken place in the courſe of the laſt century. About the year 1700, the average weight of an ox, killed for the London market, was 370lbs.; of a calf, 50lbs.; of a ſheep, 28lbs.; of a lamb, 18lbs.; whereas the average weight at preſent is, of oxen, 800lbs. each; of calves, 140lbs. each; of ſheep, 80lbs. each; and of lambs, 50lbs. each. The total value of butchers' meat ſold in Smithfield is calculated to amount to 7,000,000*l.* *per annum.*

Milk.—The quantity of this article conſumed in London ſurprizes foreigners; and yet few perſons have even a ſuſpicion of the amount, which is not leſs than 6,980,000 gallons annually. The number of cows kept for this ſupply is ſaid to be 8500; the ſum paid by the retailers of milk to the cow-keepers is ſtated at 317,400*l.* annually, on which the retailers lay an advance of *cent. per cent.*, making the coſt to the inhabitants 634,000*l.* Not content with this profit, the retailers add water to the milk, to the extent, on an average, of a ſixth part. Though the cow-keepers do not themſelves adulterate the milk, (it being the cuſtom for the retailer to contract for the milk of a certain number of cows, to be milked by his own people,) yet they are not wholly to be acquitted of the guilt; for in many of the milk-rooms where the milk is meaſured to the retailer, pumps are erected for the expreſs purpoſe of furniſhing water for the adulteration, which is openly performed in the preſence of any perſon who happens to be on the ſpot. See MILK.

Vegetables and Fruit.—There are at leaſt 10,000 acres of ground near the metropolis, cultivated wholly for vegetables, and about 3000 acres for fruit. The ſum paid at market annually is about 645,000*l.* for vegetables, and about 400,000*l.* for fruit; independently of the advance of the retailers, which, on an average, is more than 200*l.* *per cent.*, making the entire coſt for the London ſupply upwards of 3,000,000*l.*

Wheat, coals, &c.—The annual conſumption of wheat in London is, at leaſt, 900,000 quarters, each containing eight Wincheſter buſhels; of coals 800,000 chaldron, 36 buſhels, or a ton and half to each chaldron; of ale and porter 2,000,000 barrels, of 36 gallons each; ſpirituous liquors and compounds 11,146,782 gallons; wine 65,000 pipes; butter about 21,265,000lbs.; and cheeſe, 25,500,000. The quantity of porter brewed from July 5, 1809, to July 5, 1810, by two of the principal brewers, was, by Barclay, Perkins, and Co. 235,053 barrels, and by Meux, Reid, and Co. 211,009. (See PORTER.) The quantity of fiſh conſumed in the metropolis is comparatively ſmall, on account of the high price which it generally bears; and this appears to be the moſt ſtriking defect in the ſupply of the capital, when it is conſidered that the rivers of the kingdom, and the ſeas which ſurround it, muſt afford ſuch an amazing quantity. There are, on an average, annually brought to Billingſgate market 2500 cargoes of fiſh, of 40 tons each, and about 20,000 tons by land-carriage, in the whole 120,000 tons. The ſupply of poultry being inadequate to a general conſumption, and the price conſequently exorbitant, this article is confined to the tables of the wealthy, and the annual value does not exceed 60,000*l.* Game is not publicly ſold, yet a conſiderable quantity, by preſents, and even by clandeſtine ſale, is conſumed by the middling claſſes. Veniſon is ſold, chiefly by paſtry-cooks, at a moderate rate; but the chief conſumption, which is conſiderable, is amongſt the proprietors of deer parks.

Markets, &c.—London contains 15 fleſh markets, one for live cattle, ſheep, horſes, &c. and 25 for corn, coals, hay, vegetables, &c. Of theſe the principal are, at Smithfield, for bullocks, ſheep, horſes, ſwine, hay, ſtraw, &c.; Leadenhall, for butchers' meat, wool, hides, &c.; Billingſgate, for fiſh; Covent garden and Fleet, for fruit and vegetables; Newgate, Newport, Carnaby, and Clare markets, for butchers' meat, &c.; the corn market in Mark-lane: in Thames ſtreet is a coal exchange. London has only one annual fair, which is held in Smithfield, and continues for three days. It is moſtly devoted to objects of amuſement, ſuch as ſhows, exhibitions of beaſts, birds, ſlights of hand, and the very loweſt ſpecies of diverſion. Hence it is moſtly frequented by the loweſt and moſt depraved claſſes of ſociety. It is become more a place of riot and debauchery, than of public utility.

From what has been ſtated reſpecting the proviſions annually conſumed in London, we are naturally led to inquire into its population; an accurate knowledge of which forms a foundaa foundation for much curious ſpeculation. In the following table we are enabled to give the total number of perſons at four different periods; but it may be neceſſary to premiſe, that the laſt is preſumed to be the moſt correct cenſus ever taken in London.

Population.—London is leſs populous, for its extent, than many other great cities. The ſtreets are wider, and the inhabitants of every claſs, below the higheſt rank, enjoy more room for themſelves and families than is uſual for the ſame claſſes in foreign countries. Hence a given number of people is ſpread over a larger ſpace in London than in foreign cities. From the report on the population of Great Britain, publiſhed on the authority of an act paſſed 43 G. III. London, including the ſuburbs, appears to contain 837,906 ſettled inhabitants; but the great number of ſoldiers, mariners, provincial viſitors, coloniſts, and foreigners, who are conſtantly in London, for purpoſes of pleaſure and buſineſs, and the new inhabitants of 10,000 houſes built within the laſt ſeven years, extends the total population to more than a million. As the increaſe or diminution of the population claims a diſtinct notice, the following table will ſhew its five diviſions, at four different periods.

	In 1700	1750.	1801.	1811.
1. City of London, within the walls - - - - -	139,300	87,000	78,000	80,000
2. City of London, without the walls, including the Inns of Court -	169,000	156,000	155,000	168,000
3. City and Liberties of Weſtminſter - - - -	130,000	152,000	165,000	180,000
4. Out-pariſhes within the Bills of Mortality - - -	226,900	258,900	379,000	460,000
5. Pariſhes not within the Bills - - - - - -	9,150	22,352	123,000	135,000
Total population of the Metropolis -	674,350	675,250	900,000	1,023,000

Government of London.—In tracing the outline of the preſent government of this metropolis, it will be proper to divide it into three principal parts; *viz.* the city of London, with its dependencies; the city and liberties of Weſtminſter; and the ſuburbs connected with the two, but out of the juriſdiction of both the cities.

The civil government of the city of London is veſted, by charters and grants from the kings of England, in its own corporation or body of citizens. The city is divided into 26 principal diſtricts, called wards; and the corporation conſiſts of, 1, the lord mayor; 2, the aldermen; and 3, the common council. The lord mayor is choſen annually in the following manner: on the 29th of September, the livery, in Guildhall or common aſſembly, chooſe two aldermen, who are preſented to the court of lord mayor and aldermen, by whom one of the aldermen ſo choſen, (generally the ſenior,) is declared lord mayor elect; and on the 9th of November he enters on his office. The aldermen are choſen for life by the free houſholders of the ſeveral wards, one for each ward; except Bridge-ward without, where the election is by the court of aldermen from among thoſe who have paſſed the chair, commonly the ſenior: he is ſtyled father of the city. The common council are choſen annually by the free houſholders in their ſeveral wards, the number for each ward being regulated by ancient cuſtom; the body corporate having a power to extend the number. The common council are the repreſentatives of the commons, and compoſe one of the parts of the city legiſlature, which nearly reſembles that of the kingdom; for as the latter conſiſts of king, lords, and commons, ſo this is compoſed of lord mayor, aldermen, and common councilmen; the principal difference is, that in the three eſtates of the kingdom each enjoys a ſeparate negative, while in the city this right is denied to the lord mayor, and confined to the aldermen and common council. Before the year 1347, there were only two common-councilmen returned for each ward, which being thought inſufficient to repreſent ſuch a numerous body, it was at that time ſettled that each ward ſhould chooſe a number, not more than twelve, or leſs than ſix, according to its dimenſions; which has ſince been increaſed to the preſent number. The 26 wards are ſubdivided into 236 precincts, for each of which a repreſentative is elected in the ſame manner as the aldermen; with this difference, that as the lord mayor preſides in the wardmote, and is judge of the poll at the election of an alderman, ſo each alderman, in his reſpective ward, preſides at the election of common council men. The civil powers exerciſed by the corporation are very complete: the laws for the internal government of the city are wholly framed by its own legiſlature, called the court of common council, which conſiſts of the lord mayor, aldermen, and repreſentatives of the ſeveral wards, who aſſemble in Guildhall as often as the lord mayor thinks proper to convene them. They annually ſelect ſix aldermen and twelve commoners for letting the city lands, and this committee generally meet at Guildhall on Wedneſdays. They alſo appoint another committee of four aldermen and eight commoners for tranſacting the affairs of Greſham-college, who uſually meet at Mercer's-hall, at the appointment of the lord mayor, who is always one of the number. The court of common council alſo, by virtue of a royal grant, annually chooſe a governor, deputy, and aſſiſtants, for the management of the city lands in Ireland. This court alſo diſpoſe of the offices of town-clerk, common ſerjeant, judges of the ſheriffs'-court, common crier, coroner, bailiff of the borough of Southwark, and city garbler. The election of the recorder is veſted in the court of aldermen only. The lord mayor is the chief magiſtrate of the city: and the aldermen are the principal magiſtrates in their ſeveral wards. The lord mayor, the recorder, the common ſerjeant, and the aldermen, are judges of oyer and terminer (that is, the king's judges to try capital offences and miſdemeanors) for the city of London and county of Middleſex; and the aldermen are perpetual juſtices of the peace for the city. The two ſheriffs, (who are ſtrictly officers of the king, for many important purpoſes of his executive government,) are choſen annually by the livery of London, not only for the city, but for the county of Middleſex, the ſame perſons being ſheriffs for London, and jointly forming one ſheriff for the county. (See Philips's Letter on the Office of Sheriff, 8vo. and SHERIFF.) The adminiſtration, in all its branches, within the juriſdiction of the corporation, in all caſes embracing the city and the borough of Southwark, and in ſome caſes extending beyond, is exerciſed by members of the corporation or its officers. The borough of Southwark was formerly independent of the city of London, and appears to have been governed by a bailiff till the reign of Edward III., who granted the government of it for ever to the city. A part has been ſince incorporated with the city, under the appellation of Bridge Ward Without, and has its officers appointed by the court of common-council. The livery is a numerous, reſpectable, and important elective body; in which is veſted the election of the lord mayor, ſheriffs, chamberlain, members of parliament, bridge-maſters, ale-conners, and auditors of the chamberlain's accounts. The lord mayor, aldermen, common-council, and livery of London, form together the moſt important popular aſſembly, the commons houſe of parliament excepted, in the kingdom. On occaſions of the greateſt moment, their deciſions have inſpired general fortitude; and the whole legiſlature, when under evil influence, has been ſtruck with awe by the remonſtrance of the city, and prudently liſtened to a warning ſo ſolemnly pronounced.

The military government of the city of London was conſiderably changed by an act of parliament paſſed in the year 1794; under which two regiments of militia are raiſed in the city, by ballot, amounting together to 2200 men. The officers are appointed by the commiſſioners of the king's lieutenancy for the city of London; and one regiment may, in certain caſes, be placed by the king under any of his general officers, and marched to any place not exceeding twelve miles from the capital, or to the neareſt encampment; the other, at all ſuch times, to remain in the city. Regiments of aſſociated volunteers are formed in the reſpective wards and pariſhes, for the internal defence and peace of the metropolis. A conſiderable force is alſo maintained by the Bank, India-houſe, Cuſtom-houſe, and other public bodies, for their more immediate ſecurity. The Artillery company, which is principally compoſed of a voluntary enrolment of the younger citizens, affords an additional force of about ſix hundred men. (See ARTILLERY.) See alſo Highmore's Hiſtory of the Artillery Company, 8vo.

The civil government of the ſuburbs is veſted in the juſtices of the peace for the county. The county-hall for Middleſex is on Clerkenwell-green, where the quarter-ſeſſions are held; and a great part of the civil government is exercifed. In Bow-ſtreet, Covent-garden, is an office of police, under the direction of certain juſtices of Middleſex, who dedicate their time chiefly to that office, where are firſt examined the moſt ſerious caſes of miſdemeanor. The other public offices of police, where magiſtrates ſit daily, are—the Manſion-houſe and Guildhall, within the city. In the ſuburbs—Bow-ſtreet; Queen-ſquare, Weſtminſter; Marlborough-ſtreet; Hatton-garden; Worſhip-ſtreet; Lambeth-ſtreet, Whitechapel; High-ſtreet, Shadwell; and Union-ſtreet, Southwark: at Wapping New-ſtairs is an office for enquiry into offences connected with the ſhipping and port of London.

The police of London is under the controul of the magiſtrates belonging to theſe offices; who are appointed and paid by the government. They are required to attend on duty every day, and their province is to hear and determine petty offences, and ſubjects of diſpute between individuals. On many occaſions they inveſtigate felonies, and the higher claſſes of crimes, and commit the offenders to the proper priſons. Different acts of parliament have been paſſed on this ſubject, by which the duty and powers of the magiſtrates and ſubordinate officers are particularly defined. The police of the city of London is regulated by acts paſſed in 10 Geo. II. 11, 14, 33, and 34 Geo. III.: of Weſtminſter and its liberties, by acts of 27 Eliz., 16 Cha. I., 29 and 31 Geo. II. 2, 3, 5, 11, and 19 Geo. III.: municipal regulations are alſo eſtabliſhed in the borough of Southwark, by acts 28 Geo. II. and 6 and 14 Geo. III.

Under the foregoing acts, a nightly watch is appointed for the prevention of robberies, and the apprehenſion of offenders. To the city of London are attached 765 watchmen, and 38 patroles. The whole number of beadles, patroles, and watchmen, who are every night on duty in and around the metropolis, is eſtimated at 2044. Watch-houſes are placed at convenient diſtances in all parts, where parochial conſtables attend in rotation to keep order, receive offenders, and deliver them the next morning to the ſitting magiſtrate. In the winter ſeaſon, the roads adjacent to London are additionally guarded by horſe-patroles; and on extraordinary occaſions, the officers of the police are ordered out, or kept in readineſs, to aſſiſt in the preſervation of the public peace. The nightly watch is of peculiar utility in caſe of fire, as in every watch-houſe the names of the turncocks, and the places where engines are kept, are to be found. Beſides parochial engines, many public bodies are provided with them, and the principal fire-offices have engines ſtationed in various diſtricts, with active men and horſes. By means of the fire-plugs, water is immediately ſupplied, and the general ſecurity is guaranteed by every effort of vigilance and activity.

Acts of Parliament relative to London and its Inhabitants.—The internal economy, government, police, and civil regulations of London, are entitled to particular and commendable notice; becauſe theſe have tended to attract foreigners to ſettle here, and induced numerous families, both tradeſmen and perſons of fortune, to fix on this city as a deſirable place of permanent reſidence. It will be found that many legiſlative acts have been paſſed, and are in force, to ſecure the ſafety and comfort, and adminiſter to the luxuries of the inhabitants of this metropolis. Beſides numerous local acts of parliament that apply to particular pariſhes and diſtricts, the following have been paſſed expreſsly for the above purpoſes. It is thought adviſable to ſpecify theſe acts, and point out ſome of their items; becauſe many local advantages and conveniences of London are to be referred to theſe legiſlative proviſions.

By 3 Hen. VII. c. 9, citizens and freemen of London are authoriſed to carry their wares to any fair or market in the kingdom, in ſpite of any bye-law to the contrary. By 6 Geo. II. c. 22, the lord mayor and citizens were empowered to fill up part of Fleet Ditch, and the inheritance of the ground was veſted in them. By 29 Geo. II. c. 40, the lord mayor and common-council were empowered to purchaſe and remove buildings, to improve, widen, and enlarge the paſſage over and through London-bridge.

Buildings.—In the year 1764, a very important act of parliament was paſſed, reſpecting all buildings which are hereafter to be erected within London, Weſtminſter, the bills of mortality, and the pariſhes of Mary-le-bone, Paddington, Pancras, and Chelſea, whereby it is provided, that they ſhall be divided into ſeven rates, of which the external walls ſhall be of a thickneſs proportionate to their rates or ſizes; thoſe of firſt-rate buildings to be at the foundation 2½ bricks, or 1 foot 9½ inches thick, and decreaſing upwards in a degree therein ſpecified. Another act, of a more ample nature, was paſſed in 1774, reſpecting the buildings of London and its vicinage. By this it is required, that houſes contiguous to other buildings ſhall have party-walls between them, which walls and all chimnies and chimney-ſhafts ſhall be of brick or ſtone, or both together. (See CHIMNEY.) Party-walls ſhall be 18 inches above the buildings adjoining, and thoſe of firſt-rate buildings ſhall be at the foundation 3½ bricks, or 2 feet 6½ inches in thickneſs, decreaſing upwards in a given proportion. No receſſes to be made in party-walls (except for chimnies, fires, girders,

&c.) ſo as to reduce ſuch wall under the thickneſs required. No timber to be in the party-walls (except bonds, templets, and chains, and the ends of girders, beams, &c.) and $8\frac{1}{2}$ inches of ſolid brick-work to be between the ends and ſides of every piece of timber, except oppoſite to other timbers, and then no part of ſuch timber to approach nearer than four inches to the centre of the wall. Surveyors are to give information of irregular buildings, and the lord mayor and juſtices are to order the ſame to be demoliſhed or amended, and 50*s*. penalty is chargeable on the workman. Fire-engines and ladders to be kept in known places in every pariſh; and pariſh officers ſhall place on the mains of water-works, ſtop-blocks, and fire-cocks, and ſhall mark the houſe near. In caſe of fire, the turncock whoſe water comes firſt ſhall be paid 10*s*. Firſt engine 1*l*. 10., the ſecond 1*l*., the third 10*s*. Where officers pay rewards for fires in chimnies only, or beginning there, they are to be reimburſed by the occupier. Servants who through negligence ſet fire to any houſe, ſhall forfeit 100*l*. or be committed to hard labour for 18 months.

Butchers.—It is provided by an act of Hen. VII. c. 3, that butchers ſhall not kill beaſts within the walls of London; but this act is either ſuperſeded or not put in force.

Cattle.—By 14 Geo. III. c. 87, and 21 Geo. III. c. 67. any peace officer may arreſt perſons who drive cattle through the ſtreets of London in an improper or cruel manner. The party, if convicted, ſhall forfeit from 5*s*. to 20*s*. or be committed for one month. Perſons not being drivers of cattle, who ſhall throw ſtones or ſet dogs at them, ſhall be ſubject to the ſame penalties.

Carts.—By 1 Geo. I. ſtat. 2. c. 57, no carman, drayman, waggoner, or other perſon ſhall, within the bills of mortality, ride on a cart, dray, or waggon, not having ſome perſon on foot to guide the ſame, on forfeiture of 10*s*. This penalty is extended to within ten miles of London, by 24 Geo. II. c. 43.

Coals.—By 47 Geo. III. ſeſſ. 2. c. 68, the coal exchange ſhall be a free open market on Monday, Wedneſday, and Friday, from twelve o'clock till two, and coals are only to be ſold in market hours, under a penalty of 100*l*.

Hackney Coaches.—The commiſſioners may licence 800 by act 9 Anne, 200 more by 11 Geo. III., and 100 more by 42 Geo. III.; total 1100. The rates of fares are fixed, and an office is appointed to determine on complaints, which are alſo cognizable by magiſtrates.

Paving, lighting, and cleanſing.—Several acts were paſſed in the reign of Hen. VIII. for paving parts of the metropolis. The eaſtern ſuburbs were paved by act 13 Eliz. Various other acts were paſſed in ſubſequent reigns for paving the ſeveral parts which were added to the metropolis. The *new paving*, according to the preſent mode, commenced in 1763, under an act paſſed in the preceding year. Before this period the ſtreets were extremely inconvenient to paſſengers, the ſtones (moſtly Guernſey pebbles) being round, the kennels in the midſt, and no level footway, as at preſent, for the pedeſtrians. The alterations firſt took place in Weſtminſter, and the improvements progreſſively extended through moſt parts of the metropolis. At this period alſo took place the removal of the enormous ſigns which hung acroſs the ſtreets or over the footways, and, together with their poſts and iron ſcroll works, impeded as well the circulation of the air as the progreſs of the paſſenger.

Lighting.—As early as the year 1416, the inhabitants of London were obliged to hang out lanthorns on winter evenings. Among other improvements in the reign of queen Anne, was the introduction of globular glaſs lamps with oil burners, inſtead of the lanthorns with candles, and common lamps that had previouſly been in uſe. In 1736, an act of parliament was procured to regulate "the better enlightening the ſtreets, &c." within the city. A committee appointed to carry this act into execution, reported that "the number of houſes then inhabited and chargeable (*i. e.* ſuch as were ſubject to poor-rates) was in all 14,014, of which 1287 were under the rent of 10*l. per annum;* 4741 of 10*l*. and under 20*l*.; 3045 between 20 and 30*l*.; 1839 between 30 and 40*l*.; and 3092 of 40*l*. and upwards. The number of lamps required was 4200, excluſive of ſuch as were attached to public buildings. They were to be placed at the diſtance of 25 yards from each other in the principal ſtreets, and 35 yards in the ſmaller ſtreets and lanes. This was the commencement of the ſyſtem of defraying the charges of lighting the metropolis by parochial aſſeſſments. Since this time various other acts of parliament have been obtained for different diſtricts in the ſuburbs, and it is conjectured that more than 30,000 lamps are lit every night within the bills of mortality. From Lady-day to Michaelmas, a leſs number is uſed than during the other half of the year. In 1737, an act of parliament was paſſed for regulating and increaſing the city watch, &c. Various acts have been paſt for cleanſing the ſtreets, and preſerving them from obſtructions and nuiſances of every deſcription.

Sewers.—One of the moſt eſſential objects in a large city is good drainage; and in this reſpect London is well provided. Into the deep channel of the Thames, numerous large ſewers communicate, and convey all the ſuperfluous water, and vaſt quantities of filth from the houſes. By acts of the legiſlature, a number of perſons, ſtyled commiſſioners of ſewers, are empowered to make and repair ſewers, and levy a tax on every houſekeeper towards defraying the expences incurred by the ſame. An act of parliament was obtained as early as the reign of Henry VI. on this ſubject; and this has been amended and enlarged by ſubſequent acts, 6th Henry VIII. cap. 10; 23d Henry VIII. cap. 5; and 25th of ſame reign; afterwards in the 3d and 4th of Edward VI.; 1ſt of Mary; 13th of Elizabeth; 3d of James, and 7th of Anne. See SEWERS.

By an act of parliament paſſed in 1737, the number of playhouſes was limited to three, and all dramatic pieces intended for the ſtage, were firſt to be ſubjected to the peruſal and approbation of the lord chamberlain. See PLAYHOUSE.

The Charitable Inſtitutions of London are numerous, of various deſcriptions, and of incalculable advantage. Whilſt they adminiſter comfort, health, education, and protection to the neceſſitous, they reflect much honour on the affluent, and on all the patrons. Theſe conſiſt of hoſpitals, diſpenſaries, alms-houſes, charity ſchools, benefit ſocieties, and other eſtabliſhments. In a former part of this work, under the word HOSPITAL, will be found accounts of ſeveral, to which we ſhall add a few particulars. In the metropolis are 22 hoſpitals for ſick, lame, and for pregnant women; 107 alms-houſes for the maintenance of aged perſons of both ſexes; 18 inſtitutions for the ſupport of the indigent of various other deſcriptions; above 20 diſpenſaries for the gratuitous ſupply of medicine and medical aid to the poor; 45 free-ſchools with perpetual endowments, for educating and maintaining 3500 children; 17 other public ſchools for deſerted and poor children; 237 pariſh ſchools, ſupported by voluntary contribution, in which about 9000 boys and girls are conſtantly clothed and educated: each pariſh has alſo a workhouſe for the maintenance of its own helpleſs poor. Excluſive of this ample liſt, the ſeveral livery companies of the city of London diſtribute above 75,000*l.* annually in charities; and there is a multitude of inſtitutions, of a leſs prominent nature than the foregoing, which make the total of charitable donations immenſe. The ſums annually expended in the metropolis for charitable purpoſes, independently of the private relief given to individuals, have been eſtimated at 850,000*l.* The hoſpitals were chiefly founded by private munificence: ſome are endowed with perpetual revenues, and others ſupported by annual or occaſional voluntary ſubſcriptions. The alms-houſes were built and endowed either by private perſons or corporate bodies of tradeſmen. Many of the free-ſchools owe their origin to the ſame ſources. The magnitude of the buildings dedicated to public charities, and the large revenues attached to them, are highly deſerving of commendation; and the general adminiſtration of theſe eſtabliſhments confers a peculiar honour on the capital. The interior regulations of the hoſpitals well accord with the exterior magnitude: the medical aſſiſtance is the beſt the profeſſion can ſupply; the attendance is ample; the rooms are generally very clean and wholeſome; and the food is proper for the condition of the patients. The alms-houſes, and other inſtitutions for the ſupport of the aged and indigent, exhibit not merely an appearance, but a real poſſeſſion of competence and eaſe. From ſome of the free-ſchools, pupils have been ſent to the univerſities as learned as from any of the moſt expenſive ſeminaries: and all the ſcholars receive an education completely adapted to the ſtations for which they are deſigned. Among the free-ſchools may be particularly noted thoſe of Weſtminſter, Blue-coat or Chriſt's-hoſpital, St. Paul's, Merchant-taylors', Charter-houſe, and St. Martin's. For a very ample hiſtory and deſcription of all the charitable inſtitutions of London, the reader is referred to a volume publiſhed in 1810, entitled, "Pietas Londinienſis; the Hiſtory, Origin, and preſent State of the various public Charities in and near London," by A. Highmore, 12mo.

Inſtitutions.—For the accommodation and convenience of the immenſe population of the metropolis, the following inſtitutions have been formed for education, for promoting good morals, for advancing the uſeful and fine arts, and for charitable and humane purpoſes. For education (beſides the various ſchools already mentioned) there are 16 inns of court and chancery for ſtudents in the law, &c. (ſee COURT, *Inns of*,) and five colleges, *viz.* Sion-college, at London-wall, for the improvement of the clergy; Greſham-college, for divinity, aſtronomy, and other ſciences; the college of phyſicians, Warwick-lane, for profeſſors in medicine; one for the ſtudy of civil law, Doctor's Commons; and the Herald's-college. (See COLLEGE.) The number of private ſchools, for all the various branches of male and female education, is eſtimated at 3730; including ſome for children who are deaf and dumb.

For promoting religion and good morals London contains the following ſocieties: 1. For giving effect to the king's proclamation againſt vice and immorality, eſtabliſhed in the year 1787, and for the ſuppreſſion of vice in 1803: 2. For promoting Chriſtian knowledge, founded in 1699: 3. For the propagation of the goſpel in foreign parts, incorporated in 1701: 4. For promoting religious knowledge, by diſtributing books to the poor, inſtituted in 1750: 5. For promoting charity ſchools in Ireland: 6. For religious inſtruction to the negroes in the Weſt Indies, incorporated in 1795; and African education ſociety, inſtituted in 1800: 7. For preventing crimes, by proſecuting ſwindlers and cheats, 1767: 8. For the encouragement of ſervants, 1792: 9. For the relief of poor pious clergymen, 1788: 10. For giving bibles to ſoldiers and ſailors, 1780: 11. For giving bibles, and otherwiſe furthering the purpoſes of Sunday ſchools, 1785: Britiſh and foreign bible ſociety, 1804. To theſe may be added, Dr. Bray's charity for providing parochial libraries; and queen Anne's bounty for the augmentation of ſmall livings of clergymen.

For the promotion of learning, and advancement of the uſeful and fine arts, are the following inſtitutions: 1. The Royal ſociety, incorporated for promoting uſeful knowledge, was inſtituted 1663: 2. Antiquarian ſociety, Somerſet-place, 1751: 3. Society, or truſtees of the Britiſh Muſeum, 1753: 4. Royal Academy of Arts, Somerſet-place, 1768: 5. Society for encouragement of learning, Crane-court, Fleet-ſtreet: 6. Society for encouragement of arts, manufactures, and commerce, in the Adelphi-buildings: 7. Medical ſociety of London, Bolt-court, Fleet-ſtreet, 1773: 8. Society for the improvement of naval architecture: 9. Veterinary college, St. Pancras: 10. Royal inſtitution for applying the arts to the common purpoſes of life, 1799: 11. The London inſtitution, in the city, 1805: 12. The Surrey inſtitution near Blackfriar's-bridge, 1808: 13. The Ruſſel inſtitution, Coram-ſtreet, Ruſſel-ſquare, 1808: 14. The Literary fund, eſtabliſhed in 1790, &c.

Among the inſtitutions for charitable and humane purpoſes, the following may be enumerated: 1. The humane ſociety for the recovery of drowned and ſuffocated perſons: 2. Society for the relief of merchants' ſeamen: 3. Several ſocieties for ſupport of widows in general: and others reſpectively for the widows and orphans of clergymen, medical men, officers, artiſts, and muſicians; and for decayed muſicians, artiſts, authors, actors, and ſchoolmaſters: 4. Society for relief of perſons confined for ſmall debts: 5. Society for ameliorating the condition of the poor. With theſe benevolent eſtabliſhments may be claſſed the friendly or benefit ſocieties, of which there are in the metropolis and its vicinity about 1600, conſiſting, in general, of from fifty to one hundred members each. The members conſiſt of mechanic and labouring people, who, by ſmall monthly contributions, raiſe a fund for their ſupport in ſickneſs, and for their funerals, &c. An act of parliament was paſſed 33 Geo. III. for the ſpecial "Encouragement and Relief" of theſe ſocieties.

Places of Public Amuſement.—Conſidering the vaſt extent, population, and wealth of London, it certainly contains fewer places of public amuſement than any metropolis in Europe. Whether this be the reſult of accidental cauſes, or is to be referred to the genius and habits of the people, may, perhaps, be a matter of ſome doubt. But whatever deficiency exiſts with reſpect to number, it yields to no city in the world in the ſplendour and excellence of thoſe it poſſeſſes. Our dramatic authors are not leſs conſpicuous for the brilliancy of their compoſitions, than our actors are for the judgment and effect which they diſplay in their repreſentation. Mrs. Siddons is, perhaps, the moſt effective and powerful actreſs of the preſent, or of any former age; while her brother, Mr. John Kemble, muſt be allowed to poſſeſs talents of the firſt-rate deſcription. In the walk of tragedy many other players have evinced very conſiderable abilities: among the deceaſed may be named Garrick, Barry, Betterton, Henderſon, Booth, Quin, Ryan, and J. Palmer: and thoſe of the preſent age, moſt entitled to hiſtoric record, are Cooke, Young, and C. Kemble. It may be ſafely aſſerted that the comedians of the London theatres have advanced the mimetic art nearly to the height of perfection. The names of the late Meſſrs. Lewis, King, Parſons, Woodward, Shuter, and Edwin are juſtly honoured in the annals of the drama; and thoſe of the following actors are entitled to the unqualified commendation of the theatrical critic: Dowton, Munden, Banniſter, Fawcett, Emery, Knight, Matthews, Johnſon, Lovegrove, Liſton, Simmons, and Blanchard. Many actreſſes of the preſent age poſſeſs very conſiderable dramatic powers; particularly meſſdames Jordan, Edwin, Duncan, C. Kemble, Gibbs, S. Booth, Davenport, Liſton, and Storace. The Engliſh ſtage has many other performers of merit; but their talents are of a more limited nature than the preceding. In the operatic department, or ſinging, it has long been the faſhion to introduce Italian, or foreign ſingers to the London boards; although many of our native performers unite to ſine and powerful voices much ſcience. Mrs. Billington, Mr. Braham, Madame Storace, Mrs. Mountain, Miſs Bolton, Mrs. Martyr, Mrs. Bland, Mrs. Dickons, Miſs Kelly, Mr. Incledon, Mr. Phillips, and Mr. Bellamy, are juſtly admired, and have acquired much profeſſional fame. In action or pantomimic repreſentations, many eminent performers are to be found on the London boards. Beſides theſe there are many others very little inferior. Indeed it may be juſtly obſerved, that the companies at the principal theatres conſiſt in general of highly reſpectable performers. The muſical votary never had the means of gratifying his taſte with a higher reliſh than at the preſent period. New compoſitions of conſiderable merit daily iſſue from the preſs. The liſt of our vocal performers compriſes the names of ſome of the firſt ſingers in Europe. Our inſtrumental performers are no leſs celebrated; and our bands in general exhibit ſpecimens of the higheſt taſte and manual ſkill.

Appropriated chiefly to dramatic performances are the theatres of Drury-lane, Covent-garden, the Lyceum, and the Haymarket. Of theſe, the two firſt are upon a ſtyle of magnificence and grandeur, ſcarcely to be ſurpaſſed by any theatre in Europe. The laſt is on a ſmall ſcale, and opens in ſummer, when the others cloſe. The King's theatre, or Opera-houſe, ſituated in the Haymarket, was originally intended ſolely for the repreſentation of Italian operas. Of late years, however, dancing has conſtituted a prominent part of its amuſements, to the great injury of the operas, which are generally curtailed of an act to allow time for the ballets. The decorations of this theatre are ſplendid, and its band is conſidered as inferior only to that of the Opera-houſe at Paris. The concert of ancient muſic, generally called the King's concert, is held in the great room Hanover-ſquare, every week from the beginning of February to the end of May. It owes its origin to a ſeceſſion from the Academy of Muſic, another celebrated muſical inſtitution. The following is a liſt of the theatres, and other places of public amuſement, now occupied in London, and open to the public; a more particular deſcription of ſome of theſe will be given in ſubſequent parts of this work, under the heads THEATRE and WESTMINSTER.

Covent-garden Theatre is the moſt eminent for ſize and dramatic exhibitions. The preſent building was erected in the year 1809, from deſigns by Mr. Smirke, jun. architect. It occupies the ſcite of a former theatre, with connecting houſes, which were conſumed by fire in September 1808; and it is worthy of remark, that the whole of the preſent edifice was raiſed and finiſhed within one year. It is on a large ſcale, and the whole ſtage management is veſted in Mr. John Kemble, who has certainly made many improvements, and intereſting reformations in the internal economy, ſcience, and coſtumic repreſentation of dramas.

Drury-lane Theatre is now in the progreſs of building from deſigns by Mr. B. Wyatt, architect; whoſe model evinces much ſkill and judgment. Though not on ſo large a ſcale as the theatre of Covent-garden, it combines many conveniences and advantages not to be found in that building; and for ſeeing and hearing it promiſes to be very ſatisfactory to the audience. Mr. Whitbread has taken a very active part in cauſing this theatre to be rebuilt. A former theatre, built by Mr. Holland, was burnt in 1809.

Theatre Royal Haymarket is a ſmall, inconvenient houſe, and is allowed to be opened to the public from the 15th of May to the 15th of September.

The Lyceum Theatre, called the *Engliſh Opera-houſe*, is at preſent occupied by the Drury-lane company of performers, under the management of Mr. Arnold and Mr. Raymond. Operas and comedies are chiefly repreſented here; and ſome of theſe are acted in the beſt ſtyle. Many new dramas have been produced at this houſe.

The Opera-houſe, in the Haymarket, is appropriated to Italian operas, ſpectacles, and dances. The management of this houſe has occaſioned ſeveral legal litigations, and is ſtill involved in diſpute. Its principle is uncongenial to the Engliſh character, and it would be a memorable and laudable act to aboliſh it. Another ſimilar eſtabliſhment, ariſing out of the cabals of the former, and originating with ſome ſpeculating adventurers, has lately been opened at

The Pantheon in Oxford-road; but after a few nights repreſentation, and after debts of ſome thouſands of pounds had been contracted in fitting up, and adapting the houſe to the purpoſe, the theatre is again cloſed.

Sadlers Wells is a theatre appropriated to pantomimes, burlettas, ſpectacles, dancing, &c. and commences its ſeaſon on Eaſter Monday. The ſtage performances are invented and written by Mr. C. Dibdin, jun., who has diſplayed a peculiar and original talent in this ſpecies of compoſition. The muſical department is conducted by Mr. Reeve, and the ſcenery painted by Mr. Andrews. A novelty has been introduced at this theatre, *i. e.* of filling the whole ſpace beneath the ſtage with water, by which means ſome ſplendid and curious aquatic exhibitions have been diſplayed. It partly reſembles the naumachiæ of the Romans.

Aſtley's Amphitheatre, near Weſtminſter-bridge, is alſo a ſummer theatre, where pantomimes, burlettas, and various fetes of horſemanſhip are diſplayed. This houſe alſo commences its ſeaſon on Eaſter Monday, and generally cloſes in October, when the company remove to another theatre, called

Aſtley's Olympic Pavilion, in Newcaſtle-ſtreet, where the ſame ſpecies of entertainments are exhibited.

The Surrey Theatre, in St. George's-fields, is devoted to a ſimilar claſs of dramatic repreſentations; but ſince Mr. Elliſton has been proprietor and manager of this houſe, he has adopted a novelty, in abridging and verſifying many celebrated dramas, and playing the ſame with the accompaniment of muſic.

Another theatre in Wellcloſe-ſquare, called the *Royalty Theatre*, is occaſionally opened; and others are ſituated in Tottenham-ſtreet, in the Strand, and in Bridges-ſtreet, Covent-garden.

Vauxhall Gardens are opened twice a week in the ſummer months, when they are ornamented with an immenſe number of lamps, and a large concourſe of viſitors are entertained by vocal and inſtrumental muſic. Beſides the foregoing, London abounds with many other places of amuſement; ſuch as tea-gardens, exhibitions for ingenious inventions, and diſplay of works of fancy, &c.

Among the places of public amuſement or exhibitions, may be ſpecified—

The London Muſeum, in Piccadilly, the property of Mr. W. Bullock, who has devoted many years, much exertion, and a great expence, in collecting and arranging the moſt comprehenſive and intereſting aſſemblage of natural and artificial curioſities that was ever before amaſſed in England, or perhaps in Europe. His muſeum was originally commenced at Liverpool; but it has been progreſſively enlarged and improved. Its preſerved ſpecimens in natural hiſtory are ſelect, in the higheſt preſervation, and arranged according to the Linnæan ſyſtem. They conſiſt of about 15,000 quadrupeds, birds, reptiles, fiſhes, inſects, corals, &c. One department of the muſeum is peculiarly curious and intereſting. It is called the Pantherion, in which moſt of the known animals, in a preſerved ſtate, and in natural attitudes, are exhibited as ranging in their native, or appropriate haunts; and exact models of exotic plants, rocks, and trees, are diſperſed over the apartment: the whole interior of the ſame is painted in a panoramic manner, repreſentative of oriental ſcenery. For a particular account of this truly intereſting collection, the reader is referred to a printed "Companion to the Muſeum and Pantherion," 12mo. 2*s.* 6*d.* or to a larger work, with etchings, by Howitt, price 14*s.* A new building, in the Egyptian ſtyle, has been erected for this muſeum from deſigns by Mr. Robinſon, architect.

Polito's Muſeum, at Exeter Change in the Strand, contains a choice collection of living beaſts and birds; and to the ſtudents and lovers of natural hiſtory is very intereſting. Here are lions, leopards, tygers, oſtriches, baboons, and monkies of different kinds, kangaroos, beavers, and various other foreign animals and birds. Other muſeums and exhibitions of natural and artificial curioſities are—

Dubourgh's, in Groſvenor-ſtreet, for cork models of ſeveral temples, and ancient buildings in Rome:—*Maillardet's* automatical exhibitions in Spring-gardens, for ſome ſingular works of mechaniſm:—*Week's Muſeum*, Haymarket, is alſo for mechanical works. At *Barker's Panorama*, in Leiceſter-ſquare, are exhibited circular views, on a large ſcale, of ſeveral foreign and Engliſh cities, towns, and other particular ſcenes. Mr. Barker has evinced very conſiderable taſte and talents in this branch of art, and to him the public are indebted for the firſt invention of panoramic views. Since he commenced, ſeveral other artiſts have exhibited ſimilar pictures: Mr. Girtin, a view of London; Mr. Porter, ſeveral paintings of battles, and a *New Panorama* is now opened by Reinagle and Barker, in the Strand. See PANORAMA.

The *Fine Arts*, and *Exhibitions of Works of Art*, in London, are entitled to diſtinct and particular notice; for their preſent ſtate is calculated to ſhew the extraordinary progreſs they have made during the laſt century, and to diſplay the highly cultivated condition of the preſent age. London is the focus of the fine arts of England, and fountain-head of excellence. Here all the eminent artiſts of the country either originate, are educated, or terminate their career; becauſe all the great maſters reſide here; the beſt inſtruction is to be obtained; the moſt celebrated productions to be ſeen and ſtudied; and annual exhibitions diſplayed to the public. In the rooms of the Royal Academy at Somerſet-houſe, in thoſe of the Britiſh Inſtitution, Pall-Mall, at Spring-gardens, and in Bond-ſtreet, are annual exhibitions of paintings, drawings, ſculptural and architectural deſigns; and a careful examination of the works here exhibited will furniſh a foreigner with ample means to appreciate the individual and aggregate merits of Engliſh artiſts. Beſides theſe public exhibitions, it will be expedient to viſit the galleries of Mr. Weſt, Mr. Turner, Mr. Wilkie, Mr. Lawrence, and ſome other painters; for in theſe will be found ſeveral of the moſt meritorious works of the age. The beſt productions of our modern ſculptors will be found in the church of St. Paul's and in Weſtminſter Abbey; whilſt the true talents of the architects can only be appreciated by a perſonal examination of the buildings they have erected. The public inſtitutions devoted to the fine arts are the following:

At the *Royal Academy*, in Somerſet-houſe, is an annual exhibition, for the period of about ſix weeks, of paintings, drawings, ſketches, models, and proof-prints. This academy was eſtabliſhed by charter in the year 1768, and ſir Joſhua Reynolds appointed its firſt preſident. To this great artiſt's talents as a painter, conduct as a man, and writings on art, the Royal Academy is eſſentially indebted for its proſperity and reputation. His faſcinating productions, engaging manners, and luminous diſcourſes on painting, attracted the attention and patronage of many perſons of diſtinction, and at the ſame time rouſed the emulation and active zeal of the junior artiſts. Since ſir Joſhua's time, Mr. Weſt has occupied the preſidential chair, with little interruption, and has honoured the academic exhibitions with a continued ſucceſſion of new pictures in the higheſt branch of art. A ſeries of lectures has been annually given at the academy by different profeſſors; all calculated to advance art, and inculcate proper principles of taſte and criticiſm. Some of the preſent lecturers are deſervedly famed for profeſſional ſcience, as well as for general knowledge. In the years 1811 and 1812, the following profeſſors delivered lectures on their reſpective provinces of art: Henry Fuſeli, on painting; John Soane, on architecture; Anthony Carliſle, on anatomy (it is neceſſary to ſtate that this gentleman is not a member of the academy); J. M. W. Turner, on perſpective; and John Flaxman, on ſculpture. The Royal Academy conſiſts of forty members, called Royal Academicians, twenty aſſociates, and ſix aſſociate engravers. Further particulars of this inſtitution will be given under ROYAL *Academy*.

The *Britiſh Inſtitution*, in Pall-Mall, was eſtabliſhed by the liberal contributions of ſeveral noblemen and gentlemen in the year 1805, for the expreſs encouragement of Britiſh artiſts: and it muſt afford much gratification to the founders to contemplate its great utility and ſucceſsful effects. This inſtitution is devoted to the exhibition and ſale of pictures; and to the uſe of young ſtudents for copying from and ſtudying old paintings. Another plan has been recently adopted, which is calculated to enhance its utility and reputation. This is the purchaſe of pre-eminent pictures, which are to be preſerved as the property of the inſtitution, and from which engravings are to be made on a large ſcale. The firſt of this ſeries is a large painting by Mr. Weſt, of "Chriſt healing the Sick in the Temple!" and Charles Heath is engraving a plate from it.

The Society of Painters in Water-Colours was eſtabliſhed in November 1804, ſince which time they have annually exhibited a large and intereſting collection of drawings. This branch of art may be ſaid to have attained nearly the higheſt excellence; and many of its profeſſors have manifeſted diſtinguiſhed talents. In colouring, effect, and appropriate character, ſeveral young artiſts of the preſent age have ſurpaſſed any of the old maſters in this branch of art. Another ſociety of artiſts have made an annual exhibition of drawings in Bond-ſtreet. The collections of pictures in private houſes in London are numerous, and many of them very valuable. The moſt celebrated of theſe are the marquis of Stafford's, at Cleveland Houſe; (for an account of theſe pictures, ſee Britton's "Catalogue Raiſonné," and Treſham's "Gallery of Pictures;") the collection at Buckingham-houſe; the earl of Groſvenor's, in Groſvenor-ſtreet; Mr. Thomas Hope's, in Ducheſs-ſtreet; Mr. H. W. Hope's, in Cavendiſh-ſquare; Mr. Anderdon's, Spring-Gardens; Mr. Weſt's, in Newman-ſtreet; earl of Suffolk's, in Harley-ſtreet; the duke of Devonſhire's, in Devonſhire-houſe; Mr. Angerſtein's, Pall-Mall; ſir Abraham Hume; ſir George Yonge, in Stratford-place; lord Northwick's, in Hanover-ſquare; Mr. Weddel's, in Upper Brooke-ſtreet; lord Aſhburnham's, in Dover-ſtreet; baroneſs Lucas, in St. James's-ſquare; ſir George Beaumont, in Groſvenor-ſquare; Mr. William Smith, in Park-ſtreet; Mr. Knight, of Portland-place; Mr. Jeremiah Harman, of Finſbury-ſquare; Mr. R. P.

Knight, of Soho-ſquare; lord Radſtock, in Portland-place. Beſides theſe, there are many other collections of fine pictures in various parts of the metropolis. For much uſeful information reſpecting the fine arts in London, &c. ſee Hoare's "Inquiry into the preſent State of the Arts of Deſign in England," 8vo. 1806; alſo two other volumes in 4to. edited by the ſame intelligent and liberal writer, entitled "The Artiſt, in a Series of Eſſays;" alſo, "The fine Arts of the Engliſh School," 4to. 1812; Britton's Preface to an Account of the Corſham-Houſe Collection; and Edwards's Anecdotes of Painters in England, 4to. 1808.

Courts.—For an account of the various courts of London, the reader is referred to a former volume, under the head COURT *of Common Pleas, of Chancery, of Exchequer, of Huſtings, of King's Bench, of Marſhalſea, Mayor's, of Parliament,* (ſee PARLIAMENT,) *of the Houſe of Peers, of Star Chamber;* alſo, INNS *of Court.*

Literature and literary Publications.—To give a view of the literature of this metropolis, and to point out its preſent ſtate, compared with that of any former period, would be to develope one of the moſt intereſting traits, not only of London, but of the preſent age. The number and variety of works which annually iſſue from the metropolitan preſs are truly aſtoniſhing; while in point of ability and uſefulneſs they were probably never exceeded. There is not indeed a department, either in ſcience or general literature, which has not made conſiderable progreſs within theſe few years. The publiſhing and bookſelling buſineſſes are at preſent conducted upon very large ſcales; and, in ſpite of a long and devaſtating war, a ſucceſſion of new and intereſting volumes is continually iſſuing from the preſs. It is conjectured that nearly 800 new books and pamphlets have been annually publiſhed in London, during the laſt ten years: the groſs annual returns ariſing from the printing and ſelling of which cannot be much ſhort of one million ſterling. It is alſo eſtimated that 2000 perſons at leaſt are directly and collaterally employed in the various branches of the book buſineſs. The character and extent of periodical literature form a prominent feature of the preſent age: for the number of reviews, magazines, newſpapers, and other periodical journals, far exceed thoſe of any former period. Hence much political and general knowledge has been diſſeminated through the country; a ſpirit of inquiry and inveſtigation has been excited; and a literary turn has been given to the higher and middle claſſes of ſociety. Even the lower claſſes of mechanics and ſervants are now much accuſtomed to reading: one of the conſequences ariſing from which is that we frequently hear of men of genius and talents ſtarting up from humble ſtations, and diſplaying to the aſtoniſhed world much originality of thinking. Many inſtances of this might be adduced; but it will be ſufficient to name two or three, to prove the aſſertion: Burns, Dermody, and Bloomfield, the poets; and Drewe, the metaphyſician of Cornwall. Nothing can more plainly ſhew the reading character of the preſent times, than a knowledge of the number of newſpapers printed and circulated; and which number is thus ſtated in "The Picture of London for 1812:" "Of the morning papers, there are ſold about 17,000 of theſe publications; of the daily evening papers, about 12,000; and of thoſe publiſhed every other day, about 10,000. There are alſo about 26,000 ſold of the various Sunday papers; and about 20,000 of the other weekly papers: in all, the enormous number of 232,000 copies *per* week; yielding to their proprietors from the ſale 5800*l.*, and from advertiſements 2000*l.* more; of which the revenue to government is full 4000*l.* and the net proceeds to the proprietors about 1000*l.*; the remaining 2800*l.* affords employment and ſubſiſtence to about 50 writers and reporters, 300 printers, 100 vendors, and 100 clerks and aſſiſtants; beſides paper-makers, ſtationers, type-founders, &c. full 200 more. If to theſe be added the weekly calculation of 250,000 copies of provincial papers, yielding 10,000*l.* *per* week, and ſupporting the induſtry of 1500 perſons;—what a wonderful idea is afforded of the agency and influence of the preſs in this empire; and how eaſily is it accounted for, that we are the moſt free and moſt intelligent people on the face of the earth." Under the words MAGAZINE, NEWSPAPER, and REVIEW, we ſhall have opportunities of detailing many facts and peculiarities reſpecting theſe different publications. See alſo JOURNAL, *Literary*. London abounds with bookſellers' ſhops and circulating libraries. It is aſſerted that the firſt circulating library eſtabliſhed in this town was by a Mr. Baths, about the year 1740; but Alan Ramſay had founded one at Edinburgh as early as the year 1725. In London there are publiſhed ſeventeen newſpapers daily, and eighteen or nineteen every Sunday, beſides eighteen once or twice a week. The number of monthly magazines and reviews amounts to fifty; in addition to which, there are ſeveral works publiſhed quarterly, or at irregular periods.

Societies for the Encouragement of the Arts, Sciences, &c.—London poſſeſſes a variety of inſtitutions formed with a view to the advancement of the different branches of art and ſcience; among theſe the Royal Society undoubtedly takes the lead, being compoſed of the moſt diſtinguiſhed literary and ſcientific characters of the preſent age. It was firſt inſtituted at the cloſe of Cromwell's rebellion, at which time its meetings were held at Oxford. In 1659 they were adjourned to Greſham college, London; but of late years have been held at an apartment in Somerſet houſe. This ſociety was incorporated in 1663, when the celebrated ſir Iſaac Newton was preſident, and has, through the medium of its Tranſactions, and by its patronage, probably contributed, more than any ſimilar body in the world, to promote uſeful and practical knowledge. (See ROYAL *Society*.) The ſociety of Antiquaries, which holds its meetings in the ſame place with the Royal Society, was incorporated by Geo. II. in the year 1751. The object of this ſociety is to encourage reſearch in the elucidation, not only of our national antiquities, but of the antiquities of other countries. It has publiſhed ſixteen volumes, called the Archæologia, containing many curious and intereſting eſſays and prints, alſo a large work illuſtrative of our eccleſiaſtical architecture. (See SOCIETY *of Antiquaries*, and ANTIQUARY.) The ſociety for the encouragement of arts, manufactures, and commerce, inſtituted in 1753, and holding its meetings in the Adelphi, propoſes the attainment of its object by giving premiums for all inventions and diſcoveries which may prove, and are calculated to be, beneficial to the arts, commerce, or manufactures of the kingdom, the Britiſh colonies, or the Eaſt India ſettlements. A volume of the Society's tranſactions is publiſhed occaſionally. The walls of the great room, in which its meetings take place, are adorned with a variety of paintings from the pencil of Mr. Barry, the ſtyle and execution of which have inſured him deſerved immortality, and are really an honour to the country. The Linnæan ſociety was founded in 1788, and incorporated in 1802. (See *Linnæan* SOCIETY.) The Royal Inſtitution, ſituated in Albemarle ſtreet, owes its foundation chiefly to the ſchemes and exertions of count Rumford. Its charter of incorporation is dated in 1800. The original object of this inſtitution was to facilitate the introduction of uſeful diſcoveries and improvements in practical mechanics, and to point out, by philoſophical lectures and experiments, the application of ſcience to the common purpoſes of life. The inveſtigations and important diſcoveries of Dr. Davy, the lecturer on chemiſtry, have conferred no ſmall degree of celebrity on this eſtabliſhment, while they will not improbably be the means of effecting a complete change in our views of chemical analyſis. (See ROYAL *Inſtitution.*) The London Inſtitution, as well as the Surrey Inſtitution, embrace ſimilar objects to the one preceding. The former was founded in 1805, and the latter in 1808. Both have extenſive libraries and reading rooms, furniſhed with many of the foreign and domeſtic journals and other periodical works, together with the beſt pamphlets and new publications. The views of the Ruſſel Inſtitution are the formation of an extenſive library, conſiſting of the moſt valuable books in ancient and modern literature, to be circulated among the proprietors, the delivery of lectures on literary and ſcientific ſubjects, and the eſtabliſhment of a reading room. In Greſham college, founded by ſir Thomas Greſham, lectures are delivered gratis twice a day during the terms, on divinity, law, phyſic, aſtronomy, geometry, muſic, and rhetoric. As it happens in all inſtitutions on a ſimilar plan, the lecturers, having no ſtimulus to exertion, conſider their duty as a mere matter of routine, and are conſequently ill attended. Some idea is entertained of transferring them and the funds to the London Inſtitution, where it is hoped they may be more efficient, and anſwer better the deſign of the benevolent founder. The Britiſh Mineralogical Society was eſtabliſhed in 1799, for the expreſs purpoſe of examining gratuitouſly the compoſition of all ſpecimens of minerals and ſoils, ſent for that purpoſe by the owners of mines, agriculturaliſts, or others intereſted in the enquiry. The ſcience of entomology will probably be much forwarded by the inſtitution of the Entomological Society, which took place in 1806, and which chiefly directs its attention to the inveſtigation of the properties of ſuch inſects as are natives of the united kingdoms. The London Architectural Society has publiſhed a volume of Eſſays, 8vo. 1808: alſo an Eſſay on the Doric order. The Horticultural ſociety was founded in 1804. A Geological Society is eſtabliſhed by ſome ſcientific gentlemen in Lincoln's-inn-Fields; they have recently publiſhed an intereſting volume of their tranſactions. Before we quit theſe inſtitutions it may be proper to remark, that the number and variety of lectures that have been read in them muſt have proved beneficial to ſcience; by exciting inquiry, and inveſtigating facts by experiment. Till theſe inſtitutions were eſtabliſhed, there were but few public lectures given in London; ſuch, however, have been the influence and effect of them, that during the winter of 1811-12, it may be aſſerted that no leſs than fourteen courſes have been given at the Royal, Ruſſel, and Surrey Inſtitutions. We ſubjoin the names of the principal profeſſors: Dr. Davy, Dr. Roget, Dr. Crotch, J. M. Good, eſq., Geo. John Singer, eſq., Dr. Shaw, F. Accum, eſq., Sam. Weſtley, eſq., Mr. Hardie, Robert Bakewell, eſq., Dr. Brande, James Quin, eſq., John Pond, eſq., and Wm. Haſlitt, eſq.

The Britiſh Muſeum, ſituated in Great Ruſſel-ſtreet, is a grand national depoſitory of antiquities, MSS. and books, with various natural and artificial curioſities. It was eſtabliſhed by act of parliament in 1753, in conſequence of ſir Hans Sloane having left, by will, his muſeum to the nation, on condition that parliament paid 20 000*l.* to his executors, and purchaſed a houſe ſufficiently commodious for its reception. Since that period many valuable collections of manuſcripts, books, &c. have, at different times, been added to the Sloanean, beſides innumerable preſents from our own monarchs, foreign princes, the boards of Admiralty and Longitude, the Eaſt India Company, the various literary ſocieties of London, Edinburgh, Oxford, Cambridge, and Leyden, the Royal and Imperial academies of Bruſſels, Liſbon, &c. and a long liſt of private individuals, too numerous to be particularized. The vaſt variety of articles which this muſeum contains, its extent and value, entitle it to be conſidered equal to any in the world. Under the word MUSEUM will be given further particulars of this national repoſitory; in the mean time the reader is referred to a "Synopſis of the Contents of the Britiſh Muſeum," 8vo. 1808; and to a quarto work of "Engravings from the Gallery of Antiquities in the Britiſh Muſeum," by Mr. Taylor, Combe, and Mr. Alexander. This very handſome and intereſting work is now in the progreſs of publication, and is very creditable to the truſtees who have commenced it, and to the draftſman and author by whom it is chiefly executed.

Public Vices and Priſons.—The general tendency of the preceding ſtatements only ſhew the beſt and moſt intereſting features of the metropolis. It is our duty alſo to depict its vices; and to ſhew the numerous places that are ſet apart for the puniſhment of crimes. In Colquhoun's work on "the police of the metropolis," is ſuch a deplorable diſplay of profligacy and criminality, that an inexperienced reader, who knew London only through the medium of this publication, would conclude that its inhabitants were moſtly compoſed of vagabonds, ſharpers, pickpockets, and proſtitutes. It ſhould be remembered, however, that the work is chiefly devoted to this ſubject; and that, amidſt ſo vaſt a population, and where there are ſo many opportunities for rogues to practiſe their depredations, and ſcreen themſelves from detection, it is not ſurpriſing that ſo many are collected together, and that out of a great number ſo few are brought to condign puniſhment. To this great hive of human ſociety, the moſt vicious, and alſo the moſt learned reſort, as the beſt place for action and exertion. The worthy magiſtrate already named, has enumerated and deſcribed eighteen different claſſes of cheats and ſwindlers who infeſt the metropolis, and prey upon the honeſt and unwary: beſides perſons who live by gambling, coining, houſebreaking, robbery, and thoſe who plunder on the river. He deduces the origin of moſt of the crimes from alehouſes, bad education of apprentices, ſervants out of place, Jews, receivers of ſtolen goods, pawnbrokers, low gaming-houſes, ſmuggling, aſſociations in priſons, and prevalence of proſtitution. No leſs than 50,000 proſtitutes are ſuppoſed to live in the metropolis. An amazing number, and a diſtreſſing circumſtance to contemplate: for it is preſumed that eight-tenths of theſe die prematurely of diſeaſe and in wretchedneſs, having previouſly corrupted and contaminated twice their own number of young girls and young men. The following is a liſt of the public priſons.

1. Newgate, being the city and county goal for debtors, felons, libellers, and other offenders againſt government. See NEWGATE.

2. Giltſpur-ſtreet Compter was erected in 1791, for debtors, felons, and perſons committed for miſdemeanors. It is ſituated near Newgate, and is a large, commodious building.

3. Ludgate, adjoining to the laſt mentioned, is appropriated only to debtors who are freemen of the city of London, clergymen, proctors, or attornies.

4. The Poultry Compter is chiefly for debtors. It is ſituated near the Manſion-houſe, and has one ward ſet apart for Jews: the only priſon in England that has ſuch a proviſion.

5. The Fleet Priſon is for debtors, and for ſuch perſons as are committed for contempt of the courts of chancery.

6. The Savoy Priſon, in the Strand, is excluſively devoted to deſerters and military delinquents.

7. The New Priſon, Clerkenwell, is the goal for the county of Middleſex, for felons, and perſons fined.

8. The Priſon for the Liberty of the Tower of London, is at Bethnal-green, and is uſed only for ſoldiers belonging to the Tower.

9. Whitechapel Priſon for debtors in the 5*l.* court.

The houſes of correction are

10. The City Bridewell, Bridge-ſtreet, Blackfriars.

11. Tothill-fields Bridewell.

12. Cold Bath Fields Penitentiary Houſe.

13. New Bridewell, in the borough of Southwark.

14. County goal for Surrey, in the borough of Southwark, for felons and debtors.

15. New goal, Southwark, or Borough Compter, for felons and debtors.

16. Clink goal, for the diſtrict of that name, in Southwark.

17. The Marſhalſea goal, Southwark, for pirates, and for perſons arreſted for ſmall debts in the Marſhalſea court.

18. King's-bench priſon, St. George's Fields, for debtors, and for perſons committed for contempt of the court of King's-bench, of which this is the peculiar priſon.

Public Buildings.—It will ſurpriſe a foreign architect to look through the wealthy city of London, and perceive ſo few public edifices that diſplay architectural beauty, or grandeur. Various circumſtances have conſpired to occaſion this; and not want of abilities in our artiſts: for many names can be mentioned, both of deceaſed and living architects, whoſe deſigns would honour and ornament any city. Thoſe whoſe works are moſt conſpicuous in London, are Inigo Jones, ſir Chriſtopher Wren, Gibbs, Hawkſmoor, Dance, Soane, Samuel Wyatt, Jupp, ſir Robert Taylor, Smirke, Milne, Holland, and Adams. The public edifices of London, are bridges, (for an account of which ſee BRIDGES,) churches, public offices, hoſpitals, and private manſions. Squares and regular ſtreets conſtitute a diſtinguiſhing feature of town architecture. Some of the public buildings are ſpacious, commodious, judiciouſly adapted to their reſpective purpoſes, and diſplay beautiful, fine, and even grand parts. The Engliſh architect is juſtly noted for the ſkill and judgment he often evinces in deſigning and adapting the interior of his buildings: and this is certainly the moſt eſſential part of the profeſſion. The principal public edifices within the precincts of the city, and in the eaſtern part of the town, are the Tower; the New Mint; the Trinity Houſe; the Bank; the Manſion Houſe; the Royal Exchange; the Eaſt India Houſe; the Auction Mart; the Commercial Mart; the Cuſtom Houſe; the Exciſe Office; Guildhall; the bridges of London and Blackfriars; the Poſt-office; Newgate; Giltſpur-ſtreet Compter; St. Luke's Hoſpital; the churches of St. Paul, Bow, St. Stephen's Walbrook, St. Bride's Fleet-ſtreet.

Tower of London.—This celebrated building ſtands on the north bank of the river Thames, at the eaſtern extremity, and juſt without the limits of the city. If credit is to be given to the ſtatement of Fitz-Stephen, it owes its original foundation to Julius Cæſar, but this aſſertion is ſupported by no evidence. The firſt authentic notice of it is, that William the Conqueror erected a fortreſs here immediately upon his obtaining poſſeſſion of London in the year 1066, with the view of intimidating the citizens from any oppoſition to his uſurpation This monarch ſeems, about twelve years afterwards, either to have much enlarged the previous edifice, or to have built another on its ſcite or near it. This building forms, what is now called, the White Tower, from its having been repaired and white-waſhed by Henry III. in the year 1240. It is a large ſquare ſtructure, ſituated near the centre of the preſent fortreſs, and ſurmounted by four watch towers, one of which is uſed as an obſervatory. It conſiſts of three lofty ſtories, in the firſt of which are two grand rooms, one of which is a ſmall armory for the naval ſervice. The other buildings and fortifications have been erected at different periods. The principal of the former are, the church dedicated to St. Peter *ad vincula*; the ordnance office; the mint; the record office; the jewel office; the horſe armory; the grand ſtore-houſe; the new or ſmall armory houſes belonging to the officers of the Tower, and barracks for the garriſon. The whole compriſes, within the walls, an extent of twelve acres and five roods. The exterior circumference of the ditch, which entirely ſurrounds it, meaſures 3156 feet. This ditch, on the ſide of Tower-hill, is broad and deep, but becomes much narrower on that neareſt the river, from which it is divided by a handſome wharf, having a platform upon it, mounted with ſixty-one pieces of cannon. Beſides theſe, there are a number of great guns, arranged as ſmall batteries, on different parts of the walls. The chief entrance is by a ſtone bridge thrown over the ditch on the weſt-ſide of the Tower. At the outer extremity of this bridge are two gates, and within the ditch another, all which are ſhut every night, and opened in the morning with particular formality. The wharf is connected with the Tower by a drawbridge, near which is a cut leading from the ditch to the river, ſecured by a gate called Traitor's Gate, from the circumſtance of ſtate priſoners having been formerly conveyed by this paſſage to Weſtminſter for trial.

This fortreſs was a palace, inhabited by various ſovereigns of England till the reign of queen Elizabeth. Since that period it has been chiefly uſed as a ſtate priſon, and as a place of ſecurity for arms and property belonging to the crown. In one of the rooms of the White tower, called Cæſar's chapel, a variety of ancient records of the court of chancery are depoſited. All the models of new invented engines of deſtruction, which have been preſented to government, are preſerved in another room adjoining. The old mint, and the houſes belonging to the officers employed in the coinage, occupied nearly a third of the whole fortreſs. A yard, to the right of the weſtern entrance, contains the royal menagerie. In the Spaniſh Armory are kept the trophies of the celebrated victory over the Spaniſh armada; the axe with which the unfortunate Anne Bullen was beheaded; and a repreſentation of queen Elizabeth, dreſſed in the armour ſhe wore when ſhe addreſſed her army at Tilbury, in the year 1588. The Small Armory, one of the fineſt rooms of its kind in Europe, contains complete ſtands of arms for upwards of 100,000 men, arranged in a moſt elegant manner, beſides other curioſities. Under this armory is another very noble room belonging to the royal train of artillery, where many beautiful and uncommon pieces of cannon may be ſeen. The Horſe Armory is filled with curioſities of different kinds. Among theſe are the figures of the kings of England on horſeback, chiefly dreſſed in the ancient armour. In the Jewel Office are preſerved the imperial regalia, and all the crown jewels worn by princes and princeſſes at coronations. Independently of ſeveral, which are ineſtimable, the value of the precious ſtones and plate in this office conſiderably exceeds two millions ſterling. Theſe, as well as the government of the whole Tower, are entruſted to the care of an officer, called the conſtable of the Tower, who has under him a lieutenant, deputy-lieutenant, tower-major, gentleman porter, and a number of inferior officers. The garriſon is compoſed of a detachment from the guards. The riſing ground adjacent to the

Tower is called Tower-hill. The right of the city to this ſpot was long diſputed by the crown, but in the reign of Edward III., ſome of the king's officers having erected a gallows here, the citizens remonſtrated, whereupon that monarch iſſued a proclamation, which he diſavowed in the act, and virtually acknowledged the city's juriſdiction, by delivering over the perſons about to be executed to the ſheriffs; and deſiring that they ſhould preſide at their execution. On the ſcite of the old victualling office, to the eaſt of the Tower, an extenſive building has been lately erected from deſigns by Mr. Smirke, jun. for the Mint. It is compoſed of a long front of ſtone, conſiſting of a ground-floor, with two ſtories above; the whole ſurmounted by a handſome baluſtrade. The wings are ornamented with pilaſters, and in the centre are ſeveral demi-columns, over which is a pediment, decorated with the arms of England. The porch is covered with a gallery, baluſtrades, &c. all of the Doric order. Adjoining are houſes for the principal officers.

Manſion-houſe.—This building, the reſidence of the lord mayor of London, is ſituated to the weſt of Lombard-ſtreet and Cornhill. It is of an oblong form, and conſtructed of Portland ſtone. From its maſſive ſtyle and vaſt extent, it is calculated to make a magnificent appearance, but the effect is deſtroyed by its confined ſituation. A wide and lofty portico, compoſed of ſix fluted pillars of the Corinthian order, with two pilaſters at each ſide of their pediment, of the ſame order, form the chief ornament of the front. Under this portico is a low baſement ſtory, in the centre of which is the gate-way leading to the kitchen and offices. A flight of ſteps aſcends to the principal entrance door-way beneath the portico. Theſe ſtairs are incloſed by a ſtone baluſtrade, continued along the whole length of the front. The pediment of the portico is adorned with a piece of ſculpture emblematical of the wealth and grandeur of the city. In the centre is a female figure repreſenting the city, having a wand in her right hand, and her left reſting on the city arms. On her head is a mural crown, and under her left foot a figure of Envy. Near her on the right is a cupid, with the cap of liberty affixed to a ſhort ſtaff, leaning on his ſhoulder, and beyond him reclines a ſea god, to repreſent the Thames, having at his ſide an anchor faſtened to a cable. To the left of London is Plenty, with a cornucopia, and behind her two naked boys, with bales of goods to denote Commerce. The weſt ſide of this edifice preſents a range of very noble windows, placed between coupled Corinthian pilaſters. Its interior exhibits a ſufficient degree of ſplendour, but is far from being comfortable, as many of the rooms are dark. Some of the apartments are very large, and fitted up in a ſumptuous ſtyle; particularly the Egyptian hall, the ball-room, &c.

Commercial Hall.—It has long been a complaint in the city that ſome reſpectable place of general accommodation was wanted for the diſpoſal of imported merchandize, but principally for that of colonial produce. Several attempts have been made to remedy this defect, but without ſucceſs. About a year ago, Meſſrs Smith, Marten, and St. Barbe called a meeting of merchants and brokers, in order to eſtabliſh an inſtitution for this purpoſe. A large ſubſcription was raiſed almoſt inſtantly, and as ſoon as a plot of ground, ſufficiently large, and in a ſuitable ſituation, could be procured, a number of plans were ſubmitted by different architects, from an examination and compariſon of which, a new deſign was formed and carried into execution under the direction of J. Woods, jun. whom the committee choſe for their architect. The original intention of the eſtabliſhment was principally for the accommodation of public ſales, but it has been extended to provide equal conveniences for ſale by private contract; and thus to form a complete market for ſugar, cotton, coffee, tobacco, indigo, and other imported goods.

The building is compoſed of two principal parts. The front conſiſts of an entirely new edifice, 64½ feet long, and 39 feet broad, with a ſtone front, ornamented with ſix columns of the Ionic order, adopted, with little variation, from the temple of Minerva Polias, at Priene. Theſe columns are ſupported on pedeſtals, which reſt on the cornice of an inferior order, compoſed not of columns but of piers, whoſe ſquareneſs and ſolidity form a contraſt with the lighter and more varied proportions of the columns above. This order of piers forms the ground ſtory of the building. The ſpaces between the pedeſtals are filled up with baluſters, and above the windows, which are large and ſuited to the ſcale of the building, are five bas-reliefs, executed in artificial ſtone by Bubb: the middle compartment repreſenting the city of London, the four others, Navigation, Commerce, Agriculture, and the Arts. The whole of the ground-floor of this edifice is occupied by a magnificent coffee-room, at one end of which, between two columns, appear the ſtairs leading to two public ſale-rooms, one of which is about 35 feet by 30, and again on the upper floor to three more ſale-rooms, each about 25 by 20 feet.

The ſecond building formerly conſiſted of three houſes, which are now thrown into one: the lower floors are divided into a number of counting-houſes, the upper into five ſhow-rooms, the largeſt of which, ſixty feet long, is appropriated for the exhibition of goods intended for ſale.

Particular attention has been paid to the lights in theſe rooms, and by a ſucceſſion of ſky-lights ſloping to the north the perfect light of day is admitted, and the ſun effectually excluded. The ſpace between theſe buildings, and that behind the latter on the ground-floor, is occupied by a number of rooms lighted in the ſame way, all of which are intended for the ſale of ſugars.

The object of this building is the attainment of public convenience; by bringing into one point what before had been ſcattered among ſeveral coffee-houſes, and the rooms of individuals.

Eaſt India Houſe.—This edifice is ſituated on the ſouth ſide of Leadenhall-ſtreet, and compriſes the principal offices of the Eaſt India Company. It was originally founded in the year 1726, but has recently been ſo much altered and enlarged, under the ſuperintendance of Mr. Jupp, architect to the company, as to appear like an entire new building. The front, compoſed of ſtone, is very extenſive, and diſplays a general air of grandeur and ſimplicity. In the centre riſes a noble portico, ſupported by ſix Ionic fluted columns. The frieze is ſculptured with a variety of antique ornaments, and the pediment exhibits ſeveral figures emblematical of the commerce of the company, protected by his majeſty, who is repreſented in the act of extending a ſhield over them. On the apex of the pediment is placed a ſtatue of Britannia, to the eaſt of which is a figure of Aſia, and on the weſt another of Europe. The interior can boaſt of ſeveral very noble apartments, particularly the ſale-room, which may be juſtly reckoned among the curioſities of the metropolis. In this houſe the courts of the Eaſt India Company are held, and all its official and general buſineſs tranſacted. Several large and commodious warehouſes are diſtributed in different parts of the towns, where teas and other imported goods are depoſited. See Company, *Eaſt India.*

The London Monument.—This noble pillar, perhaps the fineſt in the world, ſtands on the eaſt ſide of Fiſh-ſtreet-hill, about two hundred yards from the north end of London bridge. It was erected by the celebrated ſir Chriſtopher Wren, to commemorate the dreadful fire of 1666, which deſtroyed a great part of the city, and commenced near this ſpot. This monument is a fluted column of the Doric order, with a baſe and capital, ſurmounted by a ball. Its diameter at the baſe is fifteen feet. The maſſy pedeſtal meaſures 40 feet, the column 120, the cone above it, with its urn, 42, ſo that the entire height of the pillar is 202 feet. The interior contains a flight of 345 ſteps, aſcending to a balcony, from which the viſitor has a very extenſive proſpect of the metropolis and the adjacent country. The obſcure ſituation of this beautiful and majeſtic pillar is much to be lamented, for were it placed in a conſpicuous poſition, it would form a great and ſtriking ornament to the metropolis.

The Poſt-Office is ſituated in an area on the ſouth ſide of Lombard-ſtreet. As a building, it is not only unworthy of notice, but when the importance and magnitude of its concerns are conſidered, is really a diſgrace to the country and the metropolis. Such an important eſtabliſhment ſhould be well and properly accommodated. As a national inſtitution, however, it deſerves particular attention, being perhaps the moſt perfect ſyſtem of internal economy, of its kind, in the world: it keeps up a conſtant communication, directly or indirectly, with every town in the united kingdom, as well as with every foreign port in the moſt remote degree connected with the Britiſh empire. It poſſeſſes likewiſe the double advantage of being incalculably uſeful to individuals, and affording a large revenue to the government. Indeed, of all the means of finance any miniſter ever employed, it is beyond compariſon the beſt; while at the ſame time it may juſtly be regarded as the ſoul of commerce. The preſent poſt-office was built in 1760, but ſince that time great additions have been made to the building. At the commencement of the poſt-office ſyſtem, the whole was veſted in private perſons, and was irregular, defective, and inſecure. A few years back a very important plan was ſuggeſted by Mr. Palmer, of conveying letters to all parts of the kingdom by means of mail coaches; whereby a ſpeedy communication, and ſecurity from robbery were effected. See MAIL COACHES, and POST-OFFICE.

The Trinity Houſe.—On the north ſide of Tower-hill is a large, handſome, regular building, which was erected from deſigns by Samuel Wyatt, architect. The chief buſineſs of the Trinity-houſe corporation, which was founded in 1512, is conducted here, though the old eſtabliſhed houſe is at Deptford. The corporation conſiſts of one maſter, four wardens, eight aſſiſtants, and twenty-eight elder brethren, who are ſtyled "the guild, or fraternity of the moſt glorious and undivided Trinity, and of St. Clement, in the pariſh of Deptford-Strond, in the county of Kent." The object of this corporation is to ſuperintend and guard the intereſts of the Britiſh ſhipping, both military and commercial. Their powers are extenſive; and their objects important. They have to examine the children who are inſtructed in mathematics in Chriſt's hoſpital; examine the maſters of the king's ſhips; appoint pilots for the Thames; erect light-houſes and ſea-marks in the Britiſh ſeas; grant licences to poor ſeamen who are not free of the city, to ply for fares on the Thames; ſuperintend the deepening and cleanſing of the river, &c. The Trinity-houſe contains ſome handſome apartments, particularly the hall, the ſtair-caſe, and the court-room; in one of which is a fine model of the ſhip called the Royal William; alſo portraits of twenty-four of the elder brethren, and of other eminent perſons.

The Lunatic Hoſpital, called St. Luke's, in Old-ſtreet, a large pile of building, was erected from deſigns by George Dance, who alſo built the priſons of Newgate and the city Compter. In all theſe he manifeſted much ſkill and judgment; but there is a great want of both in the new front.

The Guildhall of the city is a piece of architectural abſurdity.—It is appropriated to the chief public offices of the corporation of London: the principal of theſe is the great hall, (153 feet long, by 48 broad and 55 high,) in which the large city feaſts are held, where public meetings are aſſembled, and the lord-mayor and members of parliament elected. Here are ſeveral portraits of ſovereigns, judges, lord-mayors, &c.; alſo large marble monuments to the juſtly eſteemed lord-mayor, Beckford, the great lord Chatham, &c. Beſides the hall, the following offices are included in the preſent building; chamberlain's-office, the court of king's bench, in which the lord-mayor's court and ſeſſions of the peace for the city are held; a court of common pleas, and court of exchequer; a court, called common council chamber, for the lord-mayor, aldermen, and common council. Attached to the Guildhall is an old chapel, which formerly belonged to a religious eſtabliſhment, but is now uſed as a juſtice-room for the aldermen.

The Bank of England, an immenſe pile of building, is more extenſive in its range of offices, and more eminent for its architectural adornment and interior arrangement, than any ſingle public edifice in the metropolis: for Somerſet-houſe, or place, conſiſts of various offices, dwelling-houſes, &c. It preſents an irregular and incongruous medley of ſtyles and forms; having been built at various periods by three different architects. The oldeſt part, *i. e.* the centre of the principal, or ſouth front, with ſome apartments on the ſame ſide, was deſigned and erected by George Sampſon, in the year 1733: and the lateral wings of this façade, and the returns on the eaſt and weſt ſides, with ſeveral offices immediately attached, were built by ſir Robert Taylor, between 1770 and 1786: but the great alterations and additions that have been made ſince the year 1788 by Mr. Soane, conſtitute the prominent features of this noble edifice. It would occupy a volume to deſcribe the whole arrangement and extent of the bank: it muſt ſuffice on the preſent occaſion to mention a few of its leading characteriſtics. The whole buildings are included in an area of an irregular form, the exterior wall of which meaſures 365 feet in front, or on the ſouth ſide; 440 feet on the weſt ſide; 410 feet on the north ſide, and 245 feet on the eaſt ſide. This area compriſes eight open courts, one rotunda, or circular room, ſeveral large public offices, committee rooms, and private apartments for the reſidence of officers and ſervants. The principal ſuite of rooms is on the ground-floor, and there is no floor over the chief offices; but it is neceſſary to ſtate, that beneath this floor, and even below the ſurface of the ground, there is more building, and more rooms than above-ground. Part of the edifice is raiſed on a marſhy, ſoft ſoil, for the ſtream called Wallbrooke ran here, and it has been neceſſary to pile the foundation, and conſtruct counter arches beneath the walls. The following is a liſt of the principal public rooms, with their dimenſions: on the ſouthern ſide, dividend-pay office, 44 by 40 feet; the three *per cent.* reduced office, 50 by 40 feet; pay-hall, 40 by 70 feet; ſtock-office, 60 by 45 feet: three others of nearly the ſame dimenſions; the rotunda, 55 feet in diameter; the conſol office, 80 feet by 48, is a noble room; court-room, 60 by 30 feet, adjoining which is the great committee room; office for notes under 5*l.*, 60 by 40 feet; and the chief caſhier's office, 45 by 30 feet. Beſides theſe, the Bank contains many other offices and apartments: among which may be named the ſecretary's office, bullion office, deputy governor's rooms, general caſh-book office, out-teller's office, land-tax redemption office, loan, or property office, drawing office, accomptant's office for the new ſpecie, cheque office, reduced annuity office, dividend pay-office, armoury, bank-note printing-office, engraver's rooms, the library, &c. Such is the extenſive buſineſs of the bank, that above 1000 perſons are employed in its various offices. Of the architectural characteriſtics of this edifice, its extent, arrangement, and adaptation to the accumulated and increaſing buſineſs of the Britiſh bank, it will be impoſſible to convey ſatisfactory information, in a limited ſpace, and without illuſtrative prints. We can only briefly deſcribe a few of the principal features. The oldeſt part by Sampſon, combines a degree of ſimplicity united with grandeur; and was admirably adapted to its original purpoſe. It beſpoke the character of a public edifice, with a rich and appropriate ſtyle of deſign. The whole aſſumed an air of dignity and importance, with a ſufficiency of ornament and dreſs. On a ruſticated baſement are two ſtories with Ionic columns, and a bold entablature. An uniformity of character pervades the whole. With ſuch a model before him, it is aſtoniſhing that ſir Robert Taylor did not deſign his additions in the ſame ſtyle, or in one that harmonized with it: but it ſeems evident that he did not feel or appreciate the charms of ſimplicity. He preferred prettineſs to propriety, and gaiety to grandeur, and therefore deſigned the wings, with the offices immediately attached, in the moſt gorgeous ſtyle of Roman architecture. Corinthian fluted columns, arranged in pairs, are placed along the whole front, ſupporting pediments at both extremities, and a baluſtraded entablature between.

In this façade, the architect has copied a building of Bramantes in the Belvidere gardens at Rome; but this very circumſtance impeaches his taſte and judgment. For though the ſtyle and deſign might have been appropriate and judicious in a ſmall ornamental building, it is very abſurd in a great national ſtructure, where ſolidity, ſecurity, and ſimple grandeur were required. The four and five *per cent.* ſtock offices are truly diſguſting, as works of art; and alſo very defective as rooms for buſineſs. They are both exact imitations of the interior of the church of St. Martin's-in-the-Fields. The forms and proportions of the exterior columns much excite our admiration. In the additions and improvements made to the bank by Mr. Soane, ſince his appointment in 1788, we find many novelties in deſign, and ſkilful appropriations. The rotunda is a ſpacious circular room, with a lofty dome; where a large and heterogeneous maſs of perſons of all nations and claſſes aſſemble on public days to buy and ſell ſtock. The deſign and conſtruction of the dome, by the laſt named architect, are entitled to the particular notice and admiration of ſtrangers. In the three *per cents.* warrant office, the ſame profound artiſt has diſplayed much taſte and ſkill. It is an oblong room, with a vaulted ceiling ſpringing from ornamented piers; and in the centre is a handſome dome, or lanthorn light, ſupported by caryatides. The ſoffites of the arches are decorated with pannels, roſes, and other objects in ſtrict conformity to the practice of the ancient architects. It is worthy of remark, that the whole is conſtructed without timber. Branching from this apartment is another, called the interior office, adapted to clerks whoſe buſineſs is to guard againſt forgery. It opens to Lothbury court, which is a grand diſplay of architectural deſign, two ſides of it being formed by open ſcreens, with handſome fluted columns of the Corinthian order. Theſe are copied from the little temple at Tivoli. On the ſouthern ſide of this court is a noble arch of entrance to the bullion court, and to other offices. This arch and façade are deſigned after the model of the celebrated triumphant arch of Conſtantine at Rome. On the ſides of the great archway, are four handſome fluted columns, ſupporting an entablature, and four ſtatues emblematic of the four quarters of the globe. In pannels are baſſo-relievi, executed by that great maſter of ſculpture, Banks, allegorically repreſenting the Thames and Ganges. The chief caſhier's office is a noble apartment, in the deſign of which the architect has again ſhewn his enthuſiaſtic attachment to claſſical antiquity. It is in imitation of the temple of the ſun and moon at Rome, and is ſpacious, ſimple in decoration, and cheerfully lighted by large and lofty windows. In the accomptant's office, governor's-court, veſtibule and paſſage from Prince's-ſtreet, and receſſed portico at the north-weſtern angle, are ſome ſpecimens of architectural deſign, which muſt excite the admiration of every accompliſhed connoiſſeur. In all theſe parts we recognize the forms, ſtyle, and detail of the beſt antique ſpecimens, carefully adapted to their reſpective ſituations, and calculated to gratify the eye and ſatisfy the judgment. Stability is certainly the moſt eſſential object in ſuch a building; but beauty and grandeur are equally deſerving of attention; for the Britiſh bank is rich, its proprietors are preſumed to be men of learning and ſcience, and under their auſpices we are entitled to look for ſuch actions and ſuch works as ſhall be ornamental and honourable to the character and taſte of the kingdom. In the great enlargements that have been recently made in the preſent building, it is evident, that the architect has been particularly attentive to the immediate buſineſs of the company, the ſecurity of their property from fire and depredation, and a chaſte, claſſical ſtyle of embelliſhment. Theſe remarks and deſcriptions are the reſult of a recent examination of the building.

Places of Worſhip.—London is diſtinguiſhed by the number and variety of its places of worſhip. It contains 116 churches of the eſtabliſhed religion; above 80 chapels of eaſe on the eſtabliſhment, in pariſhes where the population is too great for their reſpective churches; 11 Roman Catholic chapels; 17 churches and chapels belonging to foreign Proteſtants; ſix ſynagogues of the Jews; and 132 meeting-houſes of the different denominations of Engliſh Proteſtant diſſenters.

Of the 116 churches above-mentioned, 74 are within the walls of the city, 10 in London, without the walls, nine in the city and liberties of Weſtminſter, five in the borough of Southwark, and 18 in the ſuburbs, not included in theſe claſſes. Of theſe we can only particulariſe a few; for deſcriptions of the whole would require a large volume. Pre-eminent above all the buildings of the metropolis, is the

Cathedral Church of St. Paul, which holds the moſt diſtinguiſhed rank among the modern works of architecture in the Britiſh empire. The original cathedral was commenced in the year 610, by Ethelbert, king of Kent, and the building, with its revenues and privileges, were greatly increaſed by ſucceeding ſovereigns. This ſtructure was deſtroyed by a conflagration in 1086; after which, Maurice, then biſhop, commenced the magnificent edifice which immediately preceded the preſent cathedral. So great was the magnitude of the building, that neither Maurice, nor his ſucceſſor De Belmeis, were able to complete the undertaking, though each of them preſided twenty years, and expended great ſums in the proſecution of it; the latter prelate appropriated the whole revenue of his biſhopric to carrying on the work, and ſupported himſelf and family by other means. After his death the building was for ſome time ſuſpended, and the eaſtern part, or choir, was burnt in the year 1135. At what period it was reſtored is uncertain; the grand ceremony of conſecration was performed in 1240; large additions were afterwards made to the ſtructure, and it was not till the year 1315 that the church was entirely completed; being 225 years from the time of its foundation by Maurice. This ancient cathedral muſt always be regarded as one of the great works of architecture of the middle ages; in dimenſions it far exceeded every other religious edifice in this country; and it is repreſented by hiſtorians as equally pre-eminent in magnificence and ſplendour of ornament. (For an account of this edifice, ſee Dugdale's Hiſtory of St. Paul's.) In the reign of James I., the cathedral having fallen to decay, a royal commiſſion was iſſued for its repair; but nothing of conſequence was done till the advancement of Laud to the ſee of London, in the ſucceeding reign. This prelate exerted himſelf zealouſly in favour of the neglected building; a ſubſcription was collected to the amount of 101,330*l.* 4*s.* 8*d.*; and Inigo Jones was appointed to ſuperintend the undertaking. He commenced his operations in 1633; and the work went rapidly on till the breaking out of the civil war threw all things into confuſion, and the parliament confiſcated the unexpended money and materials. After the reſtoration, the repairs were again commenced; but after much labour and expence, the great conflagration in 1666, deſtroyed the chief part of the building, and irreparably damaged the remainder. Still, however, the magnitude of the work, and the contemplation of the vaſt expence of building a new cathedral, occaſioned a lapſe of ſeveral years before it was finally determined that all attempts at reparation were hopeleſs. The impracticability of reſtoring the ancient church being now apparent, Dr. (afterwards ſir) Chriſtopher Wren, was ordered to prepare plans for a new cathedral. The pulling down the remaining walls of the old ſtructure, and the removal of the rubbiſh to the amount of 47,000 loads, proved exceſſively laborious as well as dangerous, and ſeveral men were killed in the progreſs of the work. This being completed, the firſt ſtone of the new edifice was laid June 21, 1675; and the deſign was proſecuted with ſuch diligence and ſucceſs, that within ten years the walls of the choir and ſide aiſles were finiſhed, together with the circular porticoes on the north and ſouth ſides. The laſt or higheſt ſtone of the building was laid at the top of the lantern in the year 1710; and ſhortly afterwards the queen and both houſes of parliament attended divine ſervice in the new cathedral. The whole ſtructure was thus completed in thirty-five years, by one architect, ſir Chriſtopher Wren, and one maſter maſon, Mr. Thomas Strong, and while one prelate, Dr. Henry Compton, filled the ſee of London.

The general form or ground plan of St. Paul's cathedral is that of a Latin croſs, with an additional arm or tranſept at the weſt end, to give breadth to the principal front, and a ſemicircular projection at the eaſt end for the altar. At the extremities of the principal tranſept are alſo ſemicircular projections for porticoes; and at the angles of the croſs are ſquare projections, which, beſides containing ſtaircaſes, veſtries, &c. ſerve as immenſe buttreſſes to the dome, which riſes from the interſection of the nave and tranſept, and is terminated by a lantern, ſurmounted by a ball and croſs of copper gilt. The weſt front of this fabric conſiſts of a noble portico of two orders, the Corinthian and the Compoſite, reſting on a baſement formed by a double flight of ſteps, of black marble, and ſurmounted by a ſpacious pediment. On each ſide is a tower, with columns, &c.; one ſerving as a belfrey, the other as the clock-tower. In the tympan of the pediment is a very large piece of ſculpture, in baſſo-relievo, of the converſion of St. Paul; and on the apex a gigantic ſtatue of the ſame apoſtle; whilſt on either hand, along the ſummit of the front, are other coloſſal ſtatues of St. Peter, St. James, and the four evangeliſts. Large ſtatues of the other apoſtles are placed upon pediments on the ſide walls of the fabric. The dome is the moſt remarkable and magnificent feature of the building. It riſes from a circular baſement, which, at the height of about twenty feet above the roof of the church, gives place to a Corinthian colonnade, formed by a circular range of thirty columns. Above the colonnade, but not reſting upon it, riſes an attic ſtory with pilaſters and windows, from the entablature of which ſprings the exterior dome, which is covered with lead, and ribbed at regular intervals. Round the aperture, at its ſummit, is another gallery; and from the centre riſes the ſtone lantern, which is ſurrounded with Corinthian columns, and crowned by the ball and croſs.

In its interior form, this edifice is entirely conſtructed on the plan of the ancient cathedrals, *viz.* that of a long croſs, having a nave, choir, tranſepts, and ſide aiſles; but, in place of the lofty tower, the dome in this building riſes in elevated grandeur from the central interſection. The architectural detail is in the Roman ſtyle, ſimple and regular. The piers and arches, which divide the nave from the ſide aiſles, are ornamented with columns and pilaſters of the Corinthian and Compoſite orders, and are further adorned with ſhields, feſtoons, chaplets, cherubim, &c. The vaulting of this part of the church merits great praiſe for its light and elegant conſtruction: in this, each ſevery forms a low dome, ſupported by four ſpandrils; the baſe of the dome being encircled by a rich wreath of artificial foliage. The central area below the dome deſerves particular attention: this is an octagon, formed by eight maſſive piers, with their correlative apertures, four of which, being thoſe that terminate the middle aiſles, are forty feet wide, while the others are only twenty-eight; but this diſparity only exiſts as high as the firſt order of pilaſters, at which level the ſmaller openings are expanded in a peculiar manner, ſo that the main arches are all equal. The ſpandrils between the arches above form the area into a circle, which is crowned by a large cantilever cornice, partly ſupporting by its projection the "whiſpering gallery." At this level commences the interior tambour of the dome, which conſiſts of a high pedeſtal and cornice, forming the baſement to a range of apparently fluted pilaſters of the Compoſite order, the intervals between which are occupied by twenty-four windows and eight niches: all this part is inclined forward, ſo as to form the fruſtum of a cone. Above, from a double plinth, over the cornice of the pilaſters, ſprings the internal dome; the contour being compoſed of two ſegments of a circle, which, if not interrupted by the opening beneath the lantern, would have interſected at the apex. The dome, the idea of which was confeſſedly taken from the pantheon at Rome, is of brick, two bricks thick; but, as it riſes, at every five feet has a courſe of brick, of eighteen inches long, bending through the whole thickneſs: for greater ſecurity alſo, in the girdle of Portland ſtone which encircles the low part, an enormous double chain of iron, ſtrongly linked together, and weighing nearly 96 *cwt.*, was inſerted in a channel, which was afterwards filled up with lead. Over this cupola is a cone of brick, ſo built as to ſupport a ſtone lantern of an elegant figure. The choir is of the ſame form and architectural ſtyle as the body of the church.

The dimenſions of this vaſt fabric are, height from the ground without to the top of the croſs 340 feet, extreme length within 500 feet, greateſt breadth 223 feet. The entire aſcent to the ball includes 616 ſteps. The weight of the ball, which is capacious enough to contain eight perſons, is 5600 lbs.; and that of the croſs, 3360 lbs. For a more particular deſcription of this edifice, with plan of the ſubſtructure, elevation of the weſt front, ſection of the dome, and north-eaſt view of the exterior, ſee "Fine Arts of the Engliſh School," 4to. 1812.

The particular objects of curioſity which are compriſed in this church, and generally ſhewn to ſtrangers, are the whiſpering gallery, which encircles the interior of the lower part of the dome, and is ſo conſtructed, that a low whiſper breathed againſt the wall, in any part of the circle, may be heard on the oppoſite ſide; the library, chiefly remarkable for the floor, which is conſtructed with ſmall pieces of oak, diſpoſed in geometrical figures; the beautiful model, conſtructed by ſir Chriſtopher Wren; the geometrical ſtaircaſe, the fineſt ſpecimen of the kind in Great Britain; the clock, and great bell on which it ſtrikes. The clock is of great magnitude: the length of the minute-hand is eight feet, and its weight 75 lbs.; the hour-hand five feet four inches, and its weight 44 lbs.; the diameter of the dial is eighteen feet ten inches; the length of the hour-figures two feet two inches and a half; the bell is about ten feet in diameter, and its weight nearly four tons and a quarter.

About the year 1790 a ſcheme was ſuggeſted, and has been happily carried into effect, for breaking the monotonous uniformity of the architectural maſſes in the interior of the cathedral. This was done by admitting large and noble monuments for eminent public perſons deceaſed. Theſe may with ſtrict propriety be termed *national*, as commemorative of Britiſh virtues, talents, or heroiſm. Statues are already erected for Mr. Howard the philanthropiſt, Dr. Johnſon, and ſir William Jones. Here are alſo monuments for generals Abercromby and Dundas, and for captains Moſſe, Riou, Weſtcott, Burgeſs, and Faulknor. Others are now erecting for marquis Cornwallis, lord Howe, and lord Nelſon. The latter is interred in the vault under the centre of the building; and near him, his friend lord Collingwood. Among other eminent characters who have been depoſited in theſe vaults, are ſir Chriſtopher Wren; Dr. Newton, late biſhop of Briſtol; Alexander Wedderburn, earl of Roſslyn; ſir John Braithwaite; ſir Joſhua Reynolds, preſident of the Royal Academy; and two other eminent artiſts, James Barry and John Opie, eſqrs.

Although the churches in London are moſtly plain, ordinary in architecture, and in obſcure ſituations, yet a few of them are entitled to the notice and admiration of a ſtranger. That of St. Stephen Walbrooke, built by ſir Chriſtopher Wren, is very ſmall, but is juſtly eſteemed for its novelty of deſign and architectural adornment. "The plan is original, yet ſimple; the elevation ſurpriſing, yet chaſte and beautiful; the dome, ſupported by eight arches, ſpringing from eight ſingle columns, is wonderfully light and ſcenic in its effect." (Malton's Pictureſque Tour, p. 76.) Over the altar is a fine picture repreſenting the interment of St. Stephen, by Weſt. The following churches and towers have claims to architectural beauty, or ſcientific merit. The tower and ſpire of Bow-church, in Cheapſide, by ſir Chriſtopher Wren; the tower of St. Michael's, in Cornhill; the tower and ſpire of St. Bride's, in Fleet-ſtreet; the church of St. Mary, called the New church, in the Strand, by James Gibbs; the church of St. George, in Bloomſbury, by N. Hawkſmoor, built in 1731; the tower and ſpire of St. Dunſtan in the Eaſt, by ſir Chriſtopher Wren; and the church of St. Paul, Covent Garden, by Inigo Jones.

Members of Parliament.—The city of London has no more weight in the legiſlative repreſentation of the kingdom, than two ſmall boroughs which are the property of an individual. It ſends four repreſentatives to parliament, who are choſen, not by the inhabitant houſeholders at large, but by the livery of the ſeveral companies. The right of election was anciently veſted in the freemen of the city, which gave riſe to many conteſts between the freemen and livery; till an act of parliament, paſſed in the eleventh year of George I., decided the queſtion, and gave a peremptory right to the livery only. To be poſſeſſed of this elective franchiſe, a man muſt have previouſly obtained his freedom of the city, and alſo of one of the trading companies, either by patrimony, ſervitude, or purchaſe; and muſt afterwards be admitted to the livery of his company. The preſent number of electors is about eight thouſand, which is not above a third part of the number of inhabitant houſekeepers. The elections are held in Guildhall, and the ſheriffs are the returning officers. The city ſent two members to parliament as early as 49 Henry III. The number was increaſed to four, 6 Edward II.: in that and the ſucceeding reign, four were frequently ſent; but ſince 43 Edward III., this number has been uniformly returned.

Inns of Court and Chancery.—The deſign of theſe eſtabliſhments having been curſorily noticed under Inns, it may be proper here to ſubjoin ſome further particulars relative to each. The inns of court in London are the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn; but there are ſeveral other places called inns, which are appendages to the former. The Temple, belonging to the two ſocieties of the Inner and Middle Temple, is an immenſe aſſemblage of buildings, extending from Fleet-ſtreet to the Thames; and from Lombard-ſtreet, White-friars, to Eſſex-ſtreet in the Strand. It derives its name from a religious houſe, which was founded by the Knights Templars, who were cruſaders; and, in the beginning of the twelfth century, formed themſelves into a military body at Jeruſalem, for the protection of the pilgrims who viſited the holy ſepulchre. On the diſſolution of the order, the Temple was granted to the Knights Hoſpitallers of St. John of Jeruſalem; and by them it was let for 10*l.* *per annum* to the ſtudents of the law, whoſe ſucceſſors ſtill poſſeſs it. (See Hospitallers and Templars.) The Temple is an irregular building: in Fleet-ſtreet are two entrances, one to the Inner and one to the Middle Temple; the latter has a front, in the ſtyle of Inigo Jones, of brick, ornamented with four large ſtone pilaſters, of the Ionic order, with a pediment. There are four other entrances; but the gates of all are ſhut at night. The garden of the Inner Temple is of great extent, and is laid out on the banks of the Thames, with ſpacious walks, &c. The Middle Temple has alſo a garden, but ſmall: both are open to the public in ſummer. The hall of the Middle Temple is a ſpacious and curious room: the Inner Temple hall, which is ſmaller, is ornamented with the portraits of ſeveral of the judges. Each ſociety has a good library for the uſe of its ſtudents. In the treaſury chamber of the Middle Temple is preſerved a great quantity of ancient armour, which belonged to the Knights Templars. The Temple church belongs in common to both ſocieties, and is open for divine ſervice twice every day. The Knights Templars built a church on this ſcite, which being deſtroyed, the preſent edifice was erected by the Knights Hoſpitallers. It is in the early pointed and late circular ſtyles of architecture, and conſiſts of two diſtinct parts: at the weſtern end is a ſpacious round tower or veſtibule, forming a grand and ſingular entrance to the church. In this are the ſtatues of eleven Knights Templars. The organ is eſteemed one of the fineſt in the world. Since the time of Henry VIII. the ſuperior clergyman of this church is called the maſter of the Temple, and is ſo conſtituted by the king's letters patent. For an account of this church, with ground plan and prints, ſee Britton's Architectural Antiquities of Great Britain, vol. i.—Lincoln's Inn is ſituated on the weſt ſide of Chancery-lane. On its ſcite anciently ſtood a houſe of the Black-friars, and the palace of the biſhops of Chicheſter. The ground was afterwards granted to Henry Lacy, earl of Lincoln, from whom it derives its name. It appears to have reverted to the biſhops; for the preſent poſſeſſors hold it as a grant from a prelate of that ſee. Lincoln's Inn occupies a very extenſive ſpace: the buildings are moſtly old and irregular. An attempt has been made, but never completed, to rebuild the Inn on a regular plan. A conſiderable range, called the Stone Buildings, faces the weſt. This plan, the work of ſir Robert Taylor, is ſimple and elegant in its exterior architecture; and the chambers are on a grand and commodious ſcale. In the old part of the building are the hall and chapel; the firſt of which is a ſpacious room, in which the lord chancellor holds ſeals and ſittings out of term. At the upper end is a painting by Hogarth, of St. Paul before Felix. The chapel, deſigned by Inigo Jones, is ſpacious, and raiſed on large piers and arches, which form an open area beneath, uſed as a burial-place for benchers only. The chapel is open for public worſhip every morning and evening. The garden, which in ſummer is open to the public, is ſpacious, and forms one of the fineſt promenades within the capital. Lincoln's Inn has a good library, which contains a great number of manuſcripts; the greater part of which was bequeathed by lord Hale, with a ſingular injunction, that no part ſhould ever be printed. Gray's Inn is ſituated on the north ſide of Holborn, and derives its name from a lord Gray, who reſided here. In this Inn is a ſmall neat chapel, a commodious hall, and an extenſive garden, with a grove of large elm trees. The inns of chancery, which are dependent on the inns of court, are Furnival's Inn, an appendage to Lincoln's Inn: it is ſituated on the north ſide of Holborn-hill, and was the manſion of ſir William le Furneval, in the time of Richard II.—Thavies Inn, alſo dependent on Lincoln's Inn: the old fabric having been recently burnt down, a neat range of buildings is erected on its ſcite, which is near St. Andrew's church, Holborn.—Staple Inn, ſituated on the ſouth ſide of Holborn, and an appendage to Gray's Inn: in the hall are caſts of the twelve Cæſars, and portraits of Charles II., queen Anne, lord Maccleſfield, and the lords chancellors Cowper and Camden.—Barnard's Inn, ſituated near Fetter-lane, Holborn, and a dependent on Gray's Inn.—Serjeant's Inn, in Chancery-lane: it has a ſmall neat chapel, with ſeats for the judges.—Clifford's Inn, ſituated near St. Dunſtan's church, Fleet-ſtreet, and an appendage to the Inner Temple: in the hall is an oak caſe, of very great antiquity.—Clement's Inn, near St. Clement's church in the Strand, a dependent on the Inner Temple: it contains an elegant hall, and a garden kept with particular care, in which is a ſun-dial, ſupported by a kneeling figure of conſiderable merit, brought from Italy by lord Clare.—New Inn, adjoining to the laſt mentioned, and an appendage to the Middle Temple.—Lyon's Inn, ſituated in Wych Street, and belonging to the Inner Temple. For hiſtorical and deſcriptive particulars of theſe eſtabliſhments and buildings, the reader is referred to Dugdale's "Origines Juridiciales," folio, 1680; Herbert's "Antiquities of the Inns of Court and Chancery," 8vo. 1804; and Lane's "Student's Guide to Lincoln's Inn," 8vo.

General remarks.—Before cloſing this intereſting and important article, it ſeems proper to offer a very few remarks on the characteriſtic features of the metropolis, the manners and condition of its inhabitants, and the local peculiarities by which it is diſtinguiſhed. Such obſervations, however, the reader will readily perceive muſt be extremely general indeed. The ſubject is too various and comprehenſive to admit of full developement in a ſection, ſuch as the nature and limits of a work of this kind neceſſarily preſcribe.

The vaſt extent of London, and its immenſe population, cannot fail to ſtrike every viſitor with wonder and aſtoniſhment. Even to thoſe who have previouſly reſided in Paris, or in any other large city, theſe circumſtances alone muſt be matter of ſurpriſe; for not only is this city far more extenſive than the imperial metropolis, but it contains at leaſt 400,000 more perſons. Theſe, like the inhabitants of all great trading cities, are a heterogeneous maſs, compoſed of foreigners from every town and province of the united kingdoms, with a large portion of Jews, both native and foreign, Indians, Germans, French, Italians, Spaniards, Swiſs, and people of almoſt every nation in the world. From its immenſe trade, foreign and internal, a conſtant communication is kept up with every part of the globe, as well as with every part of our own dominions, both at home and abroad. The quantity of property of every deſcription flowing into the metropolis, and diſtributed from it, is immenſe. The number of ſtrangers conſtantly here, either on buſineſs or for pleaſure, is ſuppoſed to be not leſs than 100,000. Hence the prodigious concourſe of people in the ſtreets, and the number of carriages, carts, and other vehicles, continually crowding through them, are unparalleled in any city in the world.

London, in its uſual and more extenſive application, contains two cities, London and Weſtminſter, beſides the borough of Southwark. The city of Weſtminſter was formerly entirely detached from London, for the ſtreet now denominated the Strand was, at no very diſtant period, a ſort of bog, or moraſs, by which they were ſeparated. The monarchs of England have, for ſeveral centuries, fixed upon this city as their court reſidence, and the ſeat of the legiſlative and judicial authorities. This portion of modern London and its ſuburbs have extended with more rapidity than any other diſtrict of the town. Its buildings are in a much ſuperior ſtyle of architecture, and more open and regular in their diſtribution and arrangement, than thoſe in the city of London. They are chiefly inhabited by the nobility, gentry, and higher claſs of merchants, and though perhaps even inferior in external appearance to the reſidences of the nobles in ſome other countries, are no where ſurpaſſed in internal ſplendour and magnificence. London, within the walls, is the great repoſitory of the mercantile wealth, not merely of the metropolis, but of the whole country. Hence the buildings themſelves bear ample teſtimony to the object for which they were raiſed. Almoſt every houſe is a ſhop, or a counting-houſe, and ſo cloſely are they huddled together, that in many places room is ſcarcely left for the paſſage of a ſingle cart. Ground is valuable, and is fully occupied. This renders it certainly a matter of regret, and the remark is applicable to every part of the town, that there exiſt no regulations, or general plan authorized by act of parliament, to which all builders ſhould be obliged to conform. Such a plan, it is believed, was ſuggeſted by ſir Chriſtopher Wren after the great fire in 1666, and ſince by Gwynn, in a quarto volume, entitled "London and Weſtminſter improved, &c."

In a political point of view, London bears a moſt important ſway in deciding the opinions of the country at large. It is the centre from which all information, civil or military, emanates. The number of newſpapers and other political vehicles diſtributed here, and hence over the united kingdom, is prodigiouſly great. The foreigner who peruſes a few of theſe, cannot but be aſtoniſhed at the oppoſite ſentiments they contain, and the freedom with which they praiſe or cenſure the meaſures of government. This is the conſequence of liberty, and is doubtleſs one of its chief ſupports. The ruling magiſtrate of the kingdom is not exempt from public cenſure and critical animadverſion. At the commencement of the year 1812, this is more notorious than at any former period; and future hiſtorians will have occaſion to explain the cauſe and lament the effect. Not only has London a powerful influence over the political ſentiments of the country, but it has likewiſe no inconſiderable ſhare in directing the conduct of the higher powers. This it effects in ſome degree by the members it returns to parliament, which are ſix in number, but much more by the influence and riches of ſome of its chartered companies, as well as individuals. The bank of England, moſtly a body of merchants, is cloſely identified with government. The miniſter is compelled to have recourſe to the citizens for ſupplying the deficiences in the revenue, by loan, all which circumſtances render it neceſſary for the government to pay peculiar attention to the intereſts of the city in general.

London may further be characterized as the grand theatre for the diſplay of talents either in the arts or ſciences. It is here alone, perhaps, of all the cities in the united kingdom, that literary ability will receive any adequate reward. The artiſt of genius will likewiſe in general meet here with ſupport and encouragement. He will here find the fineſt productions of the moſt celebrated maſters in every department of art, by the ſtudy of which alone it is poſſible for him to attain the praiſe of excellence. In London are to be ſeen the beſt actors, and the moſt ſplendid theatres, Great Britain can boaſt of. The talents of the vocal and inſtrumental performers at the opera and concerts are unrivalled, and probably no city in Europe poſſeſſes a place of public amuſement more brilliant and magnificent than Vauxhall. London likewiſe abounds with muſeums, alſo various ſcientific, literary, and rational eſtabliſhments.

The merchants, bankers, and higher claſſes of tradeſmen, bear a ſtrong reſemblance in manners to the gentry with whom, from their immenſe wealth, they are generally accuſtomed to aſſociate. The ſame wealth, and the greater ſecurity they poſſeſs for its enjoyment than the merchants of other countries, confer upon them a ſpirit of real independence, to which the latter are totally ſtrangers. From this ſpirit of independence many advantages have undoubtedly ariſen both to the political condition and commercial proſperity of England. Reacting as it were upon the ſprings of our free conſtitution, from which it proceeds, it tends to render them vigorous and effective. Britons juſtly boaſt of their trial by jury as the bulwark of their freedom, but of what uſe would juries be, if the individuals who compoſe them were dependent and ſubmiſſive. It is to the ſpirit of the people rather than to any particular forms of adminiſtration that a country is indebted for its freedom.

The nobility and gentry of London are of a very different complexion from the ſame claſſes in other countries. They poſſeſs the higheſt poliſh of manners, but unite with their accompliſhments a degree of manlineſs and moderation, the reſult of the freedom of the Engliſh conſtitution and the general diffuſion of riches. A foreign nobleman conſiders himſelf as a diſtinct ſpecies of being from thoſe who are his inferior in rank and ſtation, and conſequently treats them with arrogance and contempt. An Engliſh nobleman, on the other hand, while ſufficiently conſcious of his own ſuperiority, behaves towards thoſe whom fortune has placed beneath him with real attention and civility; even in the article of dreſs he is ſcarcely to be diſtinguiſhed from the ordinary tradeſman or mechanic, while the higher claſs of merchants fully equals him in the ſplendour of his equipages and eſtabliſhments. He is almoſt wholly a ſtranger to that indolence which uſually reſults from exceſſive wealth and hereditary titles. Even the ladies of high rank are much leſs enervated and feeble than moſt of the ſame claſs abroad. They are accuſtomed to much exerciſe, and to mix in the public world.

The beneficial operation of this ſpirit on our commerce is the conſequence of that honour and integrity, which are uniformly found to accompany elevation of mind. That honeſty is the beſt policy, has long been an undiſputed dogma in commercial tranſactions in London. Hence it is that an Engliſh merchant can often obtain credit even in foreign countries, where it is little practiſed, and bills of immenſe value are ſometimes entruſted to him without receipt or acknowledgment. But theſe remarks ought not to be conſidered as applicable to the higher orders of traders only. The ſame freedom of conduct and ſterling integrity are prominent features in the character of the generality of eſtabliſhed ſhop-keepers, particularly thoſe of the city.

With reſpect to phyſicians, ſurgeons, and barriſters, they may be ranked with the gentry, though influenced by ſome little peculiarity of habits and manners. Apothecaries and attornies may be claſſed with the better ſort of ſhop-keepers.

The labouring claſſes in London are uſually of induſtrious and frugal habits. Their dreſs and appearance are far more decent and reſpectable than in any other city in the world, and this alone is a ſufficient evidence of its great trade and wealth. The ſame thing may be ſaid of the poorer ſort of ſhop-keepers, who, from the rate of their earnings, may be placed in the rank of labouring people. Male and female ſervants, in plain and honeſt families, may likewiſe be thrown into this rank with a ſimilar character.

Among many eſſential improvements recently made in London, the following are worthy of notice and commendation. In the city, and at the eaſt end of the town, we find that new docks have been made on a vaſt ſcale, whereby the property of merchants, companies, and the government is, and will be, materially benefited. Many commodious ſtreets and new houſes have alſo been made in the vicinity of thoſe docks, ſo that from the Tower to Limehouſe a new town has been formed. All the great roads leading to London have been much improved, and every approach to the metropolis, excepting that through the Borough, is broad, good, and flanked by handſome rows of houſes, or detached villas. In the city, and immediately adjacent, a wide and handſome ſtreet, called Skinner-ſtreet, has been entirely new built; a handſome ſquare formed in Moorfields, other ſtreets made near Temple Bar, ſeveral new buildings erected around the Bank, and others on Tower-hill. In Mary-le-bone a new plan is executing of laying out a large park into various allotments of detached villas, with gardens and pleaſure grounds, by John Naſh, eſq. architect. The deſtruction of the two great theatres by fire has afforded opportunities for much improvement, and much has been effected. North of Holborn many new ſquares and ſtreets have been built, the greater part of which has been deſigned by James Burton, eſq. In ſubſequent accounts of MARY-LE-BONE, PADDINGTON, and WESTMINSTER, many other ſubjects will be deſcribed.

Publications relating to London and Weſtminſter.—Though many volumes have been expreſsly devoted to the hiſtory and topography of the metropolis, it is generally admitted, and much to be regretted, that not one work is ſatisfactory either as a comprehenſive hiſtory, or popular and general deſcription. The moſt elaborate, and the moſt complete at the time of publication, is Strype's edition of Stow's “Survey of London,” 2 vols. folio, ſixth edition, 1754: but this is merely a reprint of a former edition of 1720. As a ſort of guide, or popular account of the preſent metropolis, “The Picture of London for 1812,” called “the thirteenth edition,” is beſt adapted to furniſh a ſtranger with a view of London ‘as it is’: but this, though admirably planned, and well executed in parts, is replete with errors of names, dates, and events. Many of its ſtrictures are objectionable on points of art, taſte, and antiquities; and one ſection on reviews and literary criticiſm is unjuſt, and of injurious tendency. The moſt eſſential points of theſe two works, with much additional information, will be compriſed in Brayley's “London and Middleſex; or, An hiſtorical, commercial, and deſcriptive Survey of the Metropolis of Great Britain,” now in the progreſs of publication, and promiſed to be completed in two large octavo volumes. The following are the titles of the other principal works relating to the topography of the metropolis.

“The Hiſtory of London, from its Foundation by the Romans, to the preſent Time,” by William Maitland, F.R.S. and others, 2 vols. folio, 1765.

“A new and complete Hiſtory and Survey of the Cities of London and Weſtminſter, the Borough of Southwark, and Parts adjacent,” to the year 1770, by Henry Chamberlain, eſq. and a ſociety of gentlemen.

“A new Hiſtory of London, including Weſtminſter and Southwark,” by John Noorthouck, citizen and ſtationer, 4to. 1773.

“Repertorium Eccleſiaſticum,” by —— Newcourt, 2 vols. folio. 1708.

“Londinopolis, or An hiſtorical Diſcourſe of the City of London,” by Howell, folio, 1657.

“A pictureſque Tour through the Cities of London and Weſtminſter,” by Thomas Malton, folio, 1792.

“Londinium Redivivum, or An ancient Hiſtory and modern Deſcription of London,” by James Peller Malcolm, F.S.A. 4 vols. 4to. 1807.

“Some Account of London,” by Thomas Pennant, eſq. 4th edition, 4to. 1805.

“The Cuſtoms of London, otherwiſe called Arnold's Chronicle,” new edit. 4to. 1811.

“London; being an accurate Hiſtory and Deſcription of the Britiſh Metropolis, and its Neighbourhood,” 6 vols. 8vo. ſaid to be by David Hughſon; but really compiled and written by David Pugh. This mode of giving fictitious names is very reprehenſible.

“London and Weſtminſter improved, with a Diſcourſe on public Magnificence,” by John Gwynn, 4to. 1766.

“A critical Review of the public Buildings, Statues, and Ornaments, in and about London and Weſtminſter,” by —— Ralph, architect, a new edition, 12mo. 1783.

“A Treatiſe on the Police of the Metropolis; containing a Detail of the various Crimes and Miſdemeanors by which public and private Property and Security are injured; and ſuggeſting Remedies for their Prevention,” by P. Colquhoun, L.L.D. 8vo. Several editions have been publiſhed.

“A Treatiſe on the Commerce and Police of the River Thames; containing an hiſtorical View of the Trade of the Port of London, and ſuggeſting Means for preventing Depredations thereon, &c. With a Map of the River from London Bridge to Sheerneſs,” by P. Colquhoun, L.L.D. 8vo.

“A Treatiſe on the Functions and Duties of a Conſtable; containing intereſting Details and Obſervations, relative to the Corruptions of Morals, and the Protection of the peaceful Subjects againſt penal Offences,” by P. Colquhoun, L.L.D. 8vo.

“The Thames; or, Graphic Illuſtrations of the Seats, Villas, &c. on the Banks of that River,” 2 vols. 8vo. 1811, chiefly a book of prints.

“The Hiſtory of London and its Environs,” 2 vols. 4to. publiſhed by John Stockdale.

It appears from Mr. Kirwan's “Eſtimate of the Temperature of different Latitudes,” that from a mean of the obſervations made at the houſe of the Royal Society, from the year 1772 to 1780, the annual temperature of London is 51°.9, or in round numbers 52°; the monthly temperature is ſtated in the following table:

	°		°
January -	35.9	July -	66.3
February -	42.3	Auguſt -	65.85
March -	46.4	September -	59.63
April -	49.9	October -	52.81
May -	56.61	November -	44.44
June -	63.22	December -	41.04

The greateſt uſual cold is 20°, and happens in January; the greateſt uſual heat is 81°, and happens generally in July. The limits of the annual variation are 2°.5, that is, 1° above and 1°.5 below the mean.

The greateſt variations of the mean temperature of the ſame month, in different years, are as follows:

	°		°
January -	6	July -	2
February -	5	Auguſt -	2
March -	4	September -	3.5
April -	3	October -	4
May -	2.5	November -	4
June -	2	December -	3

Hence it appears that the ſummers differ much leſs than the winters.

The moſt uſual variations of temperature within the ſpace of 24 hours in every month, are

January	6°	July	10°
February	8	Auguſt	15
March	20	September	18
April	18	October	14
May	14	November	9
June	12	December	6

Hence is ſeen the origin of vernal and autumnal colds.

Mr. Kirwan has ſhewn that, proportionably to its latitude, it is much colder in London than at Edinburgh; for the mean temperature of Edinburgh in January is 34° 5, and that of London is 35°.9; and this difference he aſcribes to the following cauſes: 1ſt. That Edinburgh is not expoſed to the Siberian winds as London is. 2dly. That Edinburgh is nearer to the ſea. 3dly. The rigour of the northerly winds is very little moderated, if not increaſed, in paſſing from Scotland to us, particularly if the ſurface of the earth is covered with ſnow; and hence, if we believe Dr. Smollet (Travels to Italy), the winters are ſometimes milder at Edinburgh than at London.

London, a town of America, in Ann-Arundel county, Maryland; 5 miles S.W. of Annapolis.

London, *The townſhip of*, is ſituated in Upper Canada, on the main fork of the river Thames, is a central poſition from the lakes Erie, Huron, and Ontario, and offers many advantages for being the capital of the province. It communicates with lake St. Clair and the Detroit by the river Thames; with lake Huron by the northern branch of the Thames and a ſmall portage, and with the Ouſe and lake Ontario by the military way called Dundas-ſtreet. It abounds with black and white walnut, cherry, baſs, elm, hickory, beech, aſh, and many other kinds of timber. It is ſupplied with excellent water, and the ſituation is healthy.

London *Cove*, a narrow water of Long iſland ſound, which ſets N. into the townſhip of New London; 4 miles W. of the mouth of Thames river.

London *Harbour*, a bay and harbour on the N. coaſt of the iſland of St. John, in the gulf of St. Lawrence. N. lat. 46° 26′. W. long. 67° 8′.

London, *New*. See New *London*.

London *Pride*, in *Gardening*, the name of a well-known plant of the flower-kind. See Saxifraga.

LONDONDERRY, in *Geography*, a county of Ireland, in the province of Ulſter. It lies to the weſt of Antrim, from which it is in a great meaſure ſeparated by the river Bann. Lough Neagh waſhes it on the ſouth-eaſt; on the ſouth it has Tyrone, from which it is ſeparated, in part, by the little river Ballinderry; on the weſt it has Donegal and Lough Foyle; and on the north, that part of the Atlantic ocean which is ſometimes called the Deucaledonian ſea. A great part of it was given by James I. to the twelve London companies, on condition of their fortifying the towns of Derry and Coleraine. From this circumſtance, both the county and town were called by the name of Londonderry. It extends 32 Iriſh miles from north to ſouth, and about the ſame from eaſt to weſt, where it is broadeſt. This length and breadth are equal to 40½ Engliſh miles. It meaſures in area 318,500 Iriſh acres, and 479 ſquare miles, which, in Engliſh meaſure, are 511,688 acres, and 798 ſquare miles. It contains 31 pariſhes, which have 29 churches, moſtly in the dioceſe of *Derry*; which ſee.

Londonderry is in general very mountainous, excepting the eaſtern part, adjoining Lough Neagh and the river Bann. The principal hills are Benyevenagh in the north; Sliebh-Gallen in the ſouth; Cairntogher, which ſometimes gives name to the chain extending into the county of Tyrone, and Sawell on the borders of the ſame county. The higheſt of theſe, however, is not more than 1600 feet above the level of the ſea. The face of the country, near the ſea and the river Bann, bears a great reſemblance to that of the adjoining county of Antrim. Baſaltes, intermixed with zeolite, is found on a bed of white limeſtone, which is ſometimes concealed by the baſaltes, and ſometimes ſhows itſelf in ſteep and elevated rocks, eſpecially in Benyevenagh, and the adjacent forelands. The ground about Lough Foyle is, in general, a ſtrong loam, which is well adapted for wheat, barley, flax, and potatoes, and which is principally manured by the ſhells procured from the lough. The land in the vallies does not conſiderably differ, except in manure, ſhells being at too great a diſtance; a circumſtance which is, in ſome meaſure, recompenſed by the depoſits from the mountain torrents. The river Roe, which paſſes through the middle of the county to Lough Foyle, is thought to ſeparate the baſaltic region from the ſchiſtoſe, or ſlaty. There are in the latter various kinds of ſchiſt; and with them are found pudding ſtone, gneiſs, and blue limeſtone. Sandſtone is found univerſally under the baſaltes, and occaſionally intermingled with ſchiſt. Iron is in great abundance throughout the county, either in an ochreous ſtate, or mixed with manganeſe. It was formerly ſmelted by an agent of the Drapers' company, but the ſpeculation was unſucceſsful. Boate mentions gold found in Londonderry; and ſome ſpecimens of quartz containing thin leaves of gold are ſaid to have been lately met with (A.D. 1802); they were found on the ſurface, and ſuppoſed to be adventitious. The ſiliceous, or flinty matter, like the calcareous, has two diſtinct appearances, which denote the regions of which they are the natives. The ſilica in the ſchiſt country is in the character of quartz, and the lime of the ſame country is blueiſh and laminated. In the baſaltic country the ſilica is in the character of flint, including chalcedony, &c.; and the lime white, and abounding in marine ſubſtances. Both the quartz and flint are of various tinges. The former ſometimes clear, yellow, browniſh, reddiſh, &c.; the latter horn-coloured, purple, browniſh black, &c. The flint has ſometimes marine impreſſions; the quartz never. Rock cryſtals of great hardneſs, and weighing from one ounce to twelve, are found in the ſchiſtoſe region. The graſs which is moſt prevalent in this county is the Agroſtis ſtolonifera, called in Iriſh *fiorin*, and ſo ſtrongly recommended for cultivation by Dr. Richardſon. It is peculiarly luxuriant in low meadows. The ſoft meadow graſs (Holcus mollis), is thought to be next in value and predominance, and is that generally ſown. The variety, however, found in other counties, is not wanting in this. Of other vegetables, the moſt remarkable is the Lichen lomphaloides, which, when manufactured, is called litmus, turnſole, and archil. This is found on the rocks in great abundance, and is uſed both for dyeing purple, and in a ſimple watery decoction, for giving woollen goods, ſuch as flannels, an orange-red colour. The flats near the river Bann have a greater extent of bog than is at preſent neceſſary for fuel, which bog is in general very reclaimable. Both this part of the county and the mountainous diſtrict require much improvement. Some young cattle are reared on the mountains, and ſome ſheep fed.

The linen manufacture is carried on extenſively through every part of the county. Londonderry is well watered by ſeveral ſtreams. Of theſe the Bann flows from Lough Neagh, and forms the eaſtern boundary, till it approaches the town of Coleraine, when it ceaſes to be a boundary, flowing through the liberties of that town into the ſea about three miles below it. About a mile above Coleraine is a ridge of rocks called the Salmon Leap, at which weirs are built for the ſalmon-fiſhery. Great quantities of this fiſh are caught in the Bann, and being ſalted at Coleraine form a valuable article of commerce. There is alſo an eel-fiſhery at Toome, between Lough Beg and Lough Neagh, which, as well as the other, is very valuable to the proprietor. The Foyle, a wide and deep river, having divided the counties of Tyrone and Donegal, and received ſeveral ſmaller, enters this county a little above the city of Londonderry, and paſſing by it expands into that large ſaltwater lake, known by the name of Lough Foyle. The rivers Fahan and Roe riſing in the Cairntogher mountains alſo flow into this lough. Several other ſtreams join the Bann in its courſe, or increaſe the waters of Lough Neagh; amongſt the latter is the Moyowla. In tracing the coaſt from the little harbour of Portruſh, in Antrim, we firſt meet with Bannhaven at the mouth of the Bann, about three miles from which is the town of Coleraine. (See Coleraine.) Proceeding along the coaſt, Magilligan Point, at the extremity of a large ſandy tract, preſents itſelf, approaching the coaſt of Donegal, and thus forming the entrance of Lough Foyle. Between Benyevanagh mountain and this point is a warren, which yields, on an average, three thouſand dozen of rabbits each year. The ſale of the ſkins, which are ſent to Dublin, produces a large revenue to the proprietor. Near this point is the Tons, a ſand-bank not far from the entrance of the lough, on which the ſea ſometimes beats with a prodigious noiſe. The entrance of Lough Foyle is not above half a mile wide, ſo that it is land-locked on all ſides. It is a large oval baſin, twelve miles long, and near ſeven broad in the wideſt part, but it has only one deep channel in the middle between long ſhoals or banks of ſand. It is, nevertheleſs, on the whole, a ſafe, large, and commodious harbour. Near the mouth of the river Roe, which runs into the lough, is a ridge of ſtones mixed with ſhells and ſand, extending a mile and a half in length, which is called the Giant's Grave. There are other banks of the ſame kind at a greater diſtance from the lough, which renders it probable, that this part of the county was once overflowed by the ſea. The county town, called alſo Londonderry, is on the Foyle. (See next article.) Other towns are, Newtown Limavaddy, Magherafelt, and Moneymore. Londonderry returns three members, two for the county and one for the city. Sampſon's Statiſtical Survey, and Beaufort's Memoir.

Londonderry, the capital of the county deſcribed in the preceding article: it is on the river Foyle, over which it has a wooden bridge, 1068 feet in length, and of ſingular and excellent conſtruction. It is a well built and neat city, and has a general appearance of order, induſtry, and ſobriety. It contains about 10,000 inhabitants. Its trade is conſiderable, eſpecially with America; the exports are linen, linen-yarn, &c. In the time of queen Elizabeth, Derry was a conſiderable military ſtation, being well fitted for keeping the adjoining country in ſubjection. In the reign of James I. it was rebuilt and ſtrengthened by the citizens of London, to whom it was given by that monarch. In the rebellion of 1641, and the ſucceeding years, it was twice beſieged, but without ſucceſs; but it is moſt celebrated in hiſtory for the ſiege nobly ſuſtained by the inhabitants in 1688 and 1689, for 105 days againſt the army of king James, although preſſed by a very ſevere famine. It deſerves to be recorded, that when the military governor was inclined to give up further reſiſtance, the inhabitants, inſtigated by the Rev. George Walker, whom they choſe governor, took it upon themſelves, and have thus gained immortal renown. Londonderry is ſtill ſurrounded by walls and has a military governor, who is alſo commander of Culmore fort. (See Culmore.) Londondery is a poſt-town, and returns a member to parliament. It is 115 miles N. by W. from Dublin. N. lat. 55°. W. long. 7° 13′. Sampſon, &c.

Londonderry, a poſt-town of America, in Rockingham county, New Hampſhire, near the head of Beaver river, which diſcharges itſelf into Merrimack river, at Pawtucket Falls, ſettled in 1718, incorporated in 1722, and containing 2650 inhabitants. The inhabitants are moſtly the deſcendants of emigrants from Ulſter county, Ireland, and are employed in the manufacture of linen cloth and thread; 36 miles S.W. by S. from Portſmouth.—Alſo, a townſhip in Halifax county, Nova Scotia, on the N. ſide of Cobequid or Colcheſter river, about 30 miles from its mouth, at the baſin of Minas; ſettled by North Iriſh and Scotch.—Alſo, a townſhip in the N.W. part of Windham city, Vermont, on the head waters of Weſt river, about 33 miles N.E. of Bennington. In 1795 it was divided into two parts, the E. half being called *Windham*, and the W. part retaining its original name.—Alſo, two townſhips in Pennſylvania; one in Dauphin county, containing 1577 inhabitants, the other in Somerſet county, having 709 inhabitants.

LONDONGROVE, a townſhip in Cheſter county, Pennſylvania, containing 921 inhabitants.

LONDRES, or London, a town of South America, in the province of Tucuman, built by Tarita, the governor, in 1555, in compliment to Mary, queen of England, then married to Philip, king of Spain. S. lat. 19° 12′.

LONEE, a town of Hindooſtan; 12 miles E.S.E. of Poonah.

LONEL, a town of the iſland of Sardinia; 22 miles S.E. of Boſa.

LONER, a town of Hindooſtan, in Baglana; 16 miles N.W. of Chander.

LONERSTATT, a town of Bavaria; 14 miles S.S.W. of Bamberg.

LONG, James le, in *Biography*, a learned French prieſt, was born at Paris in 1665. In 1686 he entered into the congregation of the Oratory, and occupied the poſt of profeſſor in ſeveral houſes of that ſociety, and finally was appointed their librarian at St. Honorè. He paſſed his life in learned labours, and died in 1721, with the character of a virtuous and eſtimable man. He was thoroughly converſant in the ancient and many of the modern languages, and had an extenſive acquaintance with the hiſtory of literature, of bibliography, and printing. His chief work is entitled “Bibliotheca Sacra,” containing a catalogue of all the editions and tranſlations of the ſcriptures, in two volumes octavo, to which he ſubjoined, in a ſecond part, a liſt of all the authors who had written upon the ſcriptures. He publiſhed, likewiſe, “Bibliotheque Hiſtorique de la France,” being an account of all the hiſtorical works relative to that country, which is highly eſteemed, and ranks among the great productions of the reign of Lewis XV.; alſo a “Hiſtorical Diſcourſe on Polyglott Bibles,” and their ſeveral editions.

Long, Roger, an Engliſh divine, and aſtronomical profeſſor, was born in 1679, received his college education at Cambridge, and became maſter of Pembroke-hall, and Lowndes's profeſſor of aſtronomy. He is chiefly known as an author, by a Treatiſe on Aſtronomy, in two volumes; the firſt of which was publiſhed in 1742, and the ſecond in 1764. He was the inventor of a curious aſtronomical machine, erected in a room at Pembroke-hall. This is a hollow ſphere about eighteen feet in diameter, in which thirty perſons may ſit. The concave ſurface repreſents the heavens with the ſtars and conſtellations in their order; the axis is placed parallel to the axis of the world, upon which it is eaſily turned by a winch. (See Constellation.) He publiſhed a Commencement Sermon, and an Anſwer to Dr. Galley's pamphlet "On Greek Accents." He died in the year 1770, at the age of eighty-one.

Long, Thomas, a learned divine, was born at Exeter in 1621, and educated at the college of that name in Oxford. His higheſt preferment in the church was a prebend in Exeter cathedral, of which he was deprived at the Revolution for refuſing the oaths. He died in 1700. He was author of many theological pieces; of a Life of Julian; Hiſtory of all the Popiſh and Fanatical Plots and Conſpiracies; and a Vindication of the Claim of King Charles I. to the Authorſhip of the Eikon Baſilike.

Long *Accent.* See Accent.

Long *Bay*, in *Geography*, a bay on the E. coaſt of Jamaica. N. lat. 18° 8′. W. long. 76′.—Alſo, a bay on the W. coaſt of the iſland. N. lat. 18° 20′. W. long. 78° 21′.—Alſo, a bay on the S. coaſt of the ſame iſland; ſix miles E. of Callibaſh bay.—Alſo, a bay of America, extending along the ſhore of N. and S. Carolina, from Cape Fear to the mouth of Pedee river.—Alſo, a bay on the W. ſide of the iſland of Barbadoes.—Alſo, another on the S. ſide of the iſland.

Long *Boat*, the largeſt and ſtrongeſt boat belonging to a ſhip. See Boat.

Long *Hand.* See *Long* Hand.

Long-*horned Cattle*, in *Agriculture*, a breed of neat cattle, which is chiefly diſtinguiſhed by the length of the horn, the thickneſs and firm texture of the hide, the length and cloſeneſs of the hair, the large ſize of the hoof, and the coarſe leathery thickneſs of the neck. It is ſometimes termed Lancaſhire breed from its being predominant there. See Cattle.

Long-*jointed*, in the *Manege.* A horſe is ſaid to be long-jointed, whoſe paſtern is ſlender and pliant. Long-jointed horſes are wont to have wind-galls.

Long *Iſland*, in *Geography*, an iſland in Penobſcot bay. (See Isleborough.)—Alſo, an iſland of America, on the coaſt of Main, 4 miles long and 1½ wide. N. lat. 44° 20′. W. long. 68° 20′.—Alſo, an iſland near the S. coaſt of Jamaica. N. lat. 17° 51′. W. long. 76° 58′.—Alſo, an iſland near the N. coaſt of the iſland of Antigua. N. lat. 17° 17′. W. long. 61° 28′.—Alſo, an iſland in Hudſon's Straits. N. lat. 61°. W. long. 75°.—Alſo, another in Hudſon's bay. N. lat 55° 16′. W. long. 78° 30′.—Alſo, a narrow iſland about two miles in length, on the S. coaſt of the county of Cork, Ireland, in Roaring-water bay. It contains 316 acres of land. N. lat. 51° 26′. W. long. 9° 27′.—Alſo, one of the ſmaller Bermuda iſlands.—Alſo, a ſmall iſland in the gulf of Mexico, near the coaſt of Eaſt Florida. N. lat. 27° 50′. W. long. 82° 55′.—Alſo, a ſmall iſland near the coaſt of S. Carolina. N. lat. 32° 50′. W. long. 79° 45′.—Alſo, a ſmall iſland near the coaſt of Virginia, at the mouth of York river. N. lat. 37° 16′. W. long. 76° 35′.—Alſo, a ſmall iſland in the Atlantic, near the coaſt of Braſil. S. lat. 16° 30′.—Alſo, an iſland of America, formerly called "Manhattan," afterwards "Naſſau iſland," diſcovered by Henry Hudſon, an Engliſhman, in 1609, and belonging to the ſtate of New York. It extends from Hudſon river, oppoſite to Staten iſland, almoſt to the weſtern boundaries of the coaſt of Rhode iſland, terminating with Montauk point. Its length is about 140 miles, and its medial breadth from 10 to 14 miles; and it is ſeparated from Connecticut by "Long iſland Sound." It contains 1400 ſquare miles, and is divided into three counties, *viz.* King's, Queen's, and Suffolk; and theſe are again ſubdivided into 19 townſhips. The N. ſide of the iſland is rough and hilly, but the ſoil is well adapted for raiſing grain, hay, and fruit. The S. ſide of the iſland lies low, and its ſoil is light and ſandy. On the ſea-coaſt are extenſive tracts of ſalt-meadow, which extend from Southampton to the W. end of the iſland. Nevertheleſs, the ſoil is well adapted to the culture of grain, eſpecially Indian corn. Near the middle of the iſland is Hampſtead plain, in Queen's county, which is 16 miles long, and about eight broad. This plain, the ſoil of which is black, and apparently rich, yields naturally a particular kind of wild graſs and a few ſhrubs; but it produces ſome rye, and furniſhes, together with the ſalt marſhes, food for large herds of cattle. On the E. part of the iſland, E. of Hampſtead plain, is a large barren heath, called Bruſhy plain, overgrown with ſhrub oak, intermixed with a few pine-trees, which afford harbour to wild deer and grouſe. In a bay on the S. ſide of the iſland, vaſt quantities of oyſters are taken, and alſo of baſs. The largeſt river in the iſland is Peakonok, which is but an inconſiderable ſtream; it runs E. and diſcharges itſelf into a large bay that ſeparates Southhold from Southampton. In this bay are Robin and Shelter iſlands. Rockonkama pond lies about the centre of the iſland, between Smith-town and Iſlip; it is about a mile in circumference, and has been found to riſe gradually for ſeveral years, until it had arrived to a certain height, and then to fall more rapidly to its loweſt bed; and thus it is continually ebbing and flowing. Two miles to the ſouthward of the pond is a ſtream called Connecticut river, which runs into the bay. There are two whale-fiſheries; one from Soggharbour, which produces about 1000 barrels of oil annually. The other is much ſmaller, and is carried on by the inhabitants in the winter ſeaſon, from the S. ſide of the iſland. They commonly catch from three to ſeven whales in a ſeaſon, which produce from 25 to 40 barrels of oil each. This fiſhery was formerly a ſource of conſiderable wealth to the inhabitants, but on account of a ſcarcity of whales, it has of late years much declined. From Soggharbour to the Weſt Indies and other places, there is a conſiderable trade in whale oil, pitch, pine-boards, horſes, cattle, flax-feed, beef, &c. The produce of the middle and weſtern parts of the iſland is carried to New York. The iſland contains 42,097 inhabitants, of whom 3893 are ſlaves. (Morſe.)—Alſo, an iſland in Holſton river, Teneſſee, five miles long, and containing 2500 acres of rich land, ſubject to inundations. Many boats are built here annually, and loaded with the produce of the ſtate for New Orleans; 100 miles above Knoxville, and 1000 from the mouth of the Teneſſee.—Alſo, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of Billiton. S. lat. 2° 51′. E. long. 107° 30′.—Alſo, a ſmall iſland near the S.E. coaſt of the iſland of Madeira. S. lat. 7° 16′. E. long. 113° 5′.—Alſo, a ſmall iſland near the N. coaſt of the iſland of Flores. S. lat. 8° 6′. E. long. 122° 27′.—Alſo, a ſmall iſland in a bay on the N. coaſt of New Guinea. S. lat. 1° 4′. E. long. 135° 18′.

18'.—Alſo, an iſland in Queen Charlotte's ſound, on the coaſt of New Zealand, called by the natives "Hamote," about four miles long; nine miles S. of Port Jackſon.—Alſo, an iſland in the South Pacific ocean, at the entrance of Broad ſound, on the N.N.E. coaſt of New Holland, about 30 miles in length. S. lat. 22° 24'. W. long. 210° 33'.—Alſo, an iſland diſcovered by captain Wallis in 1767, and ſo called by him. N. lat. 10° 20'. W. long. 247° 24'.—Alſo, a ſmall iſland near the W. coaſt of Scotland. N. lat. 56° 15'. W. long. 5° 37'.—Alſo, a ſmall iſland in the Eaſt Indian ſea, near the coaſt of Africa. S. lat. 10° 25'.—Alſo, one of the iſlands in the Mergui Archipelago. N. lat. 12° 36'. E. long. 98° 12'.

Long *Iſland Sound*, a kind of inland ſea, from three to 25 miles broad, and about 140 miles long, extending the whole length of Long iſland, in the ſtate of New York, and dividing it from Connecticut. This ſound communicates with the ocean at both ends of the iſland, and affords a very ſafe and convenient inland navigation.

Long *Iſle*, or *Iſle River*, *Indians*, are Indians who inhabit the territory, on Iſle, or White river, which runs W. into the Wabaſh river. The mouth of White river is in N. lat. 38° 58'. W. long. 90° 7'.

Long *Key*, *Middle*, a ſmall iſland in the bay of Honduras, near the coaſt of Mexico. N. lat. 17° 10'. W. long. 88° 48'.

Long *Key*, *North*, a ſmall iſland in the ſame bay. N. lat. 17° 58'. W. long. 88° 40'.

Long *Key*, *South*, a ſmall iſland in the ſame bay. N. lat. 16° 57'. W. long. 88° 50'.

Long *Konang*, a town of Corea; 125 miles S.S.E. of King-ki-tao. N. lat. 35° 55'. W. long. 79° 20'.

Long *Lakes*, *The*, a chain of ſmall lakes in Upper Canada, extending weſterly from the grand portage of lake Superior toward Rain lake.

Long *Legs*, in *Natural Hiſtory*. See Tipula.

Long *Meadow*, in *Geography*, a town of America, in Hampſhire county, Maſſachuſetts, on the E. bank of Connecticut river, about four miles S. of Springfield, and 23 N. of Hartford; incorporated in 1783, and containing a congregational church, and about 70 houſes, forming a ſtreet parallel with the river. The townſhip contains 973 inhabitants.

Long *Meaſure*. See Measure.

Long *Mountain*, in *Geography*, a mountain of Virginia; 80 miles W.S.W. of Richmond. N. lat. 37° 15'. W. long. 79° 20'.

Long *Noſe*, a cape on the E. coaſt of New Holland. S. lat. 35° 6'. E. long. 151° 15'.

Long *Point*, is a long beach or ſand bank, on lake Erie, in Upper Canada, now called the "North Foreland," ſtretching into lake Erie from the townſhip of Walſingham, and forming the deep bay of Long Point, upwards of 20 miles in length.

Long *Pond*. See Bridge-town.

Long *Reach*, a narrow part of the ſtraits of Magellan, between Cape Quod and Buckley Point.

Long *Reef*, a ſhoal in the Spaniſh Main, near the Moſquito ſhore. N. lat. 12° 22'. W. long. 82° 50'.

Long *Saut*, a ſmall iſland of Upper Canada, in the river St. Lawrence, in front of the townſhip of Oſnabruck, containing from 1000 to 1500 acres, with good ſoil. N. lat. 55° 2'. W. long. 74° 55'.

Long *Shoal*, a river of America, in North Carolina, which runs into Pamlico ſound, at the mouth of which is a cape called *Long Shoal Point*. N. lat. 35° 22'. W. long. 76° 2'.

Long *Timbers*, or *Double Futtocks*, in a *Ship*, thoſe timbers afore and abaft the floors which extend from the deadwood to the run of the ſecond futtock head.

LONGA, in *Geography*, one of the ſmaller Shetland iſles. N. lat. 60° 12'. W. long. 1° 37'.—Alſo, a ſmall iſland near the W. coaſt of Scotland. N. lat. 56° 12'. W. long. 50° 40'.

Longa, Ital. *Longue*, Fr. *A long*, Engl. in *Muſic*, is a character for time in the firſt time-table, half the duration of the *maxima*, or *large*, and twice the length of the breve. The long is formed thus: , or . John de Muris and his contemporaries had longs of three ſeveral kinds; the *perfect*, with a tail on the right ſide, thus , or , equal to three pointed breves; it is called perfect, ſays de Muris, on account of its numerical ratio with the Trinity. The *imperfect* long is of the ſame figure as the perfect, and is only diſtinguiſhed by the mood or character for time at the beginning of a movement. It was accounted imperfect, from its being incomplete without a breve to precede or follow it. The *double* long contains two imperfect breves: it is like the long only of a much larger ſize . John de Muris quotes Ariſtotle to prove that this note is not uſed in canto fermo. At preſent, the term long is only correlative with *ſhort*, in ſcanning verſes.

LONGABOO, in *Geography*, one of the ſmaller Friendly iſlands; 12 miles E.S.E. of Naenava.

LONGARA, a town of Naples, in Calabria Ultra; 20 miles W.N.W. of Severina.

LONGARES, a town of Spain, in Aragon; 20 miles S.S.W. of Aragoſſa.

LONGAY, a ſmall iſland near the E. coaſt of Skye. N. lat. 57° 19'. W. long. 5° 53'.

LONGEAU, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Langres; ſix miles S. of Langres. The place contains 438, and the canton 9485 inhabitants, on a territory of 295 kiliometres, in 29 communes.

LONGEPIERRE, Hilaire-Bernard de Roqueleyne, *Lord of*, in *Biography*, born of a noble family at Dijon, in 1659, was ſecretary of commands to the duke of Berry. He diſtinguiſhed himſelf by an accurate knowledge of the Greek language, and publiſhed notes upon Anacreon, Sappho, Bion, Moſchus, and the Idylls of Theocritus. In 1690 he gave the public a collection of "Idylls" of his own invention: he was author of the tragedies of "Medea," and "Electra," written after the manner of the Greek tragedians, which were brought on the ſtage, and gave him a reputation among dramatic poets. He wrote other tragedies of conſiderable merit, and died at Paris in 1721. Moreri.

Longepierre, in *Geography*, a town of France, in the department of the Saône and Loire, ſituated near the river Doubs; 16 miles N.E. of Chalons ſur Saône.

LONGERI, a town of Africa, in the kingdom of Loango, where the kings are generally interred.

LONGEVITY, a term expreſſing length of life.

From the different longevities of men in the beginning of the world, after the flood, and in theſe ages, Dr. Derham deduces a good argument for the interpoſition of a Divine

Providence. Immediately after the creation, when the world was to be peopled by one man and woman, the ordinary age was nine hundred years and upwards. Immediately after the flood, when there were three perſons to ſtock the world, their age was cut ſhorter; and none of thoſe patriarchs, but Shem, arrived at five hundred. In the ſecond century we find none that reached two hundred and forty, in the third, none, but Terah, that came to two hundred years; the world, at leaſt a part of it, by that time being ſo well peopled, that they had built cities, and were cantoned out into diſtant nations. (See Antediluvian.) By degrees, as the number of people increaſed, their longevity decreaſed, till it came down at length to ſeventy or eighty years; and there it ſtood, and has continued to ſtand, ever ſince the time of Moſes. This is found a good medium, and, by means hereof, the world is neither overſtocked, nor kept too thin; but life and death keep a tolerably equal pace. So that from this period the common duration of man's life has been much the ſame in all ages, as we learn both from ſacred and profane hiſtory. In conſequence of the reſearches of the ingenious Mr. Whitehurſt (ſee his Inquiry into the Origin of the Earth), and of Dr. Fothergill (ſee his Obſervations on Longevity in the Mancheſter Memoirs, vol. i.) we are enabled to preſent our readers with tables of longevity, and appropriate reflections, which will be no leſs inſtructive than amuſing.

Table I.

Names of the Perſons.	Ages.	Places of Abode.	Living or Dead.
Thomas Parre	152	Shropſhire	Died Nov. 16, 1635, Phil. Tran. N° 44.
Henry Jenkins	169	Yorkſhire	—— Dec. 8, 1760, Phil. Tran. N° 221.
Robert Montgomery	126	Yorkſhire	—— in 1670.
James Sands	140	Staffordſhire	Ditto Fuller's Worthies, p. 47.
His Wife	120	Staffordſhire	
Counteſs of Deſmond	140	Ireland	Rawleigh's Hiſtory, p. 166.
Counteſs of Ecleſton	143	Ireland	Died 1691 (a)
J. Sagar	112	Lancaſhire	—— 1668 (b)
—— Laurence	140	Scotland	Living (c)
Simon Sack	141	Trionia	Died May 30, 1764
Colonel Thomas Winſlow	146	Ireland	—— Auguſt 26, 1766
Francis Confiſt	150	Yorkſhire	—— January 1768
Chriſt. J. Drakenberg	146	Norway	—— June 24, 1770 (d)
Margaret Forſter	136	Cumberland	Both Living 1771
Her Daughter	104	Cumberland	
Francis Bons	121	France	Died February 6, 1769
John Brookey	134	Devonſhire	Living 1777 (e)
James Bowels	152	Killingworth	Died Auguſt 15, 1656 (f)
John Tice	125	Worceſterſhire	—— March 1774 (g)
John Mount	136	Scotland	—— February 27, 1776 (h)
A. Goldſmith	140	France	—— June 1776 (i)
Mary Yates	128	Shropſhire	—— 1776 (k)
John Bales	126	Northampton	—— April 5, 1706 (l)
William Ellis	130	Liverpool	—— Auguſt 16, 1780
Louiſſa Truxo, a Negreſs in South America	175	Tucuman, South America	Living October 5, 1780 (n)
Margaret Patten	138	Lockneugh, near Paiſley	Lynche's Guide to Health.
Janet Taylor	108	Fintray, Scotland	Died October 10, 1780
Richard Lloyd	133	Montgomery	Lynche's Guide to Health.
Suſannah Hilliar	100	Piddington, Northamptonſhire	Died February 19, 1781 (o)
James Hayley	112	Middlewich, Cheſhire	—— March 17, 1781 (p)
Ann Cockbolt	105	Stoke-Bruerne, Northamptonſhire	—— April 5, 1775 (q)

William Walker, aged 112, not mentioned above, who was a ſoldier at the battle of Edge-Hill.

(q) Well known to perſons of credit at Northampton.

If we look to an early period of the Chriſtian era, we ſhall find that Italy has been, at leaſt about that time, peculiarly propitious to longevity. Lord Bacon obſerves, that the year of our Lord 76, in the reign of Veſpaſian, was memorable; for in that year was a taxing, which afforded the moſt authentic method of knowing the ages of men. From it, there were found in that part of Italy, lying between the Apennine mountains and the river Po, one hundred and twenty-four perſons who either equalled or exceeded one hundred years of age, namely:

TABLE II.

	54 Perſons of	100 Years each.
	57	110
	2	125
	4	130
	4	136
	3	140
In Parma	3	120
	2	130
In Bruſſels	1	125 Years each.
In Placentia	1	131
In Faventia	1	132
	6	110
	4	120
In Rimino	1	150 *viz.* Marcus Aponius.

Mr. Carew, in his Survey of Cornwall, aſſures us, that it is no unuſual thing, with the inhabitants of that county, to reach ninety years of age, and upwards, and even to retain their ſtrength of body and perfect uſe of their ſenſes. Beſides Brown, the Corniſh beggar, who lived to one hundred and twenty, and one Polezew to one hundred and thirty years of age; he remembered the deceaſe of four perſons in his own pariſh, the ſum of whoſe years, taken collectively, amounted to three hundred and forty. Now, although longevity evidently prevails more in certain diſtricts than in others, yet it is, by no means, confined to any particular nation or climate; nor are there wanting inſtances of it, in almoſt every quarter of the globe, as appears from the preceding, as well as the ſubſequent table.

TABLE III.

Names of the Perſons.	Ages.	Places of Abode.	Where recorded.
Hippocrates, phyſician	104	Iſland of Cos	Lynche on Health, chap. 3.
Democritus, philoſopher	109	Abdera	Bacon's Hiſtory, 1095.
Galen, phyſician	140	Pergamus	Voſſ. Inſt. or lib. i.
Albuna Marc	150	Ethiopia	Hakewell's Appendix, lib. i.
Dumitur Raduly	140	Haromſzeek Traſilvania	Died January 18, 1782, General Gazetteer, April 18th.
Titus Fullonius	150	Bononia	Fulgoſus, lib. viii.
Abraham Paiba	142	Charles-Town, South Carolina	General Gazetteer
L. Tertulla	137	Arminium	Fulgoſus, lib. viii.
Lewis Cornaro	100	Venice	Bacon's Hiſtory of Life, &c. p. 134.
Robert Blakeney, Eſq.	114	Armagh, Ireland	General Gazetteer.
Margaret Scott	125	Dalkeith, Scotland	See Inſcription on her Tomb in Dalkeith Church-yard.
W. Gulſtone	140	Ireland	Fuller's Worthies.
J. Bright	105	Ludlow	Lynche on Health.
William Poſtell	120	France	Bacon's Hiſtory, p. 134.
Jane Reeves	103	Eſſex	St. James's Chronicle, June 14, 1781.
W. Paulet, marquis of Wincheſter	106	Hampſhire	Baker's Chronicle, p. 502.
John Wilſon	116	Suffolk	General Gazetteer, Oct. 29, 1722.
Patrick Wian	115	Leſbury, Northumberland	Plempius Fundammed, ſect. 4, chap. 8.
M. Laurence	140	Orcades	Buchanan's Hiſtory of Scotland.
Evan Williams	135	Caermarthen Workhouſe	General Gazetteer, October 12, 1782.

If we aſcend to the firſt ages of the world, and endeavour to inveſtigate the cauſes of the longevity of the antediluvians, we ſhall find that different writers have ſtated them very variouſly. Some have imputed it to the ſobriety of the antediluvians, and the ſimplicity of their manners; alleging that they abſtained from fleſh, and had none of thoſe excitements to gluttony, which have been deviſed in ſubſequent times. Others have aſcribed their longevity to the excellency of their fruits, and ſome peculiar virtues in the herbs and plants of thoſe days. Others again have thought that the long lives of the inhabitants of the old world proceeded from the ſtrength of their ſtamina, or firſt principles of their bodily conſtitutions; and this might be a concurrent, though not the ſole and adequate cauſe of their longevity: for Shem, who was born before the deluge, and had all the virtue of the antediluvian conſtitution, fell 300 years ſhort of the age of his forefathers, becauſe the greateſt part of his life was paſſed after the flood. It has therefore been more rationally ſuppoſed, that the chief cauſe of their longevity was the ſalubrity of the antediluvian air; which, after the deluge, became corrupted and unwholeſome. But how the flood ſhould occaſion this change in the air, it is not eaſy to comprehend; and the difficulty muſt remain unſolved, and we muſt content ourſelves with aſcribing it to the conſtitution of Providence, operating by unknown cauſes. The examples which are exhibited in the above tables are abundantly ſufficient to prove, that longevity, in more modern times, does not depend ſo much as ſome have ſuppoſed, on any particular climate, ſituation, or occupation in life. For we ſee that it often prevails in places, where all theſe are extremely diſſimilar; and it would, moreover, be very difficult, in the hiſtories of the ſeveral perſons above mentioned, to find any circumſtance common to them all, except perhaps that of being born of healthy parents, and of being inured to daily labour, temperance, and ſimplicity of diet. Among the inferior ranks of mankind, therefore, rather than amongſt the ſons of eaſe and luxury, ſhall we find the moſt numerous inſtances of longevity; even frequently, when other external circumſtances ſeem extremely unfavourable: as in the caſe of the poor ſexton at Peterborough, who, notwithſtanding his unpromiſing occupation among dead bodies, lived long enough to bury two crowned heads, and to ſurvive two complete generations. The livelihood of Henry Jenkins and old Parr is ſaid to have conſiſted chiefly of the coarſeſt fare, as they depended on precarious alms. To which may be added, the remarkable inſtance of Agnes Milburne, who, after bringing forth a numerous offspring, and being obliged, through extreme indigence, to paſs the latter part of her life in St. Luke's work-houſe, yet reached her hundredth and ſixth year, in that ſordid, unfriendly ſituation. The plain diet, and invigorating employments of a country life, are acknowledged, on all hands, to be highly conducive to health and longevity; while the luxury and refinements of large cities are allowed to be equally deſtructive to the human ſpecies: and this conſideration alone, perhaps, more than counterbalances all the boaſted privileges of ſuperior elegance and civilization reſulting from a city life.

From country villages, and not from crowded cities, have the preceding inſtances of longevity been chiefly ſupplied. For an illuſtration of this fact we refer to the article *Bills of* MORTALITY.

Attached as we are to life by the conſtitution of our nature, and deſirous of protracting the ſhort ſpan, it ſeems to be no leſs our duty than our intereſt to examine minutely into the various means that have been conſidered as conducive to health and long life; and to diſcriminate between thoſe that are collateral and accidental and ſuch as are eſſential to this great end. In order to obtain ſufficient data for reaſoning juſtly and ſatisfactorily on this ſubject, it would be deſirable to improve the mode of framing our bills of mortality; and with this view, it would be proper to add a particular account of the diet and regimen of every perſon, who dies at 80 years of age, or upwards; and to mention, whether his parents were healthy, long-lived people, &c. &c. All the circumſtances, that are moſt eſſentially neceſſary to life, may be compriſed under the ſix following heads: 1, air and climate; 2, meat and drink; 3, motion and reſt; 4, the ſecretions and excretions; 5, ſleep and watching; 6, affections of the mind. With regard to the firſt head, it may be obſerved that the common atmoſphere may be more or leſs healthy, in proportion as it abounds with pure dephlogiſticated gas, or oxygen; and as this is copiouſly ſupplied by the green leaves of all kinds of vegetables, we may hence in ſome meaſure account why inſtances of longevity are ſo much more frequent in the country than in great cities, where the atmoſphere is contaminated with noxious animal effluvia, and with mephitic air or carbonic acid. As to climate, various obſervations conſpire to prove that thoſe regions which lie within the temperate zones are beſt adapted to promote long life. Hence perhaps we may be enabled to explain, why Italy has produced ſo many perſons whoſe lives have been prolonged, and why iſlands in general are more ſalutary than continents. However, the Author of nature has wiſely enabled the inhabitants of hot and cold countries to endure great and ſurpriſing changes of temperature with impunity. See an account of experiments in a heated room, under the article HEAT. For the effects of *food* and *drink*, ſee theſe articles. It needs no proof, that alternate motion and reſt, ſleep and watching, are neceſſary conditions of health and longevity, and that they ought to be adapted to age, temperament, conſtitution, temperature of the climate, &c. Moreover, when the animal functions are duly performed, the ſecretions go on regularly; and the different evacuations ſo exactly correſpond to the quantity of aliment taken in, in a given time, that the body is found to return daily to nearly the ſame weight. Beſides, the due regulation of the paſſions, perhaps, contributes more to health and longevity than that of any other of the non-naturals. We may further add, that longevity is, in a great meaſure, hereditary; and that healthy, long-lived parents would commonly tranſmit the ſame to their children, if it were not for the frequent errors in the non-naturals, which ſo evidently tend to the abbreviation of human life. Nevertheleſs the duties and occupations of life will not indeed permit the generality of mankind to live by rule, and ſubject themſelves to a preciſe regimen. Fortunately, this is not neceſſary: for the divine Architect has, with infinite wiſdom, rendered the human frame ſo ductile, as to admit of a very conſiderable latitude of health; yet this has its bounds, which none can long tranſgreſs with impunity. For if old Parr, notwithſtanding ſome exceſſes and irregularities, arrived at ſo aſtoniſhing an age, yet we have reaſon to ſuppoſe that theſe were far from being habitual; and may alſo conclude, that had it not been for theſe abuſes, his life might have been ſtill conſiderably protracted.

On the whole, though ſome few exceptions may occur to what has been already advanced, yet it will be found, in general, that all extremes are unfriendly to health and longevity. Exceſſive heat enervates the body; extreme cold renders it torpid: ſloth and inactivity clog the neceſſary movements of the machine; inceſſant labour ſoon wears it out. On the other hand, a temperate climate, moderate exerciſe, pure country air, and ſtrict temperance, together with a prudent regulation of the paſſions, will prove the moſt efficacious means of protracting life to its utmoſt limits. Now, if any of theſe require more peculiar attention than the reſt, it is undoubtedly the laſt: for the ſocial paſſions, like gentle gales, fan the brittle veſſel calmly along the ocean of life; while, on the other hand, rough, turbulent ones daſh it upon rocks and quickſands. Hence, perhaps, it may be explained why the cultivation of philoſophy, muſic, and the fine arts, all which manifeſtly tend to humanize the ſoul, and to calm the rougher paſſions, are ſo highly conducive to longevity. And, finally, why there is no ſure method of ſecuring that habitual calmneſs and ſerenity of mind, which conſtitute true happineſs, and which are, at the ſame time, ſo eſſential to health and long life, without virtue.

"Æquanimitas ſola, atque unica felicitas."

LONGFORD, in *Geography*, a county of Ireland, in the north-weſtern extremity of the province of Leinſter. It has Roſcommon on the weſt, Leitrim and Cavan on the north, and Weſtmeath on the eaſt and ſouth. Its length from north to ſouth is 20 Iriſh miles (25 Engliſh), and its breadth from eaſt to weſt 19 Iriſh, or 24 Engliſh miles. It contains 134,152 Iriſh acres (215,522 Engliſh), which are divided into 23 pariſhes, all of which, except one, are in the biſhopric of Ardagh, united to Tuam. Though the northern angle conſiſts of rugged mountains, and the ſouth-weſtern part is chiefly bog to a great extent, yet Longford may be reckoned populous; and it ſupplies large quantities of oats for diſtant markets. About Granard is a fine tract of dry gravelly land, which is much uſed for fattening cattle. Lime-ſtone is here abundant; and it is ſurpriſing that, with this advantage, ſo little has been done towards reclaiming the bogs. In other parts of the county, the ſoil is in general a vegetable mould on the ſurface for three or more inches deep; under that, two inches thick of blue clay, which retains water; below this is yellow clay for two or three feet; and then lime-ſtone gravel. Oats is the grain principally raiſed. The linen manufacture has ſpread much through Longford. Spinning is univerſal, and there are now many weavers. The increaſe of the latter has been attributed to the liberal conduct of a gentleman, in giving 500*l*. to be lent to poor weavers, in ſums of 5*l*. each, which were to be repaid by quarterly payments of 25*s*. The benefits attending ſuch loans to the poor have been experienced in many places; and if care be taken in the management, it is a mode of aſſiſting them which encourages their induſtry, and can never be called *a premium for idleneſs and extravagance*. There are alſo ſome bleach greens; and great quantities of yarn are ſent to diſtant markets.

In the northern part of the county, near Lough Gawnagh, is a very rich iron ore in great abundance, not in thin beds, as that in the mountains near Lough Allen, and at Arigna in the adjoining county of Leitrim, but in ſolid rocks. It is of a dark red colour, and breaks into ſmall ſhelving pieces. There are alſo indications of coal in the ſame neighbourhood. Longford is well watered. The Shannon forms its weſtern boundary, and the Inny croſſes it in the ſouth. Lough Gawnagh, which covers ſeveral acres, is in the north; and ſome ſmall rivers flow into the Shannon, on one of which, called the Camlin, the town of Longford is ſituated. It is intended that the Royal Canal ſhould croſs this county, and join the Shannon at Tarmonbury; a meaſure which cannot fail of leading to much improvement, if it ſhould be ever completed. The towns are ſmall. For Longford, the county town, ſee the next article; and for Granard and Laneſborough, thoſe names in this work. Edgeworthſtown, which was by ſome accident omitted in the proper place, may be noticed here. It is not, indeed, remarkable for its ſize, but it is remarkable for the reſidence of a family, which is diſtinguiſhed for literary and ſcientific attainments. The name of Maria Edgeworth is too well known, and her talents as a pleaſing and uſeful author too generally acknowledged, to need the praiſe of the writer of this article. The ſame may be ſaid of her lively, ingenious, and patriotic father, Richard Lovell Edgeworth; and there is reaſon to expect that ſome of the younger branches of this family will add to a celebrity already very great. The writer has before him the reports of the bog commiſſioners, the eighth of which contains many proofs of the ingenuity of Mr. William Edgeworth. Mr. Edgeworth's houſe and the adjoining church contain many proofs of his mechanical ſkill.

The whole of the county of Longford was formerly called Annaly, and was a principality ſo late as the fifteenth century. It is now only repreſented in parliament by two knights of the ſhire; though it had, before the union, no leſs than four boroughs, which ſent two members each. Beaufort, &c.

LONGFORD, a poſt-town of the county of Longford, Ireland, of which it is the ſhire town. It is ſituated on the river Camlin, and is of tolerable ſize, and pretty well built. It has a charter ſchool for 60 boys. Longford is 59 miles W.N.W. from Dublin. Beaufort and Carliſle.

LONG-GNAN, a city of China, of the firſt rank, in the province of Se-tchuen, which contains a city of the third claſs under its juriſdiction, and is a place of great trade. N. lat. 32° 22′. E. long. 104° 18′.

LONG-HOU-KOEN a town of China, in the province of Hou-quang; 52 miles S.S.W. of Tao.

LONGIANO, a town of Italy, in the department of the Rubicon; 12 miles N.W. of Rimini.

LONGIMETRY, the art of meaſuring lengths, both acceſſible, as roads, &c., and inacceſſible, as arms of the ſea, &c.

Longimetry is a part of trigonometry, and a dependant on geometry, in the ſame manner as altimetry, planimetry, ſtereometry, &c.

The art of longimetry ſee under the names of the inſtruments uſed in it, particularly THEODOLITE, CHAIN, DISTANCE, &c. See alſo MENSURATION.

LONGING in pregnant women, an inordinate deſire for ſome particular kind of food, which, if denied, or not procured for them, was ſuppoſed to occaſion waſting, and ſometimes hyſteric affections, in the women, and on the child, beſides impairing its health, to impreſs the figure of the object longed for. This affection, which heretofore occaſioned in families much anxiety and uneaſineſs, ſeems wearing away, juſt in proportion as the belief in witches, ghoſts, and hobgoblins vaniſhes, or as reaſon and common ſenſe procure an aſcendency over ſuperſtition and impoſture. See that part of the article CONCEPTION, which treats of pica.

LONGINUS, DIONYSIUS, in *Biography*, celebrated for his treatiſe on the ſublime, flouriſhed in the third century, and is ſuppoſed by ſome to have been a native of Athens, by others of Syria. In his youth he travelled for improvement: he was known at Rome, Alexandria, and other cities diſtinguiſhed for literature; and attended upon the lectures of all the eminent maſters in eloquence and philoſophy. Such was the extent of his erudition, that he was ſtyled by his contemporaries "the living library." He appears to have taught philoſophy at Athens, where Porphyry was one of his diſciples. He was invited to the court of Palmyra, by its illuſtrious queen Zenobia, who took his inſtructions in the Greek language, and made uſe of his counſels on political occaſions. This diſtinction was fatal to him: he was executed by order of the emperor Aurelian, who proved victorious over the troops of Zenobia, and took her priſoner. The queen, to ſave herſelf, imputed the reſiſtance which ſhe made to her counſellors, of whom Longinus was ſuſpected to be the principal. The philoſophy of Longinus ſupported him in the hour of his trial, and he ſubmitted to his fate with reſignation and cheerfulneſs. This event took place in the year 273. Gibbon obſerves on this circumſtance, that the fame of Longinus will ſurvive that of the queen who betrayed, or the tyrant who condemned him. Genius and learning were incapable of moving a fierce unlettered ſoldier, but they had ſerved to elevate and harmoniſe the ſoul of Longinus. Without uttering a complaint, he calmly followed the executioner, pitying his unhappy miſtreſs, and beſtowing comfort on his afflicted friends. He was author of numerous writings. Dr. Pearce has collected the titles of twenty-five; but his treatiſe on the ſublime, already referred to, is the only one remaining; and this, as is well known to ſcholars, is in a mutilated and imperfect ſtate. The beſt editions of it are thoſe of Hudſon, Pearce, and Toup. It has been tranſlated into the Engliſh; but it is one of thoſe works which ſcarcely admits of a tranſlation. Speaking of this treatiſe, Mr. Smith, the tranſlator, ſays, "It is one of thoſe valuable remnants of antiquity, of which enough remains to engage our admiration, and excite an earneſt regret for every particle of it that has periſhed. It reſembles thoſe mutilated ſtatues, which are ſometimes dug out of ruins: limbs are broken off, which it is not in the power of any living artiſt to replace, becauſe the fine proportion and delicate finiſhing of the trunk excludes all hope of equalling ſuch maſterly performances." Smith's tranſlation of the treatiſe on the Sublime. Moreri. Gibbon. Harwood.

LONGISSIMUS Dorsi, in *Anatomy*, a muſcle of the back. See Dorsi.

LONGITUDE *of the Earth*, is ſometimes uſed to denote its extent from eaſt to weſt, according to the direction of the equator.

By which it ſtands contradiſtinguiſhed from the *latitude of the earth*, which denotes its extent from one pole to the other.

Longitude, in *Aſtronomy* and *Geography*. The longitude of any point of the heavens is the diſtance of its place, reduced to the ecliptic, from the vernal equinoctial point; that is, if a great circle paſs through a ſtar perpendicular to the ecliptic, the arc of the ecliptic intercepted between the interſection of this circle and the equinoctial point will be the longitude of the ſtar.

The longitude of a place on the ſurface of the earth, is a portion of the equator intercepted between a meridian paſſing through the place, and another meridian which paſſes through ſome principal city or obſervatory aſſumed as a point of departure, from which the longitudes of other places are taken. The reaſon why longitude is ſo differently defined on the celeſtial and terreſtrial globe, has been already explained under Latitude, to which article the reader is referred.

The ſubjects of aſtronomical inveſtigation, ariſing from different definitions, are ſo intimately connected, that much of the preſent has been already anticipated. Under Right Ascension we have ſhewn how, having given the longitude and latitude of a heavenly body, we deduce its right aſcenſion and declination: and under Latitude, a rule has been given for computing the longitude and latitude from the obſerved right aſcenſion and declination. But though we have ſhewn how the quantities are derived reciprocally one from the other, we have reſerved for this place to explain how they are originally derived from elementary obſervations. We are therefore to ſuppoſe the caſe of a practical aſtronomer who ſhould be deſirous of making a catalogue of ſtars, and of determining their longitudes and latitudes independent of previous obſervation, except only ſuch as are abſolutely neceſſary for determining the quantity of preceſſion, aberration, nutation, &c.

The obſerver is to be even ſuppoſed unacquainted with the latitude of his obſervatory, with the ſituation of the equinoctial points, and with the obliquity of the ecliptic. The principles of the method which we mean to explain were familiar to Flamſteed and the aſtronomers of that period, and are demonſtrated in De Lalande's and Vince's Aſtronomy. But the late Dr. Maſkelyne was the aſtronomer who improved and practiſed it with the greateſt ſucceſs in forming his catalogue of the thirty-ſix principal ſtars, and which would have been much more accurate than any ever known, had the inſtrument with which his obſervations were made been as perfect as thoſe of later conſtruction.

As no inſtrument now in uſe can give directly the longitude or latitude of a ſtar, it is neceſſary, firſt of all, to determine the right aſcenſions and declinations of thoſe ſtars of which we mean to form a catalogue. The method of determining the declination has been already explained at great length. (See Declination.) It is quite independent of the ſolar theory, and is derived by direct meaſurement of the meridian diſtance between the object and the pole. A mural circle, ſuch as that now erecting at Greenwich, determines this diſtance, without any reference to the zenith; but with a quadrant, and with aſtronomical circles of the uſual conſtruction, it is either abſolutely neceſſary, or at leaſt convenient, to employ the zenith. And in this caſe we determine by one ſeries of obſervations the diſtance of the zenith from the pole, and by another ſeries the meridional diſtance of the zenith from each particular ſtar. The firſt quantity, called the co-latitude of the place, being applied to the ſecond, or zenith diſtance of the ſtar, the ſum is the polar diſtance. It is evident, that all this may be performed without any knowledge of the ſolar theory, or even without a ſingle ſolar obſervation.

To determine the right aſcenſions of the ſtars, we might have aſſumed (had right aſcenſion been otherwiſe defined) any great circle perpendicular to the equator, and paſſing through any given ſtar, as α Aquilæ, exactly in the ſame manner as we aſſume an arbitrary meridian for the determination of terreſtrial longitudes. But as aſtronomers have agreed to aſſume, as their firſt celeſtial meridian, that which paſſes through the vernal equinoctial point, the ſolar theory neceſſarily becomes involved with the ſubject of our inveſtigation: we are, therefore, under the neceſſity of combining two diſtinct objects of enquiry. In the firſt place, it is neceſſary to determine exactly the relative ſituation of the ſtars with reſpect to each other and to the equator; and next, to place the ecliptic in its true poſition both with reſpect to the equator and to the fixed ſtars, and thus determine the ſituation of the equinoctial point. To have a clear idea of the whole of this proceſs, we ſhould obſerve that the two preliminary inveſtigations are perfectly independent of each other; for the conſtellations (as we remarked above) might be truly placed on the celeſtial globe without any knowledge of the ecliptic, and the ecliptic, in like manner, might be placed making its proper angle with the equator; and the declination of the ſun and its diſtance from the equinoctial point determined at any moment, by a ſeries of ſolar obſervations conducted without any reference to the fixed ſtars, and even without any knowledge of their exiſtence. It is by the combination of the reſults of theſe ſeparate inveſtigations that the intended object is accompliſhed. The practical method of conducting the whole of this operation is as follows:

In the firſt place, we aſſume the right aſcenſion of any given ſtar, as for example α Aquilæ, as near the truth as poſſible from prior determination, or we may conſider it as entirely unknown, and call it zero. This is quite immaterial, but the former method is the moſt uſual. The ſtars of the intended catalogue are then obſerved at the tranſit inſtrument for a ſeries of years, with a view to determine their difference of right aſcenſion from α Aquilæ and from each other. This inveſtigation would be much more ſimple than it is, if the fixed ſtars always preſerved the ſame relative poſition to each other, as the differences of right aſcenſion would then remain the ſame. But this is not the caſe; the apparent poſition of each particular ſtar is altered by the effects of aberration, preceſſion, ſolar and lunar nutation. The phenomenon of *Aberration* has been already explained. That of *Preceſſion* and *Nutation* will likewiſe be minutely deſcribed under their reſpective titles. At preſent, it is only neceſſary to obſerve, that the action of the ſun and moon (conſidered as conſtant forces) produce by their action on the protuberant regions of the equator a ſlow periodical revolution of the earth's axis about the pole of the ecliptic. By this motion the equinoctial points are carried backward, and the poſition of the equator among the fixed ſtars changes at every inſtant. If the effect of this phenomenon was ſimply to cauſe a change in the poſition of the equinoctial points, the difference of right aſcenſion of ſtars would not be affected by it; but it muſt be remembered, that the right aſcenſion of a ſtar is determined by a perpendicular drawn from the ſtar to the equator; now, the equator changing its place, this perpendicular will change its place alſo; that is, the ſtar will be conſtantly referred to a new point on the equator, and hence the right aſcenſion will vary from two cauſes; one, the motion of the equinoctial point, or point of departure, which will equally affect every ſtar; and the other from the change in the point of reference, by which, according to the definition, right aſcenſion is determined. It is the latter only of theſe two cauſes that affects the difference of right aſcenſions.

The ſolar and lunar nutations of the axis of the earth ariſe from the unequal action of the ſun and moon, by which the preceſſion of the equinoxes is not deſcribed in the uniform and ſimple manner above mentioned. The reader will ſee under Nutation, that the axis of the earth never points to its *mean* place; hence the *apparent* equator never coincides with the *mean* equator, or that circle which would be the equator, if theſe periodical nutations did not exiſt. Theſe derangements of the equator, and the correſponding oſcillations of the equinoctial points, affect both the longitudes and right aſcenſions of the ſtars, and likewiſe their declinations: their latitudes alone remain unchanged, for an oſcillation in the axis of the earth produces no change in the ecliptic, which depends only on the path which the centre of the earth deſcribes in ſpace, and which is not affected by the cauſes we have above mentioned; but the ecliptic itſelf is deranged by the action of the neighbouring planets, for theſe cauſe the centre of the earth to take actually a new path in the heavens, though they are too diſtant to derange the paralleliſm of the earth's axis by any unequal action on the equatorial regions. The ecliptic, in conſequence of this diſturbance, changes its point of interſection with the equator, which circle remains, from this cauſe at leaſt, unmoved, and conſequently the declinations of the ſtars remain unchanged; but their longitudes are affected, not only becauſe the equinoctial point is diſturbed, from which longitudes are reckoned, but likewiſe becauſe each ſtar is referred to a new point on the ecliptic; hence ariſes a ſecular variation in longitude, peculiar to each ſtar. The right aſcenſions are altered by the change of poſition in the equinoctial point, but this affects every ſtar alike, and therefore produces no change in the difference of right aſcenſion; in fact, the effect of this latter derangement enters as an element in the conſtant part of the preceſſion common to all ſtars. The nature of all theſe changes, or equations, as they are technically called, has been, or will be, deſcribed under their appropriate terms, as *Aberration*, *Nutation*, *Ecliptic*, *Secular Variation*, &c. &c. which ſee reſpectively.

Now the nicety and delicacy of the modern method of reducing obſervations, conſiſt in the exact determination of all theſe equations, and the due application of them to each ſeparate obſervation; ſo that inſtead of the apparent place, we make uſe of that in which we preſume the object would have appeared, had none of theſe periodical oſcillations exiſted. Agreeable to this conception of the ſubject, we may define ſome of the terms we have uſed above with greater preciſion than we have yet done. For inſtance, *mean right aſcenſion* of a ſtar, is the diſtance of the ſtar's place corrected for aberration, reduced to the mean equator, from the mean vernal equinoctial point. *Apparent right aſcenſion*, is the diſtance of the ſtar's place reduced upon the apparent equator from the apparent equinoctial point.

Mean declination, is the diſtance of a ſtar corrected for aberration from the mean equator. *Apparent declination*, is the apparent diſtance of the ſtar from the apparent equator. The *mean equator*, is an imaginary great circle of the heavens, about which the apparent equator revolves without ever coinciding with it, in the manner already deſcribed. The *apparent equator*, is that great circle of the heavens which actually correſponds with the equinoctial line on the earth, whatever the poſition of the earth may be at the moment of obſervation.

If, with the mean right aſcenſion, the mean declination, and the mean obliquity of the ecliptic, we compute the longitude of a ſtar, that longitude will be its mean longitude, that is, its place referred to the ecliptic will be reckoned from the mean equinox.

If, with the apparent right aſcenſion, the apparent declination, and the apparent obliquity, we compute the longitude, this will be reckoned from the apparent equinox. Sidereal time, (as uſed in theſe computations,) is that which has elapſed ſince the paſſage of the apparent equinoctial point over the meridian; for aſtronomers have not yet adopted a *mean ſidereal time*, which might be defined the interval which elapſes from the paſſage of the *mean equinoctial point*. This latter method would be more ſcientific than that now in uſe, and would be a ſimilar improvement to the ſubſtitution of *mean ſolar time* for apparent ſolar time. Were this latter mode adopted, an alteration muſt be made in our preſent tables of nutation, and the equation of the equinoxes in right aſcenſion, which now enters as common to all ſtars, would be omitted, as the ſame quantity would previouſly be applied to the error of the clock which is now applied to the ſtar.

We have been led into this digreſſion, and induced to dwell rather at length upon theſe preliminary conſiderations, becauſe we do not, at this moment, recollect any author that has entered much on the ſubject, to whom we can refer.

The right aſcenſion of α Aquilæ then, being aſſumed as near the truth as poſſible, the right aſcenſions of the other ſtars are to be inferred from it, by applying all the above equations, and likewiſe a correction for the error of the clock.

We ſubjoin an example of one day's computation, taken from the Greenwich Obſervations, 1809. The requiſite tables for theſe reductions, for aberration, preceſſion, nutation, have been given under Declination (Tables II. and III.), and for applying the error of the clock to each ſtar, the following table will be found very uſeful.

Table IV.

† The ſigns are reverſed in the reduction, becauſe apparent A.R. is deduced from the aſſumed mean A.R. In the other ſtars the mean A. R. is deduced from the apparent.

In the above example the mean right aſcenſion of α Aquilæ is aſſumed 19ʰ 41′ 21.″75 for January 1, 1807, and its apparent right aſcenſion is deduced 19ʰ 41′ 25.″58 by applying the corrections of Tables II. and III. The firſt of theſe include the effect of preceſſion, aberration, ſolar nutation, and proper motion peculiar to the ſtar; the ſecond gives the nutation, including the equation of the equinoctial point, ſo that the whole correction, when applied, gives the interval of ſidereal time that ſhould elapſe between the paſſage of the ſtar and that of the apparent equinoctial point; this interval is 19ʰ 41′ 25.″58; and if the A.R. of the ſtar be rightly aſſumed, it is the time which the clock ſhould mark at the interval of the tranſit; but the clock marked only 19ʰ 40′ 55.″74. The difference is 29.″84, which we call the error of the clock, and ſince its rate is — 0.28, we can, by means of the above table, calculate the error of the clock for every other ſtar. For inſtance Capella, the decimal multiplier of which is 0.39, which is to be multiplied by the daily rate, — 0.28 × 0.39 = .109, which added to 29.″84 = 29.95, the reduction correſponding to

Capella, or the quantity to be added to the obſerved tranſit to obtain the apparent right aſcenſion. The apparent right aſcenſions are next reduced to mean right aſcenſions for the beginning of the year by Tables II. and III. obſerving to apply the contrary ſigns to thoſe for α Aquilæ, becauſe now the mean place is to be deduced from the apparent, whereas we deduced the apparent place of α Aquilæ from the mean.

A ſeries of obſervations and calculations, ſimilar to the above, being continued for a great length of time, a catalogue is to be formed, which, ſuppoſing the inſtrument to be perfect, will be ſubject to no other error than that of the aſſumed right aſcenſion of α Aquilæ, and with this error every right aſcenſion will be affected.

The ſun is likewiſe to be obſerved during the whole of this proceſs, and its right aſcenſion deduced as in the above example, and which will be ſubject to the ſame common error as ſubſiſts in the right aſcenſions of the ſtars.

While this ſeries of obſervations is going on at the tranſit inſtrument, both the ſun and ſtars are to be obſerved aſſiduouſly with the mural quadrant, or any other inſtrument deſtined to the determination of polar diſtances. We need not enter into the details of this proceſs, as it has already been minutely deſcribed under DECLINATION, but ſhall proceed to conſider the uſe we are to make of the reſult.

With reſpect to the ſtars, it is evident that by this double inveſtigation we have determined their places accurately, both with reſpect to each other and to the equator, ſo that we might place them in their true poſitions on the celeſtial globe, provided no attention was required to be given to the ſituation of the ecliptic; and this would be the caſe, if the interſection of a meridian paſſing through α Aquilæ with the equator, had been aſſumed as an arbitrary point of departure in the ſame manner, as we aſſume a meridian paſſing through Greenwich or Paris on the terreſtrial globe, as a ſtandard to which terreſtrial longitudes are referred. But the great circle to which celeſtial longitudes are referred, is required to paſs through the equinoctial point: it is the exact poſition, therefore, of this point which we are in ſearch of, and which is to be determined by the data we are now ſuppoſed to have collected.

The continued ſeries of ſolar obſervations gives us the obliquity of the ecliptic, and the declination of the ſun at the moment of obſervation, from which its right aſcenſion may be eaſily deduced by the ſolution of a right-angled ſpherical triangle; but in making theſe computations, attention muſt be paid to the periodical oſcillations of the equator, and to the ſecular variation of the ecliptic itſelf; that is, the right aſcenſions muſt be calculated with the apparent obliquity, that they may be reckoned from the apparent or variable equinoctial point, in the ſame manner as thoſe determined by the tranſit inſtrument, and with which they are now to be compared.

We have thus obtained a ſolar theory independent of the fixed ſtars, and the poſition of the fixed ſtars independent of the poſition of the ecliptic. It now only remains to combine theſe operations, and to place the ecliptic in its due poſition with reſpect to the fixed ſtars; and this is done in the following manner.

We begin by comparing the right aſcenſions of the ſun determined by the tranſit inſtrument, with the right aſcenſions determined on the ſame day with the quadrant; and if they agree, it is a proof that the right aſcenſion of α Aquilæ was rightly aſſumed; if they differ, as will moſt probably be the caſe, we muſt proceed and endeavour to aſcertain both the quantity and the cauſe of the diſcordance.

If we conſider one ſingle inſulated obſervation, the diſcordance may ariſe either from an erroneous aſſumption in the right aſcenſion of α Aquilæ, or from ſome defect in our ſolar theory, or from ſome error in the obſervation from which the declination of the ſun has been inferred. Now, though it would be impoſſible to aſſign the true cauſe of the diſcordance from one ſingle compariſon, yet the whole ſeries will lead us to the truth, from this fortunate circumſtance, that whatever error any defect in the ſolar obſervations produces in any one obſervation, the ſame defect will produce an equal error, but with the contrary ſign, in an obſervation in which the ſun is 180 degrees from its firſt poſition.

In ſelecting obſervations thus circumſtanced, it muſt however be remembered, that although in theory we may determine the right aſcenſion of the ſun by trigonometrical calculation from any given declination, yet practically, no exactneſs can be expected, except when the change of declination is conſiderable, which only happens near the equinoxes. The exact limits in which the compariſon may without impropriety be made, muſt depend on the accuracy of the inſtruments, and on the confidence of the obſerver in the correctneſs of his obſervations. In general, the period ſhould not be extended to more than ſix or eight weeks on each ſide the equinox.

When the ſeries of obſervations is complete, the reſults are to be arranged and compared as in the following table:

		A.R. of the Sun as deduced from Tranſit Obſervations.	A.R. of the Sun as deduced from obſerved Declinations of the Sun.	Differ.			A.R. of the Sun, as deduced from Tranſit Obſervations.	A.R. of the Sun, as deduced from obſerved Declinations of the Sun.	Differ.	Sum.	Half ſum, or Error.

									Mean of 9, or Correction of Catalogue -		+ 1.572

Let us examine one compariſon, for the ſake of example, in the above table; for inſtance, March 5th. It appears, that on that day the right aſcenſion deduced from the quadrant obſervation differed + 8″.6 from that obſerved at the tranſit. Now it is preſumed, that a part of this error may be in the diviſions of the quadrant, or in the aſſumed latitude, or in the obliquity of the ecliptic: we, therefore, compare this reſult with its correſponding one, Oct. 11th, when we find the error to be − 5″.4; hence we infer, that 3.″2 only is to be attributed to the error of the tranſit obſervations, and that 1.″6, or the half, is the real error of the catalogue common to every ſtar; ſince, had that quantity been added, the poſitive and negative error would have been equal, and would have been therefore aſſigned altogether to the ſolar obſervations.

The beauty of Dr. Maſkelyne's method, which we have thus endeavoured minutely to deſcribe, conſiſts in this, that it is not only extremely independent of thoſe errors that are moſt likely to occur in a ſeries of ſolar obſervations, but that it is capable of furniſhing a clue to aſcertain both the amount and cauſe of thoſe errors. As this would lead us to an inveſtigation rather foreign to the preſent ſubject, we ſhall not at preſent enter into theſe conſiderations.

Secular variation in the longitude of the fixed ſtars.

When the longitudes and latitudes of a number of ſtars are determined for a given period, theſe are computed for any diſtant period, by applying the preceſſion of the equinoctial points, and likewiſe the ſecular variation for each particular ſtar, and for which purpoſe a very accurate table has already been given under Latitude. This ſecular variation ariſes from the real change of poſition in the ecliptic itſelf; inaſmuch as this affects the ſituation of the equinoctial point. The effect is common to all ſtars; and, therefore, this part of it only influences the quantity of the general preceſſion; but becauſe the poſition of the ecliptic is really changed among the conſtellations, each ſtar becomes referred to a new point.

Though the trigonometrical inveſtigation of the exact quantity of theſe changes is extremely complicated; yet the principle may be rendered ſufficiently intelligible, by recollecting that a change in the poſition of the equator diſturbing the equinoctial points, produces a change in the longitudes, right aſcenſions, and declinations, the latitudes only remaining the ſame. But a ſimilar change in the ecliptic produces a change in the longitudes, latitudes, and right aſcenſions, whilſt the declinations remain unaltered. In other words, the diſplacement of the equator affects every thing but the latitudes, and a diſplacement of the ecliptic every thing but the declinations.

On the methods of determining the poſitions of places on the ſurface of the earth, or their longitudes and latitudes.

The general nature of the problem having been already explained under Latitude; and ſeveral practical methods of determining the longitude having been deſcribed at great length under Chronometer and Degree; we have now to explain a variety of aſtronomical proceſſes which have been deviſed and brought to a great ſtate of perfection within theſe laſt fifty years. Longitude, being only a relative term, *to find the longitude of a place*, is, in fact, to determine the difference of the longitude of two given places. And here we may obſerve rather a curious circumſtance, which is, that though the problem is in its ſtatement purely geographical, yet it can only be ſolved by the aid of aſtronomy, except upon the hypothetical ſuppoſition of a trigonometrical meaſurement extended over the whole ſurface of the earth, or at leaſt over a great circle of its circumference. This being impoſſible, we muſt have recourſe to the general principle we have ſo often had occaſion to refer to in former aſtronomical articles. We ſuppoſe, at any given moment, every point of the convex ſurface of the earth correſponds with ſome point in the concave ſurface of the heavens, called its zenith; and as the angular diſtance is the ſame on each, by meaſuring the angular diſtance of the celeſtial arc, which is always acceſſible, we obtain the correſponding and equal angular diſtance of the terreſtrial arc, which otherwiſe would be practically impoſſible. Thus, for inſtance, one perſon at London, and another at Jamaica, have no means of knowing the exact proportion of the earth's circumference intercepted between them, except, indeed, by the inaccurate eſtimate of the length of a ſhip's track in ſailing from one place to another; but if, by ſome artifice, each could aſcertain, at any given moment, his zenith point in the heavens; then, as the angular diſtance of theſe zenith points could eaſily be meaſured, the correſponding terreſtrial arc would immediately be determined. Now to this, or ſome very ſimilar principle, may every proceſs for finding the longitude be referred.

The inveſtigation of the ſubject will be much ſimplified, if we ſuppoſe the equator, inſtead of being divided into 360 degrees, to be divided into 24 parts, and each part into 60, and ſubdivided again into 60. As each of theſe larger diviſions paſſes under a celeſtial meridian in one hour of ſidereal time, they are called hours to avoid circumlocution, though it is evident that a portion of a line cannot be an hour, or any part of time. But as the difference of meaſure will be expreſſed in the ſame terms as the difference of time, this mode of diviſion is extremely uſeful, and ſhews us at once, that to determine the difference of longitude between two places, is equivalent to determining the difference of apparent time that exiſts between two places at any one given inſtant. The moſt obvious way of accompliſhing this, is for two obſervers to watch ſome inſtantaneous phenomenon, and to mark the inſtant of apparent time at which each obſerved it. The inſtantaneous exploſion of a maſs of gunpowder is extremely well adapted for this purpoſe when the diſtance is not great, and has been ſucceſsfully employed in the ſouth of France, and in the north of Europe. It is evident that this method can only be employed for very limited diſtances: for places more remote, we are obliged to recur to the celeſtial phenomena, and we ſelect thoſe which have the greateſt reſemblance to the above, that is, which are the moſt inſtantaneous, and which appear the moſt nearly alike to two obſervers at the ſame actual inſtant of time. Unfortunately, there are none which unite theſe deſirable combinations of circumſtances. Eclipſes of Jupiter's ſatellites, and of the moon, unite them in a very conſiderable degree, and accordingly have been employed to great advantage, particularly in the early ſtate of geography, and in caſes where the ſituation of the place was previouſly unknown.

An occultation of a fixed ſtar is a very inſtantaneous phenomenon, but it is not ſeen at the identical inſtant of actual time by each obſerver; for, from the vicinity of the moon and its conſequent parallax, it may to one obſerver appear to paſs over a fixed ſtar, when to another it may appear to paſs entirely over or under it: hence, even in the caſe where an occultation is obſerved by two perſons, the difference of longitude cannot be inferred by ſimply noting the difference of time at which the phenomenon happened to each obſerver. This defect, however, may be completely ſupplied by calculation, and therefore it is juſtly conſidered as one of the moſt accurate methods that can poſſibly be deviſed. We ſhall refer our readers to aſtronomical writers for examples of the various methods: our object at preſent is only to give a ſketch of the different principles on which they are founded.

The longitude of a place on land may likewiſe be found with conſiderable exactneſs, by obſerving the paſſage of the moon over the meridian, and comparing it with the paſſage obſerved in ſome fixed obſervatory. A much greater accuracy will be obtained by this method, if ſeveral ſucceſſive tranſits of the moon be taken at either place of obſervation, as then the motion of the moon in right aſcenſion will be obtained without the aid of calculation: but it will be requiſite to attend to the equation of ſecond differences, and even then the irregularity of the moon's motion in 24 hours is ſo great, that a very ſenſible error may ſtill remain uncorrected.

Several writers, in explaining this method, appear to have fallen into a miſconception of the ſubject, by confounding together the retardation of the moon in 24 hours, with the real retardation obſerved between two ſucceſſive tranſits, and which latter ſhould evidently be uſed in calculating the proportional retardation correſponding to a given difference in longitude. Suppoſe, for inſtance, for the ſake of rendering the ſubject as intelligible as poſſible, that the motions of the ſun and moon were perfectly uniform and in the equator, and that they both paſſed the meridian of Greenwich at mean noon (which would, according to our ſuppoſition, be the ſame as apparent noon); ſuppoſe that the next day the moon paſſed the meridian of Greenwich at 1^h after noon. It is evident that the retardation would be one hour in *twenty-five* hours. On the oppoſite meridian the moon will paſs at $0^h\ 30'$, at which inſtant it will be $12^h\ 30'$ mean time at Greenwich, or the half of 25 hours, this being the proportion of time anſwering to a retardation of $30'$. In general, the attention of the calculator ſhould be directed to finding the mean time at Greenwich, and to compare with this the mean time at the place of obſervation. The reader, who wiſhes to ſee more on this particular method, may conſult a paper by Mr. Gavin Lowe in the 15th vol. of Tilloch's Philoſophical Magazine.

Hitherto we have ſuppoſed two obſervations made by two obſervers, one at each place, whoſe difference of longitude with the other is to be determined; but it is evident that this is impracticable in many caſes, and particularly in the one of the greateſt importance, namely, when the object is to determine the longitude at ſea. Here the mariner muſt be ſupplied with one calculated or ſuppoſed obſervation, inſtead of one really obſerved. The difficulty to be ſurmounted in this caſe is extremely great: of the immenſe number of methods more or leſs plauſible that have been ſuggeſted, two only are in uſe at preſent, the one by the means of a *chronometer*, already explained at great length under that article; the other the lunar method, which has been gradually improved by the labour of ſucceeding aſtronomers, from the time it was firſt ſuggeſtd, many years ago, to the preſent moment, when it is brought ſo near perfection, that no reaſonable hope can be entertained of any very conſiderable improvement.

The early navigators had no means of eſtimating their longitude but by the computed run of the ſhip; and the dangers they incurred by this inaccurate method, were ſufficient to convince every enlightened government, particularly of maritime ſtates, of the importance of encouraging, to the utmoſt effort of human ingenuity, what could be directed to the improvement of this defective ſtate of navigation.

The early ſpeculations of aſtronomers were of but little practical utility to the navigation of thoſe times. In the 16th century, eclipſes of the moon were ſtrongly recommended; but they happened very ſeldom, and were too inaccurately computed to be of any great uſe. Perhaps, now and then, the approximate longitude of an almoſt unknown country, where a mariner might accidentally be on ſhore, was computed by this method, but to determine the place of a ſhip it was perfectly inadequate.

Philip III. of Spain, in 1598, offered an hundred thouſand crowns; and the ſtates of Holland, at the beginning of the ſeventeenth century, propoſed a reward of thirty thouſand florins to the perſon who ſhould be fortunate enough to ſolve this difficult and important problem. In 1635, John Morin, profeſſor of mathematics at Paris, propoſed a method of reſolving it to cardinal Richelieu, extremely ſimilar to the lunar method now in uſe; but it was rejected as of no practical utility: and indeed, at that period, neither the lunar tables were of ſufficient accuracy, nor the nautical inſtruments delicate enough to render the lunar method very promiſing. However, though the commiſſioners, who were appointed to examine this method, judged it inſufficient, on account of the imperfection of the lunar tables, cardinal Mazarin, in 1645, procured for him a penſion of 2000 livres.

Many attempts were founded on the theory of the magnetic variation; but none of theſe ſucceeded. It was the general opinion of aſtronomers, that the moon's motion was the moſt promiſing phenomenon to ſelect; but long after the idea was firſt ſuggeſted, neither lunar tables nor inſtruments were ſufficiently exact to render any method, founded on this theory, practically uſeful. Still, however, there was a rational hope that theſe difficulties might be overcome.

The firſt perſon who recommended the inveſtigation of the longitude, from obſerving the diſtance between the moon and ſome ſtar, is ſaid to have been John Werner, of Nuremberg, who printed his annotations on the firſt book of Ptolemy's Geography, in 1514: Peter Apian, profeſſor of mathematics at Ingolſtadt, in 1524; Oronce Fine, of Briançon, about 1530; Gemma Friſius, at Antwerp, in 1530; Nonius or Pedro Nunez, in 1560; and Kepler, in 1630; all ſuggeſt and recommend the ſame method. In 1675, king Charles II. erected the obſervatory at Greenwich, and appointed Mr. Flamſteed his aſtronomical obſerver, with this expreſs command, that he ſhould apply himſelf with the utmoſt care and diligence to the rectifying the table of the motions of the heavens, and the places of the fixed ſtars, in order to find out the ſo much deſired longitude at ſea, for perfecting the art of navigation. To the fidelity and induſtry with which Mr. Flamſteed executed his commiſſion, we are in a great meaſure indebted for that curious theory of the moon, which was afterwards formed by the immortal Newton. This incomparable philoſopher made the beſt uſe which human ſagacity could make of the obſervations with which he was furniſhed; but, as theſe were interrupted and imperfect, the difference of ſir Iſaac's theory from the heavens would ſometimes amount at leaſt to five minutes. Dr. Halley employed much time on this ſubject; and a ſtarry zodiac was publiſhed under his direction, containing all the ſtars to which the moon's appulſe can be obſerved: but for want of proper inſtruments and correct tables, he could not proceed in making the neceſſary obſervations. In a paper on this ſubject he expreſſes his hope, that the inſtrument juſt invented by Mr. Hadley might be applied to taking angles at ſea with the deſired accuracy. (See Phil. Tranſ. N° 421.) This great aſtronomer, and after him the abbé de la Caille, and others, have reckoned the beſt aſtronomical method of finding the longitude at ſea, to be that wherein the diſtance of the moon from the ſun, or from a ſtar, is uſed; for the moon's daily mean motion being about thirteen degrees, her hourly mean motion is about half a degree, or one minute of a degree in two minutes of time; and ſo an error of one minute of a degree in poſition will produce an error of two minutes in time, or half a degree in longitude: and if by obſervation it is determined what part of her daily motion the moon has run through during the interval between a certain point of time under a known meridian, and the inſtant of time when the obſervations are made on her, under an unknown meridian, then her daily motion at that time will have, to the part thereof determined by obſervation, the ſame ratio which twenty-four hours has to the interval of time taken to deſcribe that arc.

It was in the year 1714 that the parliament of Great Britain firſt began to conſider this queſtion as an object of national concern. And the loſs of ſir Cloudeſly Shovel's fleet ſeems to have had ſome effect in drawing their attention to this ſubject; at leaſt, if we may judge from the following document, copied from a manuſcript in the Royal Obſervatory, ſigned by thoſe well-known perſonages, William Whiſton and Humphrey Ditton. It appears to have been one of the many petitions preſented to the houſe of commons on this occaſion.

Reaſons for a Bill, propoſing a Reward for the Diſcovery of the Longitude.

I. This bill is unexceptionable, becauſe it is general, and not confined to any one project, perſon, or method; but gives equal hopes to all judicious propoſers whatſoever.

II. Becauſe in this bill no money is inſiſted on, before any method for the diſcovery of the longitude is, upon trial, actually found practicable and uſeful.

III. Becauſe ſir Iſaac Newton's own paper, delivered into the Committee, gives hopes that the known method by the theory of the moon, which is hitherto not exact enough, may, upon due encouragement, in time be brought to perfection.

IV. Becauſe the method now propoſed is owned by all, to whom it has been communicated, to be certainly *true in theory:* it cannot, therefore, be fit to have it concealed, even though it were not yet known to be practicable; becauſe, in that caſe, future improvements might ſtill make it ſo.

V. Becauſe its great uſe at land and in geography is indiſputable, and was diſtinctly obſerved by ſir Iſaac Newton and Dr. Halley, upon the firſt propoſal of this method to them: and we beg leave to ſay, that this uſe alone is *ſo great and extenſive,* that if there were no other, it would highly deſerve the encouragement of the public.

VI. Becauſe another great uſe is alſo undoubted, *viz.* for all places in the narrow ſeas, and within about 100 miles of all ſhores and iſlands; that is, for all places where ſhips are in the greateſt danger, as ſir Iſaac Newton owned to the committee; ſo that if this method extended no farther, yet it would highly deſerve the public encouragement.

VII. Becauſe there is little or no reaſon to doubt of its uſe at any place at ſea, even where ſhips are allowed to be in the leaſt danger; ſince, in the moſt doubtful caſe of all, ſir Iſaac Newton has, in his paper delivered to the committee, propoſed an effectual remedy, as will be clearly underſtood, when the method itſelf is known to the world.

VIII. Becauſe this method will ſave the nation great ſums of money, which the want of it does now occaſion, as will appear upon trial.

IX. Becauſe the charges of it will be inconſiderable, in compariſon of the advantage, as will alſo fully appear upon trial.

X. Becauſe it will prevent the loſs of abundance of ſhips and lives of men; as it would certainly have ſaved all ſir Cloudeſly Shovel's fleet, had it then been put in practice.

XI. Becauſe it is eaſy to be underſtood and practiſed by ordinary ſeamen, without the neceſſity of any puzzling calculations in aſtronomy.

And we take leave to recommend the learned Savilian profeſſor of geometry at Oxford, Dr. Halley, as the fitteſt perſon in the world for the trial, and practice, and improvement of this method; and do hereby declare, that we are willing that he go equal ſhares with us in the reward, if he pleaſe to undertake ſo uſeful a work, and the public pleaſe to make that reward equivalent to the great dignity and importance of the diſcovery.

June 10, 1714.
Will. Whiston.
Humphrey Ditton.

Accordingly an act was paſſed in this year, 1714, in the Britiſh parliament, appointing and empowering certain commiſſioners to make out a bill for a ſum not exceeding 2000*l.* towards making neceſſary experiments; and alſo granting a reward to the perſon who ſhould diſcover the longitude at ſea, proportioned to the degree of accuracy that might be attained by ſuch method; *viz.* a reward of 10,000*l.*, if it determines the ſame longitude to one degree of a great circle, or ſixty geographical miles; 15,000*l.*, if it determines the ſame to two-thirds of that diſtance; and 20,000*l.*, if it determines it to half that diſtance. It is added, that one moiety or half part of ſuch rewards or ſum ſhall be due and paid when the ſaid commiſſioners, or the major part of them, do agree that any ſuch method extends to the ſecurity of ſhips, within eighty geographical miles from the ſhores, which are places of the greateſt danger; and the other moiety or half part, when a ſhip, by the appointment of the ſaid commiſſioners, or the major part of them, ſhall thereby actually ſail over the ocean, from Great Britain to any ſuch port in the Weſt Indies as thoſe commiſſioners, or the major part of them, ſhall chuſe or nominate for the experiment, without loſing her longitude beyond the limits above mentioned. 12 Ann. cap. 15. See alſo ſtat. 14 Geo. II. cap. 39. 26 Geo. II. cap. 25. By ſtat. 14 Geo. III. all former acts concerning the longitude at ſea are repealed, except ſo much of them as relates to the appointment and authority of the commiſſioners thereby conſtituted, and alſo ſuch clauſes as relate to the conſtructing, printing, publiſhing, &c. of nautical almanacs, and other uſeful tables; and it is enacted, that any perſon, who ſhall diſcover any method for finding the longitude by means of a time-keeper, ſhall be entitled to the propoſed reward, as we have already ſtated under the article Chronometer; which ſee.

From the very conſiderable improvements made by ſir Iſaac Newton in the theory of the moon, and more lately by M. Euler, and others on his principles, Mr. Tobias Mayer, profeſſor of Gottingen, was enabled to calculate lunar tables more correct than any that were before publiſhed, and he has ſucceeded ſo far as to give the moon's place within one minute of the truth. This has been proved by a compariſon of the tables with the obſervations made at the Greenwich obſervatory by the late Dr. Bradley, and by Dr. Maſkelyne. Theſe tables, for which the widow of Mr. Mayer was rewarded by the Britiſh parliament, were publiſhed in 1770, by Dr. Maſkelyne, by order of the commiſſioners of longitude. Dr. Maſkelyne, in his voyage to St. Helena, in 1761, made uſe of theſe tables, and found them to anſwer for the diſcovery of the longitude, within a degree; and in order to facilitate the general uſe of them, he propoſed a nautical ephemeris, the ſcheme of which was adopted by the commiſſioners of longitude, and firſt executed in the year 1767; and the publication has been regularly continued ever ſince. But as the rules that were given in the appendix to one of thoſe publications, for correcting the effects of refraction and parallax, were deemed too difficult for general uſe, they were reduced to tables: ſo that by the help of the ephemeris, theſe tables, and others that are provided, the calculations relating to the longitude, which could not be performed by the moſt expert mathematician in leſs than four hours, may now be completed with greater eaſe and accuracy in half an hour. Dr. Maſkelyne obſerved, that the error of Mr. Mayer's laſt lunar tables ſcarce ever exceeds 1′ at the moſt, and ſeldom amounts to 20″; and, therefore, the uncertainty hence ariſing in the determination of the longitude, can ſcarcely exceed half a degree, and generally will not exceed ten miles.

We obſerve, in general, with regard to the hiſtorical part of this article, that when Hadley had invented the quadrant, or octant, which ſtill bears his name, and when Mayer had brought the lunar tables to an unexpected degree of preciſion, aſtronomers of every nation began to conceive the moſt rational hopes, that, by gradual improvement, this method would at laſt be found to equal the moſt ſanguine expectation.

Thoſe who firſt attempted to practiſe it had to ſtruggle with great difficulties; and the requiſite calculations were ſo formidable, that none but aſtronomers, or at leaſt very able calculators, could poſſibly attempt them.

The late aſtronomer royal, Dr. Maſkelyne, practiſed this method with the greateſt ſucceſs; and it is to him this country is indebted for ſome of the greateſt improvements that have been made. It was he who firſt propoſed and ſuperintended the conſtruction of the Nautical Almanac, which relieves the calculator from all the very laborious part of the proceſs; and the remaining part of the computation has been ſo ſimplified by ſucceſſive improvements, both in the formulæ and conſtruction of tables, that, at preſent, the neceſſary obſervations may be both made and computed by any mariner, who has received a tolerably good nautical education.

As the practical methods of making and computing a lunar obſervation are given at great length in every nautical book, we ſhall confine ourſelves to explaining the general nature and object of the problem, and refer the reader to profeſſed treatiſes on navigation for farther information. In Mackay's treatiſe on the Longitude, the reader will find ſome excellent methods of ſolving both this and a variety of other nautical problems, accompanied by very uſeful tables. Mendoza's tables contain his own valuable method of computing a lunar obſervation, beſide general tables for every nautical purpoſe. The requiſite tables are well known, and are in the hands of every navigator.

Explanation of the principles of the method by which the longitude is found at ſea, by obſerving the diſtance of the moon from the ſun, or a given fixed ſtar.

The requiſite data for determining the longitude at ſea, by the lunar method, are the apparent diſtance of the centre of the moon from the centre of the ſun or ſtar, and the apparent altitude of the centres of each at the moment of obſervation. Hence three obſervers are uſually employed: one obſerves the diſtance between the ſun and moon, one the altitude of the ſun, and the other the altitude of the moon. When this cannot be done, the place of the other two may be ſupplied by computation.

By means of lunar tables, the exact diſtance of the moon from the ſun or ſtar is computed for every three hours, for the meridian of Greenwich. We are not, however, to ſuppoſe that theſe diſtances are ſuch as the moon and ſun would *appear* to have at Greenwich; but ſuch as they would appear to an obſerver at the centre of the earth. It is for *Greenwich time* only that they are computed; a circumſtance not ſufficiently inſiſted upon by elementary writers on this ſubject. From theſe tables (of the Nautical Almanac) it is eaſy to infer the diſtance for any intermediate interval: a ſimple proportion will be ſufficient for this purpoſe. We may therefore conſider ourſelves as in poſſeſſion of an inſtantaneous phenomenon, anſwering to every inſtant of time at Greenwich; ſince the diſtance of the ſun and the moon are never the ſame for two ſucceſſive inſtants of time. Now if we conſider the converſe of this propoſition, it is equally evident, that if we have given the diſtance of the moon from the ſun, as ſeen from the centre of the earth; we can, by the ſame tables, infer the exact time at Greenwich correſponding to this diſtance. Now the object of a lunar obſervation is to determine this diſtance at a given moment of actual time, to aſcertain the apparent time at this moment for the meridian of the obſerver, and to compare it with the moment of Greenwich time, which is to be inferred from the given diſtance. Now the difficulty of the proceſs ariſes from this circumſtance, that ſince, to an obſerver on the ſurface of the earth, the moon appears always depreſſed by the effect of parallax, and the ſun elevated by the effect of refraction, the angular diſtance obſerved with a ſextant, or any other inſtrument, is not the ſame as the diſtance ſeen from the centre of the earth, and for which alone the nautical tables are calculated. Hence a ſpherical computation becomes neceſſary. Two caſes of oblique ſpherical triangles muſt be computed, before the obſerved diſtance can be corrected, and the true diſtance aſcertained.

The general nature of the problem may be more eaſily underſtood by a reference to the figure (*Plate* XVII. *Aſtronomy*, *fig.* 1.), which is a projection of the ſphere on the plane of the meridian: ☽ ⊙ is the obſerved or *apparent diſtance* of the ſun and moon; Z ☽ is the zenith diſtance of the moon; Z ⊙ that of the ſun; m is the true place of the moon, when corrected for refraction and parallax, which together tend to *apparently* depreſs it; s is the true place of the ſun, when corrected by refraction and parallax, which together tend apparently to elevate it: for the moon's parallax is always greater than the refraction, the ſun's always leſs. For a ſtar, the ſimple correction for refraction is all that is required.

We have now, therefore, given three ſides in the triangle Z ⊙ ☽, and two ſides (*viz.* Z m, Z s) in the triangle Z ms.

In the triangle Z ⊙ ☽, the angle Z may be found from the three given ſides; and then with Z m, Z s, and the included angle Z found above, ms, or the true diſtance, may be obtained.

To ſhorten the ſolution of this problem, and to reduce it within the compaſs of a mariner's ordinary powers of computation, has been an object with the firſt geometricians in Europe. It would lead us much beyond our limits to give a hiſtory of the numerous ſolutions that have been propoſed. The French mathematicians, probably not having a great facility of conſtructing tables, have directed their attention chiefly to ſuch methods as require only the common tables of logarithms. In our own country, where the board of longitude is always ready to publiſh any uſeful tables that may be approved, thoſe methods and formulæ have been in general preferred, which admitted of the ſhorteſt ſolution by means of tables. In this reſpect, a progreſſive ſeries of improvement has taken place ſince the firſt introduction of the method; and a ſkilful mariner will now compute the true diſtance from the apparent in five minutes, when formerly as many hours were required.

Beſides the methods founded on a direct trigonometrical ſolution, there are many (ſuch as Lyon's and Dr. Maſkelyne's) which are founded on rather a different principle. The ſmall triangle ☽ mm' is computed as if a plane one, ☽ m' being the effect of the total depreſſion of the moon in changing the diſtance: a ſimilar triangle is formed for computing the effect of refraction for the ſun or ſtar. Various formulæ have been deduced from each of theſe principles, for the inveſtigation of which the reader may conſult Cagnole's Trigonometry, and various volumes in the Connoiſſance des Temps. A very clear and ſcientific inveſtigation of all theſe methods was given by Mr. Mendoza, in the Philoſophical Tranſactions for 1797.

To enable the reader to judge of ſome of the moſt approved of theſe, we ſhall give a ſolution of the ſame problem by a variety of different ways.

Given Apparent altitude ⊙	-	32° 34′ 47″
Apparent altitude ☽	-	39 3 4
Apparent diſtance ⊙ ☽	-	86 10 19
Horizontal parallax	-	0 58 28

Required the true diſtance.

The firſt example we ſhall give is the method of Borda, which is in general uſe among the more ſkilful of the French navigators.

The formula is as follows:

$$\text{Let } \frac{1}{\text{coſ. } \frac{1}{2}(A+H)} \cdot \sqrt{\frac{\text{coſ. } \frac{1}{2}(d+a+b)\ \text{coſ. } \frac{1}{2}(d \backsim (a+b))\ \text{coſ. } A\ \text{coſ. } H}{\text{coſ. } a\ \text{coſ. } b}} = \text{ſin. } N.$$

Then $\text{ſin. } \frac{1}{2} D = \text{coſ. } \frac{1}{2}(A+H)\ \text{coſ. } N.$

In which A = true altitude of ☽
a = apparent altitude of ☽
H = true altitude of ⊙
b = apparent altitude of ⊙
d = obſerved or apparent diſtance ⊙ ☽
D = true diſtance required.

Example I.—Borda's Method.

Apparent diſtance ⊙ ☾ -	86° 10′ 19″			
Apparent altitude ⊙ -	32 34 47	Com. ar. log. coſ.	0.0743564	
Apparent altitude ☾ -	39 3 4	Com. ar. log. coſ.	0.1098114	
Sum - -	157 43 10			
Half ſum - -	73 54 5	—— log. coſ.	9.2844266	
Diſtance half ſum -	7 16 14	—— log. coſ.	9.9964940	
Corrected altitude ⊙ -	32 33 25	—— log. coſ.	9.9257539	
Corrected altitude ☾ -	39 47 18	—— log. coſ.	9.8855952	
Sum - -	72 20 43	Sum -	39.2764375	
		Half ſum	19.6382187	Diff. 9.7312148, which is the log. ſin. N.
Half ſum - -	36 10 21.5	—— log. coſ.	9.9070039	
		Log coſ. N. -	9.9256221	
		Sum log. ſin. of the	9.8326260	
		Half diſtance -	42° 51′ 29″	
		True diſtance -	85 42 58	

When Callet's Logarithms are uſed, much labour may be avoided, by taking the neareſt multiple to 10″ in the apparent diſtance and making an equal alteration in the reſult. In the above example, the diſtance for calculation might be 86° 10′ 20″; and then one ſecond ſhould be deducted from the reſult, which would have been 85° 42′ 59″.

Example II.—According to the method given by Dr. Maſkelyne in the Preface to Taylor's Logarithms. Let the apparent altitude of the moon's centre be 39° 3′ 4″, that of the ſun 32° 34′ 47″; their apparent diſtance 86° 10′ 19″, and the moon's horizontal parallax 58′ 28″. Required the true diſtance of the ſun and moon.

☽'s horizontal parallax - - -	0° 58′ 28″	Log. ſine - - -	8.23061
☽'s apparent altitude - - -	39 3 4	Log. coſine - -	9.89019
☽'s parallax in altitude - -	0 45 24	Log. ſine - -	8.12080
☽'s refraction from Table I. - -	− 1 10

				Aux. arg.	20 22
Apparent diſtance - -	86 10 0	No. 3.	33820		
	85 42 38.5	No. 4.	25207		
Seconds reſerved	19.		021		
True diſtance	85 42 57.5		186		

This method is not only extremely ſhort and eaſy, but is exempt from any poſſible confuſion of ſigns, all the corrections being additive. It is really ſo perfect, that it ſhould ſuperſede every other now in uſe.

Mr. Mendoza's formula is

$$\text{Sin. ver. } D + 4 = \left\{ \begin{array}{ll} \text{ſin. ver. } (A + H) + \text{ſin. ver. } (d + M) + \text{ſin. ver. } (d \backsim M) & = P \\ + \text{ſin. ver. } (a + h + M) + \text{ſin. ver. } ((a + h) \backsim M) & = Q \end{array} \right.$$

$$2 \text{ coſ. } M \text{ being taken} = \frac{\text{oſ. } A \ \text{ coſ. } H}{\text{coſ. } a \ \text{ coſ. } h}$$

The operation performed by his tables is as follows:

Obſerved altitude ⊙ - - -	h	
Ditto ☽ - - -	a	
Sum - - - -	$a + h$	
With h in Table VI. take -	$60' - r + p$	r = refract. p = parallax.
—— d - take M and -	$r - p$	
The ſum - - -	A + H	

With $(a + h)$ and M in Table XI.	take Number	I = Q
—— (A + H) - - XI.	- - .	II = ſin. ver. (180° − (A + H) − 59′)
—— d and M - - XI.	- -	III = ſin. ver. $(d + M)$ + ſin. ver. $(d \backsim M)$

The ſum or number IV = ſin. ver. D + 4 = I + II + III = IV

Example V.

By the method propoſed in the Appendix of the requiſite Tables publiſhed by Dr. Maſkelyne a very ſhort time before his death. A very good table of verſed ſines accompanies it.

The apparent diſtance of the moon's centre from the ſun's centre being 86 10′ 19″; the apparent altitude of the ſun's centre 32° 34′ 47″; the apparent altitude of the moon's centre 39 3′ 4″; and the moon's horizontal parallax 58′ 28″; required the diſtance of their centres.

☽'s horizontal parallax	0° 58′ 28″		
⊙'s apparent altitude	32 34 47	− 1′ 22″	45′ 36″ whole correction.
☽'s apparent altitude	39 3 4	+ 44 14

0.2883 pr. log.	1 32 41			+ 5′ 27″¾ =	1,5179
0.7405 = prop. log.	— 32′ 43″ + 5 27¾		— 27 15¼		
			85 43 3¾		

This method, by a ſmall ſet of tablets, has lately been publiſhed by Mr. W. Garrard, of the Naval Aſylum, Greenwich.

There is a formula in Keith's Trigonometry, which might be ſimplified and reduced to the following method.

Apparent diſtance 86° 10′ 19″	-	Nat. coſ.	066762			
Difference of apparent altitudes	-	Nat. coſ.	993629			
		Difference	926867	-	Log.	5.9670174
Log. diff., or reſerved logarithm, Table IX. reg. tab. or Table XLII. of Mackay	- - - -			-	Log.	9.9955169
		Nat. num.	917349	-	Sum	5.9625343
Difference of true altitudes	- -	Nat. coſ.	992043			
True diſtance 85° 42′ 59″	-	Nat. coſ.	074694			

In this example the log. diff., taken from Mackay's Table XLII. is ſubſtituted for the following logarithms, which are uſed by the author, and are indeed common to all the formulæ of this nature.

Log. ſecant of apparent altitude ⊙	0.0743564
Log. ſecant of apparent altitude ☽	0.1098114
Log. coſine of true altitude ⊙	9.9257539
Log. coſine of true altitude ☽	9.8855952
Sum	9.9955169

This ſum is the reſerved logarithm of Requiſite Tables, and that of Table XLII. of Mackay.

Another Example by Borda's method.

Apparent diſtance ⊙ ☽ - - 108° 42′ 3″
Exceſs of this diſtance above the reduced 14 22

Diſtance reduced ⊙ ☽ - - 108 27 41

The only advantage of this method is that it requires only a table of logarithms to five places.

The true diſtance being thus determined, it only remains to find the correſponding time at Greenwich, and to compare it with that found on board the ſhip. This latter may be found from the altitude of the ſun at the moment of obſervation: but it may happen that the ſun is not favourably ſituated at this moment, in which caſe, and indeed generally, the time had better be deduced from ſolar obſervations made expreſsly for the purpoſe; and which, with a good chronometer, may even be made two or three days before or after the obſervations for the longitude, if cloudy weather ſhould prevent others being made at a ſhorter interval; only it muſt be remembered, that the deduced longitude will correſpond with that of the place where the error of the chronometer is determined, and not for the place of obſervation.

The inſtruments uſed for theſe lunar obſervations are ſextants and reflecting circles. Under CIRCLE we have already deſcribed the reflecting circle of Mr. Troughton's conſtruction, which we conceive to be vaſtly ſuperior to any ſextant for obtaining with accuracy the angle ſubtended by the moon and ſtar. As each obſervation has three readings, two obſervations (one on each ſide) of zero, give ſix reſults. This inſtrument, in the hands of a careful obſerver, will not give a greater error than 20″, or about ten geographical miles at the equator. The error of the lunar tables may amount to about as much more, and an error in the altitudes and other data, about the ſame quantity. Should all theſe conſpire to produce a total error in the ſame direction, this total error would amount to 60″, or 30 miles. We truſt, therefore, that the advantage and importance of this method will every day be more and more appreciated; and that the time will come when no naval officer or mariner of tolerable education will be found ignorant of it. With Mendoza's tables, a circle of the above deſcription, and a good chronometer, the longitude may always be determined within thirty miles, and generally within leſs.

Some perſons ſtill prefer ſextants, from an opinion that they derive ſome advantage from length of radius; but they are ſubject to errors which have no tendency to correct each other, and ſhould only be uſed for the altitudes, and the circle to be taken in preference for the obſervations of the diſtance. When circumſtances do not admit of three obſervers, the altitudes of the ſun and moon may be computed, and we are diſpoſed to think that this would always be the more preferable method, where the obſerver is ſufficiently ſkilful to make the additional computation without fear of miſtakes. The altitudes found in this caſe by computing the horary angles are the true altitudes, and muſt be corrected by applying the refraction and parallax *inverſely*, but for doing this accurately, tables ſhould be computed for reducing *true diſtances* to *apparent*. However, a little attention to this circumſtance will render the whole operation ſufficiently eaſy, and if the computations are well made, the accuracy of this method will probably exceed that of direct obſervation. For the method of making theſe computations, ſee Mendoza's Tables, Requiſite Tables, &c. Mackay's Longitude, &c. &c.

LONGITUDE.

A Table containing the Latitudes of Places, with their Longitudes from the Meridian of the Royal Obſervatory at Greenwich; alſo the Time of High Water at the Full and Change of the Moon, at thoſe Places where it is known.

LONGITUDE.

A Catalogue of the Longitudes and Latitudes of Six Hundred fixed Stars, with the Angle of Poſition of each Star, adapted to the Beginning of 1800.

N. B. This Catalogue is taken from the Connoiſſance des Temps l'An. XII. and was calculated from the French Annual Catalogue, by M. Chabrol.

Longitude, *Angle of.* See Angle.

Longitude, *Argument of.* See Argument.

Longitude, *Circles of.* See Circle.

Longitude, *Degrees of.* See Degree.

Longitude, *Parallax of.* See Parallax.

Longitude, *Refraction of.* See Refraction.

Longitude *of Motion,* is uſed by Dr. Wallis for the meaſure of motion, eſtimated according to the line of direction; on which principle, longitude of motion is the diſtance, or length, which the centre of any moving body runs through, as it moves on in a right line.

The ſame author calls the meaſure of any motion, eſtimated according to the line of direction of the vis motrix, the *altitude* of it.

Bellini alſo uſes the terms longitude and altitude in the ſame ſenſe, in many places of his writings, which an ordinary reader finds hard to underſtand, for want of this interpretation. By *altitude* alſo in his 19th propoſition De Febribus, he makes the thickneſs of the viſcid matter in the blood-veſſels; or the greateſt length a viſcid particle is extended into, from the ſide of a canal to its axis.

LONGITUDINALIS Sinus, a name given to two of the venous cavities of the dura mater; they are diſtinguiſhed by the epithets ſuperior and inferior. See Vein.

LONGJUMEAU, in *Geography*, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Corbeil; 10 miles S. of Paris. The place contains 1434, and the canton 13,650 inhabitants, on a territory of 47½ kiliometres, in 25 communes.

LONGNESS Point, a cape on the S. coaſt of the Iſle of Man; 10 miles S.S.W. of Douglas.

LONGOBARDO, a town of Naples, in Calabria Citra; 10 miles S.W. of Coſenza.

LONGOBUCO, a town of Naples, in Calabria Citra; 14 miles S. of Roſano.

LONGOMONTANUS, Christian, in *Biography*, an eminent Daniſh aſtronomer, ſon of a labouring peaſant, was born at Longomontium, a village in Jutland, whence he took his ſurname, in the year 1562. His father was anxious to afford him a good education, but dying before he was eight years of age, he was committed to the care of an uncle, who finding the expence devolved on him by the lad more than he could bear, adviſed him to return to his mother, and to earn his living by the ſweat of his brow. The youth, who ſhewed a great inclination for learning, was mortified at the propoſal, but not wholly diſheartened; he returned to the labours of an agricultural life, and at the ſame time improved every leiſure moment in acquiring uſeful knowledge. At length he was driven, by the jealouſies of his brothers, to quit his home, and he ſought an aſylum at Wiburg, where there was a college. Here he ſpent eleven years, and made great progreſs in the mathematical ſciences, though he was at the ſame time obliged to ſupport himſelf by his induſtry. From Wiburg he went to Copenhagen, and became an aſſiſtant to Tycho Brahe, with whom he continued eight years. During this perod, he afforded Tycho much aſſiſtance in obſerving the heavens and in his calculations, and was ſo accurate and laborious, and at the ſame time ſo ſkilful, that he became the confidential friend of that great man. At length he returned to his native country, with the higheſt recommendations from Tycho, who furniſhed him with money to defray the expences of ſo long a journey. He travelled through Poland, in order that he might have a ſight of the place which witneſſed Copernicus's aſtronomical labours. At Copenhagen he met with a noble-hearted patron in the chancellor Chriſtian Friis, who afforded him an honourable employment in his family. In 1605 he was nominated to a profeſſorſhip of mathematics in the univerſity of Copenhagen, a ſituation which had ever been the object of his higheſt ambition, and for which his genius and talents peculiarly qualified him; and he diſcharged the duties of it with the greateſt ability, and higheſt reputation, till his death, which took place in 1647, when he was about the age of eighty-five. He was author of many valuable works, of which the moſt diſtinguiſhed is entitled "Aſtronomia Danica," which contains all the great diſcoveries of Regiomontanus, Purbach, and Tycho Brahe. The titles of his other works are given in Hutton's Dictionary. Obſcure as his native place and father were, he contrived to immortalize both, by taking his name from the village, and in the title-page to ſome of his works, calling himſelf Severini filius, his father's name being Severin, or Severinus.

LONGOTOMA, in *Geography*, a town of Chili, on the N. ſide of a river of the ſame name, that runs into the Pacific ocean, S. lat. 31° 30′. The town is diſtant 84 miles S. from Coquimbo.

LONGSPIEL, a very ancient muſical inſtrument, found by ſir Joſeph Banks and Dr. Solander in Iceland, when they viſited that country in 1773. This inſtrument, of a long and narrow form, and ſtrung with four ſtrings of copper, is extremely rude and clumſy. One of the four ſtrings is uſed as a drone, the reſt are played with a bow. Pieces of wood are placed at different diſtances on the finger-board, to ſerve as frets. It ſeems, indeed, to have been the primitive idea of a fiddle, and is a proof that the uſe of the bow, that wonderful engine, which the ancients, with all their ingenuity and muſical refinements, had never been able to diſcover, and which has been rendered ſo miraculous, was known by the Scalds in Iceland, at leaſt as early as in any other part of Europe. See Scalds.

LONG-TAN, in *Geography*, a town of Corea; 42 miles S. of Hetſin.

LONG-TCHANG-CHING, a town of China, in Chang-tong; 15 miles E. of Tci-nan.

LONG-TCHIAN, a mountain of Thibet. N. lat. 27° 48′. E. long. 86° 39′.

LONG-TCHUEN, a town of Corea; 55 miles W.N.W. of Han-tcheou.

LONGTOWN, a market town in the pariſh of Arthuret and ward of Eſkdale, in the county of Cumberland, England, is ſituated on the borders of Scotland, near the conflux of the rivers Eſk and Liddel, 9 miles diſtant from Carliſle, and 313 N. from London. The houſes are moſtly built in the modern ſtyle, and ſome of the ſtreets are regular and ſpacious. At the north-end of the town is a ſtone bridge over the Eſk. Longtown was returned to parliament, in the year 1801, as containing 176 houſes, inhabited by 1335 perſons, of whom 648 were ſtated to be employed in trades and manufactures. A market is held on Thurſdays; and two fairs annually. Longtown ſtands in the midſt of the eſtate of ſir James Graham, of Netherby, whoſe predeceſſor, Dr. Robert Graham, may be conſidered as having been the principal cauſe of the proſperous ſtate of this part of Cumberland. Under his patronage Longtown became populous; and by conſtructing the little harbour at Sarkfoot, he furniſhed the people with an eaſy mode of exporting their produce and ſupplying themſelves with neceſſaries.

Netherby, the ſeat of ſir James Graham, is much celebrated in the topographical annals of this county, from the vaſt improvements that were made here during the latter part of the laſt century; nor is it leſs intereſting to the antiquary from the aſſemblage of Roman remains that have been here preſerved; and from its having been a Roman ſtation.

Strahan and Preſton

ſtation. The manſion, which ſtands on an eminence near the river Eſk, was erected by the late Dr. Graham, about the year 1760, but has been much improved by the preſent proprietor. It is elegantly fitted up; and contains a valuable collection of ancient and modern medals, and a library furniſhed with a ſelection of claſſic and other valuable authors. The gardens and pleaſure grounds are diſpoſed with much taſte and judgment. Beauties of England and Wales, vol. iii.

LONGUE', a town of France, in the department of the Maine and Loire, and chief place of a canton, in the diſtrict of Baugé; 10 miles S. of Baugé. The place contains 5003, and the canton 13,935 inhabitants, on a territory of 280 kiliometres, in 17 communes.

Longué, a ſmall iſland in the Indian ſea; 10 miles N. of Mauritius.

LONGUEIL, Christopher de, in *Biography*, born at Mechlin in 1488, was natural ſon of Antony de Longueil, biſhop of Leon, and chancellor of Anne, queen of Bretagne. He was taken to Paris while he was very young, and carefully educated in claſſical learning and the ſciences. After this he ſtudied the law, practiſed in the profeſſion, and obtained the place of a counſellor in parliament. He travelled into Italy, Spain, England, Germany, and Switzerland, for the purpoſe of improvement. At Rome he made an harangue before pope Leo X., who highly admired his eloquence. He died at Padua, at the age of thirty-four. His works conſiſt of epiſtles and harangues: they were publiſhed at Paris in 1553, with his life, by cardinal Pole. He acquired a great reputation among thoſe ſcholars in that age who were ambitious of being the cloſe imitators of the ſtyle of Cicero, and were, on that account, termed *Ciceronians.* Eraſmus beſtows great praiſes on his genius and acquiſitions, but laments that all the force of his powers ſhould have been devoted to this one object.

Longueil, in *Geography*, a townſhip of Glengary county, in Upper Canada, being the ſecond in aſcending the Ottawa river.

LONGUEVAL, James, in *Biography*, a learned French Jeſuit, deſcended from a family in humble life, was born near Peronne, in Picardy, in the year 1680. He was educated in grammar-learning at Amiens, and purſued his maturer ſtudies at Paris, where he was ſoon diſtinguiſhed among his fellow ſtudents by his proficiency in learning. In the year 1699, he entered into the ſociety of Jeſuits, and after he had completed his ſtudies, he taught the belles-lettres at the college of La Fleche with great applauſe, during about five years, when he commenced his lectures in divinity and the ſacred ſcriptures. He died in the year 1735, at the age of fifty-five. His reputation as a writer, is chiefly founded on his elaborate hiſtory of the Gallican church, of which he lived to publiſh eight volumes: theſe bring the hiſtory down to the year 1137. This work diſplays profound erudition and deep reſearch, and is written in a beautifully ſimple ſtyle. While he was engaged on this work he was allowed an annual penſion of 800 livres by the French clergy, whoſe eſteem he had ſecured by his learned labours, his piety, and the amiableneſs of his manners. The work, afterwards completed by fathers Brumoy and Berthier, made 18 vols. 4to. Moreri.

LONGUEVILLE, in *Geography*, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Dieppe; 9 miles S. of Dieppe. The place contains 430, and the canton 7875 inhabitants, on a territory of 130 kiliometres, in 29 communes.

LONGUS, in *Biography*, author of a romance in Greek proſe, entitled "Paſtorals," and relating to the loves of Daphnis and Chloe, is ſuppoſed to have lived in the reign of Theodoſius the Great. His work is a curious ſpecimen of that kind of compoſition in its ſimpleſt form, and is ſaid to contain many deſcriptive beauties; but ſome of its ſcenes are ſuch as the loweſt modern writer would ſcarcely venture to paint. The beſt edition is that of Villoiſon, Gr. et Lat. 8vo. in two vols. Paris 1778.

Longus, *Long*, an epithet given by *Anatomiſts* to a great number of muſcles, hereby contradiſtinguiſhed from brevis.

Longus *Colli*, præ-dorſo-atloidien of Dumas, is a muſcle ſituated on the anterior and lateral parts of the bodies of the three firſt vertebræ of the back, and the ſix laſt of the neck. It extends from the body of the third dorſal vertebra to the anterior arch of the atlas. It is elongated, broad in the middle, and pointed at the ends. On the front it is covered by the rectus capitis anticus, the pharynx, the carotid artery, the nerve of the eighth pair, and the œſophagus. Its poſterior ſurface covers the lateral portion of the anterior ſurface of the bodies of the three firſt dorſal, and ſix laſt cervical vertebræ, to which it is attached, as well as to the intervertebral ligaments. It is alſo attached to the front edge of the tranſverſe proceſſes of the five laſt cervical vertebræ; and it covers the vertebral artery in the intervals of theſe proceſſes. The outer edge of the muſcle is attached below to the bodies of the two firſt dorſal vertebræ: here it is ſeparated from the anterior ſcalenus by an interval in which the vertebral artery and vein are found. This margin is then fixed to the front of the tranſverſe proceſſes of the five laſt cervical vertebræ; and it is unattached in the reſt of its extent. The internal edge is fixed to the longitudinal line, which may be obſerved on the front of the bodies of the two firſt dorſal, and the ſix laſt cervical vertebræ. Between theſe bones it is attached to the intervertebral ligaments. The inferior extremity is attached to the front and lateral portion of the body of the third dorſal vertebra: from this point it riſes nearly parallel to that of the oppoſite ſide, becoming larger as far as the middle: then it gradually decreaſes to the ſuperior extremity. The latter, joined to the oppoſite muſcle, is attached to the tubercle of the anterior arch of the atlas. It is rather difficult to develop the ſtructure of this muſcle: its fleſhy fibres are placed obliquely between aponeuroſes, ſome of which cover the anterior ſurface, both above and below, while others are ſituated in the ſubſtance of the muſcle. Theſe fibres are ſhort, although the muſcle itſelf is long. Its action inclines the neck forwards, and reſiſts the efforts which might tend to carry it backwards.

LONGUY, in *Geography*, a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Mortagne; 9 miles E. of Mortagne. The place contains 1917, and the canton 7368 inhabitants, on a territory of 210 kiliometres, in 11 communes.

LONGUYON, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Briey; 7 miles S.W. of Longwy. The place, in which is a conſiderable iron forge and foundery of cannon, contains 1532, and the canton 9509 inhabitants, on a territory of 237½ kiliometres, in 26 communes. N. lat. 49° 27'. E. long. 5° 40'.

LONGWY, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Briey, ſituated on the Chiers. The place contains 2011, and the canton 10,743 inhabitants, on a territory of 242½ kiliometres, in 35 communes. This place was merely a village, ſurrounded with three ſharp mountains, on which was built, by Louis XIV. a new town, fortified by Vauban. N. lat. 49° 32'. E. long.

E. long. 5° 50′.—Alſo, a town of France, in the department of the Jura, on the Doubs; 9 miles S. of Dôle.

LONHANKO, a town of the Birman empire; 65 miles N. of Munchaboo.

LONICERA, in *Botany*, well known to every lover of Britiſh poetry by the name of Honeyſuckle, or Woodbine, received its name from Linnæus; the *Lonicera* of Plumier being a *Loranthus*. This name is intended to commemorate the merits of an old phyſician and naturaliſt, who lived during the middle of the ſixteenth century. Adam Lonicer, a phyſician at Frankfort, was born at Marburg, Oct. 10th, 1528, and died at the age of 58. He publiſhed two volumes folio, in Latin, upon the *Materia Medica*; and a German Herbal, with wooden cuts, which are occaſionally to be met with rudely coloured.—Few plants are more generally known, or admired, than ſeveral ſpecies of Honeyſuckle, whoſe beauty is only exceeded by the exquiſite delicacy of their fragrancy. Like the richeſt exotics they find a place in every one's fancy, and though as common as almoſt any other field or hedge plant, they have always been held in the greateſt eſtimation.—Linn. Gen. 93. Schreb. 128. Willd. Sp. Pl. v. 1. 982. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 260. Ait. Hort. Kew. ed. 2. v. 1. 377. Lamarck Illuſtr. t. 150. (Caprifolium; Tournef. t. 378. Juſſ. 219. Gærtn. t. 27.—Periclymenum; Tournef. t. 378.—Chamæceraſus; Tournef. t. 379.—Xyloſteon; Tournef. t. 379. Juſſ. 212.—Diervilla; Tournef. Act. 1706. t. 7. f. 1. Dill. Gen. App. 154. Juſſ. 211.—Symphoricarpos; Dill. Hort. Elth. 273. Juſſ. 211.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Aggregatæ*, Linn. *Caprifolia*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, five-cleft, ſmall. *Cor.* of one petal, tubular; tube oblong, gibbous; limb in five revolute ſegments, one of which is more deeply ſeparated. *Stam.* Filaments five, awl-ſhaped, about as long as the corolla; anthers oblong. *Piſt.* Germen inferior, roundiſh: ſtyle thread-ſhaped, the length of the corolla; ſtigma obtuſely capitate. *Peric.* Berry umbilicate, of two cells. *Seeds* roundiſh, compreſſed.

Obſ. The ſynonyms above quoted are all referred by Linnæus and ſucceeding writers to *Lonicera*, by whom the generic names of Tournefort and Dillenius are retained for the ſake of diſtinguiſhing the ſeveral ſpecies originally ſo called. We find the following remarks upon their differences in the *Genera Plantarum*.—*Caprifolium* has the lower ſegment of the limb ſeparated twice as deeply as the reſt, and the berries diſtinct.—*Periclymenum* has all the diviſions of the corolla equal; the berries alſo diſtinct.—*Chamæceraſus* has the lower diviſion of the corolla twice as deeply cut, with two berries ſeated upon the ſame baſe.—*Xyloſteon* has the diviſions of the corolla almoſt equally ſeparated, and two berries on the ſame baſe. In *Symphoricarpos*, the corolla is nearly bell-ſhaped; the fruit ſimple, two-celled, ſeeds ſolitary.

L. *alpigena* and *cærulea* are remarkable for having one germen for two florets, as in *Mitchella*.

Eſſ. Ch. Corolla of one petal, irregular. Berry inferior, of two cells, with ſeveral ſeeds.

Thirteen ſpecies of *Lonicera* are deſcribed in the *Species Plantarum* of Linnæus, ſixteen in the *Syſt. Veg.* ed. 14, and twenty by Willdenow. The genus is divided into three ſections, from which we have ſelected the following examples. Some of theſe ſections, as it will appear, comprehend, each of them, more than one of Tournefort's ſuppoſed genera.

Sect. 1. *Periclymena*, ſtem twining.

L. *Caprifolium*. Pale perfoliate Honeyſuckle. Linn. Sp. Pl. 246. Engl. Bot. t. 799. Jacq. Auſtr. t. 357.—Flowers ringent, whorled, terminal. Leaves deciduous; the uppermoſt united and perfoliate.—Firſt known as a native of this country from being found by the Rev. Mr. Relhan at Hinton near Cambridge. It flowers in May or June.—*Stem* ſhrubby, woody, twining. *Branches* nearly oppoſite, round, ſmooth. Almoſt all the *leaves* are combined, elliptical, obtuſe, entire, ſmooth, rather glaucous beneath; the upper ones in united perfoliate pairs, ſomewhat orbiculate, accompanying the flowers. *Flowers* in whorls, ſpreading, yellowiſh, with a fleſh-coloured tube, very fragrant. *Berries* of an orange red, crowned by the almoſt entire calyx.

L. *Periclymenum*. Common Honeyſuckle, or Woodbine. Linn. Sp. Pl. 247. Engl. Bot. t. 800. Curt. Lond. faſc. 1. t. 15. Fl. Dan. t. 908.—Heads of flowers ovate, imbricated, terminal. Leaves all ſeparate, deciduous. Corolla ringent.—Found almoſt univerſally in groves and hedges, flowering in June and July, occaſionally in the autumn.—*Stem* ſhrubby, woody, twining. *Branches* oppoſite, round. *Leaves* oppoſite, on very ſhort footſtalks, elliptical, entire, ſometimes pubeſcent, glaucous beneath. *Flowers* in a terminal head, ſpreading in a radiate manner, yellowiſh-white, and bluſh-coloured, very fragrant, and more particularly ſo early in the evening. *Berries* red, crowned with the five-toothed calyx, bitter, with a ſweetiſh flavour.—Dr. Smith obſerves that this ſpecies is liable to many variations in the different degrees of ſmoothneſs or hairineſs of its leaves, fruit, and younger branches; and that, by the coaſt, its flowers are often quite green.—A remarkable variety ſometimes occurs with ſinuated, variegated leaves, called the Oak-leaved Honeyſuckle.

Sect. 2. *Chamæceraſa*, Stalks bearing two flowers.

L. *Xyloſteum*. Upright Honeyſuckle. Linn. Sp. Pl. 248. Engl. Bot. t. 916.—Stalks two-flowered. Berries diſtinct. Leaves entire, downy.—Admitted as an Engliſh plant by Dr. Smith ſince the publication of his Flora, on the authority of Mr. W. Borrer, who found it “growing plentifully, and certainly wild, in a coppice called the Hacketts, to the eaſt of Houghton-bridge, four miles from Arundel, Suſſex.” It flowers in July.—*Stem* upright, buſhy, much branched. *Leaves* oppoſite, on footſtalks, ovate, clothed with ſoft hairs, deciduous. *Flowers* inodorous, in pairs, on ſolitary, axillary ſtalks, ſhorter than the leaves, yellowiſh-white, tinged with red, downy. *Berries* oval, red, containing ſix or more ſeeds.

L. *cærulea*. Blue-berried upright Honeyſuckle. Willd. n. 14. Pall. Roſſ. v. 1. p. 1. 58. t. 37. Jacq. Auſtr. App. t. 17.—Two flowers on a ſtalk. Berries united, globular. Styles undivided.—A native of Switzerland, Auſtria, Siberia, and the iſlands adjacent to America. It flowers in the ſpring.—*Stems* three or four feet high. *Branches* ſlender, covered with a ſmooth, purpliſh bark. *Flowers* white, two on a ſtalk. *Berries* of a beautiful blue colour, ſingle and diſtinct.—The wood of *L. cærulea* is very hard, and handſomely veined with grey and pale yellow. The juice of the berry ſtains paper of a ſtrong purple colour, and might perhaps be uſeful in dyeing.—The buds of this ſhrub ſtand three together, one above another, being provided for three years beforehand.

Sect. 3. Stem erect. Stalks many-flowered.

L. *Symphoricarpos*. Shrubby St. Peter's-wort. Linn. Sp. Pl. 249. (Symphoricarpos foliis alatis; Dill. Elth. 371. t. 278. f. 360.)—Heads of flowers lateral, on footſtalks. Leaves nearly ſeſſile.—A native of Virginia and Carolina, where it flowers in the autumn.—*Stem* about four feet high, ſending forth many ſlender *branches*. *Leaves* oppoſite, ovate. *Flowers* in whorls, round the ſtalk, ſmall, of a greeniſh colour. *Berry* hollow and fleſhy, containing cartilaginous, roundiſh *ſeeds*.

L. *Diervilla.* Yellow-flowered upright Honeyſuckle. Linn. Sp. Pl. 249. (Diervilla; Dill. Gen. App. 154. t. 10. Linn. Hort. Cliff. 63. t. 7.)—Heads of flowers terminal. Leaves ſerrated. A native of North America, and firſt introduced into Europe by M. Dierville, a French ſurgeon, whoſe name it ſtill commemorates. It flowers from May to September.—*Stem* about three feet high. *Bark* of a reddiſh colour. *Leaves* oppoſite, ſlightly ſerrated, pointed. *Flowers* ſmall, pale yellow, two or three together at each diviſion of the bunch. *Berries* oval, black, with one hard ſeed in each cell. They ſeldom, however, come to maturity in this country.

LONICERA, in *Gardening*, contains plants of the deciduous, flowering, ſhrubby, and evergreen kinds; of which the ſpecies moſtly cultivated are, the black-berried upright honeyſuckle (L. nigra); the Tartarian upright honeyſuckle (L. Tatarica); the fly honeyſuckle (L. xyloſteum); the Pyrenean upright honeyſuckle (L. Pyrenaica); the red-berried upright honeyſuckle (L. alpigena); the blue-berried upright honeyſuckle (L. cærulea); the ſhrubby St. Peter's-wort (L. ſymphoricarpos); the yellow-flowered upright honeyſuckle (L. diervilla); the common honeyſuckle (L. periclymenum); the Italian honeyſuckle (L. caprifolium); the trumpet honeyſuckle (L. ſempervirens); and the evergreen honeyſuckle (L. grata).

The ſecond ſort varies in ſhady groves, and other ſimilar ſituations, with white flowers.

And the ninth kind has ſeveral varieties, as the *late red*, which produces a greater variety of flowers together, than either the Italian or Dutch ſorts, making a finer appearance than either of them during the time of flowering; but it has not been ſo long cultivated as the latter. This was formerly termed the Flemiſh honeyſuckle.

There are alſo ſometimes varieties with ſtriped leaves.

The Dutch variety may be trained with ſtems, and formed into heads, which the wild ſort cannot, the branches being too weak and trailing for the purpoſe.

And there are two ſub-varieties of it, the *long blowing*, and the *late red*, in which the ſtems are ſtronger, the leaves, flowers, and heads of berries larger, and the corollas redder than in the woodbine ſort; the oak-leaved variety has ſinuate leaves, cut like the oak, but ſmooth.

And there is likewiſe a variety which has variegated leaves.

The tenth ſpecies has a yellow variety, in which the ſhoots are much ſimilar to it, but the bark darker in colour, the leaves of a deeper green, the flowers of a yellowiſh-red, appearing a little after it, being not of much longer duration, but are ſucceeded by red berries, containing one hard ſeed incloſed in the ſoft pulp in each, which ripens in the autumn.

And beſides this, ſome mention other varieties, ſuch as the early red-flowering, the late red-flowering, and the evergreen red-flowering.

Method of Culture.—An increaſe in all theſe plants may be effected either by layers or cuttings, but the latter is the better practice. The layers ſhould be made from the young ſhoots, and be laid down in the autumn or early ſpring, the ſtraggling tops being removed, when, by the following autumn, they will have taken root, and ſhould be cut off from the plants, being either planted where they are to remain, or into a nurſery to be trained for ſtandards, by fixing down ſtakes to the ſtem of each plant, to which the principal ſtalk ſhould be faſtened, all the others being cut off; training each of them to the intended height, when they ſhould be ſhortened to force out lateral branches, and theſe be again ſtopped to prevent their growing too long. By conſtantly repeating this as the ſhoots are produced, they may be formed into a ſort of ſtandard; but if regard is had to their flowering, they cannot be formed into regular heads, as the conſtant ſhortening will deſtroy the flower-buds, and prevent the deſired effect.

In reſpect to the cuttings, they ſhould be taken from the ſtrong ſhoots of the former ſummer, with three or four joints, and be placed in rows in a ſhady border, to the depth of two or three of them, a foot apart, and ſix inches from plant to plant. When they have taken good root in the autumn or ſpring following, they may be removed into the nurſery, and be planted out in rows two feet diſtant, and a foot aſunder in them, where they may be kept a year or two, till wanted for planting out where they are to remain.

The eighth ſort may be raiſed from ſuckers, which it affords in plenty, by taking them off, and planting them as above in the autumn in a rather moiſt ſoil.

Several of the ſorts may likewiſe be increaſed by ſowing the ſeed or berry in a bed of light mould in the autumn, to the depth of an inch. The plants riſe in the firſt or ſecond ſpring; and afterwards require the ſame management as the others.

In regard to their management afterwards, the only culture which any of them require, is, in the upright ſorts, to have their ſtraggling ſhoots ſhortened, and the dead wood cut out; and thoſe trained as climbers, to have their branches conducted in a proper manner upon their reſpective ſupports; and every year all rambling ſhoots reduced and trained as may be proper, ſo as to preſerve them within due limits and order, except where they are deſigned to run wild in their own rural way, eſpecially thoſe intended to climb among the branches of trees, ſhrubs, and buſhes; thoſe alſo intended to cover arbours and ſeats, ſhould be pruned and trained annually, laying the ſhoots along to their length, till they have covered the allotted ſpace; ſhortening or clearing out all ſuch ſtragglers as cannot be properly trained; alſo ſuch of thoſe ſorts as are trained againſt walls, &c. muſt have an annual pruning and training, by going over them two or three times in ſummer, laying in ſome of the moſt convenient proper ſhoots, ſome at their length, ſhortening or retrenching others, as neceſſary, to preſerve regularity, and the proper ſucceſſion of flowers; being careful to train enough, at this time, of ſuch as appear neceſſary to continue the bloom as long as poſſible; and in winter pruning, all thoſe left in ſummer, which may appear ſuperfluous or unneceſſary, ſhould be turned out, ſhortening all ſuch as are too long for the ſpace allotted for them, eſpecially all thoſe with weak ſtraggling tops, nailing in the remaining proper branches and ſhoots cloſe to the wall, or other ſupport which they may have.

They may all be introduced with propriety in plantations, both from the variety of their different growths, and the ornament and fragrance of their flowers; though the flowers of the upright kind are not ſo ſhowy as thoſe of the trailers; but they exhibit an exceedingly agreeable variety. But the trailing ſpecies have the greateſt merit, not only in their numbers, but ſize, elegance, and odour, as well as in their duration. The ſhrubs of all the ſorts are, notwithſtanding, proper to be introduced in ſhrubberies, the upright kinds to intermix as ſtandards. The trailing kinds, whoſe branches are great ramblers, and, without ſupport, trail along the ground, ſhould generally be introduced as climbers, having ſtout ſtakes placed to each of them to climb upon, which they effect by aſcending ſpirally round the ſupport, to a conſiderable height; and alſo be placed to aſcend round the ſtems of trees, and to climb among the boughs of the adjacent buſhes, ſhrubs, and hedges, which they effect in a very agreeable manner, by interweaving their branches with them. The climbers are likewiſe proper for training againſt walls and arbours, &c. for the ornament and fragrance of their flowers, laying their branches in, four or five inches aſunder; thinning out the ſuperabundant ſhoots annually, and training in ſome of the moſt robuſt for ſucceſſion wood, either at full length, or ſhortened, as moſt proper to fill the ſpace or vacancy that may be wanted to be covered.

The evergreen kinds are principally of the climbing tribe, and have much effect in their evergreen foliage, and the elegance of their flowers, as well as their long continuance in blow.

The uncommon beauty, and exquiſite fragrance of the flowers in the ninth ſpecies, entitle it to a place in moſt ſorts of plantations of the ornamental kind. In climbing, it turns from eaſt to weſt, in the manner of moſt of our climbing plants; and in common with them bears clipping and pruning well; as in a ſtate of nature, thoſe plants which cannot aſcend without the aid of others, are often liable to loſe great branches; they have conſequently a proportionate vigour of growth given them, in order to reſtore ſuch accidental damages. It is however ſubject, when planted near building, to be injured and disfigured by *aphides*, which are vulgarly termed *blights;* theſe inſects are not very numerous in the ſpring ſeaſon; but as the ſummer advances, they increaſe in a very rapid manner; their firſt attacks ſhould, of courſe, be carefully attended to, and the branches on which they firſt fix be cut off and deſtroyed, as when they have once gained ground they are defended by their numbers. Small plants may however be cleared of them by the uſe of tobacco duſt, or Spaniſh ſnuff, but this method is not practicable for large trees. The leaves of the plants are likewiſe liable to be punctured and curled up by a ſmall caterpillar, which produces a beautiful little moth, the phalæna tortrix. About the evening alſo, ſome ſpecies of ſphinges or hawk-moths are often ſeen to hover over the bloſſoms, and with their long tongues extract the honey from the very bottoms of the flowers.

LONICERUS, or Lonicer, John, in *Biography*, a learned German, was born in 1499: after having received a good education, he became himſelf a profeſſor at Marpurg, where he died about the year 1 ,60. He was author of a Greek and Latin Lexicon, and publiſhed an edition of Dioſcorides. Moreri.

LONIGO, or Leonico, in *Geography*, a town of Italy, in the Vicentin, ſeated on a river called Fiume Novo, and containing ſeveral churches and monaſteries; 14 miles S.S.W. of Vicenza.

LONKA, a town of Poland, in the palatinate of Podolia; 44 miles N. of Kaminiec.

LONSCHAKOVA, a town of Ruſſia, in the government of Irkutſk; 40 miles N.N.E. of Stretenſk.

LONSCHIN, a town of Pruſſia, in the palatinate of Culm; 10 miles S. of Culm.

LONS-LE-SAULNIER, a town of France, and principal place of a diſtrict, in the department of the Jura, formerly celebrated for its ſalt-works, but now diſcontinued. The place contains 6041, and the canton 14,999 inhabitants, on a territory of 112½ kiliometres, in 23 communes. N. lat. 46° 40′. E. long. 5° 38′.

LONTARUS, in *Botany*, Rumph. Amboin. v. 1. 45. t. 10. Juſſ. 39. Gærtn. t. 8, a barbarous name of Rumphius for the *Boraſſus flabelliformis* of Linnæus. See Borassus.

LONT-CHOUDSONG, in *Geography*, a town of Thibet; 35 miles N.N.E. of Laſſa. N. lat. 29° 58′. E. long. 92° 14′.

LONTHOIR, a town of the iſland of Banda, in the Eaſt Indian ſea.

LONTOU, a town of Africa, in Galam, on the Senegal; 60 miles S.E. of Galam.

LOO, a town of France, in the department of the Lys; ſix miles S.S.E. of Dixmude.

LOOBOE, or Loeboe. See Loeboe.

LOOCALLA, a town of Congo, on the Zaire; 90 miles W. of St. Salvador.

LOOCHRISTI, a town of France, in the department of the Scheldt, and chief place of a canton, in the diſtrict of Ghent. The place contains 3056, and the canton 14,432 inhabitants, on a territory of 140 kiliometres, in 7 communes.

LOODUERA, a town of Bengal; 11 miles S. of Rogonatpour.

LOOE, a ſmall iſland near the coaſt of Cornwall; two miles S.E. of Looe.

Looe, *Eaſt*, a borough and market town in the pariſh of St. Martin, hundred of Weſt, and county of Cornwall, England, is ſituated at the mouth of the river Looe, 12 miles from Plymouth, and 233 weſt from London. It is moſtly built on a flat piece of ground, having the river on the weſt, and the ſea on the ſouth. The ſtreets are narrow, and the houſes built with ſlate. The port is protected by a ſmall battery and breaſt-work. The town was incorporated by queen Elizabeth in 1587; the government is veſted in a mayor and nine burgeſſes, who jointly elect a recorder. Two members have been returned to parliament ever ſince 13 Elizabeth; the right of election is in the mayor, burgeſſes, and freemen; in number about fifty. In the ſurvey taken in 1801, Eaſt Looe was found to contain 126 houſes, and 467 inhabitants, who were chiefly ſupported by the pilchard fiſhery, and the trade connected with the port. Four annual fairs are held, and a weekly market on Saturdays. Beauties of England and Wales, vol. ii.

Looe, *Weſt*, originally named *Portpigham*, a borough and market town in the pariſh of Talland, hundred of Weſt, and county of Cornwall, England, is alſo ſituated at the mouth of the river Looe, and is connected with Eaſt Looe by a ſtone bridge of fifteen arches. Weſt Looe formerly was much more conſiderable in point of trade, &c. than Eaſt Looe; it now preſents a long ſtreet of mean irregular houſes, with a ſmall town-hall, anciently a chapel, and a few other buildings on the brink of the river. This borough, as well as the adjoining one, received its firſt charter of incorporation from queen Elizabeth, veſting the government in a mayor, and twelve burgeſſes, who with the freemen, in the whole about 50, elect two members of parliament. In the population return for 1801, Weſt Looe was ſtated to conſiſt of 82 houſes, and 376 inhabitants. A fair is held annually, and a market every Saturday. Beauties of England and Wales, vol. ii.

LOOF, or as it is uſually pronounced, *Luff*, a term uſed in conding of a ſhip. Thus,

Loof *up*, is to bid the ſteerſman keep nearer to the wind.

Loof *into a harbour*, is to ſail into it cloſe by the wind.

Loof, *to ſpring the*, or *luff*, is when a ſhip that was going large before the wind is brought cloſe by the wind.

When a ſhip ſails on a wind, that is, on a quarter-wind, they ſay to the ſteerſman, *keep your luff! veer no more! keep* *her to! touch the wind! have a care of the lee-latch!* All which words ſignify much the ſame thing, and bid the man at the helm to keep the ſhip near the wind.

Loof *of a ſhip*, denotes the after-part of a ſhip's bow; or that part of her ſide forward where the planks begin to be incurvated into an arch, as they approach the ſtem. Hence, the guns which lie here are called *loof-pieces*.

Loof-*hook*, in a *Ship*, a tackle with two hooks to it, one of which is to hitch into the crengle of the main and fore-ſail, and the other is to hitch into a certain ſtrap, which is ſpliced into the cheſs-tree, and ſo down the ſail. Its uſe is to ſuccour the tackles in a large ſail, that all the ſtreſs may not bear upon the tack. Sometimes alſo it is uſed when the tack is to be ſeized the ſurer.

Loof-*tackle*, or Luff-*tackle*, a large tackle, larger than the jigger-tackle, but ſmaller than thoſe which hoiſt the heavier materials into and out of the veſſel, ſuch as the main and fore tackles, the ſtay and quarter tackles, &c. ſerving to lift all the ſmall weights in or out of the ſhip, and otherwiſe variouſly employed as occaſion requires.

Loof, or *Loop*, a corn-meaſure at Riga, equal to 3978 cubic inches; of which 4324 are equal to ten Engliſh quarters.

LOOHOGGO, in *Geography*, one of the ſmaller Friendly iſlands, ſurrounded by a reef of rocks. S. lat. 19° 41′. E. long. 185° 36′.

LOOJAMA, a town on the E. coaſt of the iſland of Timor. S. lat. 8° 27′. E. long. 126° 18′.

LOOKING-Glass, a plain poliſhed glaſs ſpeculum, or mirror, to one ſide of which a plate of tin-foil is made to adhere by means of quickſilver; which being impervious to the light, reflects its rays, and ſo exhibits the images of objects placed before it.

In conſequence of this conſtruction, the looking-glaſs makes a double reflection of every object, *viz.* one from the upper ſurface, which is the weakeſt, and another from the under ſurface, which is contiguous to the tin-foil. When a perſon ſtands juſt before the glaſs, the two reflections coincide, and he perceives one image; but if he ſtands oblique, as at A, (*Plate* IX. *Optics*, *fig.* 10.) and views the reflection D, of an object B C, ſituated on the other ſide, he will then perceive two images, *viz.* one cauſed by the upper, and the other cauſed by the lower ſurface of the glaſs E F. If the object B C be very luminous, ſuch as a lighted candle, then the eye at A will perceive a great ſucceſſion of candles at D, gradually decreaſing in ſplendour; the cauſe of which phenomenon is, that the ſtrong reflection from the under ſurface of the glaſs is again reflected from the upper ſurface, and this again by the lower, &c.

The theory of looking-glaſſes, and the laws whereby they give the appearance of bodies, ſee under Mirror.

Looking-*glaſſes, the manner of grinding and preparing*, is as follows:—a plate of glaſs is fixed to a horizontal table of free-ſtone or wood, of about the ſame ſize, and cemented to it by Paris plaſter; and to another leſſer table is fixed in the ſame manner another plate. Over the firſt plate is ſprinkled fine ſand and water, in a ſufficient quantity for the grinding, and the ſecond or leſs plate is laid on it; and thus worked this way and that way, till each has planed the other's ſurface. Theſe plates are made to rub againſt each other evenly and ſteadily by a kind of hand-mill, the wheel of which is wrought by a man, or if the plates be large by two men, who regulate the preſſure as they think proper. As they begin to become ſmoother, finer ſand is ſucceſſively uſed. When one ſide of the plate is finiſhed, the plaſter that cemented it is picked off, and the plate turned, ſo that the other ſide may be ground in the ſame manner. Towards the cloſe of the operation of grinding, the preſſure is increaſed by loading the upper plates with flat ſtones of different thickneſſes. This proceſs laſts about three days, and it is of great importance that the ſurfaces ſhould be perfectly flat and parallel, which is determined by the ruler and plumb-line. In order to complete this proceſs, emery of different fineneſſes is uſed, and great care is taken in ſeparating and ſorting them. This is done by putting into a veſſel of water a quantity of rough emery, and well ſtirring it: the coarſeſt particles will ſink to the bottom, and the finer will be held ſuſpended for ſome time by the ſupernatant liquor. This liquor is poured off, and after ſome time, about 20 minutes, the finer particles will ſubſide. More water is then added to the veſſel, and the emery ſtirred again; and after remaining at reſt about 15 minutes, the ſupernatant liquor is poured off; and this by reſt furniſhes an emery of the ſecond degree of fineneſs. The ſame operation is repeated twice more at the different intervals of about five minutes and half a minute; by which two other ſorts are obtained. The wet emery obtained from all theſe liquors is ſeparably heated over a ſtove to evaporate the water, and when nearly dry, is made up into balls for the further operation. The plates are then ground on both ſides with two or three emerys, beginning with the coarſeſt, and finiſhed with great care. They are now perfectly even, and the ſcratches, which after the firſt operation remained and rendered them almoſt opaque, diſappear. (See Grinding.) For the method of poliſhing looking-glaſſes and mirrors, we refer to the article Polishing.

The plates being poliſhed, a thin blotting paper is ſpread on a table or marble ſlab; and ſprinkled with fine powdered chalk; and this done, over the paper is laid a thin lamina or leaf of tin, on which is poured mercury, which is to be equally diſtributed over the leaf, with a hare's foot or cotton. Over the leaf is laid a very thin ſmooth paper, of which the kind called fan-paper is beſt, and over that the glaſs plate. With the left hand the glaſs-plate is preſſed down, and with the right the paper is gently drawn out; which done, the plate is covered with a thicker paper, and loaden with a greater weight, that the ſuperfluous mercury may be driven out, and the tin adhere more cloſely to the glaſs. When it is dried, the weight is removed, and the looking-glaſs is complete.

Some uſe an ounce of mercury with half an ounce of marcaſite or biſmuth, melted by the fire; and left the mercury evaporate in ſmoke, pour it into cold water; and when cold, ſqueeze it through a cloth or leather. Some alſo add a quarter of an ounce of lead and tin to the marcaſite, that the glaſs may dry the ſooner. For more particular directions in the conduct of this operation, ſee Silvering.

In the Phil. Tranſ. N° 245, we have a method of *foliating* (ſee Foliating) globe looking-glaſſes, communicated by ſir R. Southwell. The mixture is of quickſilver and biſmuth, of each three ounces, and tin and lead, of each half an ounce; to the laſt throw in the marcaſite, and afterwards the quickſilver; ſtir them well together over the fire; but they muſt be taken off, and be towards cooling before the quickſilver be put to them. When the mixture is uſed, the glaſs ſhould be well heated, and very dry; but it will do alſo when it is cold, though beſt when the glaſs is heated.

Mr. Boyle's method, which he prefers to any which he ever met with in print, is this: take tin and lead, of each one part, melt them together, and immediately add of good tin-glaſs, or biſmuth, two parts; carefully ſkim off the droſs; then take the crucible from the fire, and before the mixture grows cold, add to it 10 parts of clear quickſilver, and having ſtirred them well together, keep the fluid in a new clean glaſs. When you are going to uſe it, firſt purge it by ſtraining it through linen, and gently pour ſome ounces into the glaſs to be foliated through a narrow paper funnel, reaching almoſt to the glaſs, to prevent the liquor from flying to the ſides. After this, by dextrouſly inclining the glaſs every way, endeavour to faſten it to the internal ſurface; which done, let it reſt for ſome hours; then repeat the ſame operation, and ſo continue at times, till the liquor is ſlowly paſſed over, and equally fixed to the whole ſuperficies; which may be diſcerned by expoſing the glaſs to the eye between that and the light. Boyle's works abr. vol. i. p. 129.

For the method of blowing and caſting glaſs, and the choice of the materials for looking-glaſſes, ſee Glass.

Looking-*Glaſs*, *Venus's*, in *Botany*. See Campanula.

LOOKNAPOUR, in *Geography*, a town of Hindooſtan, in Oude; 15 miles S.W. of Kairabad.

LOOK-OUT, Cape, a cape on the coaſt of North Carolina, being the ſouthern part of a long, inſulated, and narrow ſtrip of land, E. of Core Sound. Its N. point forms the S. ſide of Ocrecoch inlet, which leads into Pamlico Sound; N.E. of Cape Fear, and S. of Cape Hatteras, in about N. lat. 34° 50′. Its excellent harbour has been filled up with ſand ſince the year 1777.—Another cape, of the ſame name, lies on the ſouthern coaſt of Hudſon's bay, in New South Wales, E.S.E. of the mouth of Severn river. N. lat. 56°. W. long. 84°.

Look-out, in *Sea Language*, denotes a watchful attention to ſome important object, or event, which is expected to ariſe from the preſent ſituation of a ſhip, &c. It is principally uſed when there is a probability of danger from the real or ſuppoſed proximity of land, rocks, enemies, &c. There is always a look-out kept on a ſhip's forecaſtle at ſea, to watch for any dangerous objects lying near her track; the mate of the watch accordingly calls often from the quarter deck, *look out afore there!* to the perſons appointed to this ſervice. Falconer.

LOOKSEENGAH, in *Geography*, a town of Bengal; 35 miles N.W. of Ramgur.

LOOL, in *Metallurgy*, a veſſel made to receive the waſhings of ores of metals. The heavier or more metalline parts of the ores remain in the trough to which they are waſhed; the lighter, and more earthy, run off with the water, but ſettle in the lool.

LOOM, in *Geography*, a town of Norway; 60 miles S.E. of Romſdal.

Loom, the weaver's frame; a machine whereby ſeveral diſtinct threads are woven into one piece.

Looms are of various ſtructures, accommodated to the various kinds of materials to be woven, and the various manners of weaving them; *viz.* for woollens, ſilks, linens, cottons, cloths of gold; and other works, as tapeſtry, ribbands, ſtockings, &c. divers of which will be found under their proper heads. See Weaving.

The weaver's loom-engine, otherwiſe called the Dutch loom-engine, was brought into uſe from Holland to London, in or about the year 1676.

Loom, *Heir*, in *Law*. See Heir-*Loom*.

Loom, at *Sea*. If a ſhip appears big, when at a diſtance, they ſay ſhe looms, or appears a great ſail; the term is alſo uſed to denote the indiſtinct appearance of any other diſtant objects.

The moſt remarkable phenomena of this kind, depend on the accidental variations of the temperature of the air at different parts, producing great irregularities in its refraction, eſpecially near the horizon. Accordingly the rarefaction of the air in the neighbourhood of the ſurface of water, of a building, or of the earth itſelf, occaſions a diſtant object to appear depreſſed inſtead of being elevated, and to be ſometimes ſeen at once both depreſſed and elevated, ſo as to appear double, one of the images being generally in an inverted poſition, as if the ſurface poſſeſſed a reflective power; and there ſeems to be a conſiderable analogy between this kind of refraction and the total reflection which happens within a denſer medium. See Fata *Morgana*.

Loom-*Gale*, a gentle, eaſy gale of wind, in which a ſhip can carry her top-ſails a-trip.

LOOMAKA, in *Geography*, a town of Bootan; 28 miles S. of Taſſaſudon.

LOON, in *Ornithology*. See Colymbus *glacialis*, and Colymbus *Auritus*.

LOONENBURG, in *Geography*, a town of Green county, New York, near the city of Hudſon.

LOONGHEE, a town of the Birman empire, on the Irawaddy, which has a celebrated temple; 55 miles N. of Prome. N. lat. 19° 42′.

LOONPOUR, a town of Hindooſtan, in Guzerat; 40 miles E. of Junagur.

LOOP, in the *Iron Works*, is a part of a ſow or block of caſt iron broken or melted off from the reſt, and prepared for the forge or hammer. The uſual method is, to break off the loop of about three quarters of a hundred weight. This loop they take up with their flinging-tongs, and beat it with iron ſledges upon an iron-plate near the fire, that ſo it may not fall to pieces, but be in a condition to be carried under the hammer. It is then placed under the hammer, and a little water being drawn to make the hammer move but ſoftly, it is beat very gently, and by this means the droſs and foulneſs are forced off, and after this they draw more and more water by degrees, and beat it more and more till they bring it to a four-ſquare maſs, of about two feet long, which they call a bloom.

Loop, in *Rural Economy*, the hinge of a door or gate. See Gate.

Loop-*Holes*, in *Sea Language*, are holes made in the coamings of the hatches of a ſhip, to fire muſkets through in a cloſe fight.

LOOPHEAD, in *Geography*, a cape of Ireland, in the county of Clare, being the north point of the mouth of the Shannon. On this headland is a lighthouſe. N. lat. 52° 30′. W. long. 9° 50′.

LOOPING, in *Metallurgy*, a word uſed by the miners of ſome counties of England, to expreſs the running together of the matter of an ore into a maſs, in the roaſting, or firſt burning, intended only to calcine it ſo far as to make it fit for powdering. This accident, which gives the miners ſome trouble, is generally owing to the continuing of the fire too long in this proceſs.

LOOSA, in *Botany*, a name which originated with Adanſon, but of whoſe meaning or derivation we find no account, except that it has been ſuppoſed intended to commemorate ſome Spaniſh botaniſt, of whoſe merits or name nothing elſe is known. Adanſon writes it *Loaſa*, and he is followed by Jacquin and the French botaniſts. Linnæus, Murray and Schreber uſe the above orthography, which we have retained, though we much ſuſpect it to have been originally an error of the preſs; but having nothing better to guide us, we leave matters as we find them. It is pity ſo fine a genus ſhould not have a certain or intelligible appella-

tion. Linn. Syſt. Nat. ed. 12. v. 2. 364. Syſt. Veg. ed. 14. 494. Schreb. 360. (Loaſa; Adanſ. v. 2. 501. Jacq. Obſ. faſc. 2. 15. t. 38. Willd. Sp. Pl. v. 2. 1176. Mart. Mill. Dict. v. 3. Juſſ. 322. Lamarck Dict. v. 3. 758. Loaza; Lamarck Illuſtr. t. 426.)—Claſs and order, *Polyandria Monogynia*. Nat. Ord. *Onagris affine*, Juſſ.

Gen. Ch. *Cal.* Perianth almoſt entirely ſuperior, of five lanceolate, ſpreading, permanent, equal leaves. *Cor.* Petals five, large, obovate, hooded, ſpreading, equal, attenuated at their baſe into ſlender claws. Nectary of five leaves, alternate with the petals, approximated in the form of an acute cone, each rather ſhorter than the petals, lanceolate, corrugated, awned with a double briſtle. *Stam.* Filaments numerous, capillary, in parcels of from 15 to 17 oppoſite to each petal, longer than the nectary; anthers incumbent, roundiſh. *Piſt.* Germen ſomewhat ovate, more than half inferior; ſtyle thread-ſhaped, erect, the length of the ſtamens; ſtigma ſimple, obtuſe. *Peric.* Capſule turbinate, of one cell, opening with three valves at the top, which are half-ovate, acute, finally ſpreading. *Seeds* numerous, ovate, ſmall. *Receptacles* three, linear, longitudinal.

Eſſ. Ch. Calyx of five leaves. Petals five. Nectary of five leaves alternate with the petals. Capſule half-inferior, of one cell, three valves at the top, and many ſeeds.

Obſ. This genus is, as Jacquin obſerves, nearly akin to *Mentzelia*.

1. L. *hiſpida*. Lamarck t. 426. fig. 1. (L. urens; Jacq. Obſ. faſc. 2. 15. t. 38.)—Very briſtly. Leaves alternate, doubly pinnatifid. Edges of the calyx-leaves revolute. Gathered by Dombey, in ſandy ground in Lima. The *root* is annual, fibrous. *Stem* erect, from one to three feet, or more, in height, ſlightly ſubdivided, leafy, round, beſet with innumerable, horizontal, tawny, briſtles, which are obſervable, more or leſs, in all the ſpecies. Lamarck has found each of theſe briſtles to be furniſhed with a ſlight bag at its baſe, and thence he reaſonably concludes that the plant ſtings like a nettle, whoſe venom is lodged in ſimilar bags. Theſe ſtings are, in the plant we are deſcribing, intermixed with fine down. *Leaves* alternate; the lower ones ſtalked; the reſt ſeſſile; all doubly pinnatifid, more or leſs deeply, two or three inches long, ſomewhat briſtly, downy beneath; their diviſions and teeth irregular and obtuſe. *Flower-ſtalks* ſcattered, generally oppoſite to the leaves, ſolitary, ſimple, ſingle-flowered, briſtly, above an inch long, deſtitute of bracteas. *Flowers* large, handſome and very remarkable, above an inch wide. *Petals* yellow, briſtly on the outſide, concave. *Nectaries* white, dotted with red and green. *Stamens* at firſt erect, then lying in five tufts upon the petals, conſpicuous for their dark anthers. This plant dries remarkably well, and has the appearance of being very ſhowy when growing. We never heard of this or any other ſpecies being cultivated in Europe, but they would doubtleſs ſucceed with the ſame treatment as the *Calceolaria pinnata*.

2. L. *contorta*. Lamarck n. 2. t. 426. fig. 2.—Stem twining. Leaves oppoſite, ſtalked, ſomewhat runcinate, toothed. Capſule twiſted.—Gathered by Joſeph de Juſſieu in Peru. One of his ſpecimens is figured and deſcribed by Lamarck, with a weak twining *ſtem*, two feet or (probably) much more in height, moderately briſtly. *Leaves* oppoſite, ſtalked, about three or four inches in length, pinnatifid, briſtly, ſharply toothed or cut, their loweſt pair of lobes longeſt and moſt reflexed. *Flowers* on long axillary ſimple ſtalks, yellow.

3. L. *acanthifolia*. Lamarck n. 3. (Ortiga chilienſis urens, acanthi folio; Feuill. Peruv. v. 2. 757. t. 43.)—Leaves oppoſite, pinnatifid, ſharply toothed; the upper ones ſeſſile. Calyx reflexed. Petals with two terminal teeth. Gathered by Feuillée in a valley in Chili. *Stem* ſix feet high, briſtly, branched, hollow. *Leaves* oppoſite, reſembling thoſe of *Argemone mexicana*, nine or ten inches long, and ſix broad, deeply pinnatifid, with numerous, ſharp, briſtly teeth; the lowermoſt ſtalked, the reſt ſeſſile. *Flowers* large, ſtalked as in the foregoing; their *petals* dark-green and briſtly at the outſide, bright red within; *nectary* yellow, ſtriped with red. No one but Feuillée ſeems to have known this remarkable ſpecies.

4. L. *grandiflora*. Lamarck n. 4.—"Leaves oppoſite or alternate, ovate, ſomewhat heart-ſhaped, lobed; hoary beneath. Petals flattiſh."—Gathered by Joſeph de Juſſieu in Peru. We have never ſeen a ſpecimen of this. Lamarck deſcribes it as remarkable at firſt ſight for the glaucous hoarineſs of the under-ſide of its *leaves*, and the great ſize of its *flowers*, which, when expanded, are at leaſt three inches broad. The *herb* is very briſtly. *Leaves* about three and a half inches long, two and a half wide.

5. L. *chenopodifolia*. Lamarck n. 5.—Leaves ſcattered, ſtalked, ovate, cut and toothed. Flowers drooping, in terminal, ſimple, ſomewhat leafy, cluſters. Fruit oblong, very briſtly. Gathered in Peru, by Joſeph de Juſſieu, whoſe ſpecimens were deſcribed by Lamarck. We have one gathered in moiſt ſituations in Lima, by Dombey. The *root* is fibrous and annual, as, probably, in the whole genus. *Stem* 12 to 15 inches high, erect, ſlightly branched, roughiſh with deflexed hairs. *Leaves* an inch or two long, one broad, few, ovate, bluntly pointed, variouſly toothed, rough with ſmall denſe briſtles. *Flowers* drooping, in a long, looſe, terminal cluſter, with a few ſmall leaves about its lower part, rather ſmall, yellow; the nectary apparently reddiſh. *Fruit* oblong, pendulous, beſet with long, prominent, denſe, rigid briſtles.

6. L. *nitida*. Lamarck n. 6.—Stem procumbent. Leaves oppoſite, palmate, cut and toothed; ſhining above; downy beneath. Fruit turbinate, briſtly. Gathered by Dombey in ſtony ground in Lima. The *ſtem* appears to be weak and procumbent, forked, leafy, downy, leſs briſtly than in ſome of the former. *Leaves* palmate, heart-ſhaped and three-ribbed at the baſe, variouſly jagged and toothed; nearly ſmooth and ſhining above, finely downy beneath; with a few ſcattered briſtles on both ſides. The lower leaves ſtand on downy *ſtalks*; the upper are nearly or quite ſeſſile. *Flower-ſtalks* from the forks of the ſtem, rather long, downy. *Germen* turbinate, downy, clothed with reflexed briſtles, but far leſs denſely than the laſt-deſcribed. *Calyx-leaves* broad and large. Dombey ſays, "the nectaries are very ſmall, three-cleft and white, with three purple briſtly-pointed appendages, on the outſide, at their baſe."

Specimens of theſe two laſt, gathered by him, are preſerved in the Linnæan herbarium.

LOOSE, To, in *Sea Language*, is to unfurl or caſt looſe any ſail, in order to be ſet, or dried, after rainy weather.

LOOSEDRECHT, in *Geography*, a town of Holland; 8 miles S. of Naarden.

LOOSEMORE, Henry, in *Biography*, a bachelor of muſic in the univerſity of Cambridge, 1640, and organiſt, firſt of King's college, and afterwards of the cathedral of Exeter. He compoſed ſeveral ſervices and anthems, *ex officio*,

officio, for theſe choirs; but we believe they were never printed, or adopted elſewhere. A perſon of the ſame name, a lay ſinger or organiſt of Exeter cathedral, is ſaid to have built the organ, which was erected in that church at the reſtoration; of which inſtrument, the largeſt pipe of the open diapaſon was 32 feet; which exceeded in magnitude that of any other organ in the kingdom.

LOOSEMORE, GEORGE, bachelor in muſic, of Trinity college, Cambridge. *Great* muſicians are but few in every part of Europe, except Italy and Germany, where the courts and capitals are ſo numerous; but *mediocrity* produces many muſicians everywhere.

LOOSENED. See Hoof-*looſened.*

LOOT, a weight in Holland, 32 of which are equal to 1lb. of commercial weight, and 24 = 1lb. of apothecaries' weight = ¾lb. troy.

LOP, in *Rural Economy*, a term ſignifying to prune or cut away.

LOP *Kent-chian*, in *Geography*, a mountain of Thibet. N. lat. 30° 14'. E. long. 85° 54'.

LOPARY, a town of Hindooſtan, in Benares; 10 miles S. of Jionpour.

LOPES, FERNAM, in *Biography*, the moſt ancient of the Portugueſe chroniclers, and ſaid to be one of the beſt writers of chronicles that any country can boaſt. He was private ſecretary to the infante D. Fernando, who died in captivity at Fez, afterwards became chief chronicler, and keeper of the archives. He died in 1449. He was author of the chronicles of Pedro I., of Fernando, and of Joam I. to the concluſion of peace with Caſtile. The chronicles of the earlier kings are variouſly attributed to him, or to Ruy de Pina, in whoſe name they are publiſhed. The chronicle of Pedro was edited in 1734 by P. J. P. Bayam, and was reprinted in 1760. That of Fernando, which is longer and more valuable, has never been publiſhed. A manuſcript copy of the work is in the hands of Mr. Southey. The moſt important of all his writings is his chronicle of Joam, which is the hiſtory of the grand ſtruggle between Portugal and Caſtile, towards the cloſe of the fourteenth century. "No pains," ſays the biographer, "were ſpared to render it as complete as poſſible, neither on the part of the hiſtorian himſelf, nor of the king Duarte, by whoſe command this hiſtory of his father was written. The monarch ſent into Caſtile to collect documents, and the chronicler, independently of the information which he had received at court from perſons who had borne a part in the councils and actions of thoſe times, went over the whole kingdom to collect teſtimony from all the actors in the wars, which he recorded. This was firſt publiſhed in 1644, ſoon after the Braganzan revolution; never was a publication better timed; never was any book better calculated to rouſe a nation by the example of their fathers, and encourage them to reſiſt thoſe enemies whom their fathers, under like circumſtances, had conquered. It is a truly excellent and admirable work. With the great advantage of ſingleneſs and wholeneſs of ſubject, it has all the manners, painting, and dramatic reality of Froiſſart, conveyed in a nobler language, and vivified by a more patriotic and more poetical mind." Gen. Biog.

LOPESCO, in *Geography*, a town of Naples, in Abruzzo Ultra; 19 miles S.W. of Aquila.

LOPEZ, GREGORIO, in *Biography*, a celebrated Spaniſh lawyer, was born at Guadaloupe, towards the cloſe of the fifteenth, or commencement of the ſixteenth century. He edited the laws of Alonſo the Wiſe, known by the title of "Las Siete Partidas," and added a commentary, which has been retained in moſt of the ſubſequent editions, and is included in the laſt. Lopez ſtudied at Salamanca, and was one of the royal council of the Indies. The time of his death is not known: his epitaph in St. Anne's chapel, in the monaſtery of Guadaloupe, ſays, in the Portugueſe language:

"Here lies the licentiate Gregorio Lopez, a native of this place. Pray to God for him." Gen. Biog.

LOPEZIA, in *Botany*, dedicated by Cavanilles to the memory of "the Licentiate Thomas Lopez," a native of Burgos, who had an honourable appointment in America in the reign of the emperor Charles V., and is ſaid to have written a compendium of natural hiſtory, after his return; which ſtill remains in manuſcript, under the title of a Treatiſe on the three elements of air, water and earth. Cavan. Ic. v. 1. 12. Vahl. Enum. v. 1. 3. Willd. Sp. Pl. v. 1. 18. Ait. Hort. Kew. ed. 2. v. 1. 10. Lamarck Dict. v. 3. 594.—Claſs and order, *Monandria Monogynia.* Nat. Ord. *Onagræ*, Juſſ. See Sims and Konig's Annals of Botany, v. 1. 532.

Gen. Ch. *Cal.* Perianth ſuperior, of four oblong, concave, coloured deciduous leaves; three of them aſcending; the fourth, rather the largeſt, pointing downwards. *Cor.* irregular. Petals four, ſpreading, longer than the calyx; the two uppermoſt oblong, erect, parallel, with a gland at the baſe, and ſupported by cylindrical claws; two lateral ones ſpatulate, widely ſpreading. Nectary obovate, folded, on a bent elaſtic ſtalk, parallel to the lower leaf of the calyx. *Stam.* Filament one, awl-ſhaped, aſcending, oppoſite to the nectary half as long as the upper petals; anther terminal, ovate, ſimple, of two cells, embraced in an early ſtate, by the folded limb of the nectary. *Piſt.* Germen inferior, nearly globoſe, ſmooth; ſtyle thread-ſhaped, ſomewhat declining, as long as the ſtamen; ſtigma capitate, downy. *Peric.* Capſule globular, of four cells, opening at the top by four valves. *Seeds* minute, ovate, numerous. *Receptacle* ſquare.

Eſſ. Ch. Calyx ſuperior, of four unequal leaves. Corolla irregular, of four petals. Nectary ſtalked, folded, oppoſite to the ſtamen. Capſule of four cells and four valves. Seeds numerous.

1. L. *hirſuta.* Hairy Lopezia. Dryandr. in Ait. Hort. Kew. n. 1. Jacq. Coll. Suppl. v. 5. t. 15. f. 4. (L. mexicana β; Willd. Sp. Pl. n. 1.)—Leaves ovate, downy. Stem round, hairy.—Native of Mexico. Mr. John Hunnemann obtained ſeeds from Germany, for Kew garden, in 1796. The plant is annual, kept in the ſtove, and flowers from September to November. We procured ſpecimens in 1797 from the Cambridge garden. The *ſtem* is two or three feet high, branched, pale green, clothed with longiſh ſoft hairs. *Leaves* alternate, ſtalked, ovate, pointed, minutely toothed, an inch or an inch and half long, of a bright light green, clothed on both ſides with ſhort ſoft hairs; thoſe near the flowers ſmall and ſeſſile. *Cluſters* ſolitary at the end of every little branch, ſomewhat corymboſe, leafy; their partial ſtalks capillary, ſimple, ſpreading, coloured, ſmooth. *Flowers* ſpreading, prettily variegated with pink, deep red, and white, in ſhape not unlike ſome ſort of little flies. When touched, they exhibit a ſtriking elaſticity, if not irritability, in the manner in which the nectary on one hand, and the ſtamen on the other, fly from the piſtil.

2. L. *racemoſa.* Smooth Lopezia. Cavan. Ic. v. 1. 12. t. 18. Curt. Mag. t. 254. (L. mexicana α; Willd. Sp. Pl. n. 1.)—Stem ſquare, ſmooth, as well as the leaves. Floral leaves minute.—Native of Mexico. The firſt ſeeds that arrived in this country, were ſent in a letter from Madrid in 1791, by the Abbé Cavanilles to the writer of the preſent article, and produced plants at Kew and Chelſea the follow-

ing year, which bloomed abundantly in the autumn, and were much admired. This ſpecies differs from the former chiefly in its ſmoothneſs, and the ſquareneſs of its *ſtem*. In other reſpects they are very much alike, eſpecially in the *flowers* and infloreſcence, ſo as to have been generally thought varieties. We are indeed by no means certain, that the ſtem of the *hirſuta* is not frequently angular, in ſome degree.

3. L. *coronata*. Coronet-flowered Lopezia. Andr. Repoſ. t. 551. Dryandr. in Ait. Hort. Kew. n. 3.—Leaves ſmooth and ſhining. Stem angular, from the decurrent footſtalks. Floral leaves moſtly longer than the flower-ſtalks.—Native of Mexico. Meſſrs. Lee and Kennedy are ſaid to have introduced this ſpecies in 1805, which is marked as a hardy annual in Hort. Kew. It differs from the laſt in being of more luxuriant growth, with larger floral *leaves*, the whole foliage being of a deeper more ſhining green. We are much inclined to ſuſpect theſe differences to have ariſen from differences of treatment, and that the fading of the lateral petals, as they advance in age, may be attributed to the action of ſtrong ſunſhine. S.

LOPHANTHUS, from λοφος, *a creſt*, and ανθος, *a flower*, is the ſpecific name of a ſpecies of *Hyſſopus*; ſee that article. Forſter has uſed it to deſignate a genus of his own, in his *Genera Plantarum*, of the native country of which, or of its form, habit, or duration, he has ſaid nothing, except that it is next akin to *Waltheria*; neither does any mention of it occur, as far as we can find, in his ſubſequent works. We preſume therefore he found he had made a miſtake, but we ſubjoin his characters of the genus. Forſt. Gen. t. 14. Juſſ. 427. Lamarck Dict. v. 3. 594. Illuſtr. t. 143.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Columniferæ*, Linn.? *Incertæ ſedis*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, in five ſmall, equal, acute ſegments, permanent. *Cor.* Petals five, ſpatulate, ſpreading, roundiſh, with ſlender upright claws the length of the calyx. *Stam.* Filaments five, awl-ſhaped, the length of the corolla; anthers ſomewhat incumbent. *Piſt.* Germen ſuperior, oblong, conical, hairy; ſtyle ſhort, cylindrical, nipple-like, ſlightly club-ſhaped; ſtigma ſlightly cloven. *Peric.* of one cell, clothed with long hairs. *Seed* ſolitary, ovate, covered, ſmooth, in the bottom of the calyx.

1. L. *tomentoſus*. The only ſpecies mentioned.

LOPHIA, in *Anatomy*, a term for the upper part of the cervix, or back part of the human neck.

LOPHIUS, in *Natural Hiſtory*, a genus of fiſhes of the order Branchioſtegi: the generic character is as follows: head depreſſed; many ſharp-pointed teeth; tongue broad and armed with teeth; eyes on the upper part of the head; noſtrils ſmall; gills three; one lateral aperture; pectoral fins placed on the long branchiæ; dorſal and anal fins oppoſite, and near the tail; body ſcaleleſs, covered with a thin lax ſkin; vent in the middle; no lateral line. The fiſhes of this genus are of a ſingularly uncouth appearance; the body being thick and ſhapeleſs; the head exceſſively large, and the fins ſhort and broad.

Species.

PISCATORIUS. This has various Engliſh names, as the European or common angler, frog-fiſh, toad-fiſh, fiſhing-frog, ſea-devil, &c. Body depreſſed; head rounded. The uſual length of this ſpecies is from two to four feet, though it is ſometimes found ſix or even ſeven feet long. In its form it has a reſemblance to that of a tadpole. The ſkin of the trunk is ſmooth, but that of the upper parts marked by various inequalities. The eyes are large and whitiſh; the lower jaw is conſiderably longer than the upper. There are ſome thread-like proceſſes that proceed from the upper part of the head, and ſome ſhorter ones from the back, but the edges of the body are fringed at intervals with ſhorter appendages of a ſomewhat ſimilar nature. The upper ſurface is brown, with deeper or paler variegations, and the under ſurface is whitiſh. The frog-fiſh inhabits the European ſeas; ſwims ſlowly; lies in ambuſh, in ſhallows, half-concealed by ſea-plants or mud, and decoying its prey by moving its worm-like proceſſes. According to the deſcription given by Buffon the two long beards or filaments placed immediately above the noſe are ſmall in the beginning, but thicker at the end, and anſwer the very ſingular purpoſe of a fiſhing-line, to which uſe the animal converts them. This property of thoſe filaments is referred to by Pliny and other naturaliſts, who ſay, "with theſe extended, the fiſhing-frog hides in muddy waters, and leaves nothing but the beards to be ſeen: the curioſity of the ſmaller fiſh brings them to view theſe filaments, and their hunger induces them to ſeize the bait; upon which the animal in ambuſh inſtantly draws in its filaments with the little fiſh that had taken the bait, and devours them without mercy." It is ſaid if the bowels of the fiſhing-frog are taken out the body will appear tranſparent; and if a lighted candle be ſubſtituted for the inteſtines, as in a lanthorn, the whole has a very formidable appearance. This ſpecies feeds on dog-fiſh and other ſmaller fiſhes. The "cornubienſis," or corniſh, or long-angler, or fiſhing-frog of Mount's bay, which has been taken as a ſeparate ſpecies, may be regarded only as a variety.

BARBATUS. Body depreſſed; lower jaw bearded. It inhabits the ſeas of Northern Europe; is between three and four feet long, and is a very voracious fiſh.

VESPERTILIO. Body depreſſed; head roſtrate: an inhabitant of the American ocean; the body is reddiſh, broad before, narrowed behind, and covered with radiate, ſharp, patelliform tubercles; beneath with ſmall prickles; in its mode of catching its prey it reſembles the L. piſcatorius.

HISTRIO; Harlequin angler, or American toad-fiſh; is of a compreſſed form; of a yellowiſh-brown colour, with irregular blackiſh ſpots, and beards on the head and body. This, which is one of the moſt groteſque and ſingular of fiſhes, is found in the American and Indian ſeas, and is a moſt curious and remarkable fiſh. It is about a foot long, and its ventral fins reſemble ſhort arms. It has been aſſerted, though on very doubtful authority we ſuſpect, that inſtances have been known of theſe fiſhes living three days without water.

STRIATUS. Body compreſſed, brown; marked all over with numerous black ſtreaks; is found on the coaſt of New Holland.

PICTUS. Body compreſſed, brown, with yellowiſh blotches edged with red; inhabits the ſouthern ocean; tendril on the noſe forked at the end.

MARMORATUS. Body ſubcompreſſed, livid, varied with whitiſh and ferruginous ſpots, dorſal fin ſingle; tendril at the noſe three-cleft at the end. Native of the Pacific ocean; obſerved about the coaſt of Otaheite, &c.

MONOPTERIGIUS. Body depreſſed, blackiſh, beneath whitiſh; fin above the tail almoſt erect, ramoſe. It inhabits the ſeas of Auſtralaſia. It is not quite agreed where to place this very ſingular fiſh; it has no fin except the lobate one juſt above the tail; the eyes are vertical, approximate, and far behind the ſnout: the body is roundiſh, a little tapering to both ends, and the tail at the end of the body rounded.

MURICATUS; Depreſſed angler: deſcribed firſt by La

Cepede, under the name "Lophie faujas:" body flat, orbicular, and covered with numerous ſmall tubercles tipped with divided or radiated ſpines; hind part contracting ſuddenly, covered with ſimilar ſpines, and terminated by the tail fin, which is of a moderate ſize, and ſlightly rounded; pectoral fins large, and ſituated lower than thoſe in the common angler. It is about four inches in length.

LOPO, in *Geography*, a lake of Thibet, about 18 miles long and nine broad. N. lat. 42° 20'. E. long. 89° 52'.

LOPPED Milk, in *Rural Economy*, ſuch as has ſtood till it becomes ſour and curdled.

LOPPEN, in *Geography*, a ſmall iſland in the North ſea, near the coaſt of Lapland. N. lat. 69° 43'.

LOPPING, in *Rural Economy*, the operation of cutting off the lateral or other branches of trees. Moſt old trees are found hollow within, which frequently proceeds from the fault of thoſe who have the management of them, by ſuffering the tops to grow too large before they are lopped; and this is common in the aſh, elm, hornbeam, &c. It is done in order to have more great wood; but the cutting off great tops often endangers the life of the trees, or wounds them, ſo that they yearly decay more in their bodies than the annual value of the tops; hence it is to the loſs of the owner to have them ſo managed; and though the hornbeam and elm will bear great tops, when the body is little more than a ſhell, the aſh, when it comes to take wet at the head, and decays, rarely bears any more top. When timber trees of this kind begin to decay, they ſhould be cut down as ſoon as poſſible.

But the lopping of trees at ten or twelve years old, in general, preſerves them much longer, and occaſions the ſhoots to grow more into wood in one year than they do in old tops in two or three. As great boughs, ill taken off, ſpoil trees, they ſhould always be taken off cloſe and ſmooth, and not in a ſlanting manner, as is a common practice. The wood ſhould be covered with loam and horſe-dung mixed, or ſome of Mr. Forſyth's compoſition, to prevent the wet from entering the bodies of the trees, and deſtroying them by bringing on the rot.

When trees are at full growth, the ſigns of their decay are the withering or dying of many of their top branches, and the wet entering at ſome knots, or their being otherwiſe hollow or diſcoloured; alſo by their making but poor ſhoots, and the woodpeckers making holes in them.

The above method of lopping of trees is only, however, proper for pollard-trees; nothing being more injurious to the growth of timber trees than lopping or cutting off great branches from them. Miller obſerves, that whoever will be at the trouble of trying the experiment upon two trees of equal age and ſize, growing near each other, by lopping or cutting off the ſide branches from one of them, and ſuffering all the branches to grow upon the other, will in a few years find the latter to exceed the former in growth in every way, and not decay nearly ſo ſoon.

It is generally recommended not to prune timber trees at all; and, where they naturally grow ſtraight and regular, they are much better let alone. But all common faults in ſhape may be regulated by lopping them while young, without any ill conſequences to the timber.

The very large foreſt trees ſhould not be lopped at all, except in caſes of great neceſſity, and then only the ſide branches ſhould be removed, which muſt be done as cloſe to the trunk as poſſible. The moſt proper ſeaſons for the performance of this ſort of buſineſs are thoſe of the very early autumn and ſpring months, in moſt inſtances.

It may be obſerved that moſt ſorts of reſinous trees, or ſuch as abound with a milky juice, ſhould be lopped very ſparingly, as they are ſubject to decay when often lopped, or cut over in their branches. The beſt ſeaſon for lopping thoſe kinds of trees is the latter end of ſummer, or beginning of autumn; they then ſeldom bleed much, and the wounds are commonly healed over before the weather ſets in to be bad and ſevere.

But very few ſorts of ornamental trees ſhould be much lopped, as it greatly injures their beauty and appearance. The only thing neceſſary is to take off ſuch ſtraggling branches as may grow out in an awkward or improper direction, and render them leſs ornamental. See Pruning *of trees*.

LOPPIS, in *Geography*, a town of Sweden, in the province of Nyland; 36 miles N.N.W. of Helſingfors.

LOPSCHENSKOI, a town of Ruſſia, in the government of Archangel, on the coaſt of the White ſea; 60 miles W. of Archangel.

LORA, a town of Spain, in the province of Seville; eight miles N. of Carmona.—Alſo, a town of Chili, on a river of the ſame name, which runs into the Pacific ocean, S. lat. 34° 46'; 105 miles S. of Valparaiſo.

LORAH, a town of Hindooſtan, in Bahar; 25 miles W.S.W. of Rotangur.

LORANCA, a town of Spain, in New Caſtile; eight miles S. of Hueta.

LORANGA, a river of Africa, which runs into the ſtraits of Mozambique, S. lat. 17° 30'.

LORANTHUS, in *Botany*, from λωρον, *a ſtrap* or *thong*, and ανθος, *a flower*, alluding to the long linear ſhape, and leathery ſubſtance, of the petals. Linn. Gen. 175. Schreb. 233. Willd. Sp. Pl. v. 2. 232. Mart. Mill. Dict. v. 3. Juſſ. 212. Lamarck Dict. v. 3. 594. Illuſtr. t. 258. Jacq. Amer. 97. (Lonicera; Gærtn. t. 27.)—Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Aggregatæ*, Linn. *Caprifolia*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, a ſmall, concave, entire rim. *Cor.* Petals ſix, oblong, revolute, equal. *Stam.* Filaments ſix, awl-ſhaped, growing at the baſe of the petals, the length of the corolla; anthers oblong. *Piſt.* Germen inferior, oblong, crowned with the permanent calyx; ſtyle ſimple, as long as the ſtamens; ſtigma obtuſe. *Peric.* Berry oblong, of one cell. *Seed* oblong.

Eſſ. Ch. Germen inferior. Corolla ſix-cleft, revolute. Stamens at the tips of the petals. Berry ſingle-ſeeded.

Obſ. L. *europæus* differs from the other ſpecies in having dioecious flowers, and *L. pentandrus* in having its flowers five-cleft half way down, with five ſtamens.

Loranthus conſiſts of paraſitical ſhrubs, which are chiefly tropical, and many of them extremely beautiful. Linnæus enumerates eleven, in his fourteenth edition of the *Syſt. Veg.* and Willdenow has twenty-ſix, ſome of which are adopted from Swartz. Lamarck alſo, as he himſelf juſtly aſſerts, has made us acquainted with ſeveral new ſpecies not before known, and many have been found ſince in New Holland, which will doubtleſs be deſcribed by Mr. Brown.—The leaves in the whole genus are oppoſite, coriaceous or fleſhy, and entire, rarely veiny. Infloreſcence lateral, compound, moſtly racemoſe or ſomewhat corymboſe. Petals long, cohering in an early ſtate, ſo as to form an apparent tube, their colour generally red, orange or yellow. The following may ſerve to illuſtrate the genus.

L. *europæus*. Linn. Sp. Pl. 1672. Jacq. Auſtr. t. 30. —Cluſters ſimple, terminal. Flowers dioecious.—Found as a paraſite upon oaks, in Auſtria, Hungary, and Moravia, alſo, according to Pallas, in Siberia. It bears flowers in April and May, and perfects its fruit in October. *Stems* very much branched and forked, often four feet long, ſmooth. *Bark* brown, thick, tubercled, ſlightly aſtringent, and turning water red in which it has been macerated. *Wood* whitiſh and brittle. *Leaves* oblong, obtuſe, entire or emarginate, deciduous when the fruit is ripe. *Flowers* delicately fragrant, yellowiſh-green, in ſome plants altogether barren, in others all of them fertile. *Berry* of a yellow colour. This plant has much the habit and appearance of our Miſletoe, *Viſcum album*, and is very remarkable in its genus for being found in cold climates.

L. *loniceroides*. Linn. Sp. Pl. 473. (Itti Canni; Rheed. Mal v. 7. 55. t. 29.)—Flowers in an aggregated head, often pentandrous.—This is a native of groves in Aſia.—A very handſome ſpecies, whoſe *branches* are long and flexuoſe. *Leaves* ovate-lanceolate, thickiſh, entire, ſmooth, veined, bluntiſh. *Flowers* about five in a cluſter, ſeſſile, tubular, yellow, downy withinſide. Stamens generally five. *Fruit* round, greeniſh-yellow, containing a ſmall, white *nut*, which has a bitter flavour.

L. *corymboſus*. Lamarck Dict. v. 3. 599. (Lonicera corymboſa; Linn. Sp. Pl. 249. Periclymenum foliis acutis, floribus profundè diſſectis; Feuillée Peruv. v. 2. 760. t. 45.)—Corymbs axillary, oppoſite. Leaves ovate, acute. Flowers quadrangular, with four petals, and four ſtamens.—Native of Chili, from whence we have a ſpecimen, by favour of Mr. Menzies, which enables us better than Feuillée's figure to underſtand the ſpecies.—The *flowers* are of a blood red, with yellow ſtamens. By the laſt mentioned author's account this ſeems not to be paraſitical. It is uſed for dyeing a fine black colour.

LORANTHUS, in *Gardening*, compriſes a plant of the exotic kind for the ſtove, of which the ſpecies cultivated is, the American loranthus (L. Americanus.) Its branches are ſubdivided, leafy, ſmooth, pale green, brittle, and the leaves pale with red flowers.

This plant ramps over the higheſt trees in Jamaica, &c. eſpecially the coccoloba grandifolia, with the root adhering firmly to the bark like miſletoe.

Method of Culture.—This plant may be increaſed by ſowing the ſeeds, as ſoon as they are fully ripened, in pots of light rich earth, being kept in a mild hot-bed until the beginning of the autumn, when they muſt be plunged in the bark hot-bed of the ſtove, being afterwards treated as other tender plants of the ſame kind.

It affords variety in ſtove collections.

LORARII, among the *Romans*, officers whoſe buſineſs it was, with whips and ſcourges, to compel the gladiators to engage. The lorarii alſo puniſhed ſlaves who diſobeyed their maſters.

LORBUS, or LERBA, in *Geography*, a town of Africa, in the country of Tunis, anciently called "Laribus Colonia;" 10 miles W.S.W. of Tuberlak.

LORCA, anciently called *Cliocrata*, a town of Spain, of conſiderable ſize, in Murcia, ſituated very near the confines of the kingdom of Granada, at the foot of a ſteep mountain, conſiſting almoſt wholly of ſchiſt, and denominated the Sierra del Cano, on the right bank of the Guadalentin. It lies at the entrance of a fine rich country, abounding with trees, particularly olive and mulberry, fertilized by the above-mentioned river. The town had formerly a caſtle advantageouſly ſituated on the top of the mountain, which was ſtrong under the Moors and under the kings of Caſtile; but it is now in ruins. Lorca is now much larger than it was under the Moors, by whom it was taken in 714; it is divided into the upper and lower town, the former being the old part on the declivity of the hill formerly occupied by the Moors, and the latter, which is more modern and better built, ſtands altogether on level ground; it has four gates and ſeveral ſquares, and two ſuburbs, and its extent is ſufficient to accommodate 12,000 perſons. The population of Lorca is computed at about 30,000 inhabitants, partly noble of ancient families, and devoted to agriculture, and partly very poor: intermixed with the other inhabitants are ſeveral wandering vagabonds, called Gitanos or gypſies. Lorca has at preſent a collegiate chapter, eight pariſh churches, ſeven monaſteries, two nunneries, two hoſpitals, one for men and the other for women, and a college for the inſtruction of youth. It is governed by a corregidor, and twenty-four regidors, who form the principality; it has a manufacture of ſalt-petre, but has no kind of commerce. Some of the produce of the country is taken from it, particularly ſilk and kali; but this trade is carried on by foreigners, eſpecially the French, who are ſettled here. The town ſuffered much in 1802 by an inundation from a large baſon or reſervoir, which had been conſtructed of an immenſe ſize in order to water the whole of its adjacent territory. This baſon being undermined, the water ruſhed from it with ſuch impetuoſity, that it wholly deſtroyed one of its ſuburbs, conſiſting of about 600 houſes, and ſeveral public buildings, and extended its deſtructive ravages to an extent of 16 leagues, ſo that the number of people who periſhed was eſtimated at 6000 and the animals at 24,000. The whole loſs was eſtimated at 200 millions of reals, or about 2,083,333*l.* ſterling. Lorca is diſtant 42 miles W. from Carthagena. N. lat. 37° 38′. W. long. 2°.

LORCH, a town of Germany, the inhabitants of which chiefly ſubſiſt by cultivating vineyards and making wine; 24 miles W.N.W. of Mentz.

LORCHAUSEN, a town of Germany, ſeated on the Rhine; 27 miles W. of Mentz.

LORD, a title of honour attributed to thoſe who are noble, either by birth, or creation; and veſted with the dignity of a baron.

The word is of Saxon origin, and primarily denotes a bread-giver, alluding to the hoſpitality of our ancient nobles: it is formed, according to Camden, from *hlaford*, afterwards written *loford*; a compound of *hlaf*, *bread*, and *ford*, *to ſupply*, *afford*.

In this ſenſe, lord amounts to the ſame with peer of the realm, lord of parliament.

LORD is alſo applied to thoſe ſo called by the courteſy of England; as all ſons of a duke or marquis, and the eldeſt ſon of an earl.

LORD is alſo an appellation given to divers perſons honourable by office; as lord chief juſtice, lord chancellor, lord of the treaſury, admiralty, &c.

LORD is alſo a title ſometimes given to an inferior perſon who has a fee, and conſequently the homage of tenants within his manor.

For by his tenants he is called *lord*, and in ſome places, for diſtinction ſake, *land-lord*.

It is in this laſt ſignification that the word lord is principally uſed in our law-books, where it is divided into *lord paramount*, and *lord meſne*.

LORD *Meſne*, is he that is owner of a manor, and by virtue thereof hath tenants holding of him in fee, and by copy of court-roll; and yet holds himſelf of a ſuperior lord called *lord paramount*.

We alſo read of *very lord*, and *very tenant*.

LORD *in Groſs*, he who is lord, not by reaſon of any manor, as the king in reſpect of his crown, &c.

Very Lord, is he who is immediate lord to his tenant; and *very tenant*, he who holds immediately of that lord.

So that where there is lord paramount, lord meſne, and tenant; the lord paramount is not very lord to the tenant.

Lord *High-Admiral* of England, is one of the great officers of the crown, whoſe truſt and honour are ſo great, that it was formerly ſeldom given, except to ſome of the king's youngeſt ſons or near kinſmen.

To him is, by the king, entruſted the management of all maritime affairs, as well in reſpect to juriſdiction as protection; with the government of the Britiſh navy; and a power to decide all controverſies and cauſes maritime, as well civil as criminal; ſuch as happen either on our coaſts, or beyond ſea, among his majeſty's ſubjects.

To him alſo belong ſuch wrecks and prizes, as are called *lagon*, *jetſon*, and *flotſon*; that is, goods lying in the ſea, floating, or caſt aſhore, excepting in ſuch royalties as are granted to other lords of manors, &c. with all great fiſhes, called *royal fiſh*, except whales and ſturgeon; a ſhare of prizes in the time of war, and the goods of pirates and felons condemned.

The lord high-admiral has under him many officers of high and low condition; ſome at ſea, others at land; ſome of a military, others of a civil capacity; ſome judicial, others miniſterial.

This great office is now uſually executed by ſeven commiſſioners, who are ſtyled *lords of the admiralty*: one is called the firſt lord, with a ſalary of 3000*l.* a-year, the others have 1000*l.* a-year each. Under theſe there are a ſecretary and deputy-ſecretary, and ſeveral inferior clerks. See *Lord High* Admiral *of England.*

In the court, called the *court of admiralty*, all proceſſes iſſue in his name, not the king's, as they do in all other courts; ſo that the dominion and juriſdiction of the ſea may juſtly be ſtyled another commonwealth or kingdom apart, and the lord high admiral the viceroy of the maritime kingdom.

He hath under him a lieutenant, or deputy, who is judge of the admiralty, commonly a doctor of the civil law. See Court *of Admiralty.*

Lord *Privy-ſeal* has his office by patent: before the 30th of Henry VIII. he was generally an eccleſiaſtic; ſince which, the office has been uſually conferred on temporal peers, above the degree of barons.

The lord privy-ſeal, receiving a warrant from the ſignet-office, iſſues the privy-ſeal, which is an authority to the lord chancellor to paſs the great ſeal, where the nature of the grant requires the *Seal*; which ſee. But the privy-ſeals for money begin in the treaſury, from whence the firſt warrant iſſues, counterſigned by the lord treaſurer. On the lord privy-ſeal are attendant four clerks, who have two deputies to act for them.

Lord *Steward of the King's Houſhold*, is the principal officer for the civil government of the king's ſervants below-ſtairs; over the officers of which he has juriſdiction. See Houshold.

He is conſtituted by the delivery of the white ſtaff, which is eſteemed his commiſſion. By virtue of his office, without any other commiſſion, he judges of all offences committed within the court, or the verge thereof; and gives judgment according to their ſeveral deſerts. See Court.

At the death of the ſovereign he breaks his ſtaff over the grave in which the royal corpſe is depoſited, and thereby diſcharges all the officers under his power.

Lord *Advocate.* See Advocate.

Lord *High-Treaſurer.* See Treasurer and Houshold.

Lold *Chamberlain of the Houſhold.*
Lord *Great Chamberlain of England.* } See Chamberlain and Houshold.

Lord *High-Chancellor of England.* See Chancellor, and Court *of Chancery.*

Lords *of the Bed-Chamber*, are fourteen in number, under the lord chamberlain. See Bed-chamber, and Houshold.

Lords, *Houſe of.* See Peers.

Lords *of Seſſion.* See Session.

Lords *of the Treaſury.* See Treasury.

Lords *Lieutenants of Counties*, are officers of great diſtinction, appointed by the king for the managing of the ſtanding militia of the county, and all military matters therein. They are ſuppoſed to have been introduced about the reign of king Henry VIII., for they are mentioned as known officers in the ſtatute 4 and 5 Ph. & M. c. 3. though they had not been then long in uſe; for Camden ſpeaks of them, in the time of queen Elizabeth, as extraordinary magiſtrates conſtituted only in times of difficulty and danger.

They are generally of the principal nobility, and of the beſt intereſt in the county: they are to form the militia in caſe of a rebellion, &c. and march at the head of them, as the king ſhall direct.

They have the power of commiſſioning colonels, majors, captains, and ſubaltern officers; alſo to preſent the king with the names of deputy-lieutenants, who are to be ſelected from the beſt gentry in the county, and act in the abſence of the lords-lieutenants.

Subſervient to the lord-lieutenants and deputy-lieutenants, are the juſtices of peace; who, according to the order they receive from them, are to iſſue out warrants to the high and petty-conſtables, &c. for military ſervice, &c.

Lord's *Day.* See Sunday.

Lord *Howe's Group*, in *Geography*, a cluſter of iſlands in the Pacific ocean, diſcovered by captain Hunter in the year 1791. Thirty-two of theſe iſlands were diſtinctly counted from the maſt-head, and they lay at ſuch a diſtance, as to afford reaſon for ſuppoſing that they were more numerous. Some of the natives, who appeared in a boat, were clean, ſtout, well-formed perſons, of a dark copper-colour; their hair was tied in a knot at the back of their head, and they ſeemed to have ſome method of taking off their beards, of which they were deſtitute; but they had an ornament, conſiſting of a number of fringes, like an artificial beard, which was faſtened on between the noſe and mouth, to which hung a row of teeth, ſo that they appeared as if they had a ſecond mouth lower than their natural one; they had alſo pieces of reed, or bone, thruſt into holes in the ſides of the noſe, and paſſing through the ſeptum; their arms and thighs were tattowed, and ſome were painted with red and white ſtreaks; and their middle was covered with a wrapper. Their canoe, which was badly conſtructed, had an out-rigger, and was about forty feet in length. Theſe iſlands appeared to be very thickly covered with wood, among which the cocoa-nut was very diſtinguiſhable. S. lat. 5° 30′. E. long. 159° 24′.

LORDOSIS, from λορδος, *bent inwards*, in *Surgery*, an incurvation of the back bone; or, a curvature of the ſpine forwards.

LORE, in *Geography*, a town of the principality of Georgia, in the province of Karduel; 65 miles N.E. of Erivan.

LOREDO, or Loreo, a ſee of Italy, in the Venetian Dogada, near a canal of the Adige, anciently called "Lauretum Venetum." It is the principal place of a diſtrict, and contains about 2300 inhabitants; 20 miles S. of Venice.

LOREMBERG, a town of the county of Goritz; 7 miles E. of Goritz.

LORENTE, Andres, in *Biography*, a Spaniſh writer in muſic, and author of a book, now become very ſcarce, intitled "El porque del la Muſica," in which are contained the four arts of plain-ſong, figurative muſic, or proportion of time or meaſure, plain counterpoint, and compoſitions. Printed at Alcala in 4to. 1672.

This is truly a very ancient treatiſe, which defines and explains the whole art of muſic, as far as it was known at the time it was written. See Worgam, *Dr.*

LORENTZ, in *Geography*, a town of Pruſſia, in Samland, near the Baltic; 24 miles N.W. of Königſberg.

LORENTZEN, St., a town of the duchy of Stiria; 8 miles N.E. of Windiſch Gratz.

LORENZAGO, a town of Italy, in the Cadorin; 7 miles N.E. of Cadora.

LORENZINI, Francis Maria, in *Biography*, an eminent Italian poet, was born at Rome in 1680. He was educated among the Jeſuits, and in his twenty-ſecond year was received into their ſociety, but quitted it again within a few months, on account of ill-health. He was much attached to literature; but he was obliged, by the ſcantineſs of his means, to apply to ſome profeſſion for his neceſſary maintenance. He engaged in that of the law, which he practiſed with ſucceſs for a ſhort period, after which he devoted himſelf entirely to letters. He entered into the academy of the Arcadi, the chief object of which was the reformation of the bad taſte which had infected Italian poetry. The founders of this ſociety propoſed the ſtyle of Petrarch as a model, in oppoſition to the affected and conſtrained diction of Marino and others. Lorenzini did not quite approve the method of Petrarch, but borrowed ſome of the force of freedom of Dante, and thus excelled his contemporaries. He is ſaid alſo to have excelled in melodramas, or pieces on religious ſubjects, adapted to being ſung, written in the Latin language. In the conteſt between Creſcembini and Gravina, which divided the members into two parties, Lorenzini adhered to that of Gravina, which was the minority; he would not, however, agree to the propoſal to found a new academy, and after a ſucceſſion of three years, he was admitted among the old Arcadi. He was now, from an inattention to his domeſtic concerns, fallen into a ſtate of indigence, and, as evils rarely come ſingly, he had ſuffered much from ſome calumnious reports. Being obliged, on this latter account, to appear before the prefect of the city, he ſo completely juſtified himſelf, that this magiſtrate, Falconeri, to ſhew the eſtimation in which the poet was held by himſelf, gave him a place in his houſhold. He now felt himſelf elevated above the misfortunes of life, and with a fine flow of ſpirits ſpent a part of every day in writing verſes. In theſe he diſplayed an enthuſiaſm of conception, and a loftineſs of language, which diſtinguiſhed him among his contemporaries. He has been denominated the Michael Angelo of Italian poets, on account of the boldneſs and energy of his expreſſions. To excite wonder and admiration, he conſidered as the peculiar office of poetry, whence he became an enthuſiaſtic admirer, and almoſt perpetual reader of the Hebrew poets, which never failed to inſpire him with rapture. He had a great paſſion for the ſcience of anatomy, and had made, in conjunction with an eminent ſurgeon at Rome, ſome new obſervations, which they meant to have publiſhed as the reſult of their united labours, but which were ſurreptitiouſly ſtolen from them. In 1728, Lorenzini was choſen preſident of the academy, and ſhewed his fitneſs for the office by ſeveral remarkable acts. He founded five academical colonies in the neighbouring towns, and inſtituted a private weekly meeting of the Arcadi, at which the plays of Plautus or Terence, in the original language, were performed by youths trained for the purpoſe. Theſe exhibitions were frequented by ſeveral perſons of rank, and were favoured by pope Clement XII., who often ſent conſiderable ſums to Lorenzini to defray his expences. Being deprived by death of his friend Falconeri, his circumſtances were again deranged, and he was relieved, in this inſtance, by cardinal Borgheſe, who enrolled him among his noble domeſtics, and paid him liberally without requiring any ſervice. In 1741, he diſcontinued his theatrical exhibitions, retired to apartments in the Borgheſe palace, where he applied to letters with more aſſiduity than ever. He wrote much Latin and Italian poetry; but his chief ſtudies were directed to the ſacred writings. In the midſt of his employments, he died in June 1743. He was faithful and liberal, and his houſe was open to young men who were deſirous of improvement. His Italian poems are few, but of great excellence. He publiſhed the lives of two of the Falconeri family. Gen. Biog.

LORENZO, in *Geography*, a ſmall iſland in the Pacific ocean, near the coaſt of Peru. S lat. 12° 4.

Lorenzo, *St.*, a town of Iſtria, and capital of a diſtrict; 9 miles N.N.E. of Rovigno. N. lat. 45° 16′. E. long. 13° 52′.

Lorenzo *de Borucas*, a town of Mexico, in the province of Coſta Rica; 65 miles S. of Carthago. N. lat. 9° 15′. W. long. 84° 6′.

Lorenzo, *St.*, a town of South America, in Braſil, and government of Fernambuco.—Alſo, a town of Naples, in Baſilicata; 9 miles N.E. of Venoſa.—Alſo, a town of Naples, in Capitanata; 3 miles S.E. of Leſina.—Alſo, a town of Naples, in Calabria Ultra; 8 miles W. of Bova.—Alſo, a town of Campagna di Roma, near the ſea-coaſt; 8 miles E.S.E. of Oſtia.—Alſo, a town of Paraguay; 270 miles S.E. of Aſſumption.—Alſo, a river of Sicily, which runs into the ſea, on the W. coaſt, N. lat. 38°. E. long. 12° 40′.—Alſo, a town of Mexico, in the province of New Biſcay; 85 miles N.W. of Parral.—Alſo, a town of Italy, in the Poleſine di Rovigo; 2 miles S.W. of Rovigo.

Lorenzo *de Pecuries*, *St.*, a town of New Mexico, on the Bravo; 45 miles N. of Santa Fé.

Lorenzo *el Real*, *St.*, a town of Spain, in Old Caſtile; 26 miles S. of Segovia.

Lorenzo, *Cape St.*, a cape on the coaſt of Peru, in the province of Quito, W. of the city of that name. S. lat. 0° 20′. W. long. 80° 20′.

LORETI, Il Cavalier Vittorii, in *Biography*, according to Adami, was a ſoprano ſinger in the papal chapel, 1622; one of the firſt evirati employed in muſical dramas on the ſtage, at the beginning of operas; and a celebrated compoſer of Arie *a Cantate da Camera;* which ſee.

LORETTO, in *Geography*, a ſmall, indifferently built, walled town and biſhop's ſee, in the marquiſate of Ancona, in Italy, conſiſting chiefly of one ſtreet within the walls, and another without as a ſuburb, containing 7000 inhabitants, pleaſantly ſituated on an eminence, 3 miles from the ſea-ſhore, 17 S. of Ancona, and 160½ N.E. of Rome. It is principally famous for the holy houſe, or Casa *Santa;* which ſee.

Loretto, a ſmall village of Chriſtian Indians, 3 leagues N.E. of Quebec, in Lower Canada; deriving its name from a chapel, a chapel, built according to the model of the Santa Caſa at Loretto in Italy; from whence an image of the holy Virgin has been ſent to the converts here, ſimilar to that in the famous Italian ſanctuary. Theſe converts are of the Huron tribe.

Loretto, *Lady of*, a place in the diſtrict of St. Dennis, on the iſthmus of California, called by the Indians "Caneho;" in which is a ſmall fort, erected by the miſſionaries, conſiſting of four baſtions, and ſurrounded by a deep ditch. In this juriſdiction are fifteen pariſhes, including 4000 profeſſing Indians, under the inſtruction of Dominican friars.

Loretto, or *Loreto*, a town of the iſland of Corſica; 7 miles N E of Porta.—Alſo, a town of New Mexico, in the province of Mayo; 105 miles E N.E. of Santa Cruz.—Alſo, a town of South America, in the province of Buenos Ayres; 200 miles E. of Corrientes.—Alſo, a town of South America, in the government of Majos, on the Marmora; 50 miles S. of Trinidad.

Loretto, *Order of*, in *Heraldry*, an order of knighthood, inſtituted by pope Sixtus V. in 1587, confirmed by pope Paul III., and aboliſhed by pope Gregory XIII. The knights wore, pendent to a ribbon at their button-hole, a ſmall gold medallion, enamelled with the image of the virgin of Loretto.

LORGUES, in *Geography*, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Draguignan; 6 miles S.W. of Draguignan. The place contains 4923, and the canton 10 820 inhabitants, on a territory of 302 kiliometres, in 6 communes.

LORI, in *Ornithology*. See Psittacus *Amboinenſis*.

LORICARIA, in *Natural Hiſtory*, a genus of fiſhes of the order abdominales. The generic character is, head ſmooth, depreſſed; mouth without teeth, retractile; gill-membrane ſix-rayed; body mailed, hence its name. According to Gmelin, there are but two ſpecies; but Dr. Shaw deſcribes ſeven, which we ſhall enumerate in their order.

Species.

Costata; Ribbed loricaria. Yellowiſh-brown, mailed by a ſingle row of ſhields on each ſide, with a *forked* tail. This fiſh, in its general habit, reſembles a ſpecies of the ſilurus, the mouth being furniſhed with long cirri, and the firſt rays of the dorſal and pectoral fins ſerrated; the head is large, depreſſed, covered with a rough bony ſhield, projecting on each ſide the thorax into an exceedingly ſtrong and obtuſely pointed ſpine of conſiderable length; the whole body, from the thorax, is ſtrongly mailed along each ſide by a continued ſeries of very broad bony plates or ſcales, each of which projects in the middle into a ſhort hooked ſpine or curved proceſs; the upper and under parts of the body, from the ſmall dorſal fin to the tail, are mailed in the ſame manner, but with ſmaller plates than on the ſides; the tail is large and ſharply forked. It is a native of the Indian and American ſeas; is a fiſh of great boldneſs, and is dreaded by fiſhermen; the ſtrength and ſharpneſs of its ſpines enabling it to inflict very painful, and even dangerous wounds.

Cataphracta; Armed loricaria. Brown, mailed by a ſingle row of ſhields on each ſide, with a *rounded* tail. This ſpecies is nearly allied to the preceding, but differs in having a rounded tail, and in ſome other particulars. It is about ten inches long, and is found in the American ſeas.

Callichthys; Soldier loricaria. Brown, with depreſſed, rounded head, double row of ſcales on each ſide, and rounded tail. This remarkable ſpecies grows to the length of ten or twelve inches, and is of a duſky brown colour throughout, with a tinge of reddiſh or yellowiſh-brown on the fins and under parts. It is highly eſteemed as an article of food by the inhabitants of Surinam. It has been aſſerted, and Dr. Shaw has given currency to the report, probably without attaching any credit to it, that this fiſh, when diſtreſſed for want of water, by the ſtreams which it inhabits being too ſhallow for it, contrives to make its way over land, in order to diſcover ſome deeper ſtream; and occaſionally perforates the ground for the ſame purpoſe

Punctata; Speckled loricaria. Yellow, with browniſh back; double row of ſcales on each ſide; fins ſpeckled with black, and forked tail. A ſmall, but elegant ſpecies. Length five or ſix inches; ſhape like the generality of fiſhes. Native of the rivers of Surinam.

Accipenser; Sturgeon loricaria. Yellowiſh-brown, with toothleſs mouth, rounded front, and ſpotted fins. This, as its name imports, is ſomething like a ſturgeon, and long and ſlender. It is a native of the Indian ſeas, and grows to the length of twelve or fifteen inches. This ſpecies is deſcribed by Bloch as L. dentibus carens.

Dentata; Toothed loricaria. Yellowiſh-brown, with toothed, cirrated mouth, and ſlightly pointed ſnout. This differs from the laſt, in having the mouth furniſhed with teeth, and in having a ſlightly pointed ſnout. It is a native of the Indian ſeas.

Flava; Yellow loricaria. Yellow, ſpotted with brown, with two dorſal fins and tail marked by tranſverſe bands. This is an elegant ſpecies, in length about ten inches; habit much more ſlender than in the two preceding. Inhabits the Indian ſeas.

LORICATION, or Coating, in *Chemiſtry*, is the covering of a glaſs or earthen veſſel with a coat or cruſt of a matter able to reſiſt the fire, to prevent its breaking in the performing of an operation that requires great violence of fire.

When veſſels are expoſed to a fire too ſtrong for their ſtructure, or to the corroſive quality contained in them, or on the throwing on of freſh cold fuel into the fire where they ſtand, it frequently happens that they crack and burſt; for the preventing of which, the operator has recourſe to this method of coating or loricating his veſſels. It is performed in the following manner: take a quantity of waſhed clay, with an admixture of pure ſand, powder of calcined flints, or broken crucibles; and inſtead of pure water, moiſten it with freſh blood that has not yet been coagulated, diluted with twice or three times its quantity of water; make the clay with this into a thin paſte, and work into it ſome cow's hair, or other hair not too long nor too ſtiff, and a little powdered and ſifted glaſs, if you have it at hand; ſmear over the veſſel intended to be uſed with this paſte, by means of a pencil, and ſet it to dry; when dry, beſmear it again, and repeat the operation till the veſſel have a cruſt of a third, or a quarter of an inch, at leaſt, thick of this matter, and let it be thoroughly dry before it is uſed.

To keep blood in a proper ſtate for this uſe, it muſt, when juſt let out from the animal, be well ſtirred about with a ſtick for ſome time, at leaſt till it is quite cold; and being thus prepared, it will keep for ſome days without coagulating, and fit for uſe.

This compoſition, with an admixture of bole, worked into a paſte with the whites of eggs, diluted with water, makes alſo the proper lute for cloſing the junctures of other chemical veſſels, in the diſtilling ſtrong ſpirits. See Lute.

LORIMERS, one of the companies of London, that make bits for bridles, ſpurs, and ſuch like ſmall iron ware.

They are mentioned ſtat. 1 Rich. II. cap. 12. See COMPANY.

The word ſeems derived from the Latin, *lorum*, a thong.

LORIOL, in *Geography*, a town of France, in the department of the Drôme, and chief place of a canton, in the diſtrict of Valence; 12 miles S. of Valence. The place contains 2392, and the canton 6654 inhabitants, on a territory of 177½ kiliometres, in 5 communes.

LORIOT, in *Ornithology*. See ORIOLUS *Galbula*.

LORIPES, the name uſed by ſome authors for the himantopus, a bird of the water-kind, remarkable for the length and weakneſs of its legs. See CHARADRIUS *Himantopus*.

LORIS, in *Zoology*, a ſpecies of lemur in the Linnæan ſyſtem, being the lemur tardigradus of Buffon, deſcribed by Buffon. See LEMUR *Tardigradus*.

LORME, PHILIBERT DE, in *Biography*, an eminent French architect, was born at Lyons in the early part of the ſixteenth century. He went to Italy, when he was but fourteen years of age, to ſtudy the art for which he ſeemed to have a ſort of natural taſte. His aſſiduity attracted the notice of cardinal Cervino, afterwards pope Marcellus II., who took him into his palace, and aſſiſted him in his purſuits. He returned to France in 1536, and was the means of baniſhing the Gothic taſte in buildings, and ſubſtituting in its place the Grecian. He was employed by Henry II., for whom he planned the horſe-ſhoe at Fontainbleau, and the chateaus of Anet and Meudon. After the demiſe of the king, he was made inſpector of the royal buildings by Catharine de Medicis; and under her direction he repaired and augmented ſeveral of the royal reſidences, and began the building of the Thuilleries. In 1555 he was created counſellor and almoner in ordinary to the king; and as a recompence for his ſervices, he was preſented with two abbacies. Theſe honours, it is ſaid, made him arrogant, which occaſioned the poet Ronſard to ſatirize him in a piece, entitled "La Truelle Croſſée," or "The croziered Trowel." De Lorme took his revenge, and ſhut the garden of the Thuilleries againſt him; but the queen took part with the poet, and ſeverely reprimanded the reverend architect. De Lorme died in 1577. He publiſhed "Dix Livres d'Architecture," and "Nouvelles Inventions pour bien batir et a petits Frais." Moreri.

LORME, in *Geography*, a town of France, and ſeat of a tribunal, in the department of the Niévre; 33 miles N.E. of Nevers.

LORN, a diſtrict of Scotland, in the north part of the county of Argyle; whence the eldeſt ſon of the duke of Argyle takes the title of marquis of Lorn.

LOROMIE'S STONE, a place of America, in the ſtate of Ohio, weſterly from fort Lawrence, and near a fort of a branch of the great Miami river, which falls into the Ohio. At this ſpot, bounded weſt by the Indian line, the Indians ceded a tract of land to the United States, ſix miles ſquare, by the treaty ſigned Auguſt 3, 1795. Here the portage commences between the Miami of the Ohio and St. Mary's river, which runs into lake Erie.

LOROUS, a town of Tunis, anciently called "Laribus;" 60 miles S.W. of Tunis.

LOROUX BECONNOIS, LE, a town of France, in the department of the Maine and Loire; 13 miles W.N.W. of Angers.

LOROUX *Bottereau*, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Nantes; 10 miles N. of Cliſſon. The place contains 1178, and the canton 8536 inhabitants, on a territory of 157½ kiliometres, in 5 communes.

LORQUI, a town of Spain, in Murcia; 12 miles N.W. of Murcia.

LORRACH, or LARACH, a town of the duchy of Baden; 6 miles N.E. of Bâle.

LORRAIN, ROBERT LE, in *Biography*, an eminent ſculptor, was born at Paris in 1666. He was pupil of Gerardon, who confided to him, at the age of eighteen, the inſtruction of his own children, and the correction of the deſigns of his other pupils. Having diſtinguiſhed himſelf by ſeveral works, and carried away the firſt prize at the academy, he went to Rome for improvement. In 1693 he returned; but owing to the misfortunes of the times, he found ſcarcely any employment. In 1701 he was admitted into the academy of painting and ſculpture, on account of his great merit as an artiſt. He was perfectly unaſſuming in his manners, and took no heed of putting himſelf forward; ſo that his works, which always attracted notice, were much more known than his perſon. In 1710 he was nominated adjunct profeſſor in the academy; and in 1717 he filled the office of profeſſor. The duties of theſe offices he fulfilled with great attention; and he could boaſt of having inſtructed in his art ſeveral pupils of extraordinary merit. He executed much of the exterior ſculpture of the palace of Saverne, near Straſburg, for the cardinal de Rohan; but in the midſt of his labours, and of an increaſing reputation, he was attacked by a ſtroke of apoplexy in 1738, which obliged him to return to Paris, where he lingered ſeveral years, till death terminated his afflictions in 1743. Lorrain was diſtinguiſhed by his character-heads; of which, thoſe of young perſons, particularly of the female ſex, are often exquiſitely beautiful, with airs of ſingular grace and elegance. Gen. Biog.

LORRAIN, *Duchy of*, in *Geography*, united to France, and, together with the duchy of Bar, now divided into the departments of the Meuſe, the Meurthe, the Moſelle, and the Voſges; which ſee reſpectively. This country forms only a ſmall part of a kingdom, which bore that name, and which extended from Vienne on the Rhône to Cologne. Separated from Bar, it is about 90 miles in length, and 69 in breadth. The principal rivers are the Meuſe, the Moſelle, the Meurthe, and the Saar.

According to Chaucer, we know not on what foundation, Lorrain abounded in ſingers ſuperior to thoſe of France:

> "There mighteſt thou ſe theſe flutours,
> Minſtalles, and eke jugilours,
> That well to ſinging did their pain,
> Some ſongen ſonges of Loraine;
> For in Loraine their notis be
> Fut ſweeter than in this contrè."

LORRAINE, CHARLES DE, in *Biography*, cardinal and archbiſhop of Rheims, younger ſon of Claude de Lorraine, firſt duke of Guiſe, was born in 1525. He was created archbiſhop of Rheims, at the age of fifteen, by Francis I., and cardinal by pope Paul III. in 1547. At the death of his uncle, the cardinal John of Lorrain, in 1550, he ſucceeded to a rich courſe of benefices, which, it appears, amounted in the whole to two archbiſhoprics, ſix biſhoprics, and ſeveral rich abbacies. In addition to high birth, he poſſeſſed a fine perſon, quick parts, a natural flow of eloquence, and no inconſiderable ſhare of learning. Through the intereſt of Diana de Poitiers, miſtreſs of Henry II., he was ſent out as his ambaſſador to the pope. He ſoon entered into the views of the holy pontiff, and perſuaded the king his maſter to undertake a war for the conqueſt of Naples, in which his brother, the duke of Guiſe, had the principal command. He was a bitter enemy to the reformers of the age, and promoted ſeveral ſevere and cruel edicts againſt them. He made the utmoſt efforts in his power to introduce into his own country the infernal inquiſition; a point which he would probably have carried, but for the oppoſition of the excellent chancellor de l'Hopital, ſeconded by the good ſenſe and temper of the people. During the ſhort reign of Francis II. the cardinal uſurped and maintained a moſt deſpotic authority: but he was equally zealous for his own fame as he was for the honour of the Catholic religion. At the conference of Poiſſy between the two religious parties, he gained ſome reputation, at leaſt with thoſe who felt it their intereſt to flatter him, by his eloquence in refuting the learned Beza; but it was not very difficult to confound the antagoniſt, who had truth and not power on his ſide, and whoſe reaſoning was treated as blaſphemy. The cardinal was likewiſe ambitious of the praiſe of pulpit eloquence, and preached ſeveral times at Paris before large audiences; and the violence of his diſcourſes againſt the Proteſtants led the people to regard him as one of the principal authors of the furious civil wars under Charles IX., crowned by the horrid maſſacre of St. Bartholomew's. He was remarkably fond of ſhow, and appeared with ſplendour at the council of Trent; at which, it is reported, Pius V., who denominated him "the little pope beyond the mountains," did not wiſh for his preſence. The death of his brother, the duke, diminiſhed his conſequence; and he found it neceſſary to relax in the vigour with which he began in maintaining the intereſts of the Gallican church. During the reign of Charles IX. he was the miniſter of ſtate, and alſo ambaſſador to the court of Spain. On the acceſſion of Henry III. he went to meet that prince at Avignon, on his way from Poland; and, in a religious proceſſion, placed himſelf at the head of the "blue penitents." This was the laſt ſhow in which he figured, being at the time ſeized with a fever, which terminated his life in December 1754, in the fiftieth year of his age. It is difficult to draw the character of this cardinal. His enmity to the Proteſtants cauſed him to be the object of much party ſatire and reproach. They probably exaggerated his failings and immoralities: but making due allowance for the effect of private enmities, ſtill it muſt be admitted he was a man of exceedingly licentious habits, and who expected, perhaps, to bury his faults by his zeal for the church, or by an exceſs of oſtentatious alms-giving. "He was accuſtomed," ſays one of his biographers, "to carry a great leathern purſe, which his valet-de-chambre took care to fill every morning with three or four hundred crowns; and as many poor as he met, he put his hand into his purſe, and gave them a handful of money without counting. But if he were prodigal in his alms, he was not leſs ſo in gifts to other perſons, and eſpecially to the ladies, whoſe favours he readily procured by this bait; and it was aſſerted that there were very few, married or ſingle, frequenting the court at that time, who were not debauched by the largeſſes of the cardinal." By Maimbourg it is aſſerted, that the cardinal was the boldeſt of men in forming mighty ſchemes in his cloſet, but the weakeſt and moſt timid when they were put into execution. He was venerated by the clergy as the guardian of their immunities; by the Catholics in general, as the champion of their faith. Verſed in the wiles of courts, fruitful in expedients, and eloquent in debate, he was too readily elated by ſucceſs, and too eaſily depreſſed by defeat. His perſonal courage was ever a ſubject of doubt; his vindictive temper was at all times dreaded; and the diſſolute pleaſures of his private vied with the preſumption of his public conduct. Some of his literary compoſitions have been printed: they conſiſt chiefly of harangues on public occaſions. Hiſtory of France, London, 1790. Bayle. Moreri.

LORRES, in *Geography*, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the diſtrict of Fontainebleau. The place contains 610, and the canton 9193 inhabitants, on a territory of 257½ kiliometres, in 18 communes.

LORRIS, William de, in *Biography*, a French poet, who flouriſhed about the middle of the thirteenth century, is known as the author of the "Roman de la Roſe," a poem much in requeſt in the middle ages. Under the allegory of a roſe-tree, planted in a delicious garden, and protected by bulwarks, it deſcribes a lover's purſuit, and final acquiſition of the object of his paſſion. He did not live to finiſh his work: it was completed in the next century by John de Meun. The part by Lorris, though the ſhorteſt, is by much the moſt poetical, abounding in rich and elegant deſcription, and in lively portraiture of allegorical perſonages. The beſt edition of this poem is that of the Abbé de Lenglet, three vols. 12mo. 1735. Chaucer tranſlated that part which belonged to Lorris. Gen. Biog.

Lorris, in *Geography*, a town of France, in the department of the Loiret, and chief place of a canton, in the diſtrict of Montargis; 12 miles S.W. of Montargis. The place contains 1526, and the canton 6528 inhabitants, on a territory of 205 kiliometres, in 13 communes.

LORRY, Anne-Charles, in *Biography*, a learned phyſician, was born at Croſny, near Paris, in 1725. He ſtudied and practiſed his profeſſion with unremitting zeal and peculiar modeſty, and obtained a high reputation. In 1748 he was admitted doctor of the faculty of medicine at Paris, and ſubſequently became doctor-regent of the faculty. He was author of ſeveral works, ſome of which ſtill maintain their value. His firſt publication was entitled "Eſſai ſur l'Uſage des Alimens, pour ſervir de Commentaire aux livres diététiques d'Hippocrate," Paris, 1753, 12mo.; the ſecond part of which appeared in 1757. His next publication was an edition of the Aphoriſms of Hippocrates, Greek and Latin, in 1759. Afterwards he produced a treatiſe "De Melancholia et Morbis Melancholicis," ibid. 1765, in two volumes 8vo. and edited Dr. Aſtruc's "Memoires pour ſervir á l'Hiſtoire de la Faculté de Médecine de Montpellier," ibid. 1767, 4to.; and "Sanctorii de Medicina Statica," with a commentary, 1770, in 12mo. His laſt work, which combined the merits of much erudition and accurate obſervation, with great clearneſs of arrangement and perſpicuity of language, was "Tractatus de Morbis Cutaneis," Paris, 1777, in 4to. Dr. Lorry alſo edited a Latin edition of the works of Mead, and a French one of Barker's diſſertation on the conformity of the doctrines of ancient and modern medicine. He died at the baths of Bourbonne, in 1783. Eloy Dict. Hiſt. de la Med. Gen. Biog.

LORSQUEN, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the diſtrict of Sarrebourg; four miles S.S.E. of Sarrebourg. The place contains 1164, and the canton 13,680 inhabitants, on a territory of 390 kiliometres, in 29 communes.

LORUNGAH, a paſs in the mountains of Bengal; 18 miles W. of Ramgur.

LORY, in *Ornithology*. See Psittacus *Garrulus*, &c.

LOS Reyes. See Lima.—Alſo, the chief town of the province of Uragua, in the eaſt diviſion of Paraguay, in South America.

Los *Charcos*, a province in the ſouthern diviſion of Peru, the chief cities of which are Potoſi and Porco.

LOSARI, a town of the iſland of Corſica; 15 miles N. of Calvi

LOSDORF, a town of Bohemia, in the circle of Leitmeritz; ſix miles W.S.W. of Kamnitz.

LOSENITZA, a town of European Turkey, in Servia; 30 miles S S.W. of Sabacz.

LOSER, a town of the electorate of Salzburg, on the Stampach; 21 miles S.W. of Salzburg.

LOSITZ, a town of Naples, in the province of Bari; ſix miles E. of Bittetto.

LOSORGA, St., a town of the iſland of Sardinia; 11 miles S. of Boſa.

LOSQUET, a ſmall iſland in the Engliſh channel, near the coaſt of France. N. lat. 43° 49′. W. long. 3° 31′.

LOSS, *Iſlands of*, a cluſter of ſmall iſlands in the Atlantic, near the coaſt of Africa. N. lat. 9° 16′. W. long. 13°.

LOSSA, a town of Sileſia, in the principality of Brieg; five miles S.E. of Brieg.

LOSSAU, a town of Germany, in the principality of Bayreuth; nine miles S.E. of Bayreuth.

LOSSIEMOUTH, a ſeaport town of Scotland, in the county of Murray, at the mouth of the river Loſſie, famous for its trout. A few fiſhing veſſels belong to the place; but its harbour is convenient for veſſels of 50 tons; ſix, miles N. of Elgin.

LOSSIN, or Lassin, *Great*, a town in the S. part of the iſland of Cherſo, containing about 1800 inhabitants.

Lossin, *Little*, a town of the ſame iſland, containing about 1600 inhabitants; one mile S. of Great Loſſin.

LOSSIUS, Lucas, in *Biography*, of Lunenburg, a Lutheran divine and ſchool-maſter, well ſkilled in muſic, who publiſhed at Nuremburg, in 1553, "Erotomata Muſicæ practicæ," and Lutheran pſalmodia. At the time of the Reformation the Lutherans preſerved more muſic in their liturgy than the Calviniſts, or the church of England.

LOSSNITZ, in *Geography*, a town of Saxony, in the lordſhip of Schonburg; 50 miles E. of Dreſden. N. lat. 50° 32′. E. long. 12° 37′.

LOSTORFF, a town of Auſtria; nine miles W. of St. Polten.

LOSTWITHIEL, a borough, market-town, and pariſh in the hundred of Powder, and county of Cornwall, England, is ſituated in a narrow valley on the weſtern ſide of the river Fawy, 25 miles diſtant from Launceſton, and 234 from London. The houſes are principally diſpoſed in two ſtreets, running parallel from the river to the bottom of a ſteep hill, which riſes to a great height on the weſt. The buildings are chiefly of ſtone, and covered with ſlate, which is obtained in great abundance in the vicinity of the town. The church conſiſts of one large and two ſmall aiſles, with a tower at the weſt end, terminating in a ſingular open ſpire. The font is conſtructed of a large octangular block of free-ſtone, ſupported by five cluſtered columns, charged with rude and ill-executed ſculptures. In the ſouth aiſle is an ancient monument of the time of Elizabeth, with eight ſmall figures, in baſſo-relievo, kneeling, erected in memory of Temperance, wife of William Kendall, eſq. who died in 1579. At a ſmall diſtance to the ſouth of the church are the external walls of an old building called the palace, which was anciently a reſidence of the dukes of Cornwall, but is now converted into the ſtannary priſon. This fabric was once very extenſive; but great part of its ſcite is occupied by timber yards. The walls are extremely thick, and, like many ancient caſtles, ſeem to have been conſtructed with ſmall ſtones, fixed by a liquid cement, now become harder than the ſtone itſelf. Loſtwithiel was incorporated at a very early period; numerous privileges were conferred on it by Richard, king of the Romans, who, by charter, made it a free burgh, and granted to its burgeſſes the liberty of a guild mercatory. They alſo poſſeſs the anchorage dues of Fawy harbour, and various duties on coal, ſalt, corn, malt, and other commodities brought into that port. The corporation conſiſts of a mayor, ſix burgeſſes, and ſeventeen aſſiſtants, or common councilmen, who are choſen annually by the mayor and burgeſſes. The borough has returned two members to parliament ever ſince the 23d of Edward I.; the right of election is confined to the corporation. This was anciently the ſhire town; and the county members are ſtill elected here, and the county weights and meaſures kept here. According to the enumeration made in the year 1801, this town contained 125 houſes, and 743 inhabitants. A market is held on Friday, and three fairs annually.

About one mile north of Loſtwithiel, on the ſummit of a very high hill, are the mouldering remains of Reſtormel caſtle, a fortreſs magnificent in ruin, and proudly exalting its ivy-clad walls above the contiguous narrow winding vallies. This was one of the principal reſidences of the earls of Cornwall: Richard, king of the Romans, kept his court here; his ſon Edmund alſo made this caſtle his abode; and though now in decay, yet the grandeur of its ruins, and the importance they communicate to the ſurrounding ſcenery, render it peculiarly intereſting. The caſtle and its honour were part of the inheritance of the dukes and earls of Cornwall; and were annexed by Edward III. to the duchy; but the manſion formerly connected with the eſtate, and named the Trinity-houſe, is now the property of the earl of Mount Edgecumbe, and called Reſtormel. Beauties of England and Wales. vol. ii.

LOSZLAU, or Wodislau, a town of Sileſia, and chief place of a lordſhip, in the principality of Ratibor; 11 miles S.E. of Ratibor. N. lat. 49° 57′. E. long. 18° 18′.

LOT, ſo called from the river, which riſes in the department of the Lozere, and joins the Garonne, near Aiguillon, formerly *Quercy*, one of the nine departments of the ſouthern region of France, lying in 44 30′ N. lat, N.N.W. of Tarn, and equidiſtant from both ſeas; bounded on the N. by the department of the Correze, on the E. by the Cantal, on the S.E. by the Aveiron, on the S. by the Tarn and the Upper Garonne, on the W. by the Lot and Garonne, and on the N.W. by the Dordogne; 34 French leagues in length and 30 in breadth, containing 7432½ kiliometres, or 362 ſquare leagues, and 383,683 inhabitants. It is divided into four circles or diſtricts, 41 cantons, and 440 communes. The circles are Montauban, including 115,954, Figeac, 80,372, Gourdon, 75,861, and Cahors, 111,496 inhabitants. The capital of the department is Cahors. Its contributions amount to 3,235,544 fr. and its expences to 272,533 fr. 33 cents. This department is, in general, hilly, but contains ſome fruitful plains and vallies. Its products are grain, wine of an excellent quality, fruits, ſilk, hemp, flax, tobacco, and paſtures. It has iron mines, coal, and mineral ſprings.

Lot *and Garonne*, formerly *Agenois*, one of the nine departments of the ſouth-weſt, or Garonne region of France, lying in 44° 30′ N. lat. and bounded on the N. by the department of the Dordogne, on the E. by the Lot, on the S. by the Gers, and on the W. by the Landes and Gironde, 23 French leagues in length and 18 in breadth, containing

6100 kiliometres, or 36,308 ſquare leagues, and 352,908 inhabitants. It is divided into four circles, 38 cantons, and 459 communes. The circles are Agen, including 107,840, Marmande, 112.091, Nerac, 43,119, and Villeneuve d'Agen, 89 858 inhabitants. Its contributions amount to 3,807,413 fr. and its expences to 292,739 fr. 33 cents. Its capital is Agen. The ſurface of this department is diverſified by fruitful eminences; but two-thirds of the ſoil are of a very inferior quality. It has ſeveral marſhy tracts; the Landes conſiſts of moveable ſands; ſome parts near the Lot have a rugged and barren aſpect; but the circle of Villeneuve d'Agen is diſtinguiſhed by its fertility. The products are grain, fruits, few trees, and indifferent paſtures. It has iron mines.

Lot's *Wife*, a ſtupendous rock in the ſea, encompaſſing the Ladrones, which riſes in the form of a pyramid, and is thus deſcribed by Mr. Meares in his voyage, cited by Mr. Pinkerton. "The latitude was 29° 50′ N., the longitude 142° 23′ E. of Greenwich. The waves broke againſt its rugged front, with a fury proportioned to the immenſe diſtance they had to roll before they were interrupted by it. It roſe almoſt perpendicular to the height of near 350 feet. A ſmall black rock appeared juſt above the water, at about 40 or 50 yards from the weſtern edge. There was a cavern on its ſouth-eaſtern ſide, into which the waters rolled with an awful and tremendous noiſe. In regarding this ſtupendous rock, which ſtood alone in an immenſe ocean, we could not but conſider it as an object which had been able to reſiſt one of thoſe great convulſions of nature that change the very form of thoſe parts of the globe which they are permitted to deſolate."

Lot, in a legal ſenſe. See Scot.

Lot, or *Loth*, in *Mining*, is the thirteenth diſh, meaſure, or part of the miner's ore, which the bar-maſter takes up for the king, or the farmer.

Lot, or *Pot*, a liquid meaſure in French Flanders, each equal at Liſle to 126 cubic inches, and 183.33 = 100 Engliſh gallons.

LOTA, in *Ichthyology*, the name of a ſpecies of the Muſtela fluviatilis. See Gadus *Lota*.

LÓ-TCHEOU, in *Geography*, a town of Corea; 22 miles W.S.W. of Koang-tcheou.

LOTE Tree, in *Botany*. See Celtis.

LOTH, in *Geography*, a town of Scotland, in the county of Sutherland, on the E. coaſt; 16 miles N.N.E. of Dornoch.

Loth, or *Lod*, a weight in Germany; 2 loths being = 1 oz. and 16 oz. = 2 marks = 1 pfund or pound. In eſtimating the fineneſs of ſilver, the mark fine is divided into 16 loths, and the loth into 18 grains.

LOTHAIRE I., in *Biography*, emperor of the Weſt, and king of Italy, eldeſt ſon of Lewis I., ſurnamed le Debonnaire, was born in 795. He was aſſociated with his father in the imperial dignity in 817, and was crowned king of Lombardy in 821. (See Lewis I.) On the death of his father he ſucceeded to the imperial dignity. Being confirmed in the title of emperor, he aimed at the poſſeſſion of the whole of his father's territories, and endeavoured to deprive, of their inheritance, his brothers Lewis and Charles, who aſſembled all their forces to vindicate their rights. This great family quarrel was decided on the plains of Fontenoy. The conflict was terrible, and the ground diſputed with an obſtinacy, of which few examples are left on record in the ſanguinary horrors of war. Hiſtorians agree in ſtating that a hundred thouſand men fell on this occaſion, and have in this inſtance applied the remark, "that whole generations may be ſwept away by the madneſs of kings in the ſpace of a ſingle hour." Lothaire was completely defeated, and obliged to betake himſelf to flight. He went to Aix-la-Chapelle, where he diligently exerted himſelf to repair his loſſes. The viciſſitudes of three ſucceſſive years of diſcord exhauſted at length the powers, without impairing the animoſity, of the kindred princes, and they conſented to divide thoſe dominions for which they were no longer able to contend. By this diviſion the French monarchy was divided into three ſhares, of which Lothaire, with the imperial dignity, retained Italy, with all the provinces ſituated between the Rhone, Rhine, Soane, Meuſe, and Scheldt. After this partition, Lothaire paſſed ſome years, diſquieted by the inroads of the Saracens upon Italy, and by differences with his half-brother Charles, till diſguſt with the cares of the world, and declining health induced him to abdicate his crown. The part of Gaul which Lothaire retained, he had diſtinguiſhed by his own name, Lotharingia, which, by the inſenſible corruption of time, has ſunk into that of Lorrain, which is ſtill annexed to the diſtrict. But the empire which he had purſued at the expence of every filial duty, and which he had eſtabliſhed by torrents of the beſt blood of his ſubjects, afforded him but a tranſient ſatisfaction. From the ſummit of grandeur which he had attained, the recollection of the paſt was melancholy and frightful, the proſpect of the future was dreary and comfortleſs, and fifteen years after the death of his father he aſſumed the habit of a monk; the ſhort ſpace of a few days only, however, was allowed to the prayers of the royal penitent, when he died in the ſixtieth year of his age. He left three ſons, *viz.* Lewis, Lothaire, and Charles: of whom the firſt inherited Italy, with the title of emperor; the ſecond, the kingdom of Lorrain; and the third that of Provence. Univer. Hiſt.

Lothaire II., or Lotharius, duke of Saxe-Supplemburg, was raiſed to the imperial throne, after the death of Henry V., in 1126, notwithſtanding the oppoſition of two powerful competitors, who made very vigorous exertions for the ſupport of their pretenſions. But after a ſanguinary and unavailing conteſt, they took the oath of allegiance, and were honoured with particular marks of their ſovereign's friendſhip. Lothaire was crowned at Aix-la-Chapelle, in preſence of the pope's nuncio. After he was quietly ſeated on his throne, he eſpouſed the cauſe of pope Innocent II. againſt the anti-pope Anacletus, and undertook an expedition into Italy, to re-eſtabliſh him in the papal chair. Lothaire was ſucceſsful, and the event fully anſwered his expectations. Innocent remunerated his ſervices by performing the ceremony of his coronation with great magnificence, but he had the art, at the ſame time, to make the emperor do homage to the holy ſee, of which the court of Rome availed itſelf to maintain that the empire was a fief of that ſee. Some time after theſe tranſactions, his holineſs was expoſed to imminent danger by an hoſtile incurſion of Roger, king of Sicily, but Lothaire advanced to his aſſiſtance, and Roger's inſult was puniſhed by the loſs of all his Italian poſſeſſions, and he himſelf was forced to retire into Sicily. Theſe provinces Lothaire formed into a principality, which he conferred upon Renaud, a German, one of his relations. On his return into Germany, Lothaire was ſeized with a dangerous diſtemper, which terminated his life in the twelfth year of his reign. By command of this emperor, the Juſtinian code of laws, which had been in diſuſe for more than five centuries, was revived in the empire. This reign was rendered remarkable by exceſſive heat and a great drought in Germany, which actually withered the corn and blaſted the fruits of the earth, dried up the moſt conſiderable rivers, and occaſioned a dreadful mortality among the cattle.

Lothaire, king of France, ſucceeded his father, Lewis d'Outremer, in 954, being only in the 14th year of his age. He was at firſt under the protection of Hugh, duke of France, but on the death of that prince, in the following year, he aſſumed the reins of government. In 959, he was perſuaded to enter into a treacherous plot for ſeizing the perſon of Richard, duke of Normandy, which failing of ſucceſs an open war broke out, and the duke, preſſed by the ſuperior forces of his antagoniſt, invited the Danes to his ſupport. France was accordingly afflicted by their indefatigable rapacity : independent and uncontrouled in their depredations, they refuſed to ſubſcribe the peace which Richard concluded, and their retreat was with difficulty purchaſed by the treaſures of France and Normandy. Lothaire had no ſooner diſengaged himſelf from this diſtreſs, than he attempted to oppreſs his vaſſal, the young count of Flanders, who was preſerved by the interpoſition of the Normans ; and the king, baffled in his endeavours to aggrandize himſelf by arms, flattered himſelf, with the hope of reſtoring the grandeur of the houſe of Charlemagne, by advantageous alliances. He accordingly eſpouſed Emma, the daughter of Lothaire, king of Italy, and beſtowed his ſiſter on Conrad, king of Burgundy, but the ſhort reſpite allowed by a peace was followed by years of deſolating war, and the poſſeſſion of Lorrain was diſputed, during four ſucceſſive campaigns, by the kings of Germany and France. At length Lothaire thought it adviſable to make peace, and leave the emperor in poſſeſſion of Lorrain. This treaty gave great diſguſt to the French nobles ; but the king found means to pacify or controul them ; and on the death of Otho, the emperor, he re-entered Lorrain, took the town of Verdun, and aſſaulted Cambray. When his affairs abroad were returning to a ſtate of great proſperity, and when his authority at home was acquiring ſtrength, he was ſuddenly ſurpriſed by the approach of death, whoſe power he was unable to reſiſt. He died at Rheims in the forty-ſixth year of his age, leaving his crown to his ſon Lewis V. Lothaire was unqueſtionably poſſeſſed of vigour and abilities, but he was inſincere, and almoſt always engaged in conteſts with his neighbours and vaſſals. Univer. Hiſt. Hiſt. of France, London, 1790.

LOTHAU, in *Geography*, a town of Germany, in the principality of Culmbach ; 9 miles S. of Culmbach.

LOTHIAN, an extenſive diſtrict of Scotland, divided into three parts ; *viz.* Eaſt-Lothian, or Haddingtonſhire. Mid-Lothian, or Edinburghſhire, and Weſt-Lothian, or Linlithgowſhire.

LOTHINGLAND, once an iſland, and part of the county of Suffolk, towards the German ocean, on the N.E. part of the county, and the moſt eaſtern part of Great Britain ; now a peninſula, joined to the mainland by a narrow neck near Loweſtoft, formed, as it has been ſuppoſed, about the year 1722. It is bounded on the N. by the river Yare, on the E. by the ſea, by a lake, called Lothing, on the S., and by the river Waveny on the W. From N. to S. it is in length more than ten miles, and ſix in breadth ; and contains ſixteen pariſhes, of which Loweſtoft is the principal and only market-town.

LOTICH, Peter, in *Biography*, ſurnamed *Secundus*, a diſtinguiſhed modern-Latin poet, was born, in 1528, in the county of Hanau, in Germany. He received the early part of his education at a convent in his native place, and purſued his maturer ſtudies at Frankfort, Marpurg, and Wittenburg, at which laſt place he contracted an intimacy with Melancthon and Camerarius. During the war in Saxony he ſerved a campaign in the army. In 1550 he viſited France with ſome young perſons to whom he was governor, and he continued there nearly four years. He afterwards went to Italy, where he had nearly been deſtroyed by poiſon prepared for another purpoſe : he recovered from the effects of it, but was ſubject to frequent relapſes, one of which carried him off in the year 1560. He had taken his degree of doctor of phyſic at Padua, and three years previouſly to his death was choſen profeſſor in that ſcience at Heidelberg. In that ſituation he was honoured with the friendſhip of the elector-palatine, and by the excellence of his diſpoſition, and the ſingular frankneſs and ſincerity of his character, rendered himſelf univerſally beloved. A collection of his Latin poems was publiſhed the year after his deceaſe, with a dedicatory epiſtle by Joachim Camerarius, who praiſes him as the beſt poet of his age : it has been very frequently reprinted. He had a younger brother Chriſtian, likewiſe a poet. A collection of his poems, with thoſe of his relation John Peter Lotich, was publiſhed in 1620. John Peter Lotich was a phyſician of eminence, who maintained the literary character of his family by a variety of writings. He was grandſon of the above-mentioned Chriſtian. He exerciſed his profeſſion at Minden and at Heſſe, and became profeſſor of medicine at Rintlen in Weſtphalia. He died very much regretted in 1652. His principal works are, "Conciliorum et Obſervationum Medicinalium ;" "Latin Poems :" "A Commentary on Petronius ;" and "A Hiſtory of the Emperors Ferdinand II. and III." in four volumes, is attributed to him.

LOTIERO, St., in *Geography*, a town of Naples, in Principato Ultra ; 15 miles E.N.E. of Benevento.

LOTINE, in the *Ancient Muſic*. Athenæus relates, in his Deipnos. that the flute entitled lotina was the ſame inſtrument as that which the Alexandrians termed *Photinga*, adding, that it was made of the wood of the lotos tree, which grew in Africa.

LOTION, Lotio, popularly called *waſh*, denotes a form of medicine, made up of liquid matters, chiefly uſed for beautifying the ſkin, and cleanſing it from thoſe deformities which a diſtempered blood ſometimes throws on it ; or rather, which are occaſioned by a preternatural ſecretion.

Lotion alſo denotes a remedy, poſſeſſing a medium between a fomentation and a bath.

There are refreſhing and ſomniferous lotions for feveriſh perſons, made of leaves, flowers, and roots boiled, with which the feet and hands of the patient are waſhed ; and after waſhing, wrapped up in linen, ſteeped in the ſame decoction till dry.

There are lotions alſo for the head and hair.

Lotion, in *Pharmacy*, denotes a preparation of medicines, by waſhing them in ſome liquid, either made very light, ſo as to take away only the dregs ; or ſharp, ſo as to penetrate them, in order to clear them of ſome ſalt, or corroſive ſpirit, as is done to antimony, precipitates, magiſteries, &c. &c.; or intended to take away ſome foulneſs, or ill quality ; or to communicate ſome good one.

Lotion, *Saponaceous*, *Lotio ſaponacea*, the name of a form of medicine preſcribed in the late London pharmacopeia, being properly ſoap in a liquid form. It is ordered to be made thus : Take damaſk roſe-water, three quarters of a pint ; oil of olives, a quarter of a pint ; ley of tartar, half an ounce in meaſure : rub the ley and oil together till they are mixed, and then gradually add the water.

LOTOMETRA, in *Botany*, a name given by many of the ancients to the nymphæa Indica, or Ægyptiaca, called alſo the faba Ægyptiaca, and originally the *nilufar*, an abbreviation of *nilnufar ; nufar* ſignifying a water-lily, and the prefix *nil* expreſſing its growing particularly in the river Nile.

Neophytus tells us, that this lotometra has leaves of a middle form between thoſe of the common nymphæa, which are roundiſh, and thoſe of the arum, which are oblong and pointed, and are cordated at the baſe ; and this is the very figure of the leaves of the faba Ægyptiaca, as we ſee it in all paintings, &c.

LOTOS (ſee Lotus) is held in the higheſt veneration in India, incluſive of Thibet and Nepaul. Among the Brahmans and enthuſiaſtic Hindoos, no object in nature is looked on with more ſuperſtition ; and their books abound with myſtical alluſions to this lovely aquatic. Being eſteemed the moſt beautiful of vegetables, it not unappropriately furniſhes a name for the Hindoo queen of beauty, and *Kamal* or *Kamala* is, as noticed under that article, a name of Lakſhmi ; as is Padma or Pedma, another Sanſcrit appellation for both. (See Lakshmi.) Under the form of Kamala, Lakſhmi is uſually repreſented with a lotos in her hand, and in moſt pictures and ſtatues of her conſort Viſhnu, he is furniſhed with the Pedma, or lotos bud, in one of his four hands, as a diſtinguiſhing attribute. Accordingly, as it is repreſented in different ſtages of efflorеſcence, it varies, in the eye of myſtics, its emblematical alluſions. As an aquatic, the lotos is a ſymbol alſo of Viſhnu, he being a perſonification of water or humidity, and he is often repreſented ſeated on it. Brahma, the creative power, is alſo ſometimes ſeated on the lotos, and is borne on its calyx in the whimſical repreſentation of the renovation of the world, when this myſtical plant iſſued out of the navel of Viſhnu from the bottom of the ſea, where he was repoſing on the ſerpent Seſha. (See Sesha.) The following extract from the curious and learned diſſertation of Major Wilford, "On the ſacred Iſles of the Weſt," will ſerve to ſhew the wild extravagance of Hindoo mythologiſts. "The nymphæa, or lotos, floating on the water, is an emblem of the world ; the whole plant ſignifies both the earth and its two principles of fecundation. The ſtalk originates from the navel of Viſhnu, ſleeping at the bottom of the ocean ; and the flower is the cradle of Brahma, or mankind. The germ is both Meru and the Linga ; the petals and filaments are the mountains which encircle Meru, and are alſo the type of the Yoni." (Aſiatic Reſearches, vol. viii.) This may ſuffice as to the extravaganzas of Hindoo myſtics. The reader may ſee farther hereon under our articles Linga, Meru, and Yoni. Hindoo poetry alſo ſuperabounds in alluſions to the lotos. One alluſion, connected with an intereſting fact in natural hiſtory, we will notice. In the northern parts of India the petals of the lotos are blue, as well as red and white ; while in the ſouthern provinces the blue flower is not ſeen ; the poets have hence feigned that the crimſon hue was imparted to it by the blood of Siva iſſuing from the wound made by the arrow of Kama, when the god of love daringly endeavoured to inſpire the "king of dread" with an amorous paſſion, for which preſumption he was reduced to aſhes, or, as ſome ſay, to a mental eſſence, by the fire which iſſued from the forehead of the "three-eyed god." (See Kama and Siva.) In the Hindoo Pantheon, neceſſarily compriſing a great maſs of myſticiſm in its mythological details, the reader will find many particulars and plates connected with the ſubjects of this article.

LOTTERY, a kind of game of hazard, wherein ſeveral lots of merchandize, or ſums of money, are depoſited as prizes, for the benefit of the fortunate.

The deſign of lotteries, and the manner of drawing them, are too well known among us to need a deſcription : they are very frequent in England and Holland, where they cannot be ſet on foot without the permiſſion of the magiſtrate.—In France too, there have been ſeveral lotteries in favour of their hoſpitals.

M. Le Clerc has compoſed a treatiſe of lotteries, wherein is ſhewn what is laudable, and what blameable in them.—Gregorio Leti has alſo a book on the ſubject of lotteries. Father Meneſtrier has a treatiſe on the ſame, publiſhed in 1700, where he ſhews their origin and uſe among the Romans. He diſtinguiſhes ſeveral kinds of lotteries, and takes occaſion to ſpeak of chances, and reſolves ſeveral caſes of conſcience relating thereto. See ſeveral ſtatutes relating to lotteries under the article Gaming.

An act paſſed in 1778, for regulating the conduct of the lottery, reſtrains any perſon from keeping an office for the ſale of tickets, ſhares, or chances, or for buying, ſelling, inſuring, or regiſtering, without a licence ; for which licence each office-keeper muſt pay 50*l.*, if it be in, or within twenty miles of London, Edinburgh, or Dublin, and 10*l.* for every licence for every other office, to continue in force for one year, and the produce to be applied towards defraying the expences of the lottery. And no perſon is allowed to ſell any ſhare or chance leſs than a ſixteenth, on the penalty of 50*l.* All tickets divided into ſhares or chances are to be depoſited in an office, to be eſtabliſhed in London by the commiſſioners of the treaſury, who are to appoint a perſon to conduct the buſineſs thereof ; and all ſhares are to be ſtamped by the ſaid officer, who is to give a receipt for every ticket depoſited with him. The numbers of all tickets ſo depoſited are to be entered in a book, with the names of the owners, and the number of ſhares into which they are divided ; and two-pence for each ſhare is to be paid to the officer on depoſiting ſuch tickets, who is therewith to pay all expences incident to the office. All tickets depoſited in the office are to remain there three days after the drawing. And any perſon keeping an office, or ſelling ſhares, or who ſhall publiſh any ſcheme for receiving monies in conſideration of any intereſt to be granted in any ticket in the ſaid lottery, &c. without being in poſſeſſion of ſuch ticket, ſhall forfeit 500*l.* and ſuffer three months impriſonment. And no buſineſs is to be tranſacted at any of the offices after eight in the evening, except on the evening of the Saturday preceding the drawing. No perſon is to keep any office for the ſale of tickets, &c. in Oxford or Cambridge, on penalty of 20*l.* Before this regulating ſtatute took place, there were upwards of 400 lottery offices in and about London only ; but the whole number afterwards, for all England, as appeared by the liſt publiſhed by authority, amounted to no more than 51. They are, however, at this time much more numerous.

By 42 Geo. III. c. 119, all games or lotteries called little-goes are declared public nuiſances, and all perſons keeping an office or place for any game or lottery not authorized by law, ſhall forfeit 500*l.* and be deemed rogues and vagabonds. The proprietor of a whole ticket may nevertheleſs inſure it for its value only, with any licenſed office for the whole time of drawing, from the time of inſurance, under a *bonâ fide* agreement, without a ſtamp. The laſt ſtate lottery act enacting various new regulations was 49 Geo. III. c. 94.

The propoſals for the firſt public lottery of which we have any account were publiſhed in 1567 and 1568, and it was drawn in 1569, at the weſt door of St. Paul's cathedral. The tickets were ſold at ten ſhillings each, and there were no blanks. The prizes conſiſted chiefly of plate, and the profits of it were intended for repairing the havens of the kingdom, and other public works. In 1612, James I. granted permiſſion for a lottery to be held alſo at the weſt end of St.

22 Geo. III. c. 47, and renewed in the lottery acts in 1802, and the three following years, but omitted in thoſe of 1806 and 1807, ought in future to be re-enacted, without the exception therein made, to Saturday evenings."

Theſe ſuggeſtions have been attended to in the lotteries of the laſt two or three years, which have been ſeveral of them drawn in one day, and conſequently a conſiderable check has been given to illegal inſurances. Still, however, many evils remain, which are ſo blended with the nature of lotteries, that it is impoſſible to ſeparate them, and it may fairly be queſtioned, whether, for the ſake of a ſort of voluntary tax, which is thus impoſed upon ignorance and folly, the morals of many induſtrious and honeſt members of ſociety ought to be expoſed to the danger of being enſnared by the deluſive hopes of gain, which the lottery ſchemes are calculated to inſpire. With regard to the advantage that the revenue derive from the lottery ſyſtem, it may likewiſe be collected from the reported account above alluded to. Mr. Shewell informed the committee, that the general advance put upon tickets by the contractor, was about 3*l. per* ticket, not varying much under or over. This is in conſideration of the certain loſs on ſuch tickets as the contractor is not able to ſell, the expence he muſt neceſſarily be put to in the ſale of his lottery, and the profit that he naturally expects on ſuch a concern. The lottery is conſidered as ſold pretty well, of which four-fifths of the tickets are diſpoſed of: the contractors of the lottery in hand, at the time of this enquiry, expected not to ſell more than 17,000 tickets out of the 25,000, of which it conſiſted. The tickets in this lottery were ſold by the chancellor of the exchequer at 17*l.* and a fraction, the tickets of which were not worth quite 10*l.* each; the contractor ſold it again to the licenſed lottery-office keepers at 20*l.* 19*s. per* ticket, between three and four pounds more than they gave for it. The lottery-office keeper puts on another profit, which, in thoſe numbers divided in eighths, ſixteenths, &c. amounts to about 1*l. per* ticket; whence it is obvious, that the adventurer in this lottery (and this may be conſidered as an average of lotteries in general), gamble at a diſadvantage of 100 *per cent.* Government is a gainer of about 70 *per cent.*, beſides about 20 *per cent.* farther, which is ſuppoſed to be added to the revenue by the poſtage of letters, ſtamps, duties on advertiſements, exciſe duty, on candles, paper, &c. On the face of the concern there appears, therefore, a conſiderable profit to government, which, at a mean, may be eſtimated at about 750,000*l. per annum;* but it was the opinion of thoſe who are beſt qualified to judge of theſe ſubjects, that this increaſe of revenue was rather apparent than real; that the extra parochial taxes, brought on by the diſtreſs they occaſion; the decreaſed conſumption of exciſeable articles, juſt before, and during the time the lottery is drawing, and for a few weeks afterwards, which decreaſe was actually aſcertained from competent witneſſes, fully counterbalance the apparent gain. Should this be the true ſtate of the caſe, what can induce the miniſters to continue to give their ſanction to ſuch deluſive and dangerous ſpecies of gambling? At all events, if the above profit were real, no revenue is obtained by the ſtate at half the expence, in point of pecuniary ſacrifice to the public, independent of the exceſſive injury to the morals of the people. We have already ſeen, that the purchaſers of legal ſhares gamble at the diſadvantage of 100 *per cent.*; and the inſurances are carried on, to the diſadvantage of the public, at about 40 *per cent.*; but ſtill it is not eaſy to eſtimate the annual expence which lotteries coſt the public; the following ſtatement, however, is hazarded by P. Colquhoun, eſq. and ſubmitted to the above-mentioned committee.

		£.
Suppoſe three annual lotteries, each of 25,000 tickets, the public receives - -		600,000
Contractors profit at 1*l. per* ticket - -		75,000
Lottery-office keeper's profit - - -		100,000
Inſurer's profit $33\frac{1}{2}$ *per cent.* on 1,000,000*l.* -		333,000
Total		£.1,108,000
The public are ſuppoſed to pay for 75,000 tickets, including the additional advance on halves, quarters, &c. - - -		1,275,000
The lower claſs who inſure are ſuppoſed to pay - - - - -		1,000,000
		£.2,275,000
	£.	
Deduct prizes - -	750,000	
Deduct prizes obtained by inſurers	250,000	
		1,000,000
Loſs to the public to gain 600,000*l.* to the revenue yearly - - - -		1,275,000

This eſtimate ſeems to have been made upon the moſt favourable ſuppoſitions, and probably falls conſiderably ſhort of the real loſs ſuſtained by the public.

The following is an account of the prices of tickets, and immediate profit derived from them by the ſtate, during the ſix years from 1802 to 1807.

Year.		No. of Tickets.	Price.	Profit.
1802		100,000	£.14 11 0	£.555,000
1803		80,000	13 13 1	352,333
1804				
——	1	25,000	14 15 6	119,375
——	2	25,000	15 16 0	145,000
——	3	30,000	15 13 6	170,250
				£.434,625
1805				
——	1	25,000	17 2 9	178,473
——	2	25,000	18 3 0	203,750
——	3	25,000	17 18 9	198,437
				£.580,660
1806				
——	1	20,000	16 12 0	132,000
——	2	25,000	16 14 3	167,812
——	3	25,000	16 10 0	162,500
——	4	20,000	16 19 0	139,000
				£.601,312
1807				
——	1	20,000	17 13 6	153,000
——	2	25,000	17 4 0	180,000
——	3	25,000	16 10 6	163,125
				£.496,125

To theſe ſums are to be added the advantages derived from poſtages, ſtamps, &c. which are generally eſtimated at 2*l. per* ticket, making the mean annual profit about 750,000*l.* But after deductions are made for the loſſes ſuſtained from cauſes connected with the lottery ſyſtem, it is doubtful whether any real advantage is derived from this ſource; and if even the whole of the above was a real ſaving, the evils attending it are ſuch as to lead us to hope, that miniſters will find ſome other means of raiſing an equivalent, founded upon more liberal principles, and leſs dangerous to the morals and happineſs of the people.

Having ſaid thus much with regard to the general policy of lotteries, we ſhall conclude the preſent article by an inveſtigation of the theory of lotteries, as it is connected with the doctrine of chances.

PROB. I.

Any number of things being given, as a, b, c, d, e, f; to find the probability that in taking three of them, as they happen, they ſhall be any three propoſed, as a, b, c.

Firſt, the probability of taking either a or b, or c, will be $\frac{3}{6}$ths, and ſuppoſing one of them, as a, to be taken, then the probability of taking either b or c will be $\frac{2}{5}$ths. Again, let either of them be taken, ſuppoſe b; the probability of taking c in the third place will be $\frac{1}{4}$th; wherefore the probability of taking the three things propoſed, *viz.* a, b, c, will be

$$\frac{3}{6} \times \frac{2}{5} \times \frac{1}{4} = \frac{1}{20}.$$

Otherwiſe, we might conſider what number of combinations of ſix things can be formed by taking three at a time; and out of this number there is obviouſly only one combination that anſwers the conditions of the problem propoſed; and there are, therefore, ſo many chances to one againſt the ſucceſs of the trial.

Now, the number of ſuch combinations is expreſſed by

$$\frac{6 \times 5 \times 4}{3 \times 2 \times 1} = 20.$$

And, conſequently, the chance of drawing the ſpecified things a, b, c, is $\frac{1}{20}$th, as before.

Corollary.—Univerſally, the number of combinations that can be formed, of n things taking p, at a time, is expreſſed by

$$\frac{n \cdot (n-1)\ (n-2)\ (n-3) \ldots (n-p)}{p\ (p-1)\ (p-2)\ (p-3) \ldots\ldots 1}$$

and conſequently, the reciprocal of this fraction will be the probability of ſucceſs in any caſe that may ariſe.

PROB. II.

Let the ſame ſix things be propoſed as above, to determine the probability, that in drawing four of them, the three ſpecified ones, as a, b, c, ſhall be taken.

Firſt, the number of combinations that can be formed of ſix things, taking three at a time, is $\frac{6 \times 5 \times 4}{3 \cdot 2 \cdot 1} = 20$: and the number of combinations that can be formed out of four things, taking three at a time, is $\frac{4 \times 3 \times 2}{3 \times 2 \times 1} = 4$. Whence it follows that out of the twenty combinations of threes which may happen, four of them will be in hand; and, therefore, the probability of taking the three ſpecified things under the condition of the problem, is $\frac{4}{20} = \frac{1}{5}$.

And hence, generally, to determine the probability, that in drawing out of a given number of tickets n, any propoſed number p, there ſhall be found amongſt them any number of ſpecified ones q, we muſt divide the firſt of the following ſeries by the ſecond, *viz.*

$$1.\quad \frac{p\ (p-1)\ (p-2)\ (p-3) \ldots (p-q)}{q\ (q-1)\ (q-2)\ (q-3) \ldots\ldots\ldots 1}$$

$$2.\quad \frac{n\ (n-1)\ (n-2)\ (n-3) \ldots (n-q)}{q\ (q-1)\ (q-2)\ (q-3) \ldots\ldots\ldots 1}$$

that is, the propoſed chance will be expreſſed by the fraction

$$\frac{p\ (p-1)\ (p-2)\ (p-3) \ldots (p-q)}{n\ (n-1)\ (n-2)\ (n-3) \ldots (n-q)}.$$

PROB. III.

To find what probability there is, that in taking at random ſeven counters out of twelve, whereof four are white, and eight black, there ſhall be at leaſt three white ones.

1. Find the chance for taking three white out of four, which will be

$$\frac{4 \times 3 \times 2}{3 \times 2 \times 1} = 4.$$

2. The number of chances for taking four black out of eight is, on the ſame principle, found to be

$$\frac{8 \times 7 \times 6 \times 5}{4 \times 3 \times 2 \times 1} = 70.$$

And, therefore, the chances of both ſucceeding is $4 \times 70 = 280$.

But by the queſtion, he may hold four white and three black, becauſe it is only limited that three white be taken, and not that there ſhould be three white and no more.

3. How the number of chances for taking four white out of four is one.

4. The number of chances for taking three black out of eight is

$$\frac{8 \times 7 \times 6}{3 \times 2 \times 1} = 56.$$

And the product of theſe two is $56 \times 1 = 56$, therefore the whole number by which the event may ſucceed, is $280 + 56 = 336$.

5. But the whole number of combinations that can be formed out of twelve things, taking ſeven at a time, is

$$\frac{12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6}{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} = 792:$$

therefore $\frac{336}{792} = \frac{14}{33}$, will expreſs the probability that the event will happen, and conſequently $1 - \frac{14}{33} = \frac{19}{33}$, is the probability of its failing; that is, the odds againſt three white counters being drawn, are as 19 to 14.

Corollary.—Let a be the number of white counters, b the number of black, n the whole number $= a + b$; c the number of counters to be taken out of the number n: alſo, let p repreſent the number of white counters that are to be found preciſely in c. Then the number of chances for taking none of the white, or one of the white, or two of the white, and no more; or three of the white and no more; or four of the white and no more, &c. will be expreſſed as follows:

$$\left\{\frac{a}{1} \times \frac{a-1}{2} \times \frac{a-2}{3} \times \frac{a-3}{4}\ \text{\&c.}\right\} \times$$
$$\left\{\frac{b}{1} \times \frac{b-1}{2} \times \frac{b-2}{3} \times \frac{b-3}{4}\ \text{\&c.}\right\}$$

The number of terms in which a enters being equal to the number p; and the number of terms in which b enters being equal to the number $c - p$.

But the number of all the chances for taking a certain number c, of counters out of the number n, is expreſſed by

$$\frac{n}{1} \times \frac{n-1}{2} \times \frac{n-2}{3} \times \frac{n-3}{4} \text{ \&c.}$$

to be continued to as many terms as there are units in c.

If the numbers n and c were large, ſuch as $n = 40000$, and $c = 8000$, the foregoing method would ſeem impracticable, on account of the great number of terms to be taken in both ſeries, whereof the firſt is to be divided by the ſecond; though if thoſe terms were actually ſet down, a great many of them being common diviſors might be expunged out of both ſeries; for which reaſon it will be convenient to uſe the following theorem, which is a contraction of that method, and which will be chiefly of uſe when the white counters are but few. Let, therefore, n be the number of all the counters, a the number of white, b the number of black, c the number of counters to be taken out of the number n, p the number of white that are to be taken preciſely, then making $n - c = d$. The probability of taking preciſely the number p of white counters will be as follows: *viz.* making

$$c \cdot (c-1)\ (c-2)\ (c-3) \text{ \&c.} = C$$
$$d \cdot (d-1)\ (d-2)\ (d-3) \text{ \&c.} = D$$
$$\frac{a}{1} \times \frac{a-1}{2} \times \frac{a-2}{3} \times \frac{a-3}{4} \text{ \&c.} = A$$
$$n\ (n-1)\ (n-2)\ (n-3) \text{ \&c.} = N$$

the probability $= \dfrac{C \times D \times A}{N}$:

where it is to be obſerved, that the firſt and third ſeries contain as many terms as there are units in p; the ſecond as many as there are in $a - p$; the fourth as many as there are in a.

Let us now apply theſe reſults in the ſolution of the following problems.

Prob. IV.

In a lottery conſiſting of 40000 tickets, among which are three particular benefits, what is the probability that taking 8000 of them, one or more of the particular benefits ſhall be among them. Subſtitute 8000, 40000, 32000, 3, and 1 reſpectively for c, n, d, a, and p, in that problem; and the probability of taking preciſely one of the three particular benefits will appear to be $\dfrac{8000 \times 32000 \times 31999 \times 3}{40000 \times 39999 \times 39998} = \dfrac{48}{125}$ nearly. If $p = 2$, the probability of taking preciſely two of the particular benefits will be $\dfrac{8000 \times 7999 \times 32000 \times 3}{40000 \times 39999 \times 39998} = \dfrac{12}{125}$ nearly. If $p = 3$, the probability of taking all the three particular benefits will be $\dfrac{8000 \times 7999 \times 7998}{40000 \times 39999 \times 39998} = \dfrac{1}{125}$. And the probability of taking one or more of the three particular benefits will be $\dfrac{48 + 12 + 1}{125} = \dfrac{61}{125}$ very nearly. Theſe three operations might have been contracted into one by inquiring the probability of not taking any of the three particular benefits, which will be found to be $\dfrac{32000 \times 31999 \times 31998}{40000 \times 39999 \times 39998} = \dfrac{64}{125}$ nearly, which being ſubtracted from unity, gives a remainder, $1 - \dfrac{64}{125} = \dfrac{61}{125}$, ſhewing the probability required; and therefore the odds againſt taking any of three particular benefits will be 64 to 61 nearly.

Prob. V.

To find how many tickets ought to be taken in a lottery conſiſting of 40000, among which are three particular benefits, to make it as probable that one or more of theſe three may be taken as not. Let the number of tickets requiſite to be taken be $= x$, and the probability of not taking any of the particular benefits will be $\dfrac{n-x}{n} \times \dfrac{n-x-1}{n-1} \times \dfrac{n-x-2}{n-2}$; but this probability is equal to $\frac{1}{2}$, ſince by hypotheſis, the probability of taking one or more of them is equal to $\frac{1}{2}$; whence we ſhall have the equation $\dfrac{n-x}{n} \times \dfrac{n-x-1}{n-1} \times \dfrac{n-x-2}{n-2} = \frac{1}{2}$, from the ſolution of which x will be found nearly equal to 8252. The terms of this equation, M. De Moivre obſerves, may be conſidered as being in geometric progreſſion; ſince the factors both of the numerator and denominator are few and in arithmetic progreſſion, and their difference very ſmall in reſpect of n: and, therefore, the cube of the middle term may be ſuppoſed equal to the product of the multiplication of theſe terms; whence will ariſe the equation, $\left|\overline{\dfrac{n-x-1}{n-1}}\right|^3 = \frac{1}{2}$; or, neglecting the unit both in the numerator and denominator, $\left|\overline{\dfrac{n-x}{n}}\right|^3 = \frac{1}{2}$, and x, conſequently, $= n\ (1 - \sqrt[3]{\tfrac{1}{2}})$, or $n\ (1 - \frac{1}{2}\sqrt[3]{4})$: but $n = 40000$, and $1 - \frac{1}{2}\sqrt[3]{4} = 0.2063$; therefore $x = 8252$.

Prob. VI.

To determine accurately, in a lottery of 100000 tickets, whereof 90000 are blanks, and 10000 are benefits, what the odds are of taking or not taking a benefit, in any number of tickets aſſigned. Let the number be 6; and it will appear, by the above cited problem, that the number of chances for taking no prize in 6 tickets, making $a = 10000$, $b = 90000$, $c = 6$, $p = 0$, $n = 100000$, will be $\dfrac{90000}{1} \times \dfrac{89999}{2} \times \dfrac{89998}{3} \times \dfrac{89997}{4} \times \dfrac{89996}{5} \times \dfrac{89995}{6}$; and that the whole number of chances will be $\dfrac{100000}{1} \times \dfrac{99990}{2} \times \dfrac{99998}{3} \times \dfrac{99997}{4} \times \dfrac{99996}{5} \times \dfrac{99995}{6}$; then dividing the firſt number of chances by the ſecond, by means of logarithms, the quotient will be 0.53143, the probability required: this decimal fraction being ſubtracted from unity, the remainder 0.46857 ſhews the probability of taking one prize or more in ſix tickets; wherefore the odds againſt taking any prize in ſix tickets will be 53143 to 46857. If the number of tickets be ſeven, then carrying each number of chances above written one ſtep farther, we ſhall find that the probability of taking no prize in ſeven tickets is 0.47828, which ſubtracted from unit leaves a remainder 0.52172, which ſhews the odds of taking one prize or more in ſeven tickets to be 52172 to 47828.

PROB. VII.

With the ſame data, to find the value of the chance of a prize, ſuppoſing each ticket to be 10*l.*, and that after the lottery is drawn, 7*l.* 10*s.* be returned to the blanks. There being 90000 blanks, to each of which is returned 7*l.* 10*s.* the total value of the blanks is 675,000*l.* and conſequently the total value of the benefits is 325,000*l.* which being divided by 10000, the number of benefits, gives a quotient 32*l.* 10*s.* and, therefore, one might for the ſum of 32*l.* 10*s.* be entitled to have a benefit certain, taken at random out of the whole number of benefits: the purchaſer of a chance has, therefore, one chance in ten for the ſum of 32*l.* 10*s.* and nine chances in ten for loſing his money; from whence it follows, that the value of his chance is the tenth part of 32*l.* 10*s.* *viz.* 3*l.* 5*s.* And conſequently the purchaſer of a chance, by giving the ſeller 3*l.* 5*s.*, is intitled to the chance of a benefit, and ought not to return any thing to the ſeller, although he ſhould have a prize; for the ſeller having 3*l.* 5*s.* ſure, and nine chances in ten for 7*l.* 10*s.* the value of which chance is 6*l.* 15*s.* it follows that he has his 10*l.* 5*s.*

PROB. VIII.

In the ſame kind of lottery, let A engage to furniſh B with a chance, on condition that whenever the ticket on which the chance depends ſhall happen to be drawn, whether it proves a blank or prize, A ſhall furniſh B with a new chance, and ſo on, as often as there is occaſion, till the whole is drawn; it is propoſed to find what conſideration B ought to give A before the lottery begins to be drawn, for the chance or chances of one or more prizes, admitting that the lottery will be forty days in drawing.

Let the abſolute value of a chance, or 3*l.* 5*s.*, be called s. Firſt A, who is the ſeller, ought to conſider, that on the firſt day he furniſhes neceſſarily a chance whoſe value is s.

2dly. That on the ſecond day, he does not neceſſarily furniſh a chance, but conditionally, *viz.* if it ſo happen that the ticket on which the chance depends ſhould be drawn on the firſt day; but the probability of its being drawn on the firſt day is $\frac{1}{40}$; and therefore he ought to take $\frac{1}{40}s$ for the conſideration of the ſecond day.

3dly. That in the ſame manner he does not neceſſarily furniſh a chance on the third day, but conditionally, in caſe the only ticket depending (for there can be but one) ſhould happen to be drawn on the ſecond; of which the probability being $\frac{1}{39}$, by reaſon of the remaining 39 days from the ſecond incluſive to the laſt, it follows, that the value of that chance is $\frac{1}{39}s$.

4thly. And for the ſame reaſon the value of the next is $\frac{1}{38}s$, &c. the purchaſer ought, therefore, to give the ſeller $1 + \frac{1}{40} + \frac{1}{39} + \frac{1}{38} + \frac{1}{37} \cdot \cdot \cdot \cdot \cdot + \frac{1}{2} \times s$, or $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} \cdot \cdot \cdot \cdot \cdot + \frac{1}{40} \times s$. The ſum of theſe forty terms, being 4.2785 nearly, multiplied by s or 3.25, will give a product 13.9, ſhewing that the purchaſer ought to give the ſeller about 13*l* 18*s*.

From what has been ſaid it appears, that the value of the chance s for one ſingle day that ſhall be fixed upon is the value of that chance divided by the number of days intercepted between that day incluſive and the number of days remaining to the end of the lottery; which, however, muſt be underſtood with this reſtriction, that the day fixed upon muſt be choſen before the lottery begins; or if it be done on any other day, the ſtate of the lottery muſt be known, and a new calculation made accordingly for the value of s. De Moivre's Doctrine of Chances, 1756. See alſo the article CHANCES.

LOTTERY is alſo the name of a well-known game at cards.

LOTTI, ANTONIO, of Venice, in *Biography*, principal organiſt of St. Mark, and afterwards maeſtro di cappella of the ſame cathedral, was one of the greateſt men of his profeſſion. The celebrated Haſſe, his diſciple and intimate friend, and the beſt able to judge of his abilities, thought that none of the great maſters ever united in their works ſo great a ſhare of expreſſion and ſcience. In his compoſitions, he combined with the learning of the old ſchool all the grace, rich harmony, and brilliancy of the new. He was the hero of Haſſe, who never ſpoke of him but with rapture. "What expreſſion" (he uſed to ſay), "what variety, were in that expreſſion, and what truth in the ideas!" How pleaſing it was to hear a man at his time of life, of a merit and reputation above all envy, ſpeak with ſuch enthuſiaſm of a great maſter. Lotti was long at the head of the Venetian ſchool. His eccleſiaſtical compoſitions were only uſed at St. Mark's on great and ſolemn occaſions. They are truly ſublime. The kind of pathos in his ſtyle elevates the ſoul, and expreſſes all the grandeur and reverence of devotion. (Eſſais ſur la Muſ. tom. iii.) This animated and feeling character of Lotti does not ſeem to come from an author who in general ſpeaks of the Italians with contempt, and of Rameau as the only muſician who ever knew harmony and how to uſe it. We can, however, anſwer for the truth of the above character. For though we have never heard or ſeen any of his dramatic muſic, yet, in 1770, we heard at Venice, in the church of San Giovanni e Paulo, on a day that the doge went in proceſſion to that church, a maſs by Lotti, in four parts, without any other inſtrument than the organ, which was ſo well ſung and accompanied, that we do not remember ever to have received more pleaſure from choral muſic; all was correct, clear, and diſtinct; no confuſion or unneceſſary notes; it was even capable of expreſſion, particularly one of the movements into which the performers entered ſo well as to render it affecting even to tears. The organiſt, very judiciouſly, ſuffered the voices to be heard in all their purity, with which our attention was ſo occupied, that we frequently forgot that they were accompanied. This kind of muſic, á cappella, though exploded as unfit for theatrical purpoſes, muſt be allowed to have its merit. Lotti was the diſciple of Legrenzi, the model of Haſſe, one of the maſters of Marcello, Galuppi, and Peſcetti. His name is chiefly known in England by the diſpute in the Academy of Ancient Muſic, at the Crown and Anchor, in 1732, concerning a madrigal which Bononcini was accuſed of having ſtolen from him. See BONONCINI.

Lotti compoſed for the Venetian theatres, between the years 1698 and 1717, fifteen operas. His cantatas furniſh ſpecimens of recitative that do honour to his ſenſibility. He was opera compoſer at the court of Dreſden when the Santa Stelli, his wife, performed the part of firſt woman then, in 1718; and in 1720 he returned to Venice, where he was living in 1733.

LOTUL, in *Geography*, a town of Bengal; 16 miles W. of Torea.

LOTUS, in *Botany*, a name which has been more variouſly

riouſly applied, and of which perhaps more has been written, than of any other plant. Thoſe who have ſought for its origin in the Greek language, have found nothing nearer than λω, *to will or deſire*, alluding, as they ſuppoſe, to the plant being greatly eſteemed. Others have thought, with more probability, that λωτος of the Greeks, and *Lotus* of the Latins, had one common Egyptian origin, its etymology being therefore, of courſe, inſcrutable to us. All that can be ſaid of the application of this name, at various times, and in various languages and nations, is, that it has always been uſed for ſome plant eminently uſeful as food, for man or beaſt. Thus it has been appropriated to the κυαμος, or Sacred Bean of India (ſee CYAMUS); and to its Egyptian ſubſtitute, the *Nymphæa;* to ſome African fruit, on which certain people have chiefly depended for their ſupport; and to ſeveral herbaceous plants, eſſential to the maintenance of domeſtic cattle, in countries ſparingly furniſhed with graſs. In this laſt ſenſe it is finally retained, as a generic appellation, by modern botaniſts.—Linn. Gen. 388. Schreb. 509. Willd. Sp. Pl. v. 3. 1385. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 793. Ait. Hort. Kew. ed. 1. v. 3. 90. Juſſ. 356. Lamarck. Illuſtr. t. 611. Gærtn. t. 153.—Claſs and order, *Diadelphia Decandria.* Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, nearly cylindrical, cut half way down into five, acute, erect teeth, equal in length, but not quite uniform in poſition, permanent. *Cor.* Papilionaceous. Standard roundiſh, bent backwards; its claw long, concave. Wings roundiſh, ſhorter than the ſtandard, broad, ſlightly cohering by their upper margin. Keel gibbous beneath, cloſed above, pointed, aſcending, ſhort. *Stam.* Filaments in two ſets, one ſimple, the other in nine ſegments, aſcending, rather dilated at the tips; anthers ſmall, ſimple. *Piſt.* Germen oblong, ſtraight, nearly cylindrical, rarely angular; ſtyle ſimple, aſcending; ſtigma a ſmall inflexed point. *Peric.* Legume cylindrical, ſtraight, tumid, longer than the calyx, of one cell and two valves. *Seeds* ſeveral, ſomewhat cylindrical.

Eſſ. Ch. Legume cylindrical, ſtraight. Wings cohering longitudinally above. Calyx tubular. Filaments dilated upwards.

The habit of this genus, moſtly herbaceous, in ſome inſtances ſlightly ſhrubby, approaches that of *Medicago*, but their fructification differs eſſentially. The ſpecies chiefly abound in the more temperate climates of Europe, or part of Africa. Seventeen occur in the *Sp. Pl.* of Linnæus, 18 in *Syſt. Veg ed.* 14; 30 in Willdenow. Three are reckoned natives of Britain, all confounded till lately under *L. corniculatus.*

The whole are diſtributed into two ſections.

Sect. 1. *Flowers, or legumes, one or two on a ſtalk, rarely three.*—Of theſe ſome of the principal are

L. *ſiliquoſus.* Square-podded Bird's-foot Trefoil. Linn. Sp. Pl. 1089. Jacq. Auſtr. t. 361. (L. tetragonolobus; Rivin. Tetrap. Irr. t. 79. L. trifolia corniculata; Ger. em. 1198.)—Legumes ſolitary, with four membranous wings. Stems procumbent. Bracteas lanceolate, ſolitary or ternate.—Native of rather moiſt paſtures, in various parts of the continent of Europe from Sweden to Italy, but not found in Britain. The *roots* are perennial, throwing up many weak decumbent *ſtems*, about a ſpan long, branching, zigzag and leafy. *Leaves* alternate, ſtalked, ternate; leaflets obovate, equal in length, but the two lateral ones very unequally divided by their rib; all ſomewhat fleſhy, more or leſs hairy, ſlightly glaucous beneath. *Stipulas* in pairs at the baſe of each footſtalk, large, ovate or elliptical. *Flower-ſtalks* few, axillary, ſolitary, about the tops of the ſtems, which they greatly overtop, being often three or four inches long, firm, hairy, ſingle-flowered. *Flowers* large, lemon-coloured. *Legume* an inch and half long, with four narrow wings.—Linnæus's *L. maritimus* is not even a variety of this. He ſeems at one time not to have been clear in his ideas reſpecting *ſiliquoſus* and *tetragonolobus*.

L. *tetragonolobus.* Crimſon Winged-Pea. Linn. Sp. Pl. 1089. Curt. Mag. t. 151. (L. ſiliquâ quadratâ; Ger. em. 1198.)—Legumes ſolitary, with four membranous wavy wings. Stems ſpreading. Bracteas ovate, ternate.—Native of Sicily and Spain. Very commonly cultivated as a hardy annual, for the ſake of its deep-crimſon, velvety flowers, and ſometimes for its pods, which when young are occaſionally eaten boiled, as greens. It is alſo celebrated in botanic hiſtory, as having firſt called the attention of Linnæus to the ſleep of plants. He obſerved that its flowers became inviſible in the evening, by being enfolded in their bracteas, and re-appeared in the morning, which led him to conſider this ſubject, and to write upon it.

We have ſome ſpecimens, belonging to this ſection, which appear to be new ſpecies, or very remarkable varieties, gathered at Algiers by M. Durand.

L. *diffuſus* perhaps ſhould be removed hither; ſee the end of the genus.

Sect. 2. *Flowers many together in a head.*

L. *hirſutus.* Hairy Bird's-foot Trefoil. Linn. Sp. Pl. 1091. Curt. Mag. t. 336.—Heads roundiſh Stem hairy. Legumes ſomewhat ovate.—Native of the ſouth of Europe and the Levant; long known in our gardens, where it requires the ſhelter of a greenhouſe. The *ſtem* is ſhrubby, often four or five feet high, hairy like the *leaves* and *ſtipulas.* *Flowers* white, or bluſh-coloured, prettily contraſted with their red calyx. The *legumes*, though truly cylindrical, are ſo ſhort as to become almoſt ovate. On the ſea beach of the Genoeſe coaſt, this ſpecies grows proſtrate, enlivening the ſtony ground with a profuſion of bloſſoms; ſo that the Linnæan definition, "ſtem erect," is not in all caſes exact.

L. *corniculatus.* Common Bird's-foot Trefoil. Linn. Sp. Pl. 1092. Curt. Lond. faſc. 2. t. 56. Mart. Ruſt. t. 53. Engl. Bot. t. 2090.—Heads depreſſed, of few flowers. Stems decumbent, ſolid. Legumes ſpreading, nearly cylindrical. Claw of the keel obovate. Filaments all dilated.—Native of moſt parts of Europe; very common with us in open graſſy paſtures, where it is conſpicuous in autumn. The *ſtems* ſpread, from the perennial *root*, in every direction, various in length, ſimple or branched, angular, leafy, clothed with cloſe-preſſed hairs. *Flowers* of a golden yellow, more or leſs ſtained or ſtriped with dark red, each head on a long ſtalk, with a ſmall ternate *bractea* at the top. *Legumes* of a ſhining brown, or copper-colour.—This has been recommended for fodder and hay, by the name of Milk-vetch.

L. *major.* Greater Bird's-foot Trefoil.—Scop. Carn. v. 2. 86. Engl. Bot. t. 2091. (L. corniculatus γ et δ; Fl. Brit. 794.)—Heads depreſſed, many-flowered. Stems erect, hollow. Legumes ſpreading, cylindrical. Claw of the keel linear. Shorter filaments not dilated.—Found in wet boggy places, among buſhes and reeds, flowering in ſummer and autumn, probably throughout Europe. Its more erect, hairy habit, and larger ſize, mark this plant ſufficiently to a common obſerver, and the above characters are abundantly ſufficient to diſtinguiſh it from the laſt, with which it has generally been confounded.

L. *diffuſus.* Slender Bird's-foot Trefoil. Fl. Brit. 794. Engl. Bot. t. 925. (L. pentaphyllos minor hirſutus, ſiliquâ anguſtiſſimâ; Bauh. Pin. 332. Trifolium corniculatum minus, piloſum; Bauh. Prodr. 144.)—Flower-ſtalks moſtly ſingle-flowered. Stem much branched, proſtrate. Leaves

and calyx hairy. Legumes round, linear, very ſlender.—Native of Madeira, and of the ſouth coaſt of England. It has an affinity to the two laſt, but is more delicate and ſlender, with ſmaller and paler *flowers*, one or two only together; for which reaſon it ought to be placed in the firſt ſection, though it proves ſuch a diviſion of the genus (by the number of its flowers) to be rather artificial than natural.

The lotus of Africa is rather a thorny ſhrub than a tree; and it abounds in all thoſe parts of Africa through which Mr. Park travelled; but it flouriſhes moſt in a ſandy ſoil. Its fruit is a ſmall farinaceous berry, about the ſize of an olive; which being pounded in a wooden veſſel, and afterward dried in the ſun, is made into excellent cakes, reſembling, in colour and flavour, the ſweeteſt gingerbread. The natives of all deſcriptions eſteem it highly, and ſome of them prepare from it a liquor deliciouſly ſweet; the ſame perhaps which is fabled to have produced ſuch extraordinary effects on the companions of Ulyſſes.

Lotus, in *Gardening*, comprizes plants of the herbaceous and under ſhrubby kind, of which the ſpecies cultivated are, the winged bird's-foot trefoil (L. tetragonolobus); the dark-flowered bird's-foot trefoil (L. jacobeus); the ſilvery bird's-foot trefoil (L. hirſutus); and the ſhrubby bird's-foot trefoil (L. Dorycnium).

Method of Culture.—The firſt ſort is raiſed by ſowing the ſeed annually in the ſpring, in the open ground, in the places where the plants are to remain, in patches in different parts, of five or ſix ſeeds in each, half an inch deep. The plants ſoon come up, which remaining in the ſame place for flowering, require only occaſional weeding, being either ſuffered to trail, according to their natural growth, or tied up to ſticks.

The other ſorts may be increaſed by ſeeds and cuttings. The ſeeds ſhould be ſown in pots of light earth or in a moderate hot-bed; and when the plants are about three inches high be planted out in ſeparate ſmall pots of light rich earth, giving water, and placing them in the ſhade till freſh rooted.

The cuttings of the young ſtalks and branches may be planted any time in the ſpring or ſummer, in beds or pots of rich mould, giving ſhade and water. They emit roots, and form plants in a few weeks, but may be greatly facilitated by covering them cloſe with hand-glaſſes till they begin to ſhoot at top; then they ſhould be gradually inured to the air, and ſoon after be tranſplanted into ſeparate pots.

The firſt of theſe plants is now chiefly cultivated in flower-gardens for ornament, but was formerly grown for the green-pods which were boiled and eaten.

The other kinds effect an agreeable variety in collections of green-houſe plants, both in their foliage and flowers. They all require ſhelter from froſt, the two firſt in particular; the two laſt are ſomewhat hardier, and ſometimes ſucceed in the full ground all the year, in warm dry ſituations. A few plants ſhould however conſtantly be kept in the pots, to be protected in the winter ſeaſon.

Lotus, *Bladder*. a name ſometimes given to a ſpecies of *vulneraria*, or *anthyllis*.

Lotus *Corniculatus*: this is a plant that has a perennial tapering root which ſtrikes deep; there are ſeveral trailing herbaceous ſtems, ſlender, bluntly four-cornered, procumbent except where ſupported, as in meadows or among buſhes, from ſix or ſeven inches to a foot and a half in length; varying even more in different ſoils and ſituations. The leaves are ternate, petioled, one at each joint, the leaflets differing extremely in form, in the ſeveral varieties, from bluntly ovate to linear-lanceolate. The ſtipulas reſemble the leaves, but they are more pointed, and are rather lanceolate than ovate. The flowers grow in flatted heads reſembling umbels, on peduncles from two to three inches and a half in length, but on pedicles hardly a line long. There is a ſingle ſeſſile ternate leaf at the baſe of each head without any ſtipulas; and ſometimes there is only one leaflet or two; the number of flowers varies from three or four to twelve or thirteen.

This ſort of lotus is found in meadows, paſtures, and heaths, flowering in June. It is ſaid to be cultivated in Hertfordſhire as paſturage for ſheep; and it makes extremely good hay; growing in moiſt meadows to a greater height than the trefoils, and ſeems to be of a quality equal, if not ſuperior to moſt of them. In common with ſeveral other leguminous plants, it gives ſubſtance to the hay, and perhaps contributes to render it more palatable and wholeſome for cattle. Dr. Anderſon affirms, that every ſort of domeſtic animal eats it in preference to every other plant: it ſeldom comes to flower in paſture grounds, unleſs where they have been ſaved from cattle for ſome time. What firſt recommended it to his notice was, the having obſerved it to grow and flouriſh in poor ground; as in the midſt of a barren moor, where the ſoil was ſo poor that even heath could hardly grow; upon bare obdurate clays; in dry and barren ſands. It certainly flouriſhes not only in theſe, but alſo chalky ſoils; and on moors, heaths, and downs hard ſtocked with ſheep, the ſurface may be ſeen to be yellow with the flowers of it; which is contrary to what has been aſſerted above, namely, that it ſeldom comes to flower in paſtures. But a greater number of trials are ſtill wanting to fully aſcertain the utility of this plant for field purpoſes, though it certainly promiſes well.

Lotus *Glycycalamus*, a name given by the ancient Greeks to an Egyptian plant according to ſome, and according to others, to a rare plant, found only in few places, and only met with by accident, by the people who made long and uncommon voyages. The whole account given of it, by the earlieſt writers, is no more than that it was of a very ſweet and pleaſant taſte. Myrepſus uſes the term frequently, and his interpreters underſtand him to mean the caſſia fiſtula by it. But we have accounts from Homer, that the followers of Ulyſſes were detained by eating the lotus glycycalamus; and it is not at all probable that the caſſia fiſtula could be the thing meant by the word in this place; neither will the words of the author allow it to be any thing of this kind. The caſſia fiſtula is the fruit of a tree: but this glycycalamus, we find in Homer himſelf, was an herbaceous plant. Quintilian calls it expreſsly a kind of graſs, gramen; and from the other accounts of its growing in form of reeds, and in wet places, it ſeems very probable that it was the ſugar-cane that they called by this name.

Lotus, in *Agriculture*, a ſort of plants of the bird's-foot trefoil kind, of which there are ſeveral ſpecies, ſome of which may be cultivated for the purpoſe of cattle food with advantage.

LOTZEN, in *Geography*, a town, with a caſtle, of Pruſſia, in the province of Natangen, ſeated on a canal which joins the Angerburg and Leventin lakes; 56 miles S.E. of Königſberg. N. lat. 53° 53′. E. long. 21° 57′.

LOVA, a town of Hungary; 20 miles W. of St. Crot.

LOVAGE, in *Botany* and *Gardening*. See Ligusticum.

Lovage, *Baſtard*. See Laserpitium *ſiler*.

LOUAR, in *Geography*, a town of Hindooſtan, in Dowlatabad; 10 miles W.N.W. of Kondur.

LOVAT, a town of European Turkey, in Bulgaria; 64 miles E. of Sofia.

LOVATINI, Giovanni di Ravenna, in *Biography*, a burletta ſinger, with the ſweeteſt tenor voice and ſtyle of ſinging we ever heard on any ſtage. He arrived in England in the autumn of 1766, with Morigi, Savoi, Micheli, La Guadagni, Piatti, and Gibetti.

This excellent troop appeared December 9th, for the firſt time, in our lyric theatre, in the admirable comic opera "La Buona Figliuola," written by Goldoni, and ſet by Piccini. The performance and ſucceſs of this burletta were complete, and rendered the name of Piccini, which had hardly penetrated into this country before, dear to every lover of muſic in the nation. All the performers in this drama eſtabliſhed a character which was of uſe to them during the reſt of their lives.

Lovatini's mellifluous voice, manner of ſinging, and humour; La Guadagni's graceful figure, acting, and ſinging; Morigi's mimickry of the pronunciation, accent, and manner of a German ſoldier; Savoi's fine voice, the characteriſtic manners of the two prating female domeſtics, Piatti and Gibetti, and even the raven-like croak of Micheli, had its ſhare of notice; but whoever remembers the elegant cantabile ſtyle in which Lovatini began the charming duet, "La Baroneſs' Amabile," muſt retain an exalted opinion of his captivating powers in *ſerious* ſinging.

Lovatini, when he quitted this country for his own in 1774, merely retired to die, as news of his death arrived here the next year, and we cannot diſcover that he performed in any other theatre after he left England.

LOVATOVA, in *Geography*, a town on the E. coaſt of the iſland of Flores. S. lat. 8° 30′. E. long. 122° 50′.

LOUBENS, a town of France, in the department of the Upper Garonne; 12 miles N.W. of Revel.

LOUBERE, Simon de la, in *Biography*, was born at Toulouſe in 1642. He ſtudied at the Jeſuits' college, and diſplayed a good poetical taſte by a multitude of light compoſitions, though he was far from neglecting more ſerious purſuits, and particularly attended to politics and public law. He commenced his political career as ſecretary to M. de St. Romain, embaſſador to Switzerland. In 1687, he was appointed by Lewis XV. his envoy extraordinary to the court of Siam, where he remained only about three months, during which he collected a large ſtore of information concerning its natural and civil hiſtory, the religion, manners, &c. of the people. On his return, he publiſhed an account of what he had obſerved, in two vols. 12mo. which became a very popular work. He was afterwards ſent without a public character into Spain, on a ſecret commiſſion, but was arreſted, and obtained his releaſe only in conſequence of repriſals on ſome Spaniards in France. In 1693 he was elected into the French academy, and ſoon afterwards retired to his native city, where he re-eſtabliſhed the "Floral Games," which had ſunk into decay. He died at the very advanced age of eighty-ſeven, in the year 1729. He was a man of very general knowledge, well acquainted with ſeveral languages ancient and modern, and excelled as a writer in various branches of literature. Moreri.

LOUBES, St., in *Geography*, a town of France, in the department of the Gironde; 12 miles N.E. of Bourdeaux.

LOUBIERE, a town of the iſland of Dominica, on the W. coaſt; 17 miles S. of Portſmouth.

LOUBO, a town of Benin, at the mouth of the river Formoſa; 60 miles S.W. of Benin.

LOUBOUEX, St., a town of France, in the department of the Landes; nine miles S.E. of St. Sever.

LOUBRESSAC, a town of France, in the department of the Upper Loire; ſix miles N.W. of Le Puy en Velay.

LOUCHOU, a town of Perſia, in the province of Mazanderan; 45 miles N.E. of Caſbin.

LOUDEAC, a town of France, and principal place of a diſtrict, in the department of the North Coaſts; in which are an iron forge and a manufacture of thread; 20 miles S. of St. Brieuc. The place contains 6096, and the canton 14,611 inhabitants, on a territory of 205 kiliometres, in ſix communes. N. lat. 48° 8′. W. long. 2° 40′.

LOUDES, a town of France, in the department of the Upper Loire, and chief place of a canton, in the diſtrict of Le Puy; ſix miles N.W. of Le Puy. The place contains 800, and the canton 5377 inhabitants, on a territory of 175 kiliometres, in nine communes.

LOUDON, a county of Virginia, in America, on the river Potowmac, adjoining Fairfax, Berkley, and Faquier counties; about 50 miles long and 20 broad, containing 15,533 free inhabitants, and 4990 ſlaves. Its chief town is Leeſburg. Quarries of grey ſtone, white flint, and lime are found in this county. The climate is favourable to apples, pears, peaches, plums, cherries, and grapes. The county was firſt ſettled from Pennſylvania and New Jerſey.—Alſo, a townſhip in Rockingham county, New Hampſhire, taken from Canterbury, and incorporated in 1773; ſituated E. of the Merrimack river, and containing 1279 inhabitants.—Alſo, a townſhip in Berkſhire county, Maſſachuſetts; 21 miles S.E. of Lenox; incorporated in 1773, and containing 614 inhabitants, and 13,000 acres, of which 2944 are ponds.

LOUDUN, a town of France, and principal place of a diſtrict, in the department of the Vienne, ſituated on an eminence between the Creuſe and the Dive; 12 miles E. of Thouars. The place contains 5138, and the canton 11,299 inhabitants, on a territory of 245 kiliometres, in 18 communes. N. lat. 47°. E. long. 0° 10′.

LOVE, in *Ethics*, is one of the primitive paſſions; and may be generally defined to be the gravitation or tendency of the ſoul toward good. According to Dr. Hartley, who traces all our paſſions to the ſources of pleaſure and pain, they may be firſt and generally diſtributed into the two claſſes of love and hatred; *i. e.* we may have all thoſe affections of the pleaſurable kind, which objects and incidents raiſe in us, love, and all thoſe of the painful kind, hatred. Thus we are ſaid to love not only intelligent agents of morally good diſpoſitions, but alſo perſonal pleaſures, riches, and honours, and to hate poverty, diſgrace, pain, bodily and mental. When our love and hatred are excited to a certain degree, they put us upon a variety of actions; and may be termed deſire and averſion, by the latter of which Dr. Hartley underſtands active hatred.

If the affection of love be conceived ſeparate from any alteration in the body, it is called intellectual or rational love; if it be attended with an agitation of blood and ſpirits, it is called ſenſitive or paſſionate love. It is obſerved by moral writers, that thoſe paſſions in which love predominates, are more agreeable to the original intention of nature than thoſe which are ranged under hatred; becauſe they are found to have a more friendly influence upon the body, and tend, within proper bounds, to the preſervation and happineſs of life, which the others do not. See Cumberland de Leg. Nat. c. 2. § 19.

Love, regarding its object as abſent, begets deſire; as preſent, either immediately or in proſpect, joy and hope. Love of deſire, abſtractedly conſidered, is a ſimple tendency towards good; when conſidered as wiſhing the good deſired to ſome being or other, it is called *benevolence* and *ſelf-love*. See Pleasure and Pain, and Passion.

Love inſpires muſic and poetry. This was a memorable maxim among the Greeks, and the ſubject of one of Plutarch's ſympoſiacs. See Scolta and Song.

Love, in its uſual and more appropriate ſignification, denotes that affection, which, being compounded of intellectual and ſenſitive love, or of animal deſire, eſteem, and benevolence, becomes the bond of attachment and union between individuals of the different ſexes; and makes them feel in the ſociety of each other a kind of happineſs which they experience no where elſe.

Love, *Family of.* See Family.

Love, *Platonic.* See Platonic.

Love *Apple*, is the Engliſh name for the fruit of the lycoperſicon, a plant cultivated in gardens with us, for the ſingularity of its appearance. The Portugueſe call it tomato, and eat the fruit, either raw or ſtewed: as do the Jew families in England. See Solanum *Lycoperſicum.*

Love-*Graſs.* See Grass.

Love *in a Miſt.* See Passion *Flower.*

Love *lies Bleeding.* See Amaranthus.

Love, *Tree of.* See Cercis.

LOUÉ, in *Geography*, a town of France, in the department of the Sarthe, and chief place of a canton, in the diſtrict of Le Mans; 15 miles W. of Le Mans. The place contains 1204, and the canton 12,563 inhabitants, on a territory of 245 kiliometres, in 16 communes.

LOVELL, a town of America, in York county, Maine, N. of Great Oſſipee, 89 miles N. of York.

LOVENTINUM, or Luentinum, in *Ancient Geography*, a town of the Demetæ, in Britain, ſuppoſed by ſome, without ſufficient reaſon, to have been ſwallowed up by an earthquake in the ſcite of the preſent Llyn Savanathan, near Brecknock, but by others, with great probability, to have been ſituated at or near Llan-Dewi-Brevi, in Cardiganſhire; where, in a field called Caer Ceſtlib, or Caſtle-field, Roman coins and bricks are ſometimes found.

LOVERANO, in *Geography*, a town of Naples, in the province of Otranto; five miles N.N.E. of Nardo.

LOVESKAIA, a town of Ruſſia, on the Caſpian ſea; 27 miles S E. of Aſtrachan.

LOUGHABER, or Lochaber, a ſmall ſettlement in Georgia, on a branch of Savannah river, above its confluence with the Tugalo.

LOUGHBOROUGH, a market town and pariſh in the hundred of Weſt Goſcote, and county of Leiceſter, England, is ſituated 12 miles diſtant from the county town, and 108 miles from London, on the banks of the river Soar, over which it has a good ſtone bridge. According to its ſize and population, it may be eſteemed the ſecond town in the county. Leland ſays, "The town of Lughborow is yn largeneſs and good building next to Leyrceſter, of all the markette tounes yn the ſhire, and hath in it a four faire ſtrates or mo, well pavid. The paroch chirche is faire. Chapelles or chirches beſides, yn the towne, be none. The hole toune is builded of tymbre. At the ſoutheſt end of the chirch is a faire houſe of tymbre, wher ons king Henry VII. did lye." Loughborough conſiſts of one pariſh, to which belong the two hamlets of Wood-thorpe and Knight-thorne, both about a mile diſtant; each having its proper officers, and maintaining its own poor. Great part of the town is the property of the earl of Moira, to whom it came from his uncle the late earl of Huntingdon, in whoſe family it has been ſince the time of queen Mary. The church is a large pile of building, conſiſting of a nave, ſide aſles, chancel, tranſept, and tower; the latter was built by ſubſcription, towards the end of the ſixteenth century. In the church-yard is a free grammar ſchool, which was endowed with the rents of certain lands, &c. left by Thomas Burton for the maintenance of a chantry within the church. Here is alſo a charity ſchool for eighty boys and twenty girls. Four meeting-houſes are appropriated to the Preſbyterians, Baptiſts, Quakers, and Weſleyan Methodiſts. On the ſcite of an old croſs, a modern market-houſe, or what is called the butter and hen croſs, was erected in 1742; it is ſupported by eight round brick pillars. At the upper end of the market place ſtands a ruinous brick edifice, called the court chamber, where the lord of the manor's court leet is annually held. The building appears to have been erected in 1688; it is ſometimes uſed as a theatre and ball-room. The town ſuffered ſeverely by the plague at various periods in the ſixteenth and ſeventeenth centuries. Under the act of 1800, the population was returned as 4546, inhabiting 981 houſes. The chief manufactures carried on here are hoſiery, wool-combing, and frame work knitting.

Six annual fairs are held, and a weekly market on Thurſdays. In the year 1770, the town contained 43 licenſed inns and alehouſes; in 1783, the number exceeded 50.

The Loughborough canal, which communicates with that called the Union canal, and with the river Soar, has proved very ſerviceable to this town, and an advantageous concern to the original proprietors; as 95*l.* a-year dividend has been paid on a ſhare of 125*l.*; and one of theſe ſhares has been ſold for 1800*l.* Nichols's Hiſtory of Leiceſterſhire.

Loughborough, a townſhip of Upper Canada, in Frontenac county, N. of Kingſton.

Loughborough *Canal*, an inlet on the W. coaſt of North America, in the gulf of Georgia, about 30 miles long, and one broad, between mountains nearly perpendicular. The entrance is in N. lat. 30° 27′. E. long. 234° 35′.

LOUGHBRICKLAND, a poſt-town of Ireland, in the county of Down, on the road to Belfaſt. It is 58 miles north from Dublin, and 22 from Belfaſt.

LOUGHGALL, a ſmall poſt-town of Ireland, in the county of Armagh; it is 66 miles N. from Dublin, and three miles N.N.W. from Richhill.

LOUGHREA, a poſt-town of Ireland, in the county of Galway. It is ſituated on a fine lake of the ſame name, and is 87 miles W. by S. from Dublin.

LOUHANS, a town of France, and principal place of a diſtrict, in the department of the Saone and Loire, ſituated at the conflux of the Seille and Solnan. The

French and Swiſs merchants have been accuſtomed to meet here for the purpoſes of commerce. The place contains 2849, and the canton 12,221 inhabitants, on a territory of 140 kiliometres, in 10 communes; 15 miles S.E. of Chalons ſur Saone. N. lat 46° 38′. E. long. 5° 18′.

LOUICHEA Cervina, in *Botany*, ſo named by l'Heritier, in honour of his countryman M. René Louiche Desfontaines, M.D. Profeſſor of Botany at Paris, in a monograph of which 12 copies only were printed; ſee Heritier. The plant was afterwards diſcovered to be *Pteranthus* of Forſkall; ſo that it appeared in l'Heritier's *Stirpes Novæ*, t. 65, under the appellation of *Louichea Pteranthus*. It is indeed the *Camphoroſma Pteranthus* of Linnæus, *Mant* 41; ſee Camphorosma. If any future botaniſt ſhould determine this plant to be a diſtinct genus, it muſt retain the name of *Pteranthus*; not only for the ſake of its aptitude and priority, but becauſe another genus is now conſecrated to the honour of M. Desfontaines. See Fontanesia.

LOVIGNANO, in *Geography*, a town of Naples, in the province of Otranto; 12 miles S.S.W. of Brindiſi.

LOUIS XII. of France, in *Biography*. See Josquin du Prés.

Louis XIII. This prince (ſee Lewis), who began his reign in 1610, at only ſix years old, is ſaid to have been not only a lover and encourager of the art of muſic in riper years, but to have compoſed ſeveral airs with the aſſiſtance of Beauchamp, his firſt violin, who made the baſe. Recueil d'aire de cour.

Père Merſenne, Kircher, and later muſical writers, have given, as a ſpecimen of his invention, an air for a grand dance, in 1618, before he was fifteen years old. *Les vingt quatre violons du roi* ſubſiſted in the time of Henry IV.; but theſe ſeem only to have been employed for dancing. The lute was more an inſtrument of parade in theſe times than any other; and in 1609, Mary de Medicis, Henry IVth's ſecond queen, was followed in a grand dance by twelve lutes, led by Ballard, the principal luteniſt of the court: and all the numerous collections of the court airs at this time were printed in the lute tablature, or notation, to which they were ſet by the authors of the tunes themſelves. The moſt minute and ſatisfactory account of the ſtate of muſic in France, during the reign of Louis XIII. is to be found in the writings of Père Merſenne, particularly in his "Harmonie Univerſelle," publiſhed at Paris in 1636, in folio, a work which he afterwards compreſſed, and tranſlated into Latin, and publiſhed in 1648, the year of his death, under the title "De Sonorum Natura, Cauſis et Effectibus." A work in which, through all the partiality to his country, want of taſte and method, there are ſuch innumerable curious reſearches, and ingenious and philoſophical experiments, of which ſubſequent writers on muſic have availed themſelves, particularly Kircher, as render the book extremely valuable. In his twenty-third propoſition, liv. i. this author explains and deſcribes twelve different kinds of muſic and movement uſed in France during his time: theſe were motets, ſongs or airs, paſſacailles, pavans, allemandes, gaillards, voltes, courantes, ſarabandes, canaries, branles, and balets, of all which he gives examples in notes. But though moſt of theſe movements were the ſpecific names of the dances then in vogue, the minuet, which, during the laſt century, was in ſuch general uſe and favour all over Europe, is never mentioned.

Louis XIV. This magnificent prince (ſee Lewis), whoſe ambition was not confined to extenſion of empire, ſeems to have patroniſed muſic, and to have eſtabliſhed an opera in his capital, more as a ſplendd ſpectacle, which no other ſovereign could afford to ſupport, than from the pleaſure which he received from modulated ſound. He was, however, during his minority, taught the guitar by an Italian, whom cardinal Mazarin ſent for expreſsly from Italy; but as the actions and faculties of this young monarch were to be regarded as wonderful, he is ſaid by his flatterers, in eighteen months to have excelled his maſter (Hiſt. de la Muſ.), and to have underſtood muſic in perfection. Indeed, the firſt dramatic muſic which he heard was Italian; as cardinal Mazarin, during the minority of this prince, had two operas in Italian verſe, and ſet to Italian muſic, performed by a company of Italian ſingers ſent from Italy, to impreſs the court of France with a favourable idea of the faſhionable muſic of his country. The firſt of theſe operas, performed at the Bourbon palace in 1645, ſeems to have been a burletta. Its title was "La Feſta Teatrale della Finta Pazza," written by Giulio Strozzi, but by whom ſet does not appear. The ſecond was "Orfeo et Euridice," 1647. Beſides theſe, at the nuptials of Louis XIV. 1660, "Ercole Amante," a ſerious Italian opera, was performed in the ſame manner, and well received at court by the flatterers of the cardinal, ſays the continuator of Bonnet's Hiſtory of Muſic. M. de Blainville, however, in his ſhort Hiſtory of Muſic, ſays, that he had ſeen the ſcore of this opera, "and found, in examining it, all the recitatives, airs, choruſes, ſymphonies, and dances, both in melody and harmony, of the ſame kind as thoſe of Lulli." And at the time that Lulli came into into France, 1646, the opera in Italy had made but a ſmall progreſs towards that perfection at which it afterwards arrived. It then conſiſted chiefly of recitative with frequent cloſes, *ad libitum*, and choruſes, but no airs or meaſured melody for a ſingle voice. And in this ſtate the opera continued in France till the death of Rameau, and arrival of Gluck and Piccini at Paris; while in all the capitals of Italy and Germany, melody was poliſhed, taſte refined, modulation extended, and harmony enriched by new combinations. Whatever horror and hatred the ambition of Louis might have excited in his neighbours, and envy by his magnificence, his moſt bitter and irreconcileable enemies muſt have allowed that muſic was the only one of all the arts and ſciences which was not ſucceſsfully cultivated in France, during the proſperous part of his long and ſplendid reign. Indeed the failure of muſic was not ſo much owing to want of genius and love of the art in the natives, as to the naſal tones and natural cantilena of their language; nor would the reſt of Europe have ſo diſliked, cenſured, and contemned their muſic, if they had not at all times inſiſted on its being the beſt in the univerſe, and the model which all other nations ought implicitly to follow.

Louis, Anthony, an eminent French ſurgeon, was born at Metz on the 13th of February 1723. He attained to great reputation in his profeſſion, and was honoured with numerous appointments and offices, the juſt rewards of his merit. He was ſecretary of the Royal Academy of Surgery at Paris, conſulting ſurgeon to the king's forces, ſurgeon-major to the hoſpital La Charité, doctor in ſurgery of the faculty of Halle, in Saxony, honorary member of the Royal College of Phyſicians of Nancy, and member of many of the learned ſocieties, not only in France, but in foreign countries. The time of his death is not known, but the lateſt of his publications is dated in 1777. In addition to the ſurgical part of the "Encyclopédie," which M. Louis wrote, and to ſeveral intereſting papers preſented to the Academy of Surgery, he was author of a great number of works on medical, chirurgical, and anatomical ſubjects, the principal of which we ſhall mention. "Obſervations ſur l'Electricité," &c. Paris, 1741, 12mo: "Eſſai ſur la Nature de l'Ame, où l'on tache d'expliquer ſon union avec le corps," ibid. 1746, 12mo.: "Cours de Chirurgie pratique ſur les plaies d'armes à feu," ibid. 1746, 4to.: "Obſervations et Remarques ſur les effets du virus cancereux," &c. ibid. 1748: "Poſitiones Anatomico-chirurgicæ de capite ejuſque vulneribus," ibid. 1749: "Lettre ſur la certitude des ſignes de la mort, avec des obſervations et des experiences ſur les noyés," ibid. 1749, 12mo. He attributed the death of perſons drowned to the entrance of water into the lungs, which farther experience has diſproved. "Experiences ſur la Lithotomie," 1757, in which he expreſſed his diſapprobation of the biſtouri caché of Frere Côme. "Memoire ſur une queſtion anatomique, relatif à la juriſprudence," &c. 1763. This memoir, written after the ſhocking affair of Calas, was intended to eſtabliſh the diſtinction of the appearances after voluntary death by hanging, and after murder by that mode. "Memoire ſur la légitimité des naiſſances prétendues tardives," 1764, in 8vo; in which the author maintains that the retardation of parturition beyond the natural period of geſtation, *i. e.* more than ten days beyond the ninth month, is phyſically impoſſible. He publiſhed a ſupplement to this treatiſe in the ſame year. "Recueil d'Obſervationes d'Anatomie et de Chirurgie, pour ſervir de baſe à la Theorie des leſions de la tête par contrecoup," 1766: "Hiſtoire de l'Academie Royale de Chirurgie depuis ſon etabliſſement juſqu'en 1743," printed in the fourth volume of the memoirs. His laſt publication was a tranſlation of M. Aſtruc's work "De Morbis Venereis," into French. In addition to theſe works, M. Louis alſo tranſlated Boerhaave's Aphoriſms of Surgery, with Van Swieten's Commentary; and wrote ſeveral eulogies on deceaſed members of the Academy of Surgery, and various controverſial tracts, eſpecially concerning the diſputes between the phyſicians and ſurgeons of Paris in 1748, &c. Eloy Dict. Hiſt. Gen. Biog.

LOUIS, *Lewis, Louis d'or*, or *Lewidore*, a French coin, firſt ſtruck in 1641, under the reign of Louis XIII. and which has ſince had a conſiderable currency.

Louis d'ors, at firſt, were valued at ten livres, afterwards at eleven, and at length at twelve and fourteen. In the latter end of the reign of Louis XIV. they were riſen to twenty, and in the beginning of that of Louis XV. to thirty and thirty-ſix, nay forty and upwards; with this difference, however, that in the laſt coinings the weight was augmented in ſome proportion to the price, which in the former reign was never regarded. The Louis d'ors coined before 1726, which then paſſed for 20 livres, were coined at the rate of $36\frac{1}{4}$ *per* French mark of gold, 22 carats fine: the remedy in the weight was 14 grains *per* mark, and the remedy in the alloy one-fourth of a carat. Theſe ceaſed to be a legal coin in France as far back as 1726; but they ſtill continued to circulate through many parts of Germany and Switzerland, where they had a fixed value, and were known by the name of "Old Louis d'ors:" of theſe few are now in circulation. From the year 1726 to 1785, Louis d'ors were coined at the rate of 30 to the mark of gold, 22 carats fine, with a remedy of 15 grains in the weight, and $\frac{1}{12}$ of a carat in the alloy. Accordingly before 1786, the double Louis weighed 10 dwt. 11 gr. contained in pure gold 224.9 gr. and was valued at 1*l.* 19*s.* $9\frac{1}{2}$*d.* ſterling: the Louis weighed 5 dwt. $5\frac{1}{2}$ gr. contained in pure gold 112.4 gr. and was valued at 19*s.* $10\frac{3}{4}$*d.* ſterling: and the demi-louis weighed 2 dwt. $14\frac{3}{4}$ gr. contained in pure gold 56.2 gr. and was valued at 9*s.* $11\frac{1}{2}$*d.* ſterling. Theſe coins ceaſed to be current in France in 1786. In Holland, Germany, &c. they were called "New Louis d'ors," by way of diſtinction from thoſe which we have before mentioned; though theſe are now become the old ones. The intrinſic value of ſuch a Louis d'or (making the full allowance for remedy) is very little more than a pound ſterling. In 1785 and 1786, all the gold coins in France were called in and ordered to be melted down; and a new coinage took place, at the rate of 32 Louis d'ors to the mark of the ſame degree of fineneſs, with the ſame allowances for remedy as above. Accordingly, the double Louis coined ſince 1786, weighed 9 dwt. 20 gr. contained 212.6 gr. of pure gold, and was valued at 1*l.* 17*s.* 8*d.* ſterling: the Louis weighed 4 dwt. 22 gr. contained of pure gold 106.3 gr. and was valued at 18*s.* 10*d.* ſterling. The intrinſic value of this new Louis d'or (allowance being made for remedy) is 18*s.* $9\frac{1}{4}$*d.* ſterling; and 1*l.* ſterling = 25 livres, 10 ſous Tournois, in gold. Louis d'ors may be conſidered as a current coin in moſt parts of the continent; but in England they are ſold merly as merchandize, and their price has fluctuated from 18*s.* 6*d.* to 21*s.* ſterling.

On one ſide of the coin is the king's head, with his name and title, thus: LUD. XVI. D.G. FR. ET NAV. REX. *i. e.* Louis XVI. king of France and Navarre; on the reverſe, the arms of France and Navarre, with a crown over them. On the pieces coined before 1786, there are two diſtinct ſhields; and on thoſe coined ſince 1786, a double ſhield: the legend is, CHR. REGN. VINC. IMPER. *i. e.* Chriſt reigns, conquers, governs: under the arms is a letter, by which the mint where the piece was coined is diſtinguiſhed. The double and half Louis bear the ſame impreſſion.

There are alſo white Louiſes, or Louis d'argent, ſome of 120, others of 60 ſols a piece, called alſo ecus; and among us French crowns, half-crowns, &c. The old ecus, coined before 1726, were coined at the rate of 9 pieces to the mark of 10 deniers 22 grains fine: theſe, like the Louis d'ors of the ſame period, after they had ceaſed to be current in France, ſtill preſerved a fixed value in ſome parts of Germany; but they are now ſcarcely in circulation. In 1726, the coinage of ecus was regulated, and continued without alteration, as follows: $8\frac{3}{16}$ ecus of 6 livres, or $16\frac{3}{8}$ ecus of 3 livres, were to be coined from a mark of ſilver 11 deniers fine, with a remedy of 36 grains per mark in the weight, and $\frac{1}{8}$ of a denier in the alloy: and their intrinſic value is (allowance being made for remedy) 4*s.* $9\frac{1}{4}$*d.* ſterling; or, 1*l.* ſterling = 25 livres, 3 ſous Tournois, in ſilver.

On the one ſide of theſe is the king's head, and on the other the French arms, with this legend, "Sit nomen Domini benedictum."

The Louis d'or is a gold coin of Malta. The double, ſingle, and half Louis d'ors are coined by the grand maſter Rohan, at 20, 10, and 5 ſcudi, copper or current money. The double Louis weighs 10 dwt. 16 gr., contains of pure gold 215.3 gr., and is valued at 1*l.* 18*s.* $1\frac{1}{4}$*d.* ſterling. The Louis weighs 5 dwt. 8 gr., contains of pure gold 108 gr., and is valued at 19*s.* $1\frac{1}{4}$*d.* ſterling. The demi-louis weighs 2 dwt. 16 gr., contains of pure gold 54.5 gr., and is valued at 9*s.* $7\frac{3}{4}$*d* ſterling. The fineneſs of the gold coins of Malta undergoes great variation. Kelly's Univerſal Cambiſt.

LOUIS, *Knights of St.*, is the name of a royal and military order, inſtituted by Louis XIV., in addition to that of "Chriſtian charity," which had been founded by Henry III. king of France, in 1693, in favour of the maimed officers and ſoldiers of his army, who had ſignalized themſelves in the ſervice. This order conſiſted of eight great croſſes, and twenty-four commanders, beſides the king, who was grand maſter, the dauphin always inveſted with it, and the treaſurer, recorder, and uſher. The badge of the order was "a croſs of eight points enamelled white, edged with gold; it in the angles four fleurs-de-lis; and in the middle a circle, within which on one ſide the image of St. Louis in armour, with the royal mantle over it, holding in his right hand a crown of laurel, and in his left hand a crown of thorns, and the three paſſion-nails, all proper;" with this inſcription, LUDOVICUS MAGNUS INSTITUIT 1693: on the reverſe, "a ſword erect, the point through a chaplet of laurel," bound with a white ribbon enamelled, with this motto, BELLICÆ VIRTUTIS PRÆMIUM. The great croſſes had the croſs pendent to a broad bright red ribbon, which they wore paſſing ſcarfwiſe over the left ſhoulder and under the right arm: they alſo wore the like croſs embroidered with gold on the outſide of their upper garment. The commanders wore the croſs pendent to a broad ribbon, in the ſame manner as worn by the great croſſes; but they have it not embroidered on their clothes. The knights wore a ſmall gold croſs pendent at a red ribbon, faſtened at a button-hole of their coats.

At the time of their inſtitution, the king charged his revenue with a fund of three hundred thouſand livres, for the penſions of the commanders and knights.

LOUIS, *St.*, in *Geography*, an iſland on the weſt coaſt of Africa, at the mouth of the river Senegal; flat, ſandy, and barren. Its name is derived from a fort built by the French. Both were ceded to the Engliſh by the treaty of Verſailles, in 1763. During the American war it was taken by the French, and kept by them after the peace of 1783. N. lat. 16°. W. long. 16° 8′.—Alſo, a ſea-port town on the ſouth coaſt of the iſland of Hiſpaniola. It is ſituated at the head of a bay of its name. N. lat. 18° 16′. W. long. 74° 19′.—Alſo, a ſea-port town of Hiſpaniola, on the north coaſt; ruined in 1797 by a hurricane; 5 miles S.E. of Cape François.—Alſo, a town of South America, in the province of Guiana. N. lat. 3° 55′. W. long. 52° 30′.—Alſo, the capital town of Guadaloupe, Grand Terre, with a fortreſs; 3 leagues S.E. of the Salt river.—Alſo, a town on the weſt ſide of the river Miſſiſippi, 25 miles below the mouth of the Miſſouri. It is ſituated on a pleaſant and healthy eminence, and contained, in 1799, 130 large commodious houſes, built of ſtone, and 925 inhabitants, of whom 268 are ſlaves.. In this year the productions of the ſettlement were 4300 buſhels of wheat, 10,300 buſhels of corn, and 1650 pounds of tobacco. The inhabitants poſſeſſed 1140 horned cattle, and 215 horſes.—Alſo, a ſmall, compact, beautiful bay in Weſt Florida, with about ſeven feet water: the land near it is of a light ſoil, and good for paſture. Formerly here were ſeveral ſettlers; but in the year 1767 the Choctaw Indians killed their cattle, and obliged them to remove.—Alſo, a lake of Canada, commencing, or rather terminating at La Chine, a village which ſtands at the lower end of it. The lake is about 12 miles in length, and four in breadth. At its uppermoſt extremity it receives a large branch of the Utawas river, and alſo the ſouth-weſt branch of the river St. Lawrence, which by ſome geographers is called the river Cadaraqui, and by others the river Iroquois; but in the country, generally ſpeaking, the whole of that river, running from lake Ontario to the gulf of St. Lawrence, goes ſimply under the name of St. Lawrence. At the upper end of lake St. Louis, the water is very ſhallow, owing to the banks of mud and ſand waſhed up by the two rivers; and theſe banks are entirely covered with reeds, ſo that when a veſſel ſails over them, ſhe appears at a little diſtance to be abſolutely ſailing over dry land. This part of the lake is infeſted with clouds of inſects, ſimilar to thoſe which have been commonly obſerved on various parts of the river St. Lawrence. Their ſize is about that of a gnat; their colour is white; and their form ſo delicate, that the ſlighteſt touch deſtroyed them, and reduced them to powder. Their wings are broad in proportion to their ſize, and fly heavily; ſo that it is only when the air is remarkably calm, that they can venture to make their appearance. N. lat. 45° 25′. W. long. 73° 20′. Weld's Travels through Canada, vol. ii.—Alſo, a group of ſmall iſlands in the river St. Lawrence. N. lat. 45° 23′. W. long. 73° 30′.—Alſo, a river of America, which runs into lake Superior. N. lat. 46° 44′. W. long 91° 52′.

LOUIS *de Maranham, St.*, a town on the north coaſt of Braſil, and on the Atlantic ocean, ſituated on the eaſt ſide of Mearim river; about half way between point Mocoripe and the mouth of the river Para.

LOUISA, or DEGERBY, a ſea-port town of Sweden, in the province of Nyland, on the north coaſt of the gulf of Finland, built in 1745 as a frontier town towards Ruſſia, and at firſt called Degerby, but afterwards Louiſa, in 1752, by king Adolphus Frederic. It is an open town, defended towards the ſea by a ſmall fortreſs. The houſes are all of wood, and of two ſtories, painted with a red colour, and appearing much neater than the common towns in Ruſſia. N. lat. 60° 27′. E. long 26° 16′.

LOUISA, a county of Virginia, adjoining Orange, Albemarle, Fluvanna, Spottſylvania, and Goochland counties. It is about 35 miles long, and 20 broad, and contains 5900 free inhabitants, and 5992 ſlaves. Many parts of this county are covered with pine.—Alſo, a river of Virginia, the head-water of Cole river, a ſouth-weſt branch of the Great Kanhaway.—Alſo, a river of Africa, which runs into the Atlantic, S. lat. 5° 10′.

LOUISA *Chitto*, or *Looſa Chitto*, a river of America, which riſes on the borders of South Carolina, and runs a ſouth-weſterly courſe, through the Georgia Weſtern lands, and joins the Miſſiſippi juſt below the Walnut hills, and 10 miles from Stony river. It is 30 yards wide at its mouth, and ſaid to be navigable for canoes 30 or 40 leagues.

LOUISBOURG, the capital of Sydney, or Cape Breton, iſland, in North America; ſituated on a point of land, on the ſouth-eaſt ſide of the iſland. Its ſtreets are regular and broad, conſiſting chiefly of ſtone houſes, with a large parade, at a little diſtance from the citadel, the inſide of which is a fine ſquare, nearly 200 feet on each ſide. On its north ſide, while the French had poſſeſſion of it, ſtood the governor's houſe and the church; the other ſides were occupied by barracks, bomb-proof, in which the French ſecured their women and children during the ſiege. The town is nearly half a mile long, and two in circuit. Its harbour is one of the fineſt in that country, being almoſt four leagues in circuit, with ſix or ſeven fathoms of water in every part of it. The anchorage is good, and ſhips may run aground without danger. Its entrance is not above 300 toiſes in breadth, formed by two ſmall iſlands, and is known, 12 leagues out at ſea, by cape Lorembec, ſituated near the north-eaſt ſide of it. The interior of the harbour is more than half a mile broad from N.W. to S.E. in the narroweſt part, and ſix miles long from N.E. to S.W. In the north-eaſt part is a fine careening wharf, ſecure from all winds. On the oppoſite ſide are the fiſhing ſtages, and room for 2000 boats to cure their fiſh. The cod-fiſhery may be continued from April to the cloſe of November. In winter the harbour is entirely frozen, ſo that it may be walked over; and it continues in this ſtate from the end of November till May or June. The principal trade of Louiſbourg is the cod-fiſhery, from which the inhabitants derive great profits; fiſh being plentiful, and deemed better than any about Newfoundland. This place was taken from the French in 1745, and reſtored to France by the treaty of Aix-la-Chapelle in 1748. It was again captured by the Engliſh in 1758, and its fortifications have been ſince demoliſhed. N. lat. 45° 55′. W. long. 59° 50′.

LOUISBOURGH, in Pennſylvania. See HARRISBURGH.

LOUISBURG, a poſt-town of America, in Franklin county, North Carolina; 265 miles from Waſhington.

LOUISIADE, the ſouthern coaſt of a conſiderable iſland belonging to New Guinea, ſo called by M. Bougainville in 1768.

LOUISIANA, a country of North America, firſt diſcovered by Ferdinand de Soto in 1541, and afterwards viſited by colonel Wood in 1654, and by captain Bolt in 1670. But the firſt perſon who attempted to ſettle in this country was M. de la Salle, who, in 1682, traverſed the Miſſiſippi; and in the following year he repaired to France, and, in conſequence of the repreſentations which he made of his diſcoveries, obtained a grant of four ſmall veſſels and 170 men, with which armament he ſet ſail for the mouth of the Miſſiſippi. In 1685 this ſmall colony, under the direction of their leader, landed in the bay of St. Bernard's, about 300 miles weſt of the place of their deſtination. After ſtruggling with many hardſhips, both in their landing and in their endeavours to ſettle, ſome of this colony murdered La Salle, and all the reſt periſhed, except ſeven perſons, who penetrated through the country to Canada. In 1699, M. Ibberville of Canada, a brave naval officer, having obtained the patronage of the French court, ſailed from Rochfort with two ſhips and a number of men, and laid the foundation of the firſt French colony on the Miſſiſippi. This colony was diminiſhed, by ſome unfavourable circumſtances in 1712, to 28 families. At this time Crozat, a merchant of great opulence and an adventuring ſpirit, obtained the excluſive trade of Louiſiana; but his plans, which were extenſive and patriotic, proving ineffectual, he reſigned his charter, in 1717, to a company formed by the famous projector John Law. From this period the country became an object of intereſt to ſpeculative adventurers, ſo that in 1718 and 1719 a numerous colony of labourers, collected from France, Germany, and Switzerland, was conveyed to Louiſiana, and ſettled in a diſtrict called "Biloxi," on the iſland of Orleans, a barren and unhealthy ſituation, where many hundreds died through want and vexation. This event ruined the reputation of the country; and the colony having languiſhed till the year 1731, the company at length, for the ſum of 1,450,000 livres, purchaſed the favour of ſurrendering their concerns into the hands of the government. The French continued in quiet poſſeſſion of Louiſiana, frequent conteſts with the Indians excepted, till the year 1762. Among theſe tribes of hoſtile Indians we may reckon the Natchez, who appear in the year 1731 to have been almoſt wholly extirpated. In 1736 and 1740 the coloniſts were engaged in bloody wars with the Chickaſaw Indians; but theſe, in proceſs of time, terminated in permanent peace. From this time the proſpects of the coloniſts were brightening, as their peltry trade with the Indians and their commerce with the Weſt Indies were increaſing. Several hundred Canadians and recruits of inhabitants from other countries ſettled on the banks of the Miſſiſippi, and imparted additional ſtrength and proſperity to the original colony.

Such was the ſtate of the country, when in the year 1764 the inhabitants received information that in November 1762, Louiſiana, comprehending New Orleans and the whole territory W. of the Miſſiſippi, had been ceded to Spain by a ſecret treaty. This meaſure incenſed the coloniſts, and was vigorouſly oppoſed, ſo that complete poſſeſſion of the country was not obtained by Spain till the 17th of Auguſt 1769, after which event ſeveral victims were ſacrificed, to atone for the delay of ſubmiſſion, and others were conveyed away to languiſh out their lives in the dungeons of the Havannah. By the treaty of peace in 1763, which ceded Canada to Great Britain, the boundaries of the Britiſh provinces were extended ſouthward to the gulf of Mexico, and weſtward to the Miſſiſippi, and Louiſiana was limited N. by Canada, and E. by the Miſſiſippi, excepting that it included the iſland of New Orleans on its E. bank. This ſtate of things remained till the American revolutionary war, during which Spain took from Great Britain the two Floridas: the United States, according to their preſent limits, became an independent government, and left to Great Britain, of all her American provinces, thoſe only which lie N. and E. of the United States. All theſe changes were ſanctioned and confirmed by the treaty of 1783. Thus things continued till the treaty of St. Idelfonſo, October 1, 1800, by which Spain engaged to cede to the French republic, on certain conditions, the colony or province of Louiſiana, with the ſame extent which it actually had when France poſſeſſed it. This treaty was confirmed and enforced by the treaty of Madrid, March 21, 1801. From France it paſſed to the United States by the treaty of the 30th of April 1803. In conſideration of this ceſſion, the government of the United States engaged to pay to the French government, under certain ſtipulations, the ſum of 60,000,000 francs, independent of the ſum which ſhould be fixed by another convention for the payment of the debts due by France to the citizens of the United States. The boundaries of Louiſiana, as formerly poſſeſſed by France and Spain, and now held by the United States, are ſtated as follows; *viz.* S. on the gulf of Mexico, from the bay of St. Bernard, S.W. of the Miſſiſippi to the mouth of the Rio Perdido, or Loſt river, ſo called by the Spaniards, becauſe it loſes itſelf under ground, and afterwards appears again, and diſcharges itſelf into the ſea a little to the E. of Mobile, on which the firſt French planters ſettled; up the Perdido to its ſource, and thence (if it riſe not N. of the 31ſt degree of lat.) in a ſtraight line N. to that parallel; thence along the ſouthern boundary of the United States, W. to the Miſſiſippi; then up this river to its ſource, as eſtabliſhed by the treaty of 1783. Beyond this point, the limits, (which have never been accurately aſcertained,) may be conſidered as including the whole country between the White Bear lake, or other head of the Miſſiſippi, and the ſource of the Miſſouri; and between this laſt and the head ſprings of the Arkanſas, Red river, and other copious ſtreams, which fall into the Miſſiſippi; or, in other words, Louiſiana may be conſidered as bounded N. and N.W. by the high lands, which divide the waters that fall into the St. Lawrence and Hudſon's Bay from thoſe which fall into the Miſſiſippi; W. by that high chain of mountains, known by the name of the "Shining Mountains," which may be called the "Spine" or "Andes" of that part of North America, and which turn the waters on the W. of them to the Pacific, and thoſe on the E. to the Atlantic ocean. In a word, it embraces the whole ſlope, or inclined plain, fronting the S.E. and E. down which the various ſtreams flow into the bed of the Miſſiſippi. On the S.W. it is bounded by New Mexico, between which and Louiſiana the diviſional line has never been ſettled. Some pretend that this boundary is a right line from the head of Red river to that of Rio Bravo, and thence down its channel to the gulf of Mexico. Others make the Rio Colerado, and others, with greater probability, make the Rio Mexicano, the S.W. boundary of Louiſiana.

Louiſiana may naturally be divided into the three following diſtricts; *viz.* Eaſtern, Lower, and Upper Louiſiana. The *Eaſtern* diviſion comprehends all that part of this territory which lies E. of the Miſſiſippi, bounded S. by the gulf of Mexico, E. by Perdido river, N. by the Miſſiſippi territory, and W. by the Miſſiſippi river. This diviſion includes the iſland of New Orleans, and is watered by the Mobile, Paſcagoula, Pearl, Boguechito, Tanſipaho, and Amit rivers, with Thompſon's creek, and Bayou Sara. The whole coaſt, embracing the old Biloxi diſtrict, conſiſts of a fine white ſand, injurious to the eyes, and ſo dry as not to be fit to produce any thing but pine, cedar, and ſome ever-green oaks. The Mobile river has few fiſh, and its banks and vicinity are not very fertile. Between Paſcagoula and Miſſiſippi rivers, the country is intermixed with extenſive hills, fine meadows, numerous thickets, and in ſome places woods thickſet with cane, particularly on the banks of rivers and brooks, and proper for agriculture. Its coaſt, though flat, dry, and ſandy, abounds with delicious ſhell and other fiſh, and affords ſecurity againſt the invaſion of an enemy.

Lower Louiſiana comprehends that part of this territory bounded E. by the Miſſiſippi river, S. by the gulf of Mexico, S.W. and W. by New Mexico, N. by a line drawn from the Miſſiſippi W., dividing the country in which ſtone is found from that in which there is none. This part of Louiſiana is watered by Red river, and many others which fall into the gulf of Mexico. On both ſides of the mouths of the Miſſiſippi are quagmires, affording a ſafe retreat for water-fowl, gnats, and moſquitoes, and extending for more than twenty miles. The whole coaſt from the Miſſiſippi, W. as far as St. Bernard's bay and beyond it, reſembles that already deſcribed of the eaſtern diviſion: and the ſoil is barren. In aſcending the Miſſiſippi, beyond the marſhes, are ſome narrow ſtrips of firm land, partly bare of trees and partly thickly covered with them; which are fit for cultivation. This part ſeems to have been either recovered from the ſea, or formed by various materials that have deſcended to it; and it is not unreaſonable to imagine, that in proceſs of time the river and ſea may form another tract of country like Lower Louiſiana. The principal river is the Miſſiſippi; which ſee. The Red river has its ſource not far from that of Rio Bravo, or Rio del Norte, on which the city of Santa Fé is built, and in the mountain which has the ſprings of the Miſſouri. On each ſide of this river are ſome ſcattered ſettlements, for about fifty miles to Bayan Rapide, in which are about 100 families. The land here is not inferior to any in the world with regard to fertility; and for a ſpace of about 40 miles from hence to the commencement of the Appaluſa prairies, the country is equally rich and well-timbered. It is perfectly level, and the ſoil 20 feet deep, and like a bed of manure. Higher up, the banks and low lands are of ſimilar quality with the lands on Bayan Rapide, the texture of the ſoil being ſomewhat looſer; but there are few ſettlements, till you come to the river Cane ſettlements, 60 or 70 miles higher up Red river. Hence to the village or port of Natchitoches, about 50 miles, and 25 miles above it, the banks of one branch of Red river are ſettled like thoſe of the Miſſiſippi, and the country abounds with beautiful fields and plantations, and luxuriant crops of corn, cotton, and tobacco. (See NATCHITOCHES.) The low grounds of Red river, generally five or ſix miles wide, have an uncommonly rich ſoil, which is overflowed annually in the month of April. The crops of corn and tobacco are plentiful, and never fail. The ſoil is particularly favourable for tobacco; an acre yields from 80 to 100 buſhels of corn; and it is no leſs productive of cotton. Two men, with ten or twelve old pots and kettles, ſupply the ſettlement on Red river with ſalt, the ſprings of which are almoſt inexhauſtible. Here is likewiſe plenty of iron and copper ore, pit-coal, ſhell and ſtone lime. The different branches of the river the lakes, creeks, and bayans furniſh abundance of very fine fiſh, cockles, ſoft-ſhelled turtle and ſhrimps, and in winter great varieties of wild fowl. The country is far from being ſickly. The moſchetto is rarely ſeen. The high lands are covered with oak, hickory, aſh, gum, ſaſſafras, dogwood, grape-vines, &c. intermixed with ſhort-leaved pine, and interſperſed with prairies, creeks, lakes, and fountains. Its hills and vallies are gently varied, and the ſoil is generally a ſtony clay. The country on Red river is moſt valuable, beginning about 50 or 60 miles above the upper ſettlements, and extending 4 or 500 miles. The low lands, about 40 miles on each ſide, are remarkably rich, interſperſed with prairies, and beautiful ſtreams and fountains; alſo quarries of free-ſtone, lime, flint, ſlate, grit, and almoſt every kind of ſtone. About 30 miles from the mouth of Red river, Black river falls into it on the N. ſide, which is a clear and navigable ſtream for 5 or 600 miles: about 100 miles upwards, it branches in three different directions: the eaſtern branch, called the Tenſaw, is navigable for many miles, and affords rich land: the middle or main branch, called Waſheta, is navigable 500 miles, and affords excellent lands, ſalt-ſprings, lead-ore, and plenty of very good mill and grindſtones: the weſtern branch, called Catahola, runs through a beautiful, rich, prairie country, in which is a large lake, called Catahola lake. On this lake are ſalt-ſprings, and it abounds with fiſh and fowl. On the river called Ozark are many valuable tracts of land, which is likewiſe the caſe with reſpect to White river and St. François.

Upper Louiſiana comprehends all the remainder of this territory, and is the largeſt and moſt valuable part. It is bound S. by Lower Louiſiana, on the E. by Miſſiſippi, N. and W. by the highlands and mountains which divide the waters of St. Laurence, Hudſon's bay, and the Pacific ocean, from thoſe of the Miſſiſippi. It is watered by the Red river, the Arkanſas, St. Francis, and the Miſſouri, with a vaſt number of ſmaller ſtreams which fall into theſe or the Miſſiſippi. From the lower ſettlement at Sans la Grace, to the upper ſettlement on the Miſſouri, about the diſtance of 250 miles, is a country equal to any part of the weſtern territory, containing a population of 50 or 60,000, and furniſhing lead and iron mines. The ſoil is at the bottom a ſolid red clay, and this is covered by a light earth almoſt black and very fertile. The graſs grows here to a great height, and towards the end of September is ſet on fire; and in eight or ten days after, the young graſs ſhoots up half a foot high. In advancing northwards towards the Arkanſas and St. Francis, the country becomes more beautiful and fertile, abounding in various kinds of game, as beavers, &c. and herds of deer, elks, and buffaloes, from 6 to 100 in a drove. Here have been alſo found ſpecimens of rock cryſtal, plaſter of Paris, lead, and iron ore, lime-ſtone, and pit-coal. It has all the trees known in Europe, beſides others that are there unknown. The cedars are remarkably fine; the cotton trees grow to ſuch a ſize, that the Indians make canoes out of their trunks: hemp grows naturally; tar is made from the pines on the ſea coaſt; and the country affords every material for ſhip-building. Beans grow to a large ſize without culture; peach trees are heavily laden with fruit; and the foreſts are full of mulberry and plum trees. Pomgranate and cheſnut trees are covered with vines, whoſe grapes are very large and ſweet. They have three or four crops of Indian corn in the year: as they have no other winter beſides ſome rains. Here are alſo mines of pitcoal, lead and copper, quarries of free-ſtone, and of black, white, and jaſper-like marble, of which they make their calumets. One ſpecies of timber, which is common from the mouth of the Ohio down the Miſſiſippi ſwamp, is cotton wood, reſembling the Lombardy poplar in the quickneſs of its growth, and the ſoftneſs of the timber. Here are alſo the papaw and black aſh, button wood or ſycamore, hickory, and cypreſs; wild cherry, ſaſſafras, beech, cheſnut, and Bermudian mulberry trees. From the Walnut hills to Point Coupee, and eaſterly 15 or 20 miles, the whole country in its natural ſtate is one continued cane-brake. The cane in general is 36 feet high, often 42; intermingled with a ſmaller ſpecies, which continue thence on all the creeks to the gulf of Mexico.

Above the Nachitoches are the habitations of the Cadodaquiebos Indians; near one of their villages is a rich ſilver mine; another lies further north. Lead ore is alſo found in different places, and alſo iron ore, pit-coal, marble, ſlate, and plaſter of Paris.

As to the climate of this country, during the winter the weather is very changeable, generally throughout Lower, and the ſouthern part of Upper Louiſiana. In ſummer it is regularly hot. In the latitude of the Natchez, Fahrenheit's thermometer ranges from 17° to 96°. The average degree of heat is ſtated to be 14° greater than in Pennſylvania. The climate of Louiſiana varies in proportion as it extends northward. Its ſouthern parts are not ſubject to the ſame degree of heat as the ſame latitudes in Africa, nor its northern parts to the ſame degree of cold as the correſponding latitudes in Europe; owing to the thick woods which cover the country, and to the great number of rivers which interſect it. The prevailing diſeaſes on the lower part of the Ohio, on the Miſſiſippi, and through the Floridas, are bilious fevers. In ſome ſeaſons they are mild, and are little more than common intermittents; in others they are very malignant, and approach the genuine yellow fever of the Weſt Indies.

The total population of all the parts or diſtricts of Louiſiana, including whites, free people of colour, and ſlaves, is 42,375, of whom 12,920 are ſlaves. But it is apprehended that this number is too ſmall. The Spaniſh government is fully perſuaded that the population at preſent conſiderably exceeds 50,000 perſons. The inhabitants of this country are chiefly the deſcendants of the French and Canadians. In New Orleans there is a conſiderable number of Engliſh and Americans. The two German coaſts are peopled by the deſcendants of ſettlers from Germany, and by French mixed with them. The three ſucceeding ſettlements up to Baton Rouge contain moſtly Acadians, baniſhed from Nova Scotia by the Engliſh, and their deſcendants. The government of Baton Rouge, eſpecially on the E. ſide, which includes the whole country between the Ibberville and the American line, is compoſed partly of Acadians, a few French, and a great majority of Americans. On the W. ſide they are moſtly Acadians; at Point Coupee and Fauſſee river they are French and Acadians; of the population of the Atacapas and Opelouſas, a conſiderable part is Americans; Natchitoches, on the Red river, contains but a few Americans, and the reſt of the inhabitants are French; but the former are more numerous in the other ſettlements on that river, *viz.* Avoyelles, Rapide, and Ouacheta. At Arkanſas they are moſtly French; and at New Madrid, Americans. At leaſt two-fifths, if not a greater proportion of all the ſettlers on the Spaniſh ſide of the Miſſiſippi, in the Illinois country, are likewiſe ſuppoſed to be Americans. Below New Orleans the population is altogether French, and the deſcendants of Frenchmen. The natives of the ſouthern part of the Miſſiſippi are ſprightly; they have a turn for mechanics, and the fine arts; but their ſyſtem of education is ſo wretched, that little real ſcience is obtained. Many of the planters are opulent, induſtrious, and hoſpitable. There is a militia in Louiſiana, amounting, as it is ſaid, to about 10,340. The Indian nations within the limits of Louiſiana, are as follow, according to the ſtatement of the late preſident of the United States, Mr. Jefferſon: on the E. bank of the Miſſiſippi, about 25 leagues above Orleans, are the remains of the Houmas or Red men, amounting to about 60 perſons; on the W. ſide of the ſame river are the remains of the Tounicas, ſettled near and above Point Coupee, conſiſting of 50 or 60 perſons. In the Atacapas, on the lower part of the Bayou Teche, about 11 or 12 leagues from the ſea, are two villages of Chitimachas, conſiſting of about 100 perſons; the Atacapas, properly ſo called, diſperſed throughout the diſtrict, are about 100; and there are about 50 wanderers of the tribes of Biloxis and Choctaws on Bayou Crocodile, which empties into the Teche. In the Opelouſas, N.W. of Atacapas, are two villages of Alibamas in the centre of the diſtrict, conſiſting of 100 perſons; and the Conchates diſperſed through the country as far as the Sabinas and its neighbourhood, are about 350. On the river Rouge, at Avoyelles, 19 leagues from the Miſſiſippi, is a village of the Biloni nation, and another on the lake of the Avoyelles, the whole including about 60 perſons. At the Rapide, 26 leagues from the Miſſiſippi, is a village of Choctaws, conſiſting of 100 perſons, and another of Biloxes, about two leagues from it, of about 100 more; and at about eight or nine leagues higher up the Red river is a village including about 50 perſons. All theſe are occaſionally employed by the ſettlers as boatmen. About eighty leagues above Natchitoches on the Red river is the nation of the Cadoquies, or Cados, who can raiſe from three to four hundred warriors, the friends of the whites, and eſteemed the braveſt and moſt generous of all the nations in this vaſt country; they are rapidly declining by their intemperance, and by the attacks of the Oſages and Choctaws. There are 500 families of the Choctaws, diſperſed on the W. ſide of the Miſſiſippi, on the Ouacheta and Red rivers, as far W. as Natchitoches. On the river Arkanſas is a nation of the ſame name, conſiſting of about 260 warriors, brave, yet peaceable and well-diſpoſed, attached to the French, and diſpoſed to engage in their wars with the Chickaſaws. They live in three villages at 18 leagues from the Miſſiſippi on the Arkanſas river, and the others are at three and ſix leagues from the firſt. A ſcarcity of game on the E. ſide of the Miſſiſippi has induced a number of Cherokees, Choctaws, Chickaſaws, &c. to frequent the neighbourhood of Arkanſas, where game is ſtill abundant, where they have contracted marriages with the Arkanſas, and incorporated themſelves with that nation. On the river St. Francis, in the vicinity of New Madrid, &c. are ſettled a number of vagabonds from the Delawares, Shawneſe, Miamis, Chickaſaws, Cherokees, Piorias, ſuppoſed to conſiſt in all of 500 families. They are piratical in their diſpoſition, attached to liquor, unſettled and vagrant in their habits, ſome of them ſpeak Engliſh, all underſtand it, and ſome of them can even read and write it. At St. Genevieve, about 30 Piorias, Kaſkaſkias and Illinois, are ſettled among the whites. Theſe are the remains of a nation, which 50 years ago could bring into the field 1200 warriors.

On the Miſſouri and its waters, are many and numerous nations, the beſt known of which are; the Oſages, ſituated on the river of the ſame name on the right bank of the Miſſouri, at about 80 leagues from its confluence with it; they conſiſt of 1000 warriors, who live in two ſettlements at no great diſtance from each other. They are of a gigantic ſtature and well proportioned, are enemies of the whites and of all other Indian nations, and commit depredations from the Illinois to the Arkanſas. The trade of this nation is ſaid to be under an excluſive grant. They are a cruel and ferocious race, and are hated and feared by all the other Indians. The confluence of the Oſage river with the Miſſouri is about eight leagues from the Miſſiſippi. Sixty leagues higher up the Miſſouri, and on the ſame bank, is the river Kanzas, and on it the nation of the ſame name; but at about 70 or 80 leagues from its mouth. It conſiſts of about 250 warriors, who are as fierce and cruel as the Oſages, and often moleſt and ill treat thoſe who go to trade among them. Sixty leagues above the river Kanzas, and at about 200 from the mouth of the Miſſouri, ſtill on the right bank, is the Rivierre Platte, or Shallow river, remarkable for its quickſands and bad navigation; and near its confluence with the Miſſouri dwells the nation of Octolactos, commonly called Otos, conſiſting of about 200 warriors, among whom are 25 or 30 of the nation of Miſſouri, who took refuge among them about 25 years ſince. Forty leagues up the river Platte you come to the nation of Panis, compoſed of about 700 warriors in four neighbouring villages; they hunt but little, and are ill provided with fire arms; they often make war on the Spaniards in the neighbourhood of Sante Fé, from which they are not far diſtant. At 300 leagues from the Miſſiſippi, and 100 from the river Platte on the ſame banks, are ſituated the villages of the Mahas. They conſiſted, in 1799, of 500 warriors, but are ſaid to have been almoſt cut off laſt year by the ſmall-pox. At 50 leagues above the Mahas, and on the left bank of the Miſſouri, dwell the Poncas, to the number of 250 warriors, poſſeſſing in common with the Mahas, their language, ferocity, and vices. Their trade has never been of much value, and thoſe engaged in it are expoſed to pillage and ill treatment. At the diſtance of 450 leagues from the Miſſiſippi, and on the right bank of the Miſſouri, dwell the Aricaras, to the number of 700 warriors, and 60 leagues above them, the Mandane nation, conſiſting of about 700 warriors likewiſe. Theſe two laſt nations are well diſpoſed to the whites, but have been the victims of the Sioux, or Mandoweſſies, who being themſelves well provided with fire-arms, have taken advantage of the defenceleſs ſituation of the others, and have on all occaſions murdered them without mercy. No diſcoveries on the Miſſouri, beyond the Mandane nation, have been accurately detailed, though the traders have been informed, that many navigable rivers diſcharge their waters into it, above it, and that there are many numerous nations ſettled on them. The Sioux, or Mandoweſſies, who frequent the country between the N. bank of the Miſſouri and Miſſiſippi, are a great impediment to trade and navigation. They endeavour to prevent all communication with the nations higher up the Miſſouri, to deprive them of ammunition and arms, and thus keep them ſubſervient to themſelves. In the winter they are chiefly on the banks of the Miſſouri, and maſſacre all who fall into their hands. There are a number of nations at a diſtance from the banks of the Miſſouri, to the N. and S. concerning whom but little information has been received. Returning to the Miſſiſippi, and aſcending it from the Miſſouri, about 75 leagues above the mouth of the latter, the river Moingona, or Riviere de Moine, enters the Miſſiſippi on the weſt ſide, and on it are ſituated the Ayoas, a nation originally from the Miſſouri, ſpeaking the language of the Otachatas; it conſiſted of 200 warriors before the ſmall-pox lately raged among them. The Saes and Renards dwell on the Miſſiſippi, about 300 leagues above St. Louis, and frequently trade with it; they live together, and conſiſted of 500 warriors; their chief trade is with Michilimakinack, and they have always been peaceable and friendly. The other nations on the Miſſiſippi, higher up, are but little known to us. The Sac and Fox nations of India have ceded to the United States a valuable country, with a front of 600 miles on the Miſſiſippi. It contains 80,000 ſquare miles, and is equal to 51,200,000 acres. The treaty ceding this territory, was ſigned at St. Louis, the 3d of Nov. The nation of the Miſſouri, though cruel, treacherous, and inſolent, may doubtleſs be kept in order by the United States, if proper regulations are adopted with reſpect to them. It is ſaid, that no treaties have been entered into by Spain with the Indian nations weſtward of the Miſſiſippi, and that its treaties with the Creeks, Choctaws, &c. are in effect ſuperſeded by our treaty with that power of the 27th October 1795.

The productions of Louiſiana are ſugar, cotton, indigo, rice, furs, and peltry, lumber, tar, pitch, lead, flour, horſes, and cattle. The ſoil is fertile, the climate ſalubrious, and the means of communication between moſt parts of the province certain, and by water. The exports of Louiſiana amount in value to 2,158,000 dollars; and the imports, in merchandize, plantation utenſils, ſlaves, &c. amount to 2½ millions, the difference being made up by the money introduced by the government, to pay the expences of governing and protecting the colony. The imports to the United States from Louiſiana and the Floridas amounted in 1802 to 1,006,214 dollars, and the exports to Louiſiana and the Floridas in the ſame year to 1,224,710 dollars. In Louiſiana there are few domeſtic manufactures. The Acadians manufacture a little cotton into quilts and cottonades, and in the remoter parts of the province, the poorer planters ſpin and weave ſome negro cloths of cotton and wool mixed. In the city, beſides the trades which are abſolutely neceſſary, there is a conſiderable manufacture of cordage, and four ſmall ones of ſhot and hair powder; and within a few leagues of the town are twelve diſtilleries for making taffia, which are ſaid to diſtil annually a conſiderable quantity, and one ſugar refinery, which is ſaid to make about 200,000lbs. of loaf ſugar. There are no colleges, and but one public ſchool, which is at New Orleans. There are a few private ſchools for children. Not more than half of the inhabitants are able to read and write. In general the learning of the inhabitants does not extend beyond thoſe two arts; though they ſeem to be endowed with a good natural genius, and a good and an uncommon facility of learning whatever they undertake. The clergy conſiſts of a biſhop, who does not reſide in the province, whoſe ſalary of 4000 dollars is charged on the revenue of certain biſhoprics in Mexico and Cuba; two canons, and 25 curates, receive each from 360 to 480 dollars a-year. At Orleans there is a convent of Urſulines, to which is attached about 1000 acres of land. Raynal, Jefferſon, Morſe.

LOUISTOWN, a town of America, in Talbot county, Maryland, on the W. ſide of Tuckahoe creek; four miles N. of King's-town.

LOUISVILLE, a port of entry, poſt-town of Kentucky, and capital of Jefferſon county, pleaſantly ſituated on the left ſide of the Ohio, on an elevated plain above the Rapids, nearly oppoſite to Fort Fenny. It commands a delightful proſpect, but the ſtagnated waters behind it render it unhealthy. It conſiſts of three principal ſtreets, and contains about 100 houſes, 350 inhabitants, a court-houſe, and gaol; 40 miles W. of Frankfort.—Alſo, the preſent ſeat of government in Georgia, ſituated in Jefferſon county, in the lower diſtrict of the ſtate, on the N.E. bank of the Great Ogeechee river, 70 miles from its mouth. It contains a ſtate-houſe, a tobacco warehouſe, and upwards of forty dwelling houſes. In the vicinity is ſituated a liberally endowed college; 52 miles S.E. of Auguſta. N. lat. 32° 55′. W. long. 82° 42′.

LOULAY, a town of France, in the department of the Lower Charente, and chief place of a canton, in the diſtrict of St. d'Angely, and ſix miles N. of it. The place contains 366, and the canton 7161 inhabitants, on a territory of 167½ kiliometres, in 19 communes.

LOULE', a town of Portugal, in the province of Algarva, on a river of the ſame name, near the ſea; ſurrounded with antique walls, and containing a caſtle, hoſpital, three convents, and about 4400 inhabitants; nine miles N. of Faro. N. lat. 37° 8′. W. long. 7° 54′.

LOULIE', François, in *Biography*, a French muſician, who publiſhed in 1696 an ingenious and uſeful book, intitled "Elements of Muſic," with a deſcription of a chronometer to meaſure time by a pendulum. See Chronometer, and its deſcription, from this book, in Malcolm, p. 407, and in 1698, another book was printed by Etienne Roger, at Amſterdam, called "A New Syſtem of Muſic," by the ſame author. In this work, beſides the uſual inſtructions in elementary books, he explains the nature of tranſpoſition, and propoſes a method of reducing a piece of muſic into any key different from that in which it was originally compoſed, by means of imaginary clefs. See Transposition, and Dr. Pepuſch's "Treatiſe on Harmony."

LOUNG, in *Geography*, a town of Hindooſtan, in the circar of Schaurumpour; 28 miles S. of Merat.

LOU-NGHAN, a city of China, of the firſt rank, in the province of Chen-ſi. N. lat. 36° 42′. E. long. 116° 42′.

LOUP, a river of France, which runs into the Mediterranean. N. lat. 43° 38′. E. long. 7° 12′.—Alſo, a river of Canada, which runs into the lake St. Pierre. N. lat. 46° 13′. E. long. 72° 47′.

Loup, *St.*, a town of France, in the department of the Upper Saone, and chief place of a canton, in the diſtrict of Lure; ſix miles N.W. of Luxeuil. The place contains 1891, and the canton 13,366 inhabitants, on a territory of 195 kiliometres, in 14 communes.—Alſo, a town of France, in the department of the Two Sevres, and chief place of a canton, in the diſtrict of Parthenay, near the river Thoue; nine miles N.N.E. of Parthenay. The place contains 1649, and the canton 5968 inhabitants, on a territory of 197½ kiliometres, in nine communes.

Loup *de Salle, St.*, a town of France, in the department of the Saone and Loire, near the river Heune; 11 miles N. of Chalons ſur Saone.

LOUPPE, La, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diſtrict of Nogent-le-Rotrou; 18 miles W. of Chartres. The place contains 1178, and the canton 10,315 inhabitants, on a territory of 245 kiliometres, in 21 communes.

LOUPTIERE, John Charles de Relongue, in *Biography*, was born in the dioceſe of Sens in 1727; he became a member of the academy of the Arcadi at Rome, and died in the year 1784. He is known by a collection of poems in two volumes 12mo., written with much ſpirit and elegance; and by ſix parts of a Journal for ladies printed in 1761.

LOURDE, in *Geography*, a town of France, in the department of the Higher Pyrenées, and chief place of a canton, in the diſtrict of Argelés; ſix miles N. of Argelés. The place contains 2741, and the canton 10,418 inhabitants, on a territory of 180 kiliometres, in 27 communes. N. lat. 43° 6′. E. long. 0° 1′.

LOURE, in *French Muſic*, a kind of dance, of which the tune is rather ſlow, and generally in the meaſure of $\frac{6}{4}$, or ſix crotchets in a bar. *Loure* is likewiſe the name of an inſtrument reſembling a bagpipe, to the muſic of which the tune is danced.

LOURER is a verb, which implies ſuſtaining and cheriſhing the times of a movement, in oppoſition to *détaché*, ſeparated.

LOUREZA, in *Geography*, a town of Spain, in Galicia; eight miles W. of Tuy.

LOURIÇAL, a town of Portugal, in the province of Eſtramadura; ſix miles N. of Leyria.

LOURINHA, a town of Portugal, in the province of Entre Duero é Minho; 8 miles S.S.E. of Peniche.

LOURISTAN. See Laristan.

LOUROUX-BECONNOIS, Le. See Loroux. The place contains 2018, and the canton 6855 inhabitants, on a territory of 227½ kiliometres, in ſeven communes.

LOUS, Λῶς, in *Chronology*, the Macedonian name for the Athenian month Hecatombæon, which was the firſt of their year, and anſwered to the latter part of our June and the beginning of July.

LOUSE, in *Zoology*. See Pediculus. This creature has ſo tranſparent a ſhell, or ſkin, that we are able to diſcover more of what paſſes within its body, than in moſt other living creatures. It has naturally three diviſions, the head, the breaſt, and the tail part. In the head appear two fine black eyes, with a horn that has five joints, and is ſurrounded with hair ſtanding before each eye; and from the end of the noſe, or ſnout, there is a pointed projecting part, which ſerves as a ſheath or caſe to a piercer, or ſucker, which the creature thruſts into the ſkin, to draw out the blood and humours which are its deſtined food; for it has no mouth that opens in the common way. This piercer or ſucker is judged to be ſeven hundred times ſmaller than a hair, and is contained in another caſe within the firſt, and can be thruſt out or drawn in at pleaſure. (Baker's Microſcope, p. 177.) The breaſt is very beautifully marked in the middle, the ſkin is tranſparent, and full of little pits; and from the under part of it proceed ſix legs, each having five joints, and their ſkin all the way reſembling ſhagreen, except at the ends, where it is ſmoother. Each leg is terminated by two claws, which are hooked, and are of an unequal length and ſize; theſe it uſes as we would a thumb and a middle finger, and there are hairs between theſe claws as well as all over the legs. Lewenhoeck's Arcan. Nat. tom. ii. p. 74.

On the back of the tail part there may be diſcovered ſome ring-like diviſions, abundance of hairs, and a ſort of marks which look like the ſtrokes of a rod on a child that has been whipped; the ſkin of the belly ſeems like ſhagreen, and towards the lower end is very clear, and full of pits: at the extremity of the tail there are two ſemicircular parts, covered all over with hairs, which ſerve to conceal the anus.

When the louſe moves its legs, the motion of the muſcles, which all unite in an obglon dark ſpot in the middle of the breaſt, may be diſtinguiſhed perfectly, and ſo may the motion of the muſcles of the head when it moves its horns. We may likewiſe ſee the various ramifications of the veins and arteries, which are white, with the pulſe regularly beating in the arteries. But the moſt ſurpriſing of all the ſights is the periſtaltic motion of the guts, which is continued from the ſtomach down to the anus. Philoſ. Tranſ. N° 102.

If one of theſe creatures, when hungry, be placed on the back of the hand, it will thruſt its ſucker into the ſkin, and the blood it ſucks may be ſeen paſſing in a fine ſtream to the fore-part of the head; where falling into a roundiſh cavity, it paſſes again in a fine ſtream to another circular receptacle in the middle of the head; from thence it runs through a ſmaller veſſel to the breaſt, and then to a gut which reaches to the hinder part of the body, where in a curve it turns again a little upward. In the breaſt and the gut the blood is moved without intermiſſion with a great force, eſpecially in the gut; and that with ſo ſtrong a propulſion downward, and ſuch a contraction of the gut, as is very ſurpriſing. Power's Mic. Obſ. 9.

In the upper part of the crooked aſcending gut before mentioned, the propelled blood ſtands ſtill, and ſeems to undergo a ſeparation; ſome of it becoming clear and wateriſh, while other little black particles paſs downward to the anus.

If a louſe be placed on its back, two bloody darkiſh ſpots appear; the larger in the middle of the body, the leſſer toward the tail. In the larger ſpot, a white film or bladder contracts and dilates upwards and downwards from the head toward the tail, the motions of which are followed by a pulſation of the dark bloody ſpot, in or over which the white bladder ſeems to lie. This motion of the ſyſtole and diaſtole is beſt ſeen when the creature begins to grow weak; and on pricking the white bladder, which ſeems to be the heart, the creature always inſtantly dies. The lower dark ſpot is ſuppoſed to be the excrements in the guts.

Lice have been ſuppoſed to be hermaphrodites, but this is erroneous; for Mr. Lewenhoeck diſcovered that the males have ſtings in their tails, which the females have not. And he ſuppoſes the ſmarting pain theſe creatures ſometimes give to be owing to their ſtinging with theſe ſtings, when made uneaſy by preſſure or otherwiſe. This accurate obſerver ſays, that he felt little or no pain from their ſuckers, though ſix of them were feeding on his hand at once.

The ſame accurate obſerver determining to know their true hiſtory and manner of breeding, put two females into a black ſtocking, which he wore night and day. He found, on examination, that in ſix days one of them had laid above fifty eggs; and upon diſſecting it, he found as many yet remaining in the ovary; whence he concludes, that in twelve days it would have laid a hundred eggs. Theſe eggs naturally hatch in ſix days, and would then probably have produced fifty males and as many females; and theſe females coming to their full growth in eighteen days, might each of them be ſuppoſed after twelve days more to lay a hundred eggs; which eggs in ſix days more, might produce a young brood of five thouſand; ſo that in eight weeks one louſe may ſee five thouſand of its own deſcendants. A louſe may be eaſily diſſected in a ſmall drop of water upon a ſlip of glaſs; and thus placed before the microſcope, it is common to find five or ſix eggs of a ſize ready to be laid, and ſixty or ſeventy others of different bigneſs. In the male the penis is very remarkably diſtinct, as are alſo the teſtes, of which he ſeems to have a double pair, as is alſo the ſting, the ſtructure of which merits a peculiar attention. Lewenhoeck's Arcan. Natur. tom. ii. p. 78.

Many animals, both of the quadruped and flying kinds, are ſubject to lice: but theſe are of peculiar ſpecies on each animal, and are not at all like thoſe which infeſt the human body. Nay, even inſects are infeſted with vermin, which feed on them and torment them. Several kinds of beetles are very ſubject to lice; but particularly that kind called thence the *louſy beetle*. The lice on this are very numerous, but will not be ſhook off. The ear-wig is often infeſted with lice juſt at the ſetting on of its head; theſe are white and ſhining like mites, but they are much ſmaller; they are round-backed, flat-bellied, and have long legs, particularly the foremoſt pair. Snails of all kinds, but eſpecially the large naked kinds, are very ſubject to lice, which are continually ſeen running about them, and devouring them. Numbers of little red lice, with a very ſmall head, and in ſhape reſembling a tortoiſe, are often ſeen about the legs of ſpiders, and they never leave the ſpider while he lives, but if he be killed, they almoſt inſtantly forſake him. A ſort of whitiſh lice are very common on humble-bees; they are alſo found on ants; and many ſorts of fiſhes are not leſs ſubject to them than the land animals. Kircher ſays, that he has found lice alſo on flies. Baker's Microſcope, p. 182.

Signior Redi, who has more accurately examined theſe creatures than any other author, has engraved ſeveral ſpecies found on different animals. He calls thoſe found on beaſts lice, and thoſe found on birds fleas. He is of opinion, that every ſpecies of birds has its peculiar ſort of flea, different from thoſe of other birds; and has obſerved that they are hatched white, but that they gradually acquire a colour, like that of the feathers they live among, yet they uſually remain tranſparent enough for a good microſcope to diſcover the motion of their inteſtines. The kinds he has obſerved are theſe: on the hawk three different ſorts; on the large pigeon, the turtle-dove, the hen, the ſtarling, the crane, the magpie, the heron, the leſſer heron, the ſwan, the turkey, the duck, the ſea-mew, the ſmall ſwan, the teal, the caſtrel, the peacock, the capon, and the crow, on each one ſort; on the moor-hen three ſorts; on the wild gooſe two ſorts; and on the crane, beſide the common one, a white ſort, marked, as it were, with Arabic characters. Men, he obſerves, are ſubject to two kinds, the common louſe, and that called the *crab* louſe. He alſo found peculiar ſorts on the goat, the camel, the aſs, the African ram, the ſtag, which has, like many of the birds, two kinds, and on the lion and the tyger. The ſame author has obſerved, that the ſize of theſe creatures is not at all proportioned to that of the animal they are to inhabit, for the ſtarling has them as large as the ſwan. Redi, Gen. Inſ. p. 312.

It is obſervable, that ſome ſort of conſtitutions are more apt to breed lice than others; and that in certain places of different degrees of heat, they are very certain to be deſtroyed upon people, who in other climates are overrun with them. It is an obſervation of Oviedo, that the Spaniſh ſailors, who are generally much afflicted with lice, always loſe them in a certain degree in their voyage to the Indies, and have them again on their coming to the ſame degree at their return: this is not only true of the Spaniards, but of all other people who make the ſame voyage; for though they ſet out ever ſo louſy, they have not one of theſe creatures to be found after they come to the tropic. And in the Indies there is no ſuch thing as a louſe about the body, though the people be ever ſo naſty. The ſailors continue free from theſe creatures till their return; but in going back they uſually begin to be louſy, after they come to about the latitude of Madeira. The extreme ſweats which the working people naturally fall into between this latitude and the Indies, drown and deſtroy the lice, and are of the ſame effect as the rubbing over the louſy heads of children with butter and oil. The ſweat in and about the Indies is not rank as in Europe, and therefore it is not apt to breed lice; but when the people return into latitudes where they ſweat rank again, their naſtineſs ſubjects them to the ſame viſitations of theſe vermin which it uſed to have.

The people in general, in the Indies, are very ſubject to lice in their heads, though free from them in their bodies. The reaſon of this is, that their heads ſweat leſs than their body, and they take no care to comb and clean them. The Spaniſh negroes waſh their heads thoroughly once every week with ſoap, to prevent their being louſy. This makes them eſcape much better than the other negroes who are ſlaves there, for the lice grow ſo numerous in their heads, that they often eat large holes in this part.

M. de la Hire has given a curious account of the creature which he found on the common fly. Having occaſion to view a living fly by the microſcope, he obſerved on its head, back, and ſhoulders, a great number of ſmall animals, crawling very nimbly about, and often climbing up the hairs, which grow at the origin of the fly's legs. He, with a fine needle, took up one of theſe, and placed it before the microſcope, uſed to view the animalcules in fluids. It had eight legs, four on each ſide; they were not placed very diſtant from one another, but the four toward the head were ſeparated by a ſmall ſpace from the four toward the tail. The feet were of a particular ſtructure, being compoſed of ſeveral fingers, as it were, and fitted for taking faſt hold of any thing; the two neareſt the head were alſo more remarkable in this particular than thoſe near the tail; the extremities of the legs, for a little way above the feet, were dry and void of fleſh, like the legs of birds, but above this part they appeared plump and fleſhy. It had two ſmall horns upon its head, formed of ſeveral hairs arranged cloſely together; and there were ſome other cluſters of hairs by the ſide of theſe horns, but they had not the ſame figure; and toward the origin of the hinder legs there were two other ſuch cluſters of hairs, which took their origin at the middle of the back. The whole creature was of a bright yellowiſh red; and the legs, and all the body, except a large ſpot in the centre, were perfectly tranſparent. In ſize, the author believes it was about $\frac{1}{4000}$dth part of the bigneſs of the head of the fly; he obſerves, that it is rarely that flies are found infeſted with them. Mem. Acad. Par. 1693.

Louse, *Tree.* See Aphis.

Louse, *Wood.* See Millepedes.

Louse-*wort*, in *Botany.* See Pedicularis.

Louse-*wort*, *Yellow.* See Rhinanthus.

The Dutch carry on a trade with the ſeeds and ſeed-veſſels of a ſpecies of this plant, reſembling the common yellow meadow louſe-wort, to Germany, and call it *ſemen ſaradillos*; they uſe it for deſtroying bugs: for this purpoſe, they boil a quantity of the ſeeds and capſules in common water, with which they waſh their wainſcots, bedſteads, &c. where theſe inſects are lodged; and thus they are effectually deſtroyed. Miller.

LOU-TCHOU, in *Geography*, a river of Thibet, which runs into the Sampoo; 22 miles S.W. of Tankia.

LOUTESTINA, a town of Croatia; 12 miles S. of Creutz.

LOUTH, a large market town in the wapentake of Louth Eſke, in the Lindſay diviſion of Lincolnſhire, England, is ſituated in a fertile valley at the eaſtern foot of the Wolds, 26 miles diſtant from Lincoln, and 153 from London. It was anciently called *Luda*, from its proximity to the Ludd, a ſmall rivulet formed by the confluence of two ſtreams. Among the few hiſtorical events relative to Louth, we find that in the rebellion of the year 1536, occaſioned by the ſuppreſſion of the religious houſes, the inhabitants took an active part, under Dr. Mackerel, who was known by the name of captain Cobler, when the prior of Barling's abbey, with the vicar and thirteen other ring-leaders, ſuffered death. In this town were anciently eſtabliſhed three religious fraternities, called "The Guild of our Bleſſed Lady, the Guild of the Holy Trinity, and the Chantry of John of Louth." King Edward VI. alienated the funds of theſe guilds, and granted them for the purpoſe of erecting and endowing a free grammar ſchool. The lands then produced 40*l. per annum*, but are now let at 400*l.* One-half of the produce was granted for a head maſter's ſalary, one-fourth for the uſher's, and the remainder for the perpetual maintenance of twelve poor women. The truſtees of this foundation were incorporated by the name of "The warden and ſix aſſiſtants of the town of Louth, and free-ſchool of king Edward VI. in Louth." Another free-ſchool, on a very reſpectable ſcale, was founded in purſuance of the will of Dr. Mapletoft, dean of Ely, bearing date Auguſt 17th, 1677. The church of St. James is a ſpacious edifice, conſiſting of a nave, two aiſles, with an elegant tower and ſpire at the weſt end. The eaſt end, which preſents a fine elevation, exhibits a large central window, having ſix upright mullions and varied tracery, with two lateral windows opening into the aiſles. Internally the nave is ſeparated from the aiſles by octagonal columns, the alternate ſides of which are relieved by ſingle flutes. The chancel, which has an altar piece containing a picture of the Deſcent from the Croſs by Williams, is of more modern date than the body of the church, and is probably coeval with the juſtly admired ſteeple. The latter was begun in the year 1501, and completed in fifteen years. The height was originally 360 feet; but the flat ſtone on the ſummit was blown off in 1587, and carried with it part of the building into the body of the church. The whole ſpire being blown down October 11th, 1634, the preſent one was erected. The tower part of the ſteeple conſiſts of three ſtories: each ſtage terminates with elegant pediments, ſupported by ornamental corbels; in this manner diminiſhing to the top, where are four octagonal embattled turrets. At eighty feet from the baſe, round the exterior of the tower, runs a gallery, guarded by a parapet wall; and at the height of 170 feet the battlements commence. The top ſtone projects with a cornice; the height of the ſpire to the croſs is 141 feet; the total height of the whole 288 feet. The living of St. James is a vicarage, in the gift of a prebendary of Lincoln cathedral, to which it was annexed by the Conqueror. The vicarage houſe, which ſtands contiguous to the church-yard, is an old thatched building; and the preſent vicar has, in uniſon with its appearance, laid out his garden in a curious ſtyle of ingenious ruſticity: it is denominated the hermitage. In Louth was formerly another church, named St. Mary's; it is now totally demoliſhed; but the church-yard is the place of ſepulture for the town, as that of St. James has not been uſed for that purpoſe for forty years paſt. The Diſſenters from the eſtabliſhment have three places of worſhip; one for Catholics, one for Baptiſts, and one for Methodiſts. The other principal buildings are a town-hall, an aſſembly room, and a theatre. The civil government of the town is veſted in the warden and ſix aſſiſtants, incorporated, as already mentioned, by Edward VI., who in the ſame charter granted two markets to be held on Wedneſdays and Saturdays, and three fairs to commence on the third Sunday after Eaſter, St. James's day, and the feaſt of St. Martin; with a particular injunction, that they ſhould continue two whole days after, that the firſt day of each fair might be appropriated "to hearing the word of God." Queen Elizabeth gave to the corporation the manor of Louth, of which the annual value was then 78*l.* 14*s.* 4½*d.* for the better ſupport of the corporate dignity; and ſome additional privileges were granted by by James I. In the year 1801, the inhabitants of Louth, as appears by the return under the population act, were 4236, and the number of houſes 950; but a conſiderable increaſe has been made ſince that time. A carpet and blanket manufactory has been recently eſtabliſhed here, and is now in a very proſperous ſtate; here is alſo a large manufactory of ſoap, and a mill for making coarſe paper. In the year 1761 an act was obtained for cutting a canal between Louth and the North ſea. It commences about half a mile from the town, and keeps parallel with the Ludd, which ſupplies it with water; leaving the river about four miles from the town, it ſweeps to the north and joins the ſea at a place called Tetney lock. The undertaking coſt 12,000*l.*, which brings in very good intereſt. By this channel veſſels of conſiderable burthen regularly trade to London, Hull, and ſeveral parts of Yorkſhire, carrying out corn and wool, and bringing home timber, coals, grocery, &c. In Louth and its vicinity are various ſprings of a very peculiar nature, worthy of inveſtigation by the philoſopher and chemiſt.

About a mile from the town is the ſcite of Louth Park abbey, which was built by Alexander, biſhop of Lincoln, in the year 1139, and appropriated to Ciſtercian monks. In the time of Henry III. this houſe contained 66 monks and 150 converts or labourers. Beauties of England and Wales, vol. ix. See alſo an account of Louth Church and Plan of the Town, publiſhed by Mr. T. Eſpin, a reſpectable ſchoolmaſter of Louth.

Louth, a county of Ireland, which, though uſually reckoned in Leinſter, bears a great reſemblance in many particulars to the adjoining ones in Ulſter. It is bounded on the N. by the county of Armagh; on the N.E. by the bay of Carlingford, which ſeparates it from Down; on the E. by the Iriſh ſea; on the S. by Meath, and on the W. by this laſt county and Monaghan. It is the ſmalleſt county in Ireland; its greateſt length being only 21 Iriſh (near 27 Engliſh) miles, and its breadth 14 Iriſh (18 Engliſh) miles. The number of acres in Iriſh meaſure is 110,750, equal to 173 ſquare miles, which in Engliſh meaſure is about 177,926 acres, or 278 ſquare miles. Small as it is, it contains 61 pariſhes in the dioceſe of Armagh, and its population many years ago was eſtimated at 57,750. Louth is in general a rich and well cultivated tract, in which there is very little waſte ground, and the population of which is very great. Though not deficient in thoſe undulations of the ground which render a country intereſting, it cannot be called hilly, except in the peninſula between the bays of Carlingford and Dundalk, and on the confines of Armagh. It is very much under tillage, and more attention is paid to agricultural improvement than in moſt other parts of the iſland, which may in great meaſure be attributed to the exertions of the late lord chief baron Forſter, who is called by Arthur Young "the prince of reformers," and of his ſon the Rt. Hon. John Forſter, who has not only followed up his father's meaſures, but in the high public offices he has held, has been an active promoter of agriculture throughout Ireland, by the laws he propoſed for its encouragement. The crops conſiſt of wheat, barley, oats, flax and potatoes, and there is alſo a great deal of peas and red clover. Limeſtone is found in a ſmall tract adjoining the county of Meath in the ſouth, in the neighbourhood of Carlingford, and at Caſtletown, on the confines of Armagh, but not in the country between Drogheda and Dundalk. This valuable manure is, however, procured at a moderate expence, and contributes to the improvement of the ſoil. At ſome depth in the bogs under the turf there is fine white ſhelly marle in great abundance, which is alſo found a very uſeful manure. Thoſe who live near the ſea-coaſt alſo avail themſelves of their ſituation to uſe weeds which are found there. The mineral treaſures of Louth do not ſeem to be great. Some ochres and ſoap rock are mentioned, and formerly a lead mine was wrought at Salterſtown, on the ſea-coaſt, in the neighbourhood of Caſtlebellingham; but the riches of Louth conſiſt in the produce of its cultivated lands. The ſtone chiefly found is the ſame as that found in Armagh and Monaghan, and called *whinſtone*, but which differs from other ſtones ſo called. It is hard, but not ſo much ſo as to ſtrike fire with ſteel. Sir C. Coote ſays, that it contains 46 parts of ſilica, 22 of alumine, 28 oxyd of iron, and four of lime in the 100 parts. The principal river of this county is the Boyne, which flowing from Meath, becomes the ſouthern boundary, about two miles W. of Drogheda, and falls into the ſea about two miles below that town. It is a river capable of affording great advantages to the country through which it paſſes. (See Boyne.) Several other ſmall rivers croſs the county and fall into the bay of Dundalk. The towns of Carlingford, Dundalk, Drogheda, and Collon, have been already noticed under their reſpective names. Of theſe Dundalk is the aſſize town, and Drogheda returns one member, ſo that the county has three repreſentatives. There are in Louth a greater number than in any other part of Ireland of thoſe high artificial mounts, the fortreſſes of early ages which the Iriſh call raths, and attribute to the Danes. In Wright's Louthiana will be found a full account of theſe antiquities, many of which are noticed in different articles of this work. Louth was early colonized by the Engliſh and was within the Pale. It had a large ſhare of the diſturbances which have afflicted Ireland. Beaufort, Young, &c.

Louth, a townſhip of Upper Canada, W. of Grantham, and fronting lake Ontario.

LOUTRA, Great and Little, two ſmall Greek iſlands in the gulf of Engia; ſeven miles N.W. of Engia.

LOVTZOVA, a town of Ruſſia, in the government of Irkutſk; 10 miles N.E. of Verchnei Udinſk.

LOUVAIN, a city of France, and principal place of a diſtrict, in the department of the Dyle. The number of inhabitants is eſtimated at 18,000, in two cantons, one conſiſting of 17,796 inhabitants, on a territory of 87½ kilometres in 12 communes, and the other containing 18,230, on a territory of 140 kilometres, in 15 communes. This city was formerly the capital of Brabant, and as ſome ſay, probably without ſufficient authority, founded by Julius Cæſar, or by one Lupus, who lived long before him; it is certain, however, that this place was known in the year 885, when Godfrey, duke of Normandy, having ravaged the country, encamped near the Dyle, on the plain of Louvain. The emperor Arnulph built a caſtle about this time to defend the country againſt the Normans, which was called "Loven," or "le Chateau de Cæſar," Cæſar's caſtle, and was a long time the ordinary reſidence of the dukes of Brabant. Here Henry I. was aſſaſſinated in 1038; and here alſo the emperor Charles V. and his ſiſters, were brought up till the year 1520; and formerly the aſſembly of ſtates was held here. It was firſt ſurrounded with walls in 1165, and much enlarged in the fourteenth century by Wenceſlaus and John, two dukes of Brabant. It was formerly much larger and richer than it is now, and its trade was much more extenſive. At the commencement of the fourteenth century, 4000 houſes were inhabited, by clothiers, who employed above 150,000 workmen. It is a traditionary report, that when the weavers left off work, notice was given of it by a large bell, that the children might be kept within doors, to prevent their being thrown down and trampled to death. Hence it became neceſſary to have more magiſtrates than in other cities, who aſſembled in the town-houſe, which is a beautiful Gothic ſtructure. In the year 1382 the weavers and other tradeſmen revolted againſt Wenceſlaus, duke of Brabant, and not only threw 17 of the magiſtrates out of the windows of the town-houſe, but proceeded to commit other acts of enormity, and to lay waſte the province: but being beſieged, they ſupplicated for mercy and obtained pardon, the moſt culpable only being puniſhed; and the weavers, who inſtigated the inſurrection, were baniſhed; and moſt of them retired to England, where they were well received. As Louvain, on this occaſion, was nearly deprived of commerce and inhabitants, John IV. duke of Brabant, in the year 1426, founded an univerſity, which was afterwards deemed the ornament and glory of the place, and is ſaid to have reſembled our Engliſh univerſities more than any other abroad. In this univerſity there are 60 colleges, which have been much admired for their ſituation and building, though leſs ſumptuous than thoſe of Oxford and Cambridge. Louvain had alſo a Dutch college for Roman Catholics, an Engliſh one of Dominican friars, an Iriſh one of ſecular prieſts, another of Dominican friars, and another of Franciſcans. Here was alſo a convent of Engliſh nuns, reckoned the beſt of any of this nation in the Low Countries. The trade of this place at preſent, which is much declined from what it was in the ancient days of its proſperity and glory, is not very conſiderable, and conſiſts principally in beer, of which a great quantity is ſent to Bruſſels, Antwerp, Liege, Tirlemont, and other cities and towns. Louvain is ill adapted for defence againſt an enemy, its walls being nine miles in circumference, though not a third part of the incloſed ground has buildings, the vacant ſpace being occupied for gardens and vineyards. It was taken by the ſoldiers of the French republic by Dumourier, in their haſty progreſs through Brabant, but evacuated March the 3d, 1793. Louvain was anciently ſituated partly in the dioceſe of Liege and partly in that of Cambray; but when the archbiſhopric of Malines was erected, it was placed under that dioceſe, and ſo it remained till its union with France; 21 miles S. of Antwerp. N. lat. 50° 54′. E. long. 4° 40′.

LOUVEGNE′, a town of France, in the department of the Ourthe, and chief place of a canton, in the diſtrict of Liege. The place contains 1541, and the canton 5925 inhabitants, on a territory of 170 kiliometres, in 7 communes.

LOUVET, Peter, in *Biography*, a native of Reinville, near Beauvais, flouriſhed in the ſeventeenth century, was educated to the profeſſion of the law, and became maſter of requeſts to queen Margaret. He was author of ſeveral works, which contain much uſeful and curious matter, and valuable to the hiſtorian. Of this deſcription are "The Hiſtory of the Antiquities of the Dioceſe of Beauvais;" "Nomenclatura et Chronologia Rerum Eccleſiaſticarum Diæceſis Bellovacenſis;" and "Remarks on the ancient State of the Nobility in the Beauvaſin, and of ſeveral French Families." He died in 1646.

Louvet de Couvray, John Baptist, one of the members of the French convention of France, noticed in the article Lewis XVI. He was of the Briſſotine party, and had the courage to oppoſe the ſavage Robeſpierre, when at the very height of his power; yet he eſcaped the ſlaughter which that tyrant inflicted on a multitude of good men, and died in the year 1797. He was author of a romance, entitled "The Amours of the Chevalier Faublas;" a political journal, called "The Sentinel;" "A Juſtification of Paris in 1789;" "Emily de Varmont;" and "An Account of himſelf, and of the Dangers which he had paſſed through."

LOUVIERS, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Eure, 12 miles N. of Evreux. The place contains 6500, and the canton 14,444 inhabitants, on a territory of 157½ kiliometres, in 22 communes. N. lat. 49° 3′. E. long. 2° 55′.

LOUVIGNE′-du-Désert, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of Fougeres; 8 miles N.N.E. of Fougeres. The place contains 3060, and the canton 13,435 inhabitants, on a territory of 172½ kiliometres, in 8 communes.

LOUVILLE, Eugene d'Alonville, in *Biography*, a French mathematician and aſtronomer, who flouriſhed in the former part of the eighteenth century, deſcended from an ancient family, was born in the dioceſe of Chartres in the year 1671. He was educated for the naval or military profeſſion: he ſerved in both capacities, and obtained a conſiderable rank in the army of Philip V. king of Spain. Being diſbanded upon the peace of Utrecht, he devoted himſelf entirely to the ſtudy of the mathematics, and particularly to the ſcience of aſtronomy. About the year 1713 he went to Marſeilles, for the purpoſe of aſcertaining the latitude of that place, in order that he might the better compare his obſervations with thoſe of Pytheas, made almoſt two thouſand years before. In 1714 he was admitted a member of the academy of ſciences at Paris, and appointed aſtronomer at the obſervatory of that city. During the year 1715 he came into England, in order to obſerve the total eclipſe of the ſun in that year, which was to be more perfectly viſible in the neighbourhood of London, than in any other part of the northern hemiſphere. He was now elected a member of the Royal Society of London; and on his return to his native country, he applied himſelf moſt aſſiduouſly to his aſtronomical purſuits. So intent was he in proſecuting his ſtudies, that he became a recluſe, who was never to be ſpoken with but during the time when he was at his meals, and who immediately afterwards withdrew into privacy. Notwithſtanding this temper of mind, he was noted for a delicacy and niceneſs with reſpect to dreſs, and articles for the table. In the year 1732 he was attacked with a lethargic diſorder, which in a ſhort time terminated his life and labours. He was author of a great number of curious "Diſſertations," on phyſical and aſtronomical ſubjects; ſeveral of which are inſerted in the "Memoirs of the Academy of Sciences," and others in the "French Mercury." Louville was a good mechanic: he poſſeſſed a fine collection of inſtruments, the beſt of which were made with his own hands. Moreri.

LOUVO, in *Geography*, a town of Siam, ſeated on a river which runs into the Mecon. The ſituation is ſo delightful, and the air ſo ſalubrious, that the king reſides here during the greateſt part of the year; 40 miles S. of Siam. N. lat. 14° 55′. E. long. 100° 30′.

LOUVRE, in *Muſic*, a well-known dance-tune.

Louvre was alſo formerly the name of the royal palace at Paris.

Louvre, *Honours of the*. See Honours.

LOUVRES, in *Geography*, a town of France, in the department of the Seine and Oiſe; 12 miles N. of Paris. N. lat. 49° 3′. E. long. 2° 35′.

LOW, Edward, in *Biography*, organiſt of Chriſt-church college, Oxford, in the ſeventeenth century. Anthony Wood ſpeaks of him as "a proud man, who could not endure that any one of the waits or common muſicians ſhould be allowed to play at the weekly muſic-meetings, among regular profeſſors and gentlemen performers." Low had been brought up in Saliſbury cathedral, and was appointed organiſt of Chriſt-church, Oxford, in 1630, where he was deputy muſic profeſſor under Dr. Wilſon; and upon his quitting the univerſity, Low was appointed his ſucceſſor in the profeſſorſhip.

Low publiſhed, in 1661, an uſeful little book of "Short Directions for the Performance of the Cathedral Service;" which was reprinted in 1664, under the title of "A Review of ſome ſhort Directions, formerly printed, for the Performance of Cathedral Service, with many uſeful Additions according to the Common Prayer-book, as it is now eſtabliſhed: publiſhed for the information of ſuch as are ignorant in the Performance of that Service, and ſhall be called to officiate in Cathedral or Collegiate Churches; or any other that religiouſly deſire to beare a Part in that Service, by E. L., Oxon. 1664." Nothing of this kind had appeared ſince Marbeck's book, in the time of Edward VI.; and as it is now (1804) 140 years ſince the ſecond edition of Low's little tract was publiſhed, it ſeems high time for another to be drawn up by ſome regular bred and able organiſt, or choral performer, in one of the choirs of the metropolis.

Low, at the Reſtoration, was appointed one of the organiſts of the chapel royal. He died in 1682, and was ſucceeded in the king's chapel by Henry Purcell.

Low, Thomas, a ſtage ſinger, with an exquiſite tenor voice. His firſt profeſſion was that of a gold and ſilver-lace manufacturer; and he began muſic too late to read it as a language, ſo that he learned the ſongs, which he performed in public, by his ear to the end of his life. He ſtood, however, very high in the favour of lovers of Engliſh ballads, particularly thoſe of Dr. Arne at Drury-lane and Vauxhall, compoſed expreſsly for his voice and bounded abilities. He was the rival of Beard, and gained as much applauſe by the ſweetneſs of his voice, through all his ignorance, as Beard, a regular bred muſician, brought up in the king's chapel, could do by knowledge of muſic, humour, and good acting.

We wiſh not "to draw his frailties from their dread abode;" but we cannot help recording, as a beacon to other popular ſingers, that Low was profligate, extravagant, and unprincipled; which rendered the latter part of his life diſgraceful and wretched. From acquiring unbounded applauſe, and an income of more than 1000*l.* a-year, he was reduced to the loweſt ſtate of indigence, and degraded into a chorus ſinger at Sadler's Wells, Cuper's Gardens, and even a ballad-ſinger in the ſtreets.

Low *Airs*, in *Horſemanſhip*. See Airs.

Low-*Bell*, in *Birding*, a name given to a bell, by means of which they take birds in the night in open champaign countries, and among ſtubble in October. The method is to go out about nine o'clock in a ſtill evening, when the air is mild, and the moon does not ſhine.

The low-bell is to be of a deep and hollow ſound, and of ſuch a ſize, that a man may conveniently carry it in one hand. The perſon who carries it is to make it toll all the way he goes, as nearly as may be, in that manner in which the bell on the neck of a ſheep tolls, as it goes on while it feeds. There muſt alſo be a box made like a large lanthorn, about a foot ſquare, and lined with tin, but with one ſide open. Two or three great lights are to be ſet in this, and the box is to be fixed to the perſon's breaſt, with the open ſide forwards, ſo that the light may be caſt forward to a great diſtance; it will ſpread as it goes out of the box, and will diſtinctly ſhew the perſon who carries it whatever there is in a large ſpace of ground which it extends over, and conſequently all the birds that rooſt upon the ground. Two perſons muſt follow him who carries the box and bell, one on each ſide, ſo as not to be within the reach of the light to ſhew themſelves. Each of theſe is to have a hand-net of about three or four feet ſquare, faſtened to a long ſtick or pole; and on which ever ſide any bird is ſeen at rooſt, the perſon who is neareſt is to lay his net over it, and take it with as little noiſe as poſſible. When the net is over the bird, the perſon who laid it is not to be in a hurry to take the bird, but muſt ſtay till he who carries the light is got beyond it, that the motions may not be diſcovered. The blaze of the light, and the noiſe of the bell, terrify and amaze the birds in ſuch a manner, that they remain ſtill to be taken; but the people who are about the work muſt keep the ſtricteſt quiet and ſtillneſs that may be.

Some people are fond of going on this ſcheme alone. The perſon then fixes the light-box to his breaſt, and carries the bell in one hand, and the net in the other; the net, in this caſe, may be ſomewhat ſmaller, and the handle ſhorter. When more than one are out at a time, it is always proper to carry a gun. It is no uncommon thing to eſpy a hare when on this expedition; and, in that caſe, it is better to ſhoot her, than to truſt to the taking her in the net, for ſhe will very eaſily eſcape from that.

Some tie their bell to their girdle, and carry the light in their left hand, and the net in their right; the light is not to be ſo large in this caſe, and the other way is therefore rather the better.

Low-*Bellers*, in our *Statute-Books*, are perſons who go in the night-time with a light and bell, by the ſight and noiſe whereof, birds ſitting on the ground become ſtupefied, and ſo are covered with a net, and taken.

Low *Countries*, in *Geography*. See Brabant, Flanders, and Netherlands.

Low *Countries*, *School of Engraving of the*. It has been deemed eligible to adopt the uſual claſſification, and follow the examples of the continental writers upon art, in arranging our ſchools of engraving. Thoſe writers have thought proper to unite the ſchools of Holland and of Flanders under the general head of "l'Ecole des Pays bas;" and as our Cyclopædia had advanced beyond the letter D, before it was determined to cluſter our biographical notices of the profeſſors of this art, in ſchools and in chronologic ſucceſſion, it is preſumed the expediency of this arrangement will need no further argument in its recommendation, or reaſon for its adoption.

The literati and connoiſſeurs of the Low Countries have not been inſenſible to the anxieties which uſually attend on the patriotiſm of art and ſcholarſhip, and have taken ſome ſmall part in the controverſy reſpecting the invention of letter-preſs engraving and printing: but the feeble pretenſions of Laurence Coſter of Haerlem to this fancied honour, though once ſtrenuouſly aſſerted by Meerman, by Bokhorn, and by Junius, have been patiently reſigned, and gradually withdrawn; and the ſtory of his wandering in a wood near Haerlem, and printing from the bark of trees, refuted by the baron Heïnneken, is no longer liſtened to with the ſmalleſt degree of credit, beyond the ſuburbs of the good city of Haerlem.

But the Low Countries may claim the more worthy rivalry, and the more ſolid diſtinction, of having given birth to ſome of the moſt juſtly celebrated engravers on copper: and the preſcience and diſplay of ſuperior and original ſkill, are ſurely a more noble ground of conteſt, than the fortuitous concurrence of caſual diſcovery, however important in its conſequences.

We have already mentioned the Gothic engraving of the Holy Virgin, which is in the royal collection, and other prints, that with the moſt ſhow of reaſon have been preſumed to be the work of Coster (ſee that article); but if that artiſt, or that perſon rather, died in the year 1441, as is reported, how happens it that we hear ſo little more of letter-preſs engraving in the Low Countries till the time of Van Aſſen and Peter Coeck, who were neither of them born till toward the cloſe of the fifteenth century?

A rude print, deſigned in a ſtiff and Gothic ſtyle, and executed in a barbarous taſte, was ſome years ago preſerved in the library of the king of France. It had formerly belonged to the celebrated abbé Marolles; was believed by the connoiſſeurs of Paris (perhaps with reaſon) to be the moſt ancient of the Flemiſh productions in this art; and is inſcribed, in the old black letter, "Gheprint t'Antwerpen by my Phillery, de Figur Snyder," *i. e.* in Engliſh, "Printed at Antwerp by me, Phillery, engraver of figures."

The ſubject of this ancient engraving, which appears to be executed on wood, is a female figure ſitting with a dog on her lap, near whom are two ſoldiers ſtanding: but if it has been inferred to be the firſt, merely becauſe it is among the very rudeſt and worſt of Flemiſh productions, we can by no means acquieſce in the juſtneſs of ſuch a criterion; and of Mynheer Phillery, the figur ſnyder and printer, nothing further is known.

If we except the doubtful claims of Phillery, Lucas Jacobs of Leyden, Peter Coeck of Aloſt, and John Walther of Aſſen, who were contemporaneous, were the earlieſt engravers of the Low Countries with whoſe names and works we are acquainted. The former is believed to have introduced into his country the art of engraving on copper, and the method of printing with the rolling-preſs; and the two latter, that of engraving on wood, or ſo as to deliver impreſſions from the ſurface of the work, and with the letter-preſs; and all, though not the proclaimed and perſonal diſciples, were evidently the ſtudents and imitators, of Wolgemuth, Schoen, and Durer. The internal evidence ariſing from comparing their ſtyles of art, with thoſe of the early German maſters, is at leaſt as ſatisfactory a proof of ſuch a fact, as could have been derived from the teſtimony of contemporary writers: for mere writers upon art, partly from want of practical knowledge, and partly from the miſtakes of inadvertency, have not unfrequently recorded errors; which errors ſometimes continue for ages to be repeated, and to flow on through the uſual literary channels, until they are detected and dragged aſhore by the local knowledge and power of profeſſional artiſts, or the cultivated eye and matured judgment of unaffected connoiſſeurſhip.

On comparing dates, it appears that the birth of Jacobs was four years poſterior to thoſe of Coeck and Walther, though he preceded them in the practice of engraving.

Peter Coeck, or Koeck, was born in the year 1490, at Aloſt, in Flanders, and died in the ſame city A.D. 1550. From Barent Van Orley, of Bruſſels, he obtained ſome inſtructions in drawing, after which he travelled to Italy for improvement, where he made very conſiderable progreſs in his ſtudies, and from whence he made a voyage to Turkey.

On his return he married, and ſettled in his native town, where he enjoyed a ſmall penſion from the government; but his wife dying ſoon after, he removed to Bruſſels, and engaged to paint for a company of merchants, who had conceived the project of eſtabliſhing a manufacture of tapeſtry at Conſtantinople under his direction.

During his reſidence abroad, he had made drawings of that magnificent city and its ſuburbs; which, on the failure of the tapeſtry ſcheme, he cut on ſeven wooden blocks, divided into as many compartments, which being joined together, make a very large, long print, reſembling a frieze. On a tablet belonging to the firſt block is written in bad French, "The Manners and Cuſtoms of the Turks, with the Countries belonging to them, drawn from Nature by Peter Coeck of Aloſt, when he was in Turkey, in the year of Jeſus Chriſt MDXXXIII. He alſo with his own hand executed theſe prints according to the drawings he had made." And upon a tablet in the laſt block, in the ſame language is inſcribed, "Mary Verhulſt, widow of the ſaid Peter d'Aloſt, who died in the yeer 1550, cauſed theſe figures to be printed under the grace and privilege of his imperial majeſty, in the year MCCCCCLIII." The principal ſubjects of theſe blocks are, 1. The March of the Grand Seignior with his Janiſaries. 2. The Suite of the Grand Seignior walking. 3. A Turkiſh Marriage, with the Ornaments and Dances of the Country. 4. Their Funeral Ceremonies. 5. Their Rejoicings on the New Moon. 6. Their Repaſts. 7. Their ſeafaring and warlike Cuſtoms.

After Coeck returned to his native country, he married a ſecond time, Mary Verhulſt, and had a daughter, who afterwards married his pupil, Peter Breughel the elder. Beſides many altar and cabinet pictures, executed by Coeck, he tranſlated from the Italian the works of Sebaſtian Serlio, and Vitruvius; contributed greatly to the improvement of the architecture of his country; and was honoured with the title of firſt painter to the emperor Charles V.

Strutt ſays of his engravings, that they contain a vaſt number of figures, executed with great care, but not much taſte: but that they are very curious, and were doubtleſs very eſtimable at the time they were performed. He uſually marked them with his initials in the form of a monogram, which will be found in our *Plate* I. of thoſe uſed by the engravers of the Netherlands.

John Walther Van Aſſen was alſo born in the year 1490, and in his youth flouriſhed at Amſterdam, but the events of his life are very obſcure. He engraved on wood with a degree of boldneſs ſuperior to that of the age in which he lived: his invention was copious; and the heads of his figures often expreſſive. His print of "Chriſt praying in the Garden" has been particularly admired, and very juſtly ſo, when regarded with reference to the time and place in which he lived: but the forms of his naked, as might be expected, are Gothic, meagre, and ill drawn.

Walther commonly marked his engravings with his initials, combined in a cypher, and as if inſcribed on a tablet, as may be ſeen in our firſt plate of the monograms, &c. uſed by the engravers of the Low Countries; and the beſt liſt which we are able to form of his works is as follows.

A ſet of ſix, of the circular form, about nine inches in diameter, from the Life and Paſſion of Chriſt. They are dated in the years 1513 and 1514; marked with the cypher of the artiſt; and each print is ſurrounded with a ſort of Dutch groteſque ornament. Their ſubjects are, "The Scourging of Chriſt;" "Our Saviour at Prayer in the Garden of Olives," wherein his three diſciples are repreſented aſleep, and the Jews are advancing, conducted by Judas; (this is the print diſtinguiſhed above for its ſuperior merits;) "Chriſt taken into Cuſtody, with St. Peter cutting off the Ear of the Servant of Malchus;" "Chriſt bearing his Croſs," with the proceſſion to mount Calvary; "The Crucifixion," in which St. John and the holy women are introduced at the foot of the croſs; and "Jeſus laid in the Sepulchre," attended by Joſeph of Arimathea bearing a vaſe of ointment.

Another ſet of ſeven plates in folio, each conſiſting of ſix different ſubjects contained in architectural compartments, with deſcriptions in the Dutch language. The ſubjects are partly hiſtorical and partly allegóric ; ſome are from the Chriſtian, and others from the heathen mythology ; and it would be difficult, if it be practicable, to connect the whole on principle. The ſeventh print is inſcribed " Gheprint tot Aemſtelredam, by Doen Pieter toon in Enghelenburch," and all are marked with the monogram of the artiſt.

Beſide theſe, are ſome proceſſions, of which we know not the titles or number, from the graver of Walther of Aſſen, and a ſmall upright print of an armed figure on horſeback, with the enſign of the caſtle of St. Angelo, inſcribed " St. Hadrianum. Amſtelodamus in Ædibus Donardi Petri ad ſigne Caſtri Angelica." The whole are after his own compoſitions.

Lucas Jacobs of Leyden, the earlieſt engraver on copper that the Low Countries produced, was an honour to his age and country. His country appears to have thought ſo, and hence in ſome parts of Europe his family name is nearly loſt, and he is univerſally known by the appellation of Lucas van Leyden.

Lucas was born in the year 1494, and was the ſon of Hugues Jacobs, a painter, but not of much talent or reputation, and whoſe chief glory has been reflected from the brightneſs of his ſon's abilities. Obtaining a rudimental acquaintance with art under his paternal roof, Lucas began, even during the age of adoleſcence, to diſtinguiſh himſelf by his drawings and his extraordinary attempts in the arts of painting and engraving. He finiſhed his elementary ſtudies in the ſchool of Cornelius Engelbrecht, who was then in the height of reputation. But perhaps his greateſt happineſs as an artiſt, conſiſted in his living at the ſame period with Albert Durer, between whom and himſelf the moſt intimate and ſincere friendſhip, and the utmoſt freedom and liberality of profeſſional communication, ſubſiſted : for Durer, who was the ſenior of our artiſt by more than twenty years, on ſeeing ſome of his youthful productions, is ſaid to have conceived for him the moſt lively eſteem, which gave birth to a correſpondence, generous and diſintereſted at firſt on the part of the German, and which by degrees grew familiar and friendly on both ſides. The biographers of Lucas have reported, that between the age of nine years and twelve, he executed a print of St. Hubert, for which he was rewarded by a certain burgomaſter with as many guilders as he was years of age. The preſent writer has not ſeen this juvenile production, nor has he found it mentioned in thoſe foreign catalogues which he has conſulted of the works of our artiſt. He therefore preſumes it may have been a copy, done for practice and improvement in the new art, of the juſtly celebrated work of Albert Durer, which is thus entitled, and that it was probably among thoſe early and ſurprizing productions which called forth the favourable notice of the artiſt of Nuremberg, and became the baſis of the ſubſequent intimacy between Albert and Lucas, which ended but with the life of the former.

Each of theſe diſtinguiſhed artiſts regularly ſent as preſents to his friend, ſelected impreſſions (for the mercantile trickeries of proof-taking and proof-making had not then been invented) of every engraving which he publiſhed ; and when Durer was driven from Nuremberg by the ill-temper of his wife, he ſought refuge at Leyden, was received by Jacobs in the moſt cordial and affectionate manner, and to commemorate their mutual friendſhip, beſides painting each other's portraits, they executed a picture in conjunction on the ſame pannel.

It ſhould have been mentioned before, that Lucas acquired his knowledge of the uſe of the graver in the workſhop of a goldſmith of Leyden, and that of the proceſs of etching, he obtained from an armourer of that city, who employed the corroſive power of aquafortis in ornamenting cuiraſſes, and other conſpicuous parts of plate armour. The preſent writer has, in another work, ſtated his conjecture, that the ancient corroded ſword-blades of Syria and Damaſcus are the probable origin of the art of etching on copper, and now ſuſpects that he may have been miſtaken in attributing (as he has done under the article ETCHING) its invention to Albert Durer. He now thinks it not improbable that Lucas imparted this art of corroſion to his friend, either by letter, or, he ſhould fancy, during the reſidence of the latter at Leyden, if there were not grounds for ſuppoſing that this journey was not undertaken until after the year 1516, when Durer's firſt etching (of which the ſubject is the rape of Proſerpine) was produced. And he thinks ſo the rather from reflecting on the generally received report, that the two earlieſt of Albert's etchings were performed on plates of iron or ſteel : yet Lucas's etching of St. Catherine, which is believed to be his firſt production in this art, did not appear until the year 1520.

Lucas of Leyden was frank, generous, and urbane, as well by nature as by habit ; yet his generoſity in ſome inſtances was requited with ingratitude ; and his urbanity, if we might credit the tale which is related below, did not ſhield him from the ſhafts of envy and malevolence. Conſpicuous by his rare and ſingular endowments, and unremitting in his habits of profeſſional induſtry, the novelty, beauty, and number of his publications could ſcarcely fail to enrich him. Strutt ſays " he gained much money by his profeſſion, and being of a generous turn of mind, had not the leaſt notion of ſhutting up his money in his cheſt ; on the contrary, he ſpent it freely, dreſſed well, and lived in a ſuperior ſtyle."

To enjoy his popularity, or improve his taſte, he made a journey into Zealand and Brabant, at the age of thirty-three, giving entertainments to the artiſts in moſt of the great towns and cities through which he paſſed ; and it is reported, that during this journey, a ſlow poiſon, which was fatal to our artiſt, was adminiſtered to him at one of theſe entertainments by a painter of Fluſhing, who was envious of the fame which followed the exerciſe of his various talents. But the honour of human nature ſhould perhaps incline us not to liſten too readily to ſtories of this kind. No delicacy ſhould have led, and no pardon was likely to lead, to the repreſſion of the name of the author of a deed ſo atrocious. Yet he was never pointed out : and it muſt be a ſlow poiſon indeed! that is ſix years in effecting its purpoſe.

It ſeems more worthy of belief that the real poiſon of Lucas van Leyden, conſiſted of a mixture of the occaſional exceſſes of convivial indulgence, with habits of intenſe profeſſional application. Contrarieties which can never aſſimilate, few conſtitutions can endure ; and ſo anxious and unremitting was the application of Lucas, that he found the day too ſhort for his purpoſe, and frequently conſumed great part of the night alſo in his ſtudies.

Even during the laſt ſix years of his life, while he lay pining under the preſſure of diſeaſe, or at leaſt oppreſſed by a ſickneſs under which ordinary minds would have languiſhed, his induſtry and love of art were eminently conſpicuous. When it was repreſented to him that ſuch cloſe attention did but increaſe the malignity of his diſorder, he calmly replied, " I am content it ſhould be ſo, ſince, by my ſtudies, I endeavour to make my bed of ſickneſs a bed of honour. An artiſt can never die in a more ſuitable manner than with his pencil in his hand."

He died accordingly at the age of thirty-nine in his native city, and in the year of our Lord 1553.

Beſide engraving both on copper and on wood, Lucas painted in oil, in diſtemper, and upon glaſs, exerciſing the latter art by a proceſs that is known to few if any of its modern practitioners. He commonly marked his works with the ſort of Gothic L, which will be found in our firſt plate of the monograms, &c. of the engravers of the Low Countries, ſometimes adding the date of the year, and inſcribing both on a tablet.

Vaſari ſays, that "perhaps Lucas equals any of the beſt artiſts in the management of the graver; that his hiſtorical ſubjects are executed with great truth, and that he knew well how to group his figures without creating confuſion in his prints;" but is certainly too loud in his praiſe, where he adds, that "he ſurpaſſed Durer in compoſition, and ſucceeded in repreſenting aerial perſpective with the graver, as well as could have been done with the aſſiſtance of colour."

A juſter eſtimate of his merits may be found in the biographical dictionary of our countryman Strutt, who affirms that his ſtyle of engraving differed conſiderably from that of Albert Durer, and ſeems evidently to have been founded upon the works of Iſrael van Mecheln. His prints are very neat and clear, but without any powerful effect. The ſtrokes are as fine and as delicate upon the objects in the front, as upon thoſe in the diſtances; and this want of variety, joined with the feebleneſs of the maſſes of ſhadow, give his engravings, with all their neatneſs, an unfiniſhed appearance, much unlike the firm, ſubſtantial effect, which we find in the works of Albert Durer. He was attentive to the minutiæ of his art. Every thing is carefully made out in his prints, and no part of them is neglected. His figures are generally tall and thin; the attitudes well choſen, and frequently graceful and elegant. In theſe he followed nature ſimply, without affectation. He gave great character and expreſſion to the heads of his figures; but on examination of his works, we find the ſame heads too often repeated. The hands and feet rather mannered than correct; and when he attempted to draw the naked figure, he ſucceeded but indifferently. He affected to make the folds of his draperies long and flowing; but his female figures are frequently ſo exceſſively loaded with girdles, bandages, and other ornamental trappings, that much of the elegance of the deſign is loſt; and that native ſimplicity, which is, as it were, the very ſoul of painting, is deſtroyed.

To Adam Bartſch of the Imperial library at Vienna, the public is indebted for a catalogue raiſonnê of nearly two hundred of the engravings of this maſter, all of which are the produce of his own fertile invention. About twenty woodcuts have alſo been aſcribed to him, but of which he was probably only the deſigner. Mariette, however, poſſeſſed two hundred and thirty of his prints.

As nothing like an Engliſh catalogue has yet appeared, we ſhall name as many as we are able, beginning with thoſe ſubjects which he has taken

From the Old Teſtament.—"The Hiſtory of the Creation, and the Fall of our firit Parents," in a ſet of ſix fine prints of ſmall folio ſize, engraven A.D. 1529; of which the ſubare, 1. God, (repreſented by the figure of an old man,) creating Eve during the Sleep of Adam. 2. God laying the Injunction on Adam and Eve not to touch the forbidden Fruit. 3. Eve, ſeduced by the Serpent, perſuading Adam to eat of the Fruit of the Tree of Life. 4. Adam and Eve expelled from Paradiſe. 5. Cain ſlaying Abel. 6. Adam and Eve deploring the Death of Abel, who is extended before them. "Adam and Eve, Fugitives, after being turned out of the terreſtrial Paradiſe," in 4to. ſize. Lucas has treated "The Treſpaſs of Eve," and "The Death of Abel," in a different manner, on ſix ſmall plates; "Lamech ſtanding, bending his Bow, and Abel ſitting at the Foot of a Tree, with the Jaw-bone of an Aſs before him," in 8vo.; "Abraham and the three Angels," of quarto ſize; "Lot and his Daughters eſcaping from the burning City," a very fine engraving, dated 1530, companion to "The Sin of Adam and Eve," in ſmall folio; "Abraham ſending away Hagar and Iſhmael," a middling-ſized plate, lengthways, dated 1510; and known among dealers by the name of the large Hagar. The ſame ſubject otherwiſe treated, called the little Hagar, of 4to. ſize, dated 1516. The Hiſtory of Joſeph, in five 4to. prints, dated 1512; and of which the ſubjects are, 1. Joſeph recounting his Dreams to his Brethren. 2. Joſeph ſolicited by the Wife of Potiphar. 3. The Wife of Potiphar accuſing Joſeph. 4. Joſeph in Priſon, explaining the Dreams of the Officers. 5. Joſeph interpreting the Dreams before Pharoah. "The Daughter of Jephtha meeting her Father," one of the earlieſt productions of Lucas, engraved ſome time about the year 1508; "Dalila cutting off Sampſon's Hair," "David and Goliah," and "David playing the Harp before Saul," all in folio; "David ſupplicating in behalf of his People," a large print. The ſame ſubject differently treated, an etching, dated in 1520. "Solomon worſhipping the Idols," in quarto; "Eſther before king Ahaſuerus," a large folio plate; the proof of which, in the royal collection at Paris, coſt two hundred and fifteen livres, according to the note of P. Mariette written at the back of the print. "Suſannah and the Elders," of 4to. ſize, dated 1508.

Subjects from the New Teſtament.—"St. Joachim embracing St. Anne," dated 1520; "The Annunciation," "The Viſitation," both of octavo ſize; "The Adoration of the Magi:" this is eſteemed one of the moſt conſiderable works of the maſter, it is dated 15 3; and of large folio ſize. "The Repoſe during the Flight into Egypt;" "Jeſus baptized in the River Jordan," a very grand compoſition, containing a very numerous aſſemblage of figures, and engraved about the year 1510; "Jeſus tempted by Satan in the Deſart," dated 1518, all of quarto ſize; "The Reſurrection of Lazarus," a grand compoſition, engraved in the year 1508, folio ſize; "The Paſſion of our Saviour," repreſented in fourteen plates, engraved A.D. 1521, and entitled as follows, *viz.* 1. The Laſt Supper. 2. Jeſus on the Mount of Olives. 3. Our Saviour ſeized in the Garden of Olives. 4. Our Saviour taken before the High Prieſt. 5. Jeſus reviled. 6. The Flagellation. 7. Jeſus crowned with Thorns. 8. Jeſus expoſed to the People. 9. Chriſt bearing the Croſs. 10. The Crucifixion. 11. The Deſcent from the Croſs. 12. Our Saviour laid in the Sepulchre. 13. The Deſcent into Hell. 14. The Reſuſcitation. Another ſet of "The Paſſion of our Saviour," in nine circular plates, eight inches in diameter. A grand "Ecce Homo," very rich in compoſition, containing more than a hundred figures, one of the beſt engravings of Lucas, dated 1510, in large folio. "Jeſus Chriſt on the Croſs, between the two Thieves," a very fine print, nearly as rich in compoſition as the preceding, having twenty-four figures admirably grouped: the good impreſſions of this plate are very ſeldom to be met with, it is dated 1517, and in large folio. "Our Saviour appearing to Mary Magdalen as a Gardener," both half figures, placed before the ſepulchre, in 4to. and dated 1519; "The Return of the Prodigal Son," a folio print, admirable for the ſpirited execution of the back-ground and ſmall figures, engraved A.D. 1510.

Various Devotional Subjects.—"The Virgin and Child, accompanied by St. Anne," dated 1516; "The Virgin and Child, ſtanding on a Biſhop's Crozier;" "The Virgin and Infant Jeſus," 1514; "A Holy Family," in quarto; "The Virgin and Holy Infant, contemplated by two Angels," in quarto. Jeſus Chriſt and his twelve apoſtles, in a ſet of fourteen plates, of octavo ſize. The four Evangeliſts, occupied in writing the goſpel, half-length figures, in 8vo. St. Peter and St. Paul, half-length figures, octavo ſize. Another plate of the ſaints "Peter and Paul," in a landſcape; a very fine engraving, dated 1527. "The Converſion of St. Paul," a very grand compoſition, in large folio, dated 1509. "Saint Chriſtopher," in which he appears ſitting at the foot of a rock, on the banks of a river: on one ſide of the ſaint, in the back-ground, is a hermit, coming out of his cell with a lantern. This print is one of the earlieſt productions of Lucas, done apparently about the year 1508, of octavo ſize. "Saint Chriſtopher in the Water, with the Infant Chriſt on his Shoulders," a ſmall print.

Albert Durer engraved and publiſhed the ſame ſubject in the courſe of the ſame year, and it is ſuppoſed the two artiſts worked in concurrence. "St. John the Baptiſt," dated 1513, "The Decollation of St. John the Baptiſt," both in octavo; "St. Jerome," the head ſurrounded with rays of glory, ſitting in an alcove, with a ſkull before him. Lucas engraved this ſubject three times; but the print which is treated in the beſt manner is dated 1521, in quarto. "St. Sebaſtian," in which the holy martyr appears faſtened to a tree, with his body pierced by arrows, in octavo, engraved probably in the year 1508; "St. Antony," habited in a long robe, with a monk's cowl on his head, and a great number of acceſſories, in octavo; "The Temptation of St. Antony," where he is repreſented ſeated on a hillock between two trees, looking at a figure, whom he perceives to be a female devil, from the horns ſticking through her head dreſs. The back-ground is a mountainous landſcape, with an old caſtle; a very fine print, dated 1509, in quarto. "St. Dominic," ſurrounded by rays of glory, holding a ſtaff, terminated by a crucifix: behind him is a dog, holding in his mouth a flaming torch, in octavo, engraved ſome time about the year 1514. "St. Gerard Sagredius," a biſhop and martyr, his head covered with an epiſcopal mitre, ſurrounded with rays of glory: he holds in his hand a heart pierced with an arrow, octavo. "St. Francis receiving the Stigmatics," from a crucifix ſuſpended in the air: at the bottom of the print is a Capuchin monk, ſitting at the foot of a tree, in octavo. "St. George liberating the Princeſs of Antioch," whom he has reſcued. In this, as in many other old prints, the action is double: in other words, two points of time are repreſented, for in the back-ground is St. George combating the dragon, and the princeſs chained againſt a rock; engraved in 1508. "Mary Magdalen entering into worldly Pleaſures," a celebrated print, of large folio ſize, known among the amateurs under the name of "The Magdalen's Dance:" in one part of the print ſhe is repreſented dancing with a man to a flute and tambourin, with various other groups: lower down ſhe is repreſented on horſeback, at the head of a troop of huntſmen; and again flying towards a wood with three men, one of whom ſounds a horn: and towards the ſummit of a rock is the ſoul of the Magdalen raviſhed in the air by four angels. This fine print was engraved about the year 1519, when the artiſt was in his meridian. "The Magdalen in a Deſert at the Foot of a Rock;" in the clouds is repreſented the eternal father with a long beard, and a tiara on his head. This is without date, but is doubtleſs one of the earlieſt productions of Lucas, while his powers of drawing and compoſition were yet feeble, and is better engraved than it is deſigned. "The Magdalen ſtanding on a Cloud, holding a Vaſe:" to this print has been miſtakenly given the appellation of "Pandora letting out the Evils of the World;" it is dated 1518, and of octavo ſize. There is in exiſtence a print of this ſubject, marked with the initials I. V. M. which has been attributed to Iſrael Von Mecheln; but, on compariſon, it appears to be a bad copy of the engraving by Lucas, by an unknown hand. "St. Catherine," a half-length figure, crowned with rays of glory, leaning on a wheel, with a book and ſword. It is an etching, touched in ſome parts with the graver, and dated 1520.

Profane Subjects.—"Mahomet ſleeping, with a Prieſt murdered by his Side, and another Figure ſtealing his Sword," a folio print, ſaid to be one of his earlieſt productions; the ſeven cardinal virtues, ſitting figures, each crowned by an angel, dated 1530, *viz.* 1. Faith. 2. Hope. 3. Charity. 4. Prudence. 5. Juſtice. 6. Fortitude. 7. Temperance. "The Death of Lucretia," dated 1512, which print is by ſome called "The Death of Dido," in octavo; "The Death of Pyramus and Thiſbe;" "The Poet Virgil, ſuſpended from a Window in a Baſket, to the Deriſion of the Populace;" a ſmall folio print, executed with great taſte and ſpirit, and very correctly drawn, and well compoſed. Vaſari, who ſpeaks very highly of this print, ſays, that "Albert Durer was ſo ſenſibly ſtruck with the merit of it, that he afterwards wiſhed to concur with Lucas in producing a pair of prints that ſhould correſpond in form, moral, and dimenſions, to which deſire we owe the celebrated print of "Death's Horſe." The two prints do correſpond in theſe reſpects: yet the inadvertency of Vaſari in this place, which has been repeated by Huber and Roſt, has not hitherto been pointed out. To make any thing credible of this ſtory, the order of the facts and perſons muſt be reverſed; for the "Death's Horſe" of Albert Durer was produced to the public in the year 1513, whereas Lucas of Leyden did not publiſh his ſuſpended poet till 1525. And what renders the non-detection of this error the more ſurpriſing and remarkable is, that both theſe engravings bear their reſpective dates; the latter on a fragment of broken ſtone at the left-hand corner of the print, the former immediately above the monogram of Albert on his uſual tablet.

The emulation muſt, therefore, have been felt by Lucas, and his engraving of "The Courtezan ſuſpending Virgil in a Baſket," which, of all his works, approaches neareſt, in point of ſtyle, to this exquiſitely finiſhed print from the graver of Durer, muſt have been produced accordingly.

The recondite moral and meaning of theſe compoſitions, and intentions of their authors, will then ſtand thus. Albert Durer had produced a juſtly admired engraving, by ſome vulgarly termed "Death's Horſe," by others "The Worldly Man," but wherein a cavalier, completely armed, ſallies forth on the buſineſs of Death. His ſteed is richly harneſſed; his helmet ſtudded and wrought with ornaments; and his armour, in the fine impreſſions, appears as if of ſilver, and of coſtly workmanſhip. He is a hero, and perhaps intended by Albert for ſome Alexander, or individual general of renown. Whilſt he is gravely bent on the purſuit of that glory which ariſes from the deſtruction of his fellow men, a crowned ſpectre, which ſeems intended for Death, croſſes the warrior's way: he is mounted on a mule, holds up an hour-glaſs with an index before the hero, and ſeems to ſcoff at his purpoſe; while a frightful monſter, with various horns, like one of thoſe mentioned in the Apocalypſe, and which is probably intended for the Devil, follows hard after him, intent and ready to ſeize on his prey. The moral has various acceſſories, ſuch as a lofty caſtle in the back-ground, and a lizard crawling in the road, whoſe allegorical office is to warn man of danger. A warning bell, too, hangs from the neck of the mule, on which rides the ſpectre, while to the capariſon of the warrior's ſteed, the jingling bell of Folly is appendant.

It is altogether a profound pictured allegory, worthy of ſerious contemplation, and dictated by the ſame muſe who afterwards prompted Dr. Young to write

> "Deaths ſtand, like Mercuries, in ev'ry way,
> And kindly point us to our journey's end."

It appears to the preſent writer, that, ſtruck with this extraordinary diſplay of the various powers, as poet, painter, and engraver, of his friend Durer, the Dutch artiſt became laudably ambitious of deſigning and executing a fit companion to a production which muſt doubtleſs have been very popular; and, accordingly, inſtitutes and ſtimulates a compariſon between the love or luſt of conqueſt and falſe glory, and that of woman, and with much ingenuity calls on the ſpectator to behold and balance their abſurd and pernicious conſequences.

A pictorial compariſon is thus provoked between the moral conſequences of the abuſe of two potent paſſions; and if it might be granted that we perceive the little diſtant figure, whom, in the print of Lucas, the courtezan ſuſpends in a baſket, and expoſes to the deriſion of the populace, to be the poet Virgil, the moral effects would be heightened by the reflection, that it is the organ of Fame, and diſpenſer of terreſtrial immortality, who is thus himſelf made to appear infamous and ridiculous, as in the print of Albert it is the deſtroyer who is the victim.

But of this it requires that the ſpectator be informed by Lucas, or by Vaſari; for as the coſtume and characters (as in all the works of this maſter) are perfectly Dutch, no other men would dream that a ſmall diſtant head, covered with the mitre of epiſcopacy, or the cap of folly, was that of the Mantuan bard.

This engraving is, however, with regard to compoſition, manual execution, high finiſh, and actions and expreſſion of the figures on the fore-ground, particularly that of the principal male figure, one of the very beſt of the works of Lucas van Leyden.

To quit this digreſſion, and reſume our liſt of the ſubjects which he has deſigned and engraved from profane hiſtory, and his own fancy. "Venus, the beautiful Goddeſs of Love," a 4to. plate, dated 1528. A folio plate of "Mars and Venus," with armour and an attendant cupid, was executed during the long illneſs of the artiſt; as was alſo "The Goddeſs Pallas," armed with her ægis and ſpear. The latter was the laſt plate which he engraved, and it is ſaid, that a ſhort time before he died, he requeſted to ſee it; upon which occaſion it ſeems probable, that he uſed thoſe remarkable words, ſo much to his honour as an artiſt, which we have cited in his biography. "A military Officer diſplaying a Flag." The attitude of the figure is very ſpirited and ſoldier-like, and the print altogether is very beautifully finiſhed; both are of octavo ſize. "Four Soldiers in a Foreſt," without a date, but probably engraven about the year 1508. A very fine print of a young man at the head of a party of ſoldiers, liſtening attentively to a man, with his hat in his hand: on each ſide is repreſented a group of three men converſing. "The Beggars," one of whom receives a platter from the other: the group is completed by a female figure, with her hand on her breaſt. This print appears to have been engraven about the year 1508. "The Promenade:" the back-ground repreſents a manſion ſituated at the foot of a mountain, which terminates the view, dated 1520. "The Earl and Lady, with a Falcon:" this is drily executed, and appears to have been engraven about the year 1508. "The Wood Nymph," ſhe is walking with a peaſant, and another figure conducting them; all of octavo ſize. [Note.—There is a copy of the Wood Nymph, engraved by Wierix at the age of twelve.] A man with a lighted torch, conducting a female, followed by a man with a ſabre, and a club acroſs his ſhoulder: this print is very delicately executed, apparently about the year 1508. A female figure preſenting a vaſe to a man; the landſcape is terminated by a mountain, the ſummit of which is crowned with an ancient caſtle, dated 1520, of octavo ſize. "The Pilgrims," conſiſting of three figures, quarto ſize; "The wedding Ring," repreſenting a man giving a ring into the hand of a young woman, ſeated by his ſide. This rare print is etched in a firm ſtyle, dated in 1520, and diſtinguiſhed by the neatneſs of the execution, in quarto. "The Fool," repreſenting a female figure, defending herſelf from the embraces of a fool, characteriſed by his dreſs and baubles, both half-length figures. This is an etching, ſlightly touched with the graver, and dated 1520. "The old Man with a Bunch of Grapes," a half-length profile. This print is admirably touched, and appears to have been done about the year 1523, when the artiſt was in his meridian. "The young Trumpeter," repreſenting a boy blowing a trumpet, to the ſound of which two others are dancing; one of the earlieſt productions of Lucas. "The Woman and the Bitch," repreſenting a female with her head enveloped with drapery, the ends of which hang in folds over her body; towards the left are perceived the head and foot of a bitch, whom the lady is feeding with fruit. This print is executed on a white ground, and dated 1509. Another "Woman and Dog," dated 1510; "The Muſicians," a very fine print, dated 1524, conſiſting of a man playing a guitar, and a woman playing a violin; "The Surgeon," performing an operation behind the ear of a peaſant, whoſe countenance tells us plainly how much he ſuffers, dated the ſame as the preceding; "The quack Doctor," operating with an inſtrument in the mouth of a peaſant, who with great vexation perceives that, during the operation, a girl behind him is emptying his purſe of its contents. This print poſſeſſes equal merit with the two former, and is dated 1523; all of octavo dimenſions. "The Milkmaid," holding in one hand her bonnet, and in the other a pail, into which ſhe is about to milk a cow held by a peaſant. This is a very rare print, dated 1510, of quarto ſize. "Uylenſpiegel," or "L'Eſpiegle," the ſcarceſt of all the works of this maſter. It was in the collection of the king of France, and miſtakenly ſaid by Marolles, and other French connoiſſeurs, to be unique. Baſſan informs us, that M. Mariette had alſo an impreſſion of this plate, and ſeveral are known to exiſt in England. It repreſents a man playing upon the bag-pipes, carrying two children in a baſket, and a woman with an infant in her arms. It is nearly ſeven inches and a half high, by four inches and three quarters wide; and has been copied of the ſame ſize ſeveral times. One of the copies is by Hondius; but the beſt has no name to it. This rare print is dated 1520.

Various Ornaments.—The profile of a warrior's head in a medallion, ſurrounded with ornaments. It is dated 1527, and marked with the letter L, on a cartouche at the bottom. A compoſition of ornaments in the taſte of that age, compoſed of a ram's ſkull and two fiſh, dated 1527. Another compoſition of ornaments, with a Mercury ſitting between two ſphinxes, folio ſize, dated 1528. A pannel of ornaments, compoſed of a marine deity with a trident, ſurrounded by ſirens and chimeræ, executed on a black ground, in octavo, and dated 1528. "The Infant Warriors," one of whom diſplays a flag, and the other carries a helmet; and "The Arms of the City of Leyden," in a ſmall circle, ſurrounded by four others, each containing a genius, engraved ſome time about the year 1510, both of octavo ſize.

Portraits.—The emperor Maximilian I. with his hair plaited and wearing a large hat. Lucas painted the portrait when the emperor viſited Leyden, but did not engrave it till the year 1520, after the death of that prince. The head is entirely engraved, and the remainder etched, and ſlightly touched with the graver to give it effect; in the back-ground is a little figure holding a ſcroll, marked with the letter L. This is the fineſt portrait Lucas ever engraved; very rare, and of folio ſize. A portrait of the artiſt himſelf, repreſented with a hat on, and a mohair doublet trimmed with fur. This portrait was drawn and etched by himſelf when he was but twenty years of age; it is touched in a light ſpirited manner, and inſcribed, "Effigies Lucæ Leidenſis propria manu inciſa," of quarto ſize. Portrait of a young man, half length, dreſſed in a cap and feathers, and pointing to a ſkull which he holds under his robe. This portrait commonly paſſes for that of Lucas himſelf, but it is very unlike the former. Lucas is always repreſented with ſhort plaited hair, and this portrait has very long and curly hair; it is of quarto ſize, and engraved apparently about the year 1525. There is a print attributed to Lucas, of which the ſubject is "A Family ſurpriſed by Death," but it is too poorly executed to be really his performance; for in the year 1529, the period when this print was engraven, our artiſt was in his meridian. The drawing of it is the beſt part, but there is great want of ſpirit and correctneſs in the contours.

Martin Van Veen was born at the village of Hemſkirk, in Holland, in the year 1498, and till he was eclipſed in the public notice, by the celebrated painter of that name, was called after his native village. He learned the rudiments of drawing from John Lucas, and of painting from John Schoreel, but of the ſubſequent progreſs of his ſtudies, there are two accounts of an oppoſite nature. Strutt ſays, that "his early application was attended with little ſucceſs, and his genius was clouded by an appearance of natural dulneſs, which ſeemed to preclude all hope of his ever attaining to any reaſonable degree of perfection." Huber, on the contrary, after ſeeing Strutt's biography of this artiſt, ſays, that he imitated the ſtyle of his maſter Schoreel ſo well, that he became jealous of the riſing talents of Van Veen, and expelled him from his ſchool; from which it is clear, that if the ſcholar was not a blockhead, the maſter was illiberal.

Van Veen, however, has obtained praiſe from Mariette, and from Girard Laireſſe, and the eaſe and accuracy of his drawing, and firmneſs of his contours, have been repeatedly commended. After quitting the ſchool of Schoreel, the fame of Michael Angelo, and the antique ſculpture, attracted him to Italy, but after ſtudying there for ſome time, he returned to Holland and ſettled at Haerlem, where he died in the year 1574.

Neither the engravings nor paintings of Van Veen would now be much admired, being deficient in grace, expreſſion, and harmony of chiaroſcuro, but among his contemporaries his works commanded reſpectful attention. They may be known by the monogram which the reader will find in *Plate* I. of thoſe uſed by the engravers of the Low Countries.

Among his beſt prints are "Judah and Tamar," and "The Annunciation," both in 4to.; "Commercial Induſtry," in folio, and "The Wiſe and Fooliſh Virgins," nearly of the ſame dimenſions. The twelve plates of the battles of Charles V., which have been attributed to him, are from the graver of Theodore Coornhaert, but were executed after his deſigns.

Dietrich, or Theodore Vander Staren, or Von Stern, was born in Holland, ſome time about the year 1500; the time of his death has not been recorded, but it is known that he continued to engrave till 1550. He is ranked by the French in the claſs of little maſters, and known by the appellation of the Maſter of the Star, becauſe in his monogram he uſed to place a ſtar between his initials, as ſeen in our firſt plate of thoſe uſed by the engravers of the Low Countries. His compoſitions prove him to have been a man of talent: he has engraven many landſcapes and ſubjects from ſacred hiſtory, after his own deſigns. He underſtood the human figure tolerably well, but his proportions, like thoſe of the Dutch people, are ſhort and heavy; and he often crowded his back-grounds with architectural ornaments. To his monogram he uſually added the day of the month on which his plates were publiſhed.

The following are engraved by Vander Staren from his own deſigns. "The Miraculous Draught of Fiſhes," dated 1523, in octavo; "Chriſt walking on the Sea," a ſmall upright; "The Temptation of Chriſt," where the Devil is repreſented with pointed ſhoes; a ſmall upright plate. A very ſmall plate of a ſaint kneeling before the Virgin, who holds the infant Chriſt, dated 1524; "St. Luke painting the Virgin and Child," dated 1526, of octavo ſize. A folio plate of "The Deluge;" marked D. Van Stern. ſec. 1523: and "The Good Samaritan," engraved A.D. 1525, in octavo.

Of Francis Babylone, better known by the appellation of the Maſter of the Caduceus, we have various accounts, and all of them involved in more or leſs of uncertainty. He was probably born ſome time about the commencement of the ſixteenth century, and, according to Roſt and Huber, at Leyden: he is ſuppoſed to have ſtudied in Italy under Marc Antonio, or Gregory Peins. The time of his deceaſe is entirely unknown.

As he neither affixed name, date, nor initials to his very ſingular prints, but ſimply the ſmall caduceus which will be found in our firſt plate of the monograms, &c. uſed by the engravers of the Low Countries, his very name is ſcarcely ſettled, and he has been by ſome writers called Iſrael Martin, and affirmed to have been the tutor of Albert Durer, Lucas of Leyden, and Aldeghever.

The maſter of the caduceus was quite original in his ſtyle of engraving, but it has not been thought worthy of imitation, and his prints are now ſought after by the curious merely on account of their great rarity. He worked entirely with the graver: his courſes of lines, which are rarely croſſed, are rather feeble than delicate; his extremities are poorly marked, and always too large; his draperies are perplexed with ſmall and inelegant folds, and his heads neither characteriſtic nor expreſſive.

The principal works which have been mentioned as bearing this myſterious mark, are as follows. A ſmall upright plate repreſenting "Apollo and Diana." Another of the ſame ſize, of three men bound. "A Holy Family," in a ſmall ſquare plate, half figures: the Virgin is leaning on the ſtump of a tree, and the head of Joſeph is ſeen towards the right hand of the print. Another "Holy Family," a ſmall plate lengthways, where the Virgin is repreſented ſeated at the foot of a tree; the child is ſtanding by her ſide; Elizabeth is ſeated near him; an angel is playing upon a muſical inſtrument; and Joſeph appears at the right hand of the print. "The Adoration of the Three Kings," a ſmall upright plate; "St. Jerom writing, with a Crucifix before him," a ſmall plate lengthways. Two ſmall upright plates: one repreſenting a man carrying a boat, and the other, a woman with a child in her arms. Jerome Hopfer has copied both theſe figures on one plate, much larger, and decorated the head of the woman with ſtars and a glory. "A Sacrifice to Priapus," (which is generally attributed to M. Antonio, becauſe it has his tablet,) is copied ſmaller by this artiſt, and the indecency which appears in the former plate is here omitted. It repreſents a woman ſtanding by the altar, and another oppoſite to her, holding an infant; and an old woman's head appears in the background. This is the only print by this maſter, with which we are acquainted, that does not appear to have been engraven from his own compoſition; and it, more than any other circumſtance, aſſiſts us in ſettling his chronology.

Cornelius Matſys, or Metenſis, was born ſome time about the year 1500, and we believe in the Low Countries: though he appears to have reſided much in Italy; and it is not improbable that he was the diſciple of George Peins. We have a great number of engravings by him, both from his own compoſitions and thoſe of the Italian painters. His ſtyle of engraving bears ſuperior reſemblance to that of Babylone in neatneſs and delicacy of execution, but his figures are much more in the Italian taſte, and are not deſtitute of elegance and proportion. Strutt has ſuppoſed there were two artiſts of theſe names, but the foreign writers mention only one. His monogram will be found in our firſt plate of thoſe uſed by the engravers of the Low Countries.

We ſhall mention the following prints by this artiſt. "Erneſt, count of Mansfeld," a print of quarto ſize; "Cleopatra with the Aſp," a ſmall print, dated 1550. An old man and two old women, one of whom holds a baſket of eggs, a ſmall print, dated 1549. "Judith with the Head of Holofernes," dated 1539. A battle, a ſmall upright plate, from G. Peins. "A Holy Family," where the Virgin is repreſented holding the infant on a cradle, careſſing the little St. John, from Raphael, of folio ſize. (This is from the ſame picture that was afterward engraven by F. de Poilly in France.) "The Miraculous Draught of Fiſhes," from Raphael. The Plague, a ſubject known in Italy under the name of "Il Morbetto," engraved by M. Antonio, and regraved by Cornelius Met, with his monogram, and the name of Raphael, folio ſize. "Chriſt laid in the Sepulchre," from an etching by Parmegiano, of quarto ſize.

Of Jerome Boſche, or Bos, an ancient painter and engraver of groteſque ſubjects, we have already treated, (ſee the article Bos,) but, by miſtake, have placed his death in the year 1500, copying the error of Strutt. According to the beſt foreign authorities he was not born till 1498; the final period of his life they have not recorded. His Gothic manner of ſubſcribing his works will be found in our *Plate* I. of the monograms, &c. uſed by the engravers of the Low Countries.

Beſides thoſe of his works which we have already mentioned, he engraved "The Temptation of St. Anthony," on wood, which being dated in the year 1522, corroborates the chronology which we now offer. "The Miraculous Viſion of the Emperor Conſtantine," in quarto; "Jeſus baptized by John," a folio print, with the name of Bos. A folio print repreſenting a number of groteſque figures, inſcribed, "Al dat op," &c. Jer. Boſche. Another folio print of the ſame kind, inſcribed, "Deſe Jeronimus Boſch drollen." An allegorical print, of an elephant, inſcribed, "H. Bos inv." Paul de la Houwe, exc. in folio.

Cornelius Bus, or Boſc, or Vanden Boſch, was born at Bois le-Duc, in Flanders, ſome time about the year 1510. In his youth he went into Italy, and eſtabliſhed himſelf at Rome, where, excluſive of his profeſſion as an engraver, he carried on a conſiderable commerce in prints. A ſubject engraved by him, of females at different domeſtic employments, with a German inſcription, beginning thus, "Alim die ein from bidert Weib überkompt, &c." has made M. de Heinneken think that Cornelius was a German, and that in Italy he changed his name to Bus; but the general opinion is, that he was born where we have ſtated above, and that his true name was Boſch.

His ſtyle of engraving ſometimes reſembles that of Marc de Ravenna; at other times that of Eneas Vico. He never arrived at any ſuperior degree of excellence. He worked entirely with the graver, in a ſtiff, dry, ſtyle, without taſte. His drawing is by no means correct; neither are the heads and other extremities of his figures ſufficiently attended to; and from the lights being diffuſed, and the feebleneſs of the maſſes of ſhadow, his engravings are uſually deſtitute of effect. He has engraved after his own compoſitions and thoſe of other maſters; and he commonly marked his prints with one or other of the monograms which will be found attached to his name in our firſt plate of thoſe uſed by the engravers of the Low Countries.

The following prints may be reckoned among his beſt. "The Laſt Judgment," marked with his cypher, and dated 1530, of quarto ſize; "Lot and his Daughters," with his monogram, dated 1550, of folio ſize; "King David giving the fatal Letter to Uriah," dated 1546; "Our Saviour preaching to the Jews," in folio; "Venus on her Car," in quarto, dated 1546; "Vulcan in his Forge," in folio, 1546, all marked with his cypher; "Combat of the Centaurs and Lapithæ," on two large plates, dated 1550; "A Monk ſeized by Death," in quarto, marked with the monogram. An equeſtrian ſtatue of Marcus Aurelius, in folio, with the monogram. A ſet of ſixteen plates of groteſque arms and trophies, engraved at Rome in the years 1550 and 1553. Another ſet of caryatides and thermes. "Moſes receiving the Tablets of the Law," from Raphael, in folio, 1551; "Triumph of Bacchus," a large print, lengthways, engraved on three plates from Julio Romano, dated 1543; "The Entombing of Chriſt," a folio plate, dated 1554, from Franciſco Floris, marked "Cornelius Bus fecit;" "Moſes breaking the Tablets of the Law," folio, from Raphael, dated 1550.

Having already treated of the family of Breughel, which flouriſhed as painters and engravers at the period now under our notice (ſee the article BREUGHEL), it remains only to add in this place, that Peter Breughel the younger, ſurnamed, or rather *nick*-named "the Helliſh," was the principal engraver of that family, and the chief of his engravings (which are ſomewhat numerous, and rendered very entertaining by his peculiarities) are as follow. They are generally marked with a monogram, which will be found in our firſt plate of thoſe uſed by the engravers of the Low Countries.

A large folio plate of a village fete: a banner is diſplayed over the door of a cabaret, and of the numerous figures introduced, ſome are ſkirmiſhing, others rejoicing, and others quarrelling. Another folio print of "Peaſants rejoicing;" "The Feaſt of the Archers," in which the banner of their company is diſplayed before an arbour, inſcribed "Dit is de Gulde." A very rare wood engraving of a maſquerade, known by the name of "Valentine and Orſon;" "Mercury and Pſyche," the landſcape part of which is a view on the Rhine; "Dedalus and Icarus," companion to the above, being another view on the Rhine: both are inſcribed "Petrus Breughel fecit Romæ 1553;" and all the above are of folio ſize.

Early proofs of the works of Hieronymus, or Jerome Cock, are much ſought after by the curious, but it is on account of their ſcarcity and not their merit, for his ſtyle is laborious, poor, and ſcratchy. The praiſe which Vaſari has laviſhed on him, is therefore not merited. His biography we have already ſufficiently detailed, (ſee the article Cock), except that we have there omitted to mention that he was born at Antwerp in the year 1510. His monogram, ſimilar to that of Hans Collaert, will be found in our firſt plate of thoſe uſed by the engravers of the Low Countries. From his numerous engravings, we ſelect the following as thoſe which are held in moſt eſteem, beginning with his

Portraits.—A pair of the oval form, in 4to. of Francis II. king of France and Scotland, and Mary queen of Scotland and France. Another pair of Guſtavus and Maria, king and queen of Sweden. Another of Soliman, emperor of the Turks, and Camilia his daughter, all in ovals, and of folio dimenſions. A large folio plate, containing the heads of Guido, Cavaleantes, Dante, Boccacio, Petrarch, Politian, and Ficinus. And, conjointly with Wierix, a ſet of twenty-four of celebrated artiſts of Germany, in folio, dated 1572.

Proceſſions, Views, &c.—A ſet of fifty-nine, entitled "Præcipua aliquot Romanæ antiquitatis monumenta Antwerpiæ M. D. L. I." Another ſet of twenty, entitled "Operum antiquorum Romanorum hinc inde per diverſas Europæ regiones." "The Funeral Proceſſion of the Emperor Charles V." engraved on ſeveral plates, and forming, when paſted together, a long frieze. A ſet of twelve plates, entitled "Divi Caroli V. ex multis præcipuæ victoriarum imagines 1556." A ſet of fifteen, entitled "Compartimentorum quod vocant multiplex genus lepidiſſimis hiſtoriolis poetarumque tabellis ornatum, 1566. Gedruckt by Hieronymus Cock in de vier Winden."

Hiſtorical, &c.—"Moſes with the Tablets of the Law;" "St. Chriſtopher croſſing the Water with the Infant Chriſt," a ſubject from the life of Sylla, inſcribed "Quidquid eſt hujuſmodi etc.;" "A Sacrifice to Priapus," where the ſacrificers are repreſented ſlaughtering an aſs, 1557; "Fœmina ſub Jove ſunt;" Tarquin and Lucretia, "Tarquinius, &c." An emblem of Vanity, inſcribed "Hodie mihi, cras tibi:" it repreſents the dead bodyof a young man lying on a table near a ſkull: at the bottom of the print is written "Vigilate quia etc." Cock excud.; all in folio.

Various Subjects from the Painters of the Low Countries.—A ſet of fifteen hiſtorical landſcapes, painted by Mathew Cock, and engraved by Jerom, of which the ſubjects are; 1. Abraham ſacrificing Iſaac. 2. Judah and Tamar. 3. The Prophet Jonas weeping over Nineveh. 4. The Departure of Tobias with the Angel. 5. The Flight into Egypt. 6. The Baptiſm of our Saviour. 7. Jeſus tempted in the Deſart. 8. The good Samaritan. 9. Mercury and Argus. 10. Mercury killing Argus. 11. Venus mourning for the Loſs of Adonis. 12. Cephalus and Procris, 1558. 13. The wondrous Labyrinth. 14. The Loves of Hero and Leander. 15. Daphne metamorphoſed into a Laurel. A large landſcape, repreſenting the feſtival of St. George, with the banner of the ſaint, from Mathew Cock; "Sampſon and Dalilah," with the temple of the Philiſtines in the back-ground, in large folio, from Hemſkerck; "Daniel in the Lion's Den," in the back-ground are the Babylonians lamenting the overthrow of the dragon and Bel, and the prophet Habakkuk is conducted through the air by an angel, from the ſame maſter, in large folio. A ſet of eight, repreſenting the illuſtrious women of the Old and New Teſtaments, *viz.* Jael, Ruth, Abigail, Judith, Eſther, and Suſannah, from the old, and the Virgin Mary and the Magdalen from the new, in folio. An allegorical ſubject, repreſenting "Fraud and Avarice;" a bacchanalian ſubject of "Children dancing," both of folio ſize, all from Hemſkerck; "The Reſurrection of our Saviour," from Breughel the elder, in large folio; "The Temptation of St. James and St. Anthony," 1565, both in folio; and from the ſame maſter, "The Laſt Judgment," with the cypher of Cock, dated 1558, in large folio; "The Laboratory of an Alchymiſt," in folio; "The Carnival, or Diſpute between the Fat and the Lean," in two folio plates, dated 1563. A ſet of twelve hiſtorical landſcapes, moſt of them ſacred ſubjects, with Latin inſcriptions, of large folio ſize, etched by Jerom Cock, all of them from the elder Breughel. A groteſque compoſition of "The large Fiſh devouring the ſmaller," from Jerom Bos; it is inſcribed "Vrinden dit heeftmen reel Jaren geweten Dat de groote Viſſen de cleynen eten," in large folio. A large folio print of "The Temptation of St. Anthony," inſcribed "Multæ tribulationes." "St. Martin in a Boat with Devils," in large folio; "A Dream," 1561; "Shrove Tueſday," an allegorical ſubject, of large folio ſize, 1567; "De Blau Schuyte," "The Blue Ship," in large folio, all from Jerom Bos; "The Combat of the Horatii and Curiatii," after Franc Floris; "Hercules ſleeping, aſſailed by Pigmies," from the ſame maſter, both in large folio; "King Ahaſuerus, ſurrounded by his Court, inveſting Eſther with Royalty," from Lambert Lombard; "Jeſus with his Diſciples, at the Houſe of Martha and Mary," 1556, in large folio; "Jeſus at Table in the Houſe of Simon the Phariſee," 1551, in folio; "The Reſurrection of Lazarus," both from the ſame maſter, in large folio, all inſcribed H. Cock, exc.

Subjects from Italian Maſters.—"Abraham offering up Iſaac," and the angel appearing with a ram, from Raphael, 1552, in folio; "The Nativity," from the ſame painter, in folio; "Many are called, but few are choſen," in large folio, from Andrea del Sarto, dated 1553; "Females bathing," a folio print, from Lucas Penni; "Captives repoſing," a frieze from Polidore; "The Paſſage through the Red Sea," from Angelo Bronzino, in folio; "The Viſitation of Elizabeth," from Sebaſtian del Piombo, in folio.

Jacob Boſius, or Boſſius, ſurnamed in Italy *the Belgian*, was born in the early part of the ſixteenth century, but in what part of the Low Countries we are unable to ſay. He ſtudied in Italy under ſome one of the diſciples of Marc Antonio, but never roſe above mediocrity. His ſtyle is neat, but wants both freedom and correctneſs of outline. The extremities of his figures eſpecially are heavy and not well marked.

He often marked his engravings with two B's, which ſhews that he adopted the ſurname of Belgia, which was conferred on him by the caprice of the Italians. The time of his death has not been mentioned.

Of his works the following few appear to include all the variety which Boſſius was capable of exerting, and more than he could exert with credit as an artiſt.

The portrait of Michael Angelo, in octavo. Buſts of St. Thomas Aquinas, and Otho Truchſeſs, biſhop of Albany, in quarto. "The Crucifixion," in folio. A ſet of the four Evangeliſts, after Blockland, in quarto. "Jacob's myſterious Dream," and "St. Peter and St. John healing the Cripple" both in folio, and after Raphael. The ſtatue of Pyrrhus, king of the Moloſſes, from the antique, in folio, dated 1562; and "The Baths of Diocleſian," with other views of antiquities executed in conjunction with Ant. Lafreri.

Lambert Suterman, or Suavius, was born at Liege, in Flanders, in the year 1510, and became the diſciple of Lambert Lombard, with whom Sandrart confounds him; but Heinneken has removed all doubt on the ſubject, proving that Lombard was merely a painter and never uſed the graver at all.

Suavius engraved many plates both from his own deſigns and thoſe of his maſter. His figures are generally tall and thin; the outlines of the naked parts of them are tolerably correct, but dry and without dignity. His draperies are generally divided into ſmall folds, which by not being ſufficiently varied or contraſted with each other, form unpleaſing lines. The attitudes of his figures are ſeldom well choſen, or properly adapted to the ſubject, and the management of the light and ſhade by no means commendable. His ſtyle of engraving is very neat, and ſeems to have been contracted in the German ſchools; but his mode of deſign diſcovers more of the Italian than the German taſte.

His engravings are numerous, but neither exquiſite nor very rare; we ſhall mention the few following

From Lambert Lombard.—"Charity," ſurrounded by eight children; "The Reſurrection of Lazarus," both in quarto, dated 1544; "Jeſus travelling to Emmaus, with his two Diſciples," in folio; "The Entombing of Chriſt," in quarto; "St. Peter and St. Paul healing the Sick;" "The Deſcent from the Croſs," and "Our Saviour reſtoring the Widow's Son," all in folio; "Pſyche with the Vaſe of Proſerpine and Juno," marked with the name of Raphael, in ſmall folio.

From his own Drawings.—"The twelve Apoſtles," in quarto. Two circular prints, repreſenting a profile of our Saviour, and one of the Virgin Mary. A buſt of Melchior Schets, in a circle, inſcribed "Mundus regitur opinionibus," 1561; Anna Stralen, "Mel Scheti conjux," 1554; "Michael Angelo Buonarotus, nobilis Florentinus," a circular print; and a portrait of Cardinal Granvelle, in quarto. All the portraits by Suavius are executed in a very delicate ſtyle.

The family of Goltzius were illuſtrious in art. Hubert, the firſt of that name who diſtinguiſhed himſelf as an engraver, was the ſon of a painter of Wurtzburg, but was born at Venloo in the year 1520. Under the tuition of his father and of Lambert Lombard, he acquired ſome proficiency both in arts and in letters, and, having to copy ſome drawings which had been done from the antique, at the houſe of the latter, they excited in him ſo ſtrong a deſire to ſee and ſtudy from the originals, that he forthwith ſet out for Rome. After remaining ſome time in that diſtinguiſhed metropolis, he travelled homeward through Italy, France, and Germany, leaving few of the celebrated works of art, or European monuments of antiquity, unſeen; and finally eſtabliſhed himſelf at Bruges, where he ſucceſſively publiſhed thoſe volumes of medals, inſcriptions, and other objects of antiquarian reſearch, collected during his travels, which are ſtill ſought after by the curious; and where he died in the year 1583.

Strutt ſays, "he was twice married, and the abominable croſſneſs and ill temper of his ſecond wife (ill ſuited as a companion to a ſtudious man) is ſaid to have ſhortened his days." Moſt of his antiquarian writings are compoſed in the Latin language, and were printed, as well as their engraved accompaniments, in his own houſe.

Hubert painted ſome few pictures which have been ſpoken of with commendation, and are valued for their rarity, but is chiefly known as a man of letters and an engraver. He obtained the title of painter and hiſtorian to Philip II. of Spain, to whom he dedicated, "Faſti Romani ex antiquis numiſmatibus et marmoribus ære expreſſi et illuſtrati;" and "Icones Imperatorum Romanorum, et ſeries Auſtriacorum, &c." both in folio, and printed at Bruges.

The medals in theſe works are executed in *clair obſcure;* and it has ſince been copied and reprinted at Antwerp by Balthaſar Moret, who has added five medallions from deſigns by Rubens, in order to bring down the ſeries to the time of Ferdinand III.

The manner in which Goltzius produced his prints in clair obſcure, was by firſt printing from an outline etched on copper, and afterward impreſſing the half tint and deeper ſhadows from the ſurfaces of blocks of wood and with the letter-preſs. In this manner our artiſt produced two other works, adorned with numerous engravings by himſelf and Joſeph Gietleughen of Courtrai, of which the firſt, printed at Bruges in 1563, and containing forty-ſix prints, is entitled "C. Julius Cæſar ſive hiſtoriæ Imperatorum Cæſarum Romanorum ex antiquis numiſmatibus reſtitutæ, liber primus, Huberto Goltzio Herbipolita Vanloniano Auctore et Sculptore;" and the ſecond, containing two hundred and thirty-four engravings, printed at Bruges in 1566, bears the title of "Faſtos Magiſtrorum et Triomphorum Romanorum ab urbe condita ad Auguſti obitum ex antiquis Monumentis reſtitutos, Hubertus Goltzius Herbipolita Venlovianus dedicavit."

Henry Goltzius was a man of more genius, though of leſs reſearch, than Hubert. His father, John Goltzius, was a painter on glaſs, of Mulbrech, in the neighbourhood of Venloo, where our artiſt was born in the year 1558.

After acquiring ſome knowledge in the rudimental part of drawing under his paternal roof, Henry was placed, firſt under Jaques Leonherd, and afterward became the diſciple of Theodore Coornhaert, who taught him engraving, and under whoſe tuition he ſoon began to diſcover very ſurpriſing talents in that novel and difficult art, notwithſtanding the diſadvantage of a lame hand, which was occaſioned by falling into the fire during his infancy.

Goltzius afterwards worked, for a ſhort time, for Philip Galle, but in conſequence of domeſtic troubles and an ill ſtate of health, occaſioned partly by his too cloſe profeſſional application, was adviſed to travel. His deſire of improvement coinciding with his medical adviſers, he paſſed through Germany into Italy, viſiting Bologna, Florence, Naples, Venice, and Rome, frequently aſſuming a feigned name, that he might with the leſs interruption apply himſelf to the ſtudy of the antique and the *grand guſto* of Michael Angelo.

Now was the time when what the profeſſor Fuſeli terms the "frantic pilgrimage" of artiſts to Italy, raged with cruſading zeal, and no painter in the eſtimation of the hypercritics, might be conſidered as perfect in his art, who had not trembled before the Laſt Judgment of the terrible Michael Angelo; moderation in ſtyle, was inſenſibility; and Goltzius himſelf, though a man of diſcernment, became infected to a certain degree with the faſhionable bombaſt.

In the genial climate of Italy his health returned, and at Rome he remained for ſome years, producing there ſeveral very excellent engravings from Raphael, Polidoro, and other eminent maſters. He finally returned to the Low Countries, and eſtabliſhed himſelf at Haerlem, where he engraved many plates, of which the ſubjects conſiſt partly of his own compoſitions, and are partly taken from the drawings which he copied from celebrated works of art during his reſidence in Italy, where, in 1617, he died at the age of fifty-nine years.

He married a widow lady of Haerlem, whoſe ſon James Maetham (the fruit of a former marriage) became (as we ſhall have occaſion to notice) a diſtinguiſhed engraver, under the inſtruction of his father-in-law. He is ſaid to have been forty years of age before he began to paint. His pictures are few in number, and their rarity perhaps has raiſed them to a higher value than they might elſe have attained.

But we have to ſpeak of him chiefly as an engraver. Poſſeſſing conſiderable anatomical knowledge, he drew the human figures admirably, and articulated the joints and extremities with ſuperior ſkill. But conceiving himſelf qualified, on his return from Italy, to correct the littleneſſes and Gothic ſtiffneſs of his Dutch and German contemporaries in art, and the taſte which prevailed among the connoiſſeurs of the Low Countries, he too frequently ran into the oppoſite extreme, and twiſted and bent his fingers and his feet, ſometimes into abſolute diſtortion, in ſpite of nature and his own ſuperior knowledge. While the mania laſted, his intended grace became real affectation, and his grandeur ridiculous ſwaggering.

In order to ſhew that the revolution in ſtyle which he aimed at accompliſhing, was the reſult of ſuperior powers, and that it proceeded not from his inability to emulate and excel, at their own weapons, the heroes of Holland and Germany, he took a moſt effectual method, in the proſecution of which he was eminently ſucceſsful. He compoſed and engraved what are termed his chef-d'œuvres, or *maſterpieces*, which ſhew the amazing verſatility of his talents; and which, though chiefly aimed at the reputations of Albert Durer and Lucas of Leyden, does not ſcruple to provoke compariſon alſo, with Baſſan, with Parmegiano, and even with Raphael himſelf.

There had not been wanting among the connoiſſeurs and amateurs of the Low Countries, ſome who inſinuated that Goltzius deviated from the ſtyles of art which had called forth their admiration, becauſe he had fancied or found them to be inimitable. No expedient could more juſtly or more completely have ſilenced theſe obſervations, than the contrivance and execution of theſe ſix large engravings. Before he made public that of which the ſubject is "The Circumciſion," and which was deſigned to vie with Albert Durer; and before his general purpoſe was known, he beſtowed a few years of age on an impreſſion, by means of ſmoke, and exhibited it in the preſence of a choſen few, who, to the great entertainment and ſecret ſatisfaction of our artiſt, ſtood in ſpectacles and in raptures, before the ſuppoſed engraving of Albert Durer. And, in truth, this print ſo very much reſembles the very beſt works of that maſter, both in deſign and execution, as to be ſcarcely any impeachment of the diſcernment of the connoiſſeurs who were thus deceived.

Goltzius might now fearleſsly publiſh his maſter-pieces, which he did with extraordinary ſucceſs, and in which, after varying his ſtyle five times in order to imitate ſeverally the maſters above-mentioned, he finiſhes the ſet of ſix with an "Holy Family," which he meant ſhould be underſtood as the improved ſtyle of Henry Goltzius, and which cloſes the proceſſion, and completes his triumph,—but not the catalogue of his merits.

He engraved portraits from his own drawings, in a very maſterly manner, very taſtefully uniting excellent drawing, and vigorous effect of light and ſhade, with neatneſs of execution. He alſo engraved from his own compoſitions on wood, in the manner which is technically termed *clare obſcure*, or *chiaroſcuro*, in which he differed from Hubert Goltzius, by employing *three* blocks of wood; on the firſt of which he cut his outline with great boldneſs and ſpirit; the ſecond ſerved to impreſs the demi-tints, the high lights being cut away; and the third the deeper ſhadows. In the works which he executed in this way, the lights appear as if emboſſed, and they are on the whole very maſterly productions.

The power of Goltzius over his graver, which was the chief inſtrument of his art, and the freedom, boldneſs, and copious variety of combination with which he hatched his courſes of lines, is wonderful, and would have been truly faſcinating, had he adhered to that pure and accurate ſtyle of drawing which once diſtinguiſhed him, inſtead of deviating into extravagance and eccentricity.

The cypher with which he marked his engravings, when he did not ſubſcribe his name at length, may be ſeen in our firſt plate of thoſe uſed by the engravers of the Low Countries.

We begin our catalogue of his works, which will probably long continue to rank in the very firſt claſs of the arts of his country, with his

Portraits.—A buſt of Gertrand Adriaanſſz Brederods, in an oval, with an allegoric accompaniment of two tigers and a laurel, a very rare print; Henry III. king of France, an oval, very rare, dated 1592; Frederic II. king of Denmark, quarto ſize; William prince of Orange, in an oval, ſurrounded with a groteſque border, in folio; Charlotte of Bourbon, princeſs of Orange, companion to the preceding; both engraved in a very delicate ſtyle; Theodorus Coornhertius ad vivum depictus et acri inciſus, ab H. Goltzius, a very rare folio print; Hans Bol, after Joannes Boltius, a folio print, ſurrounded with ornaments; John Stradan, a painter of Bruges, in quarto; Philip Galle, an engraver of Antwerp, of the ſame ſize, dated 1582; Peter Foret, or Foreſtus, a Dutch phyſician, in octavo, dated 1586; Juſte-Lipſe, a celebrated critic, inſcribed "Moribus antiquis," dated 1587; a half-length portrait of John Zurenus, painted by M. Hemſkerck, in quarto; Monſieur de la Faille, inſcribed "Leges tueri. Harm. Adolfs. exc." in quarto; Madame de la Faille, companion to the above, (a young woman with a ſkull in her hand.) This pair of portraits are executed with extreme delicacy, and are much celebrated. Chriſtopher Plantin, a famous printer; and Francis d'Egmont, completely armed, a half-length portrait, both in quarto; Robert, earl of Leiceſter, general in the United Provinces, 1586, a very fine print, in a ſmall oval; S. Sovius, inſcribed, "Bene agere et nil timere," 1583, rare; a half-length portrait of a man meaſuring a globe, inſcribed "L'homme propoſe, et Dieu diſpoſe," 1595. This is believed to be the portrait of Petri, an aſtronomer of Amſterdam, in 12mo. A lady ſitting in a garden chair, ſuppoſed to be the portrait of Catherine Dekker, of Haerlem, of the ſame ſize; buſt of a man with a round hat, in 4to.; buſt of a female with a hat, executed entirely with the graver; half-length portrait of a female, veiled, and covered with drapery, 1606, taſtefully engraven in a neat and elaborate ſtyle; and the buſt of a man, with a cocked hat, both of quarto ſize.

Various Subjects from his own Compoſitions.—A circular print in quarto, of "Judah and Tamar," one of the earlieſt engravings of Goltzius. A ſet of ſix capital prints, which we have particularly noticed in his biography, and which are known by the name of the *maſterpieces* of Goltzius. 1. The Annunciation, in the ſtyle of Raphael. 2. The Viſitation, in the ſtyle of Parmegiano. 3. The Annunciation, in the ſtyle of Baſſan. 4. The Circumciſion, in the ſtyle of Albert Durer. 5. The Adoration of the Kings, in the ſtyle of L. of Leyden. And 6. A Holy Family, in his own ſtyle, or, according to ſome critics, in the ſtyle of Baroccio, all of large folio ſize: it ſhould be known, that in the Circumciſion he has introduced his own portrait. A very rare print of "The Nativity," in large folio, which is unfiniſhed; inſcribed Jac. Matham, exc. 1615. "The Adoration of the Kings," in quarto. rare; "The Slaughter of the Innocents," C. Viſſcher excud. likewiſe very rare; and in an unfiniſhed ſtate, a very large folio. "A Repoſo," H. Goltzius fecit. in 4to. 1589; "The Good Samaritan," H. Goltzius ſc. et excud. 1589; The Paſſion of our Saviour, in twelve plates, H. Goltz. fec. 1597, in 4to. Theſe are engraven ſomewhat in the ſtyle of Lucas of Leyden. The half-length figures of Chriſt, and thirteen apoſtles, with Latin inſcriptions, engraved on fourteen plates, H. Goltzius fec. in octavo, 1598. Another ſet from the ſame originals, ſaid by Huber and Roſt to be almoſt as large as life, and the name of each apoſtle added; executed with very bold courſes of lines. "The Adoration of the Kings," a ſingular compoſition, and a very rare folio print; "The Infant Chriſt," ſeated on a cuſhion holding a globe, and ſurrounded with a glory of angels, a very finely engraved plate, in 4to. dated 1597; "The Temptation of St. Antony," and "A Saint, holding a Book," (perhaps Jerome,) both in quarto. A ſet of fifty-two, from the Metamorphoſes of Ovid: it is believed that Goltzius was aſſiſted by his pupils in the execution of this ſet. A ſet of ten of the heroes of ancient Rome, *viz.* 1. The Horatii and Curiatii. 2. Horatius Cocles. 3. Mutius Scævola. 4. Curtius. 5. Torquatus. 6. Corvinus. 7. Manlius. 8. Calphurnius. 9 and 10 are allegorical ſubjects. This ſet is executed with very bold ſtrokes, and have very fine back-grounds. A circular print of Venus reſting againſt a tree, and Cupid preſenting a ſword, inſcribed "Sine Cerere et Baccho, friget Venus," executed in ſo very delicate a manner, that it forms a ſtriking contraſt with the former. A ſet of three ovals, repreſenting 1. Bacchus; 2. Venus; and 3. Ceres, dedicated to Cornelius of Haerlem. Another ſet of three ovals, of 1. Pallas; 2. Juno; and 3. Venus, dated 1596. A couchant Venus, ſurrounded by the four elements, perſonified by cupids, an oval print, all of folio ſize. "Mars and Venus, expoſed to the Ridicule of the Gods," 1585, in large folio. Three folio plates of the loves of the gods; 1. Jupiter and Juno. 2. Neptune and Amphitrite. 3. Pluto and Proſerpine. "Apollo in the Clouds," with an inſcription round his head, 1588; "Pygmalion and the Statue," 1593, all in folio. A ſmall oval print of "Mercury and Argus," very rare; the nine muſes, dedicated to John Sadeler, dated 1592, in folio; three folio circular prints of "The Deſtinies;" "The three Graces," crowned with laurel, in folio; a large folio print of "Apollo Pythius, Statua antiqua Romæ, in palatio Pontificis Bellevedere, etc." "Hercules ΑΛΕΣΙΚΑΚΟΣ Inſcriptus Roman. Commodus Imperator. Statua antiqua Romæ, in palatio Pontificis Bellevedere, etc." in large folio, with four Latin verſes; and "Hercules Victor. Statua antiqua Romæ, in palatio Cardinalis Farneſii, etc." publiſhed after the death of Goltzius by Herman Adolf, in large folio. Theſe three ſtatues form a very beautiful and intereſting ſet, where the vigorous powers which diſtinguiſh the graver of Goltzius, are exhibited in high perfection. "Hercules;" in the back-ground are repreſented ſome of his labours; of very large folio ſize, dated 1589. In this print the artiſt appears to have intended to convey an idea of godlike ſtrength, but has run far into the extravagance which we have cenſured in his biography. "Apollo playing on his Lyre, ſurrounded by the Muſes," a very large print, dated 1590. The ſeven cardinal virtues; Faith, Hope, Charity, Juſtice, Prudence, Fortitude, and Temperance; of quarto ſize; ſeated on ornamental architecture. Three very fine prints, in folio. Eight females embracing, repreſenting human virtues in four very fine folio prints; "Labour and Diligence, (perſonified by a man and female,) embracing," a very rare quarto print, dated 1582. A naked infant reſting againſt a ſkull; an emblem of human vanity, in large quarto. "Chriſtian Prudence," repreſented by a drapered female, inſcribed "Aſtute ſerpentes, et ſimplicitate columbas," a very rare engraving, in a ſmall circle; "The Blind leading the Blind," a ſmall circle, very rare; "The War Chariot," with an explanation in French and Dutch, of large folio ſize. A young female, refuſing the offer of a rich old man, followed by a young one. A companion, of a young man refuſing an old woman, both rare prints, and of folio dimenſions. "The Dog of Goltzius," or "The Boy and Dog:" it is pretended by ſome that the boy who is introduced is the ſon of the Venetian painter Theodore Friſius, to whom the print is dedicated; and by others that it is the portrait of the engraver himſelf: it is in large folio, an exquiſite print, and the good impreſſions are now become rare and valuable. "Coridon au Silvia," a paſtoral ſubject beautifully engraven. A man in a Spaniſh dreſs, carrying two flowers, in folio, inſcribed "Sic tranſit gloria mundi." An officer with a halbert, with a battle in the back-ground, in fol. An officer marching, and a view of the city of Prague in the back-ground, 1587. A grand mountainous landſcape with ſhepherds tending their flocks in the fore-ground; and in which Dedalus and Icarus are ſeen in the air; a large folio print, and one of the fineſt etchings by Goltzius.

Engravings on Wood, in Clair-obſcure, and Cameo.—A landſcape, with ruſtic buildings, and a female drawing water from a well, in 4to. A landſcape, with an enormous rock on the ſhore of a raging ocean, and an hermit proſtrate, in 4to. A ruſtic ſubject with ſheep feeding, in 4to. Half-length portrait of a warrior, with lance and helmet, in folio. "Hercules combating with the Giant Cacus," engraved on a ſingle block, in folio. The ſame ſubject executed in clair-obſcure. A ſet of ſeven figures of heathen divinities, *viz.* Jupiter, Neptune, Pluto, Thetis, Flora, Night, and Eternity; theſe prints are in ovals of large folio ſize, and have a very ſtriking effect.

Subjects from Italian Maſters.—"St. Joachim," from a picture by Raphael in the church of St. Auguſtin at Rome, dated 1592, in folio; "The Triumph of Galatea," from a picture by Raphael, in the Farneſian gallery. Eight divinities in niches, from Polidoro; *viz.* Saturn, Neptune, Pluto, Vulcan, Apollo, Jupiter, Bacchus, Mercury, in folio. Two ſybils, after antique ſtatues, in 4to. "The Laſt Supper," from a very grand compoſition by Paul Veroneſe, dated 1585; "The Marriage of Cana," after J. Salviati, a very large engraving, executed on two plates; "St. Jerom meditating in a Deſart," from Palma the younger, in large folio.

Subjects from various Maſters in the Low Countries.—"The Fall of our firſt Parents," in 4to. from Barth. Spranger, 1585; "A Dead Chriſt," ſupported by an angel, from the ſame maſter, in large folio; "The Celebration of the Nuptials of Cupid and Pſyche among the Gods," from the ſame maſter, executed on two large plates; "The Dragon devouring the Companions of Cadmus," after Corneille Cornelius, in folio, 1588; "Ulyſſes reproving Irus before the Suitors of Penelope," from the ſame maſter, in large folio. Large circular prints of the four elements, repreſented by Tantalus, Icarus, Ixion, and Phaeton; "St. Paul ſhaking off the Viper, in the Iſle of Melita," from J. Stradan, in folio; "Lot and his Family forſaking the burning City," from Ant. Blocklant, dated 1582, in large folio; and "The four Evangeliſts at the Sepulchre of Chriſt," from the ſame maſter, 1583, of large folio dimenſions.

Julius Goltzius was probably of the ſame family with Henry, but the acquiſitions of genius are unalienable, and Julius attained to no eminence as an engraver. He was apparently educated in the ſchool of the Galles, but of his birth or death there is no record, though his principal work was executed in 1581. He engraved on copper, but his objects are ill drawn and taſteleſsly executed. Great part of the figures in "Habitus Variorum Orbis Gentium," publiſhed by Boiſſard, is from his hand, as are alſo "The good and bad Shepherd," from Martin de Vos, and "Chriſt appearing to Mary Magdalen," after Fred. Sucaris.

Henry Van Cleve, or Cleef, alſo called *Clivenſis*, was born at Antwerp in the year 1520, and died in the ſame city in 1589. He was the brother of Martin van Cleef, whom Vaſari confounds with Martin Schoen. He ſtudied in Italy, and beſide his proficiency in engraving, became an excellent landſcape painter, poſſeſſing great freedom of touch, and producing an harmonious chiaroſcuro. Upon his return to his native city in 1555, he was elected a member of the Antwerp academy of painters: he likewiſe engraved a great number of plates, which he ſometimes marked with the monogram, which will be found in our firſt plate of thoſe uſed by the engravers of the Low Countries; and at others, with "Henricus Clivenſis fecit."

Among his works the following will probably be found moſt worthy of ſelection. A bull fight, exhibited at Rome, before the Farneſe palace, in folio. Two landſcapes and figures, in folio. A ſet of ſix landſcapes, intitled, 1. Veneris Templum. 2. Forum Æmilii. 3. Templum Fortunæ. 4. Caloris. 5. Cataractes Tiburti. 6. Corfu Inſula. H. van Cleef fec. Ph. Galle exc. in folio. Another ſet of landſcapes: 1. View of a bridge at Segovia. 2. A promontory at Campania. 3. The tomb of the Horatii. 4. A view on the lake of Aricia, in folio. There is alſo a collection of thirty-five views by this artiſt, publiſhed under the title of "Henri a Cleve ruinarum ruriumque aliquot delineationes executæ, per Galleum," in folio.

Of his brother Martin van Cleef we know very little, and of his engravings nothing, excepting that profeſſor Chriſt ſays, they were marked with a monkey ſeated, with the letters V. C. upon its body, in the manner repreſented in our *Plate* I. of the monograms, &c. uſed by the engravers of the Low Countries.

A monkey it ſeems, which in England is nicknamed Jacko, is called Martin in Flanders: combined with the initials of Van Cleef, it therefore formed a kind of pun; and the age in which theſe engravers lived, is known to have been a time when puns were faſhionable, and paſſed for wit. Martin van Cleef, ſometimes miſtaken for Schoen, is the real Martin of Antwerp, of Vaſari, and thoſe Italian writers who have copied his errors.

Adrian Collaert, the elder, an artiſt of great merit, and likewiſe a printſeller, was born at Antwerp A. D. 1520. He became acquainted with the rudiments of his art in his native country, but made a journey to Italy, where he reſided ſome time in order to perfect himſelf in his profeſſion. He worked entirely with the graver in a firm and neat ſtyle, but ſomewhat ſtiff. His maſſes of light are rarely well managed, or ſkilfully blended with his demi-tints, and from being too much ſcattered and without the neceſſary graduation, he rarely produced even a tolerable chiaroſcuro. But to compenſate theſe defects (which may, in part at leaſt, be aſcribed to the age in which Adrian lived), he drew with great ability. The heads of his figures are frequently beautiful and characteriſtic, and the other extremities well marked.

The engravings of the elder Collaert are ſomewhat numerous, and are generally marked with a cypher, for which ſee our firſt plate of thoſe uſed by the engravers of the Low Countries. We ſelect from them the following, beginning with thoſe which are done

From his own Compoſitions.—A man and his wife conducted by Death, dated 1562, in 12mo. An armed warrior, to whom a female preſents a dog, a child, and a cock. The four elements, with a verſe in Latin under each, in 8vo. A ſet of thirty-ſix prints, in 12mo., entitled "Vita Jeſu Salvatoris variis iconibus, ab Adriano Collaert expreſſa." A ſet of thirty, in 4to. entitled "Avium vivæ icones in ære inciſæ et editæ ab Adriano Collardo." One hundred and twenty-five ſubjects, entitled "Piſcium vivæ icones." Another ſet, entitled "Florilegium ab Hadriano Collaert cælatum, et ab Phil. Gallo editum;" in twenty-four 4to. plates. A large folio plate from the "Laſt Judgment" of Stradan. "St. Anthony tormented by Devils;" and "St. Apollonius," ſurrounded by ſubjects from his life, both of folio dimenſions.

From various Maſters.—The twelve months of the year, from Joſhua of Momper, of 4to. ſize: the ſame ſubjects were copied by Callot. A ſet of twelve beautiful horſes in various attitudes, from Stradan, 8vo. plates, engraved very delicately. A ſet of chaces and fiſhing parties, from Stradan, in 4to. Four fine landſcapes from H. van Cleef, entitled "Regionum rurium varii atque amoeni proſpectus." A ſet of hermiteſſes, from M. de Vos, in the engraving of which, Adrian was aſſiſted by his ſon, 4to. ſize. "The Iſraelitiſh Women ſinging the Pſalm of Praiſe for the Deſtruction of the Egyptian Hoſt in the Red Sea," a 4to. plate from Stradan; "Maternal Love," preſumptively a ſatirical print, its real ſubject being a woman tearing her child to pieces with the fury of a lion, in 4to. from the ſame maſter; "The Vocation of St. Andrew," from Baroccio, in folio. This ſubject was likewiſe engraven by G. Sadeler. "The Myſtery of the Maſs," from Th. Bernard; "A Repoſe during the Flight into Egypt," where St. Joſeph is repreſented gathering grapes, from H. Goltzius, dated 1585. The Annunciations of Iſaac, Sampſon, St. John the Baptiſt, and our Saviour. St. Joſeph, and the Angel of the Shepherds, from the ſame maſter, 1586, all of folio dimenſions. Theſe laſt ſix plates are reckoned the beſt engravings of Collaert.

Hans, or John Collaert, the ſon of the preceding artiſt, was born at the ſame place, in the year 1540. He learned the elements of art of his father, but afterwards went to Italy for improvement. He aſſiſted his father in moſt of his larger works, beſides engraving a great number of plates himſelf; which he did in a ſtyle very much reſembling that of Adrian. He muſt have lived to a great age, for his prints are dated from 1555 to 1622. He marked his plates with his initials, combined in a cypher, which will be found in our firſt plate of thoſe uſed by the engravers of the Low Countries, and ſometimes his name at full length. Among his works we ſhall ſpecify the following, beginning with thoſe

From his own Compoſitions.—Ten ſubjects in 4to. dated 1581, entitled "Monilium Bullarum inauriumque artificioſiſſimæ Icones Joannis Collaert opus extremum." The hiſtory of St. Francis, in a ſeries of ſixteen plates, with groteſque ornaments, in 4to. "A Chriſt," accompanied by two other half-length figures, perhaps intended for Moſes and Elias, in an ornamental border; "A Dead Chriſt on the Lap of the Virgin," inſcribed "Torcular Calcavi etc. Joan Collaert ſculp.;" "The Laſt Judgment," ſurrounded with ſmall ſubjects from the life of Chriſt, inſcribed, "Hunc veniant juſti, etc." all of folio dimenſions; "Marcus Curtius precipitating himſelf into the Gulf;

and " Peace and Charity," with the motto " Pacem habete ;" both of folio ſize.

From various Maſters.—" St. John the Baptiſt preaching in the Deſart," a grand compoſition, in folio, inſcribed G. A. Z. inventor ; " Moſes ſtriking the Rock," a large print, lengthways, from Lambert Lombard. A great number of ſmall figures are introduced into this print, and they are admirably well executed : the heads are fine, and the drawing very correct. This is conſidered as one of the beſt prints from the graver of John Collaert : it was publiſhed by Jerome Cock, 1555, and is marked " Hans Collaert fecit." " A Satyr purſued by Females," from J. Straden, in folio ; " A female Centaur ſuckling her young ;" and " A Centaur nurſing a young Bear," (companion to the laſt ;) " Mars repoſing on the Lap of Venus," in 4to., both from the ſame painter ; " The Loves of Mars and Venus," in four plates, with Latin verſes, in folio. From Philip Galle of Haerlem. The following prints, for the miſſal of Moretus, from the deſigns of Rubens, are much ſought after by connoiſſeurs : 1. The Annunciation. 2. The Nativity, with the Adoration of the Shepherds. 3. The Adoration of the Eaſtern Kings. 4. The Laſt Supper. 5. The Crucifixion. 6. The Reſurrection. 7. The Aſcenſion. 8. The Deſcent of the Holy Ghoſt. 9. The Aſſumption. 10. An Aſſemblage of the Saints in Heaven. 11. David imploring the Mercy of God on his People, afflicted with the Plague. And, 12. The Tree of Genealogy of the Jewiſh Kings ; all in ſmall folio. This laſt ſubject is very rare.

The following are likewiſe from the compoſitions of Rubens : " Theology," perſonified by a female, holding a flaming torch, on each ſide of whom is a Thermes, repreſenting the old and the new laws. Frontiſpiece to The Eccleſiaſtical Hiſtory from the Birth of Jeſus Chriſt to the Year 1622, wherein Religion is introduced holding a croſs and tiara. Frontiſpiece to The Lives of the holy Fathers, by T. Vaders.

William Collaert was the ſon of John, and engraved with ſome ability. Of his works we are only acquainted with " The Viſitation of Elizabeth," in folio ; and a ſet of ten quarto plates for " Bullarum Inaurium, &c. Archetypi Artificioſi," from the deſigns of his father.

Theodore or Dirick Volkart Coornhaert, or Cuerenhert, was born at Amſterdam in the year 1522, and became one of that extraordinary claſs of men, whom the world honours with the epithet of ſingular or eccentric whilſt they are living, and rarely knows how to value till they are no more. In other words, Coornhaert was a ſtudious man, of various and extenſive attainments, and whoſe perceptions and reflections were entirely his own.

Beſide cultivating the arts of deſign, he diſtinguiſhed himſelf in various literary purſuits ; was a good poet, and at leaſt an original theologian. In his youth he travelled into Spain and Portugal ; but the motives or reſult of his journey, which was perhaps connected with ſome diplomatic purpoſe, have not been aſcertained.

Returning to the Low Countries, he eſtabliſhed himſelf as an artiſt and ſcholar at Haerlem, of which city he became public ſecretary, and was ſeveral times ſent as ambaſſador to the prince of Orange, to whom he addreſſed a manifeſto, which has been celebrated, and which was publiſhed by that prince in the year 1566.

But unfortunately for the temporal concerns of our artiſt, he deemed that religion was an affair between every individual man and his Creator, in which no other man had a right to preſcribe tenets of doctrine or modes of faith. He, moreover, perceiving how the prieſthood degraded themſelves by worldly purſuits, had the wiſdom or the folly to maintain, that the channels of ſpiritual communication had become corrupt ; and that without a ſupernatural miſſion, accompanied by the power of working miracles, no perſon had a right to adminiſter in any religious office.

Such direct heterodoxy could not fail to draw on him violent and empaſſioned oppoſition of the clergy. Both parties became heated by diſputation. The prieſts anathematized ; and Coornhaert proceeded to pronounce that man to be unworthy the name of Chriſtian, who would enter any place of public worſhip ; a doctrine which he not only advanced by words, but evinced the ſincerity of his belief, by abſtaining from all churches, and from all ghoſtly communication with both Proteſtants and Papiſts.

It is needleſs to add, that his deſtruction was now complete. After being ſeveral times impriſoned, during the progreſs of the controverſy, without abjuring his hereſies, he ſuffered the martyrdom of baniſhment, and died at Dergoude at the age of 68 years, perſevering in his religious opinions to the laſt.

Coornhaert had, early in life, acquired ſome knowledge in engraving, among his various purſuits, and occaſionally practiſed that art in the way of recreation, and merely for the ſake of the pleaſure which he derived from it ; but the pertinacity of his religious zeal having impoveriſhed him, he was obliged to have recourſe to engraving for his ſupport. The ſubjects of his prints are, for the moſt part, taken from the ſacred writings ; and his ſtyle, though ſlight, is original, and the ſeeming reſult rather of intuitive feeling than of acquired knowledge. He worked with the graver alone, in a looſe and open ſtyle, ſo as ſomewhat to reſemble pen and ink drawings.

Coornhaert ſometimes worked in conjunction with Philip and Theodore Galle ; and it is no ſmall addition to his reputation as an artiſt, that he was the inſtructor of Henry Goltzius, of whom we have already treated. An edition of his writings was publiſhed in three folio volumes, 40 years after his death. Whether any complete edition had preceded this, we are unable to ſay.

Our catalogue, which follows, of the works of this extraordinary man, is unfortunately very imperfect. We believe, however, that it includes the moſt favourable ſpecimens of his talents. His plates are generally marked with one or other of the two monograms, which will be found in *Plate* I. of thoſe uſed by the engravers of the Low Countries, " The Deſcent from the Croſs," in large folio, after Lambert Lombard, dated 1556 ; " Joſeph explaining the Dream of his Father, in the preſence of his Brethren," after Hemſkerck, dated 1549 ; the companion to which is " Joſeph explaining the Dreams of the Priſoners before Pharaoh," dated 1549 ; both from the ſame maſter, in 4to. " Job ſcourged by the Devil, and ſcolded by his Wife ;" " Balaam mal-treating his Aſs ;" both in large folio. " The Elector of Saxony defeated at Muhlberg by the Emperor Charles V. ;" and " The Landgrave of Heſſe Caſſel proſtrate before Charles V. ;" all from M. Hemſkerck, of quarto dimenſions.

Mark Guerard, or Gerard, was born at Bruges A.D. 1530, and died in England 1590. He was a proficient in the various arts of engraving, architecture, and painting, both landſcape and hiſtorical. He alſo drew and etched animals with great ſpirit, as is evinced in his fables of Æſop, which are from his own compoſitions ; and in his ſet of eighteen quarto plates of wild and domeſtic quadrupeds.

He likewiſe delineated and engraved a plan of the city of Bruges ; and a ſet of 14 oval prints, of the Paſſion of Chriſt.

Of Criſpin Vanden Broeck, and his daughter Barbara, who flouriſhed about this period, we have already ſpoken. See thoſe articles reſpectively.

Beſide his celebrated *chiaroſcuro* of the Circumciſion, which is particularized in vol. v., Criſpin engraved a ſet of ſeven folio plates of "The Creation of the World," or "The firſt Week," with Latin inſcriptions, beginning "Ex informi omnium;" another ſet from Bible hiſtory, beginning with "Eve eating of the forbidden Fruit," and ending with "The Conſtruction of the Tower of Babel," in nine folio plates; a ſet of nineteen, from "The Life of the Virgin," in folio; a religious emblem, of our Saviour ſeated, whilſt people are occupied in catching the blood that flows from his wounds, in folio; "Jeſus Chriſt on the Croſs, with the Virgin and St. John," in an ornamented border. Both the laſt are marked with the cypher of the artiſt. Four circular ſubjects in *clair-obſcure*, likewiſe marked with his monogram: 1. The Annunciation. 2. The Viſitation. 3. The Adoration of the Shepherds. 4. The Adoration of the Kings: all of which are very rare.

For the cyphers with which Broeck occaſionally inſcribed his performances, ſee *Plate* I. of the monograms of the engravers of the Low Countries.

In a former volume, we have treated at ſome length of the family of De Paſſe, who, by tranſplanting the practice of the Low Countries, contributed to improve our indigenous ſtock of Engliſh engraving. The principal works of Criſpin, the patriarch of that family, are as follows:

Portraits.—Andrea Doria, of Genoa, in ſmall quarto; the elector, Frederic IV. of the ſame ſize, dated 1606; Mary, baroneſs of Rebourſe; Adolphus, baron of Schwarzenberg; Henry Frederic, prince of Naſſau; Henry IV. king of France; Mary of Medicis, queen of Henry IV. all of quarto ſize; Philip II. king of Spain; a buſt of Alexander Farneſe; Axel Owenſtiern, chancellor of Sweden, all of folio ſize; a circular print, in quarto, of Louiſa Julia, counteſs of Naſſau; Henry Cæſarius, juris-conſul, in quarto; Nicholas Fontani, a phyſician, in folio; Charles Niel, a clergyman, of the ſame ſize; Maurice, prince of Orange, on horſeback; Albert, archduke of Auſtria, and Maurice, prince of Naſſau, both on horſeback: in the background of the latter a camp and fortreſs are introduced; both in large folio. Queen Elizabeth ſumptuouſly habited, in quarto, from a picture by Iſaac Oliver; king James I.; Henry, prince of Wales; Charles, prince of Wales, afterwards king of England, both in ovals; Anne of Denmark; ſir Philip Sidney; the earl of Eſſex, on horſeback; Thomas Percy, a celebrated conſpirator, a very rare print; all of quarto ſize. And fifteen plates, entitled "Speculum illuſtrium feminarum."

Hiſtorical Subjects from his own Compoſitions.—"Adam and Eve," wherein a dog is introduced; "The Chaſte Suſannah," inſcribed "Pietas et Caſtitas;" and Cleopatra, inſcribed "Nec Pietas nec Caſtitas," as a companion to the former, both in quarto; "Hercules and Antæus," inſcribed "Vitium ut ſuperas terra altius attollere," in folio; "A Quarrel in the Interior of an Hotel," dated 1589, in folio. Three ſmall circular buſts, repreſenting Faith, Hope, and Charity, very fine engravings. "The Four Evangeliſts," half-length circular prints, in octavo. Twelve plates repreſenting angels variouſly occupied, of the ſame ſize. Another ſet of twelve, of the Sybils, inſcribed "Criſpin de Paſſe, inv. Criſpin, Simon et Magdalen ſc." in folio. "The Seven liberal Arts," and "The Nine Muſes," both in 12mo. A ſet of ſeventeen, intitled "Academia ſive ſpeculum vitæ ſcholaſticæ.—Criſpini Paſſaei, anno 1612." "The Riding Academy of Antonia Pleurinel," in a large folio volume, executed in the beſt manner of Criſpin.

Subjects from various Maſters.—"The Twelve Months of the Year," on ſmall circular plates, from M. de Vos. Six plates, compriſing "The Hiſtory of Tobit," from the ſame painter; "The Four Evangeliſts, with their Attributes," inſcribed, "Geldorpius Gorcius inventor et pinx." in large folio, very fine, and in the ſtyle of Cornelius Cort. "The Annunciation of the Shepherds," from Abraham Bloemart; "Our Saviour on the Croſs, between the Two Thieves," from Jod. de Winghe, both in large folio; "The Judgment of Paris," from Criſpin vanden Broek, in folio; "The Siege of Troy," from the ſame maſter, in large folio; and a ſet of four mountainous landſcapes, with figures, from John Breughel, of folio ſize.

Criſpin de Paſſe, junior, produced but few prints, and hence it has been ſuppoſed that he either died young, or quitted the profeſſion of engraving.

The principal of theſe are the portraits of Frederic, elector palatine, and Johannes Angelius Werdenhagen, both from his own drawings, but the date of the latter, 1630, ſhews that he lived at leaſt to the age of thirty years; and three plates from the Hiſtory of Lazarus. A fourth plate from this hiſtory, which completes the ſet, was engraven by the ſenior de Paſſe.

The works of William, the ſecond ſon, who reſided chiefly in London, were ſomewhat more abundant, but conſiſt chiefly of portraits, among which are thoſe of Robert Dudley, earl of Leiceſter; Robert Devereux, earl of Eſſex, on horſeback; George Villiers, duke of Buckingham, alſo on horſeback; and Frances, ducheſs of Richmond, &c.; all of quarto dimenſions. King James I., with his family, inſcribed "Triumphus Jacobi Regis Auguſtæ qui ipſius ſcrolis;" James I, with prince Henry of Wales; ſir John Haywood, accompanied by emblems; John George, duke of Saxony, alſo with emblematical accompaniments; and ſir Henry Rich, in an oval, are all in folio; and the latter one of the moſt carefully finiſhed engravings of William de Paſſe.

A ſet of the five ſenſes, with each a Latin verſe, in quarto; a family of gypſies, dated 1621, in folio; and a family-piece, ſuppoſed to be that of the palatine, where the youngeſt child is repreſented playing with a rabbit, folio ſize. For the monograms of both theſe artiſts ſee our firſt plate of thoſe uſed by the engravers of the Netherlands.

Simon, the youngeſt of the ſons of Criſpin, reſided alſo for ſome time in England, where he was employed by Hilliard, who was the Reynolds of his day, and of whom Dr. Donne wrote that often-cited paſſage,

> "A hand, an eye, by Hilliard drawn, is worth
> An hiſtorie by a worſe painter made."

For Hilliard, Simon de Paſſe engraved the portraits of moſt of the royal family of England. He was afterwards employed by the king of Denmark, and probably died at Copenhagen. The lateſt of his works executed in England are dated 1613. They chiefly conſiſt of portraits, with ſome few devotional ſubjects and book ornaments; and are marked with his initials combined in a cypher, which will be found in our ſecond plate of thoſe uſed by the engravers of the Netherlands. The principal portraits are thoſe of king James I. and Anne his queen, on horſeback, both in folio; prince Henry and queen Elizabeth, both in quarto; Robert Carr, earl of Somerſet, an oval print, in folio; Frances Howard, counteſs of Somerſet; George Villiers, duke of Buckingham; Francis Manners, earl of Rutland; ſir Walter Raleigh; Thomas, earl of Arundel, from Mirevelt; William, earl of Pembroke, from Van Somer; George, archbiſhop of Canterbury, dated 1616; Accuna, earl of

Condomare, and plenipotentiary to Philip IV.; ſir Thomas Smith, ambaſſador to Ruſſia; Mary Sidney, counteſs of Pembroke; Robert Sidney, earl of Liſle, afterwards earl of Leiceſter; Henry Wriotheſley, earl of Southampton; Lamoral, prince of Gaver, and count of Egmont; Maurice, prince of Orange, all of quarto dimenſions. Four whole length portraits of celebrated dukes of Burgundy, John de Valois, ſurnamed the Intrepid; Philip de Valois, ſurnamed the Hardy; Philip the Good; and Charles the Timid, very rare etchings; the frontiſpiece to the works of the lord chancellor Bacon; a print, entitled “Vanitas vanitatum et omnia vanitas,” with four verſes in the Dutch language. “Our Saviour with the Pilgrims on their way to Emmaus,” in folio; and “A Holy Family,” where the infant Jeſus is repreſented taking a grape from St. Anne, after Baroccio, are alſo from the graver of Simon de Paſſe.

The principal engravings of his ſiſter Madeline we have already noticed in our article on ENGLISH *Engraving*. Her monograms are inſerted in our *Plate* I. of thoſe of the engravers of the Low Countries.

The family of the Galles are more prominent than praiſeworthy in the hiſtory of Flemiſh engraving. Philip, the firſt of that family, was born at Haerlem in the year 1537, but reſided chiefly at Antwerp, where he publiſhed a great number of prints, and where he died in 1612.

Philip underſtood the human figure, handled the graver with facility, and diſcovered a ſhare of talent, that, if brought into action, and kept on the ſtretch, might have advanced the arts of his country; but commerce was the preſiding deity of the Low Countries, and he alone was eſteemed meritorious who became rich. The preſent writer wiſhes he were not ſtruck with too much of reſemblance in this reſpect between the Low Countries at that time, and England at this.

Galle appears to have ſacrificed all deſire of improvement to the rapid production of thoſe ſets of mediocre engravings which from the fountains of Holland and Flanders began about this time to flow over the reſt of Europe; and in effecting this purpoſe he was, unfortunately for the progreſs of art, joined by his own ſons, and by the families of Wierix and Sadeler. Strutt very truly obſerves that in all their works we may trace the ſame ſtiff and formal ſtyle, with little variation, and without any attempt to add taſte and freedom to correctneſs of form, or the ſmalleſt endeavour to enlarge the compaſs, or improve the harmony of chiaroſcuro.

From theſe ſlight engravings of Philip Galle, which for the moſt part are marked with one or other of the monograms, which may be ſeen in our ſecond plate of thoſe of the engravers of the Low Countries, we ſelect the following, as being moſt creditable to his abilities, and leaſt unworthy of the modern portfolio.

A ſet of ſix, of portraits of reformers and other diſtinguiſhed characters of the ſixteenth century, *viz.* Martin Luther, John Calvin, Ulricus Zwinglius, Bilelaldus Pircheymer, Dante, and ſir Thomas More; pedeſtrian ſtatue of the duke of Alva; portraits of Martin Hemſkerck, the painter, and William Philandre, a celebrated architect; all in quarto. A ſet of thirty-four from the life of St. Catherine. A ſet of ſix, in folio, of Sybils, &c. entitled “Jeſu Chriſti dignitatis virtutis et efficientiæ præventus Sybillis X.” after Blockland. The Seven Wonders of the World, in folio; to which, as an eighth, Galle added the Amphitheatre of Veſpaſian at Rome, after M. Hemſkerck. A ſet of ſeven battles, from Stradan; entitled “Mediciæ familiæ geſtarum:” in folio. “Our Saviour travelling with his two Diſciples to Emmaus,” in large quarto, from Breughel; “The Death of St. Anne,” in large folio, from the ſame maſter; “The Holy Trinity,” a grand compoſition, in large folio, from M. de Vos. This is eſteemed the beſt engraving by Philip. “King Solomon ſuperintending the Building of the Temple of Jeruſalem,” from Franc. Floris; “The Sacrifice of Iſaac;” and “Mutius Scævola, in the Tent of Porſenna;” both from the ſame maſter: all in large folio.

Theodore Galle was the eldeſt ſon of Philip, was born at Antwerp A.D. 1560, and having learned from his father the rudiments of engraving, made a journey to Italy, either with the view of improving himſelf in his art, or with that of rendering the profits of the print trade more productive or more ſecure. At Rome he engraved ſeveral plates, but adhered to the ſtyle of his father, though ſurrounded by the fineſt examples of ſuperior art.

After his return to Antwerp, he continued occaſionally to engrave; but print-*ſelling* was with him the buſineſs of life, and he publiſhed the works of other artiſts, as well as his own. His own have the defects of feebleneſs of chiaroſcuro, and ſtiffneſs of ſtyle: yet the following prints from his hand, will ſhew, that in neatneſs he excelled his father, and was a better draftſman.

“Julius Lipſius,” with allegorical accompaniments, explained by ſix Latin verſes; “St. Jerome,” in his cavern, in the act of adoration, both in folio, and of the oval form. A rare and large folio ſet of emblems, entitled “Lites abuſus,” &c. A ſet of ſmall plates from “The Life of St. Norbert.” A ſet of twenty-eight ditto, from “The Life of St. Joſeph, and that of the Virgin Mary.” A ſet of thirteen ditto, entitled “Typus occaſionis in quo recepta commoda, neglecta vero incommoda perſonata ſchemate proponuntur;” (this is from his own deſigns, and is now become ſcarce.) “The youthful Saviour contemplating the Croſs and Inſtruments of his Paſſion;” “St. John the Evangeliſt,” and “St. Jerome,” all of octavo ſize; a folio plate of “Count Ugolino and his Sons impriſoned in the Caſtle of Piſa,” from the Inferno of Dante, after J. Stradan, a rare print; “The Roman Matrons beſeeching Coriolanus to relent;” “Tiber reſting on his Urn, and the Veſtal Tucie receiving Water in a Sieve;” “Cornelia, the mother of the Gracchii, working with her Women,” all of folio ſize. A frontiſpiece, after Rubens, entitled “Aug. Maſcardi, ſilvarum, Lib. IV.;” and another frontiſpiece from Rubens, entitled “Las obras en Verſo de Don Franciſco de Boria;” 1654: both of quarto ſize.

Cornelius Galle, (commonly known by the appellation of the elder Cornelius) was the younger of the ſons of Philip, and was born at Antwerp in the year 1570. He imitated his father's manner of engraving, and followed the ſteps of his brother Theodore, though with far better ſucceſs as an artiſt.

At Rome he reſided a conſiderable time, and acquired there that freedom, taſte, and correctneſs of drawing, which are found in his beſt works, and render them far more eſtimable than thoſe of his relatives. He finally ſettled at Antwerp, and took a ſhare in that conſiderable commerce for prints, which was carried on there by the family of Galle. Among other engravings from his hand, the following will be found more particularly worthy of notice.

Portraits of St. Charles Borromeus, cardinal and archbiſhop of Milan, an octagonal print, in folio; Philip Rubens, father to the celebrated painter, in quarto; John van Havre, and Mother Anne of Jeſus, a Carmelite nun, in folio, both after Rubens; Artus Wolfart, a painter of Antwerp, in large quarto, from Vandyke; Charles I. of England, in an emblematic border, from N. V. Horſt, in large quarto; Henrietta Maria, the queen of Charles I. (ſurrounded by three goddeſſes,) in quarto, from the ſame maſter; St. Antony, in folio; and Leopold William, archduke of Auſtria; of the ſame dimenſions.

Hiſtorical Subjects, after various Maſters.—"Adam and Eve," from John Baptiſta Paggi; "Venus careſſing Cupid," both in large quarto; "The Return into Egypt," a circular plate, in large folio, from the ſame painter; "Jeſus at the Table of Simon the Phariſee," in folio, from L. Civoli; "St. Peter baptizing St. Priſque," from the ſame painter, quarto ſize; "The Virgin and Infant Jeſus, to whom St. Bernard preſents a Laurel Branch and Book," in folio, from F. de Vanni; "Chriſt on the Croſs," at the bottom of which is introduced St. Francis and St. Thereſa, in large folio; likewiſe from Vanni. A landſcape, wherein Venus is repreſented faſtened to a tree, whilſt Minerva ſcourges Cupid, in quarto, from Aug. Caracci; "The Virgin and Child," from Raphael; "The Entombing of Chriſt," in an octagon, quarto, from the ſame maſter; "A Statue of the Holy Virgin," in a niche, around which children are twining garlands of fruit and flowers, from Rubens; "Judith beheading Holofernes," in large folio, a capital print; "The Four Fathers of the Church," in folio, from the ſame painter; this plate was enlarged, but there are impreſſions from it of its original ſize, which are more highly valued by collectors, and which are known by a black ſtreak down either ſide: "Progné diſcovering the Head of his Son and Wife, after he had eaten their Bodies," in large folio; as a companion to "The Rape of Hippodamia," by P. de Bailliu. A naked figure, called "The Colour Grinder," alſo from Bailliu, in folio; and a print, entitled "Romanæ et Græcæ Antiquitatis Monumenta, e priſcis Numiſmatibus erecta per Hubertum Goltzium Antv. 1645."

A dray-horſe never deſcends immediately from the high bred racers of Newmarket: but mental endowments are rarely hereditary. Cornelius Galle, the younger, ſo called in contradiſtinction to the Cornelius of the preceding article, inherited engraving and print-ſelling, but not talent, from his father. He was born at Antwerp A.D. 1600. He was educated under his father, and endeavoured to imitate his ſtyle of engraving. His mechanical execution is ſometimes tolerable, but his drawing very incorrect. Strutt thinks that he may have wanted the opportunity of ſtudying in Italy, as his relations had done: but as thoſe relations had enriched themſelves by trade, it is rather to be inferred that he wanted motive or inclination to travel thither.

The portraits of Cornelius are ſomewhat ſuperior to his hiſtorical works; and the beſt of his portraits are thoſe of the emperor Ferdinand III.; Mary of Auſtria, his conſort; Henrietta of Lorraine; and John Mieſſens, the painter, all in large quarto, and after Vandyke; a folio plate of Jodocus Chriſtophorus Kup de Kupenſtein, (a ſenator of Nuremberg,) after Anſelm van Hulle; and Octavius Piccolomini of Arragon, alſo in folio, with a border of fruit and flowers, after the ſame painter, &c. which latter is probably, on the whole, the beſt print of the younger Cornelius.

From his hiſtorical engravings, the following may be ſelected: "A Nativity, with the Angel appearing to the Shepherds," from D. Teniers; "Venus ſuckling the Loves," from Rubens; "The Deſcent from the Croſs," from Diepenbeck; "The Hoſpitality of Baucis and Philemon," after J. Vanden Hoeck, in folio; "Job abandoned by his Friends and ſcolded by his Wife," after Diepenbeck, in folio; and a quarto plate from "The Life of St. Dominic," after Vanden Hoeck.

Hans or John Bol was born at Mechlin in the year 1534, and died at Amſterdam in 1593. His inclination leading him to the arts, he was inſtructed in painting by a maſter of no great repute, whom he ſoon quitted; and, going to Heidelberg, aſſiſted the progreſs of his own improvement by copying the works of eminent artiſts. His ſubjects are chiefly landſcapes, with animals; but he likewiſe painted hiſtory and miniature with no ſmall ſucceſs. We have by him ſome etchings, in a free ſpirited ſtyle, that indicate the hand of a maſter: theſe he marked with a monogram, which will be found in *Plate* II. of thoſe uſed by the engravers of the Low Countries: and among them are "The Meeting of Jacob and Eſau," a quarto circular print; "The firſt Interview between the Servant of Abraham and Rebecca," of the ſame ſize; "The twelve Months of the Year," circular, in 8vo.; two ſets of landſcapes, views in Holland, in 4to.; and a large print, lengthways, repreſenting an aquatic diverſion in Holland: a man appears in a boat, catching at a gooſe, which is faſtened to a ſtring over the river, and a prodigious number of ſpectators are depicted upon the banks.

Cornelius Cort was born at Hoorn in Holland, A.D. 1536. After having learned the firſt principles of drawing and engraving, (as Strutt conjectures, from Coornhaert,) he worked for a time as the aſſiſtant of Jerome Cock, and afterwards travelled to Italy to complete his ſtudies.

At Venice, where he was courteouſly received by Titian, he made a long ſtay: ſome ſay he reſided in the houſe of Titian. However this may have been, he engraved from ſeveral of the pictures of that much admired artiſt, and no doubt profited by his inſtruction and advice.

That his mind expanded in this genial climate of art, where Titian ſhone forth, there is indeed abundant proof to be obtained, by comparing his engravings after that maſter with thoſe frigid works after Hemſkerck, which he produced under the influence of Germany and Jerome Cock.

He began now to engrave larger plates, in a bolder and broader ſtyle than that to which he had hitherto been accuſtomed; and removing to Rome, eſtabliſhed there an academy of engraving, in which ſeveral meritorious pupils (among whom was Agoſtino Caracci) liſtened with advantage to his inſtructions, and imitated his example with ſo much ſucceſs, that Cort may with juſtice be reckoned among thoſe men of genius who have contributed to the enlargement of the boundaries of the art itſelf. But the career of our artiſt, though brilliant, was ſhort: he died at Rome, in the meridian of his reputation, at the age of two-and-forty.

Cort worked with the graver only, in a bold and manly ſtyle: his drawing, though ſometimes neglected, is generally correct; and his chiaroſcuro improves upon that of his predeceſſors. Even in the careleſs paſſages of his works, ſo much taſte and freedom prevail, and ſo many indications of ſound knowledge, that his negligence muſt ever be eſteemed the negligence of haſte, and of a too eaſy reliance upon the friendſhip of the ſpectator, which he believes he has conciliated: not that of ignorance.

Baſſan, in eſtimating his merit, praiſes with juſtice the taſte and lightneſs of touch with which he engraved landſcape, without the aſſiſtance of etching; and adds, that "he was the beſt engraver with the burin, or graver alone, that Holland ever produced:" an encomium which our countryman, Strutt, thinks may be a little overſtrained.

His print of "Chriſt praying in the Garden," which is probably engraven from his own compoſition, is marked with a ſmall inſtrument, or utenſil, near the feet of one of the diſciples, which is uſually taken for a lamp, and has ſometimes been miſtakenly attributed to an old maſter who flouriſhed in 1509. On other occaſions, according to Strutt, he marked his prints with the two ſmall fighting cocks, which we have copied in *Plate* II. of the marks, &c. uſed by the engravers of the Low Countries; though for what reaſon cannot eaſily be imagined, as he was not a Frenchman, unleſs it were to denote that theſe engravings were performed by Jerome Cock and himſelf in conjunction.

The abbé Marolles poſſeſſed upwards of one hundred and fifty engravings by this maſter. Of theſe we are able to enumerate the following, beginning with his

Portraits.—Cornelius Cort, engraved by himſelf, in a quarto oval; a pair of Henricus II. Gallorum rex, and Catherine de Medicis, the French queen, in ovals of large quarto ſize; Don Juan of Auſtria; Marc Antonius Moretus, a Roman citizen; Andrea Alciati, all in ovals; three portraits engraved for J. Cock, *viz.* Roger of Bruſſels, Theodore van Harlem, and Joachim Dionatinſis, all artiſts; the genealogical tree of the illuſtrious family of Medicis, with the portrait of Scipio Amirato; the genealogical tree of the family of Cambi Importuni; and two buſts of Democritus and Heraclitus, in 12mo.

Subjects from his own Compoſitions.—“The Birth of the Holy Virgin,” in folio, dated 1568; “The miraculous Conception,” wherein the Virgin Mary is ſurrounded by allegorical devices, dated 1567; “The Infant Jeſus in the Temple;” “A Repoſe during the Flight into Egypt,” 1568; “A Holy Family,” wherein St. Joſeph is repreſented giving a pear to the infant Chriſt; “The Laſt Supper;” “A Crucifix,” ſupported by two angels, whilſt others are diſplaying the tablets of the law, and a chalice; “The Reſurrection of our Saviour;” “St. Theodore the Patron Saint of Venice, fighting with a Dragon;” “St. Catherine kneeling on the Inſtruments of her Martyrdom, crowned by two Angels;” “St. Verediana, a Virgin, kneeling before an Altar, with a Serpent at her Feet,” 1570; two tempeſtuous ſea-pieces; a frontiſpiece, repreſenting the Virgin ſeated between two chemiſts; “A Fawn placing a young Bacchus in a Niche;” “A Soldier carrying an Infant;” and “A young Man ſeated, drawing a Thorn from his Foot,” all of folio dimenſions.

Subjects engraved from various Flemiſh Maſters, before Cort went to Italy.—“Adam and Eve;” they are ſeated under the tree of life, whilſt a ſerpent, with a human head, preſents an apple to Eve, from Michael Coxie; “The Reſurrection of Chriſt;” “The Deſcent of the Holy Ghoſt;” “Our Saviour accompanied by Sts. Peter and Paul,” all of folio ſize, from Michael Coxie; a ſeries of four folio plates, from the parable of “Dives and Lazarus,” after Hemſkerck; another ſeries of four, from the parable of “The good Servant;” and the parable of “The Vineyard,” all from the ſame painter, in folio; a ſet of ſix, in folio, from “The Hiſtory of Noah,” from Franc. Floris; “The Hiſtory of Abraham,” in a ſet of the ſame number; “The Hiſtory of Jacob and Rachael,” engraved on ſix plates in the form of a fan; “The Labours of Hercules,” in ten folio plates; “The Hiſtory of Pluto and Proſerpine,” in four plates of folio ſize; “The Triumph of Bacchus and Venus,” all from the ſame; an emblematical ſubject on the immortality of virtue, after Franc. Floris, both in large folio; “The Deſcent from the Croſs,” after Van der Wyde, in folio; a ſtanding figure of St. Roch, from J. Speckart; and St. Lawrence, from the ſame painter: “St. Dominic reading,” from B. Spranger; “A Holy Family, ſurrounded with Angels,” from the ſame; “The Virgin crowned in Heaven,” after G. Moſtaert; and “The Painting Academy,” after Stradan, all of folio dimenſions.

Subjects engraved in Italy from various great Maſters. 1. *From Titian.*—“The Annunciation,” in large folio; “The Martyrdom of St. Lawrence,” of the ſame ſize; another “Annunciation,” in folio; “The Holy Trinity,” known by the appellation of “the All-powerful,” in large folio; “St Jerome reading,” in folio; another folio plate of “St. Jerome, at the Entrance of his Cell, proſtrate before a Crucifix,” a very rare print, omitted in Heinneken's catalogue of the works of Cort: a half figure of “A Magdalen;” another “Magdalen in the Deſart, before a Crucifix;” “Tarquin and Lucretia,” folio ſize; “Diana and Caliſta,” large folio; “Prometheus chained to the Rock;” and “Rinaldo delivering Angelica from the Dragon,” both in large folio.

From Jerom Mutian.—“St. Peter walking on the Sea;” “Chriſt crowned with Thorns;” “Chriſt bearing the Croſs;” “The Deſcent from the Croſs;” “Jeſus Chriſt appearing to the three Maries, and St. John, on their way to Jeruſalem;” another “Deſcent from the Croſs;” “St. Jerom meditating;” all of folio dimenſions; and “The ſeven Penitents.” Theſe are large landſcapes, in which are introduced ſmall figures of the ſaints, Mary Magdalen, Jerome, John the Baptiſt, Hubert, Onophrom, Francis (ſtigmatiſed), and Francis (in extacy): ſix of them are upright plates, and the ſeventh lengthways.

From Julio Clovio.—“The Annunciation;” “The Adoration of the Kings;” a half figure of “The Virgin holding the Infant Jeſus;” and “The youthful Jeſus preaching in the Temple;” all in folio. “Jeſus baptiſed by St. John in the River Jordan;” and “The Crucifixion,” both in large folio; “The dead Body of our Saviour, and one of the Maries kiſſing his Hand;” “The Entombing of Chriſt,” in folio; “Chriſt appearing to Mary Magdalen,” of the ſame ſize; “The Converſion of St. Paul;” “Chriſt on the Croſs,” a grand compoſition, both in large folio; and “St. George and the Dragon,” in folio.

From Taddeo Zuccaro.—“The Creation of Adam and Eve,” in large folio; “The youthful Virgin preſented in the Temple,” in folio; a large folio plate of “The Nativity,” a rich compoſition; “A Holy Family,” wherein St. John holds a lamb; “The Miracle of the five Loaves,” both in folio; “The Body of our Saviour before the Sepulchre,” a grand compoſition; “The Deſcent of the Holy Ghoſt,” both of large folio dimenſions; and a folio print of “The Martyrdom of St. Agatha.”

After Frederic Zuccaro.—“Moſes and Aaron before Pharoah;” “The Birth of the Virgin;” and “The Conception of the Virgin,” who is ſupported and crowned by angels; “The Annunciation of the Virgin;” “The Nativity,” a grand compoſition, all in large folio; “The Adoration of the Magi;” “A Holy Family,” where a cat is introduced catching a bird; “The Flight into Egypt;” “Our Saviour tempted in the Wilderneſs;” “The Woman taken in Adultery;” “Jeſus turning the Money-Changers out of the Temple;” “The Reſurrection of Lazarus;” “The good Samaritan;” “St. Peter choſen Head of the Church;” “Our Saviour on the Mount of Olives;” “The Jews approaching our Saviour in the Garden of Olives;” “The Death of the Virgin;” “The Coronation of the Virgin;” “St. Lawrence and St. Sixtus,” ſurrounded with an ornamental border, all of folio dimenſions; “The Diſpute of the Holy Sacrament,” in large folio; “Labour and Juſtice,” an emblematical ſubject, in folio. A large ſatirical print on the officers of pope Gregory XIII., repreſenting a young man accuſed by Calumny and protected by Innocence, before a judge, with the ears of an aſs, (the whole of which is taken from Lucian's deſcription of a loſt picture, by Apelles): and another ſatirical print engraved on two large plates; in the lower part of the compoſition is introduced a painter ſitting at his eaſel, painting the portraits of certain celebrated ſimpletons of the day: in the upper part ſits Jupiter on his throne, ſurrounded by all the gods, protecting the arts and ſciences; a very capital and rare print.

From Raphael d'Urbino.—"The Transfiguration," from the celebrated picture in the Vatican; "The Conteſt between the Romans and Pyrrhus," known under the appellation of "The Battle of the Elephants," both of large folio ſize. A large print, executed on three ſeparate plates, of "The Victory of Conſtantine over the Emperor Maxentius, at Ponte-Molle." Cort left this plate unfiniſhed at his death, but it was afterwards completed by Ph. Thomaſſin.

Subjects from various other Italian Maſters.—"Mount Parnaſſus," a folio print, from Polidore; "The Adoration of the Shepherds," in large folio, from the ſame maſter; "A Repoſe during the Flight into Egypt," in folio, after B. Baſſaro; an unfiniſhed print, in folio, of "The Apotheoſis of St. Jerom," from the ſame maſter; "The Viſitation of St. Elizabeth," a large folio print, from Marc of Sienna; "The Adoration of the Shepherds," a folio print, from the ſame maſter; another of "The Adoration of the Shepherds," from Paris Romano; "The Virgin ſitting near a Fountain, with the Holy Infant, and St. John," in folio, from F. Baroccio; a folio print of the "Baptiſm of our Saviour," after F. Salviati; "The Marriage of Cana," from Lorenzo Sabbatini, in folio; "The Laſt Supper," after L. Agreſti Forlivetano (there are impreſſions of this plate both with and without the mark of Cort), in large folio; "St. Stephen ſtoned," in large folio, from Marcellus Venuſtus; "St. Jerome before a Crucifix," after Riccio da Sienna, in folio; "St. Jerom, attended by two Angels," from Jacobus Parmenſis, in folio; "The Girdle of St. Francis," after Caracci, in large folio; a quarto print of "The Marriage of St. Catherine;" a folio print of "St. Margaret of Cortona," from Tempeſta; "A Dance of Dryades," in folio, from Maitre Rous, of Florence; "The three Deſtinies," from Julio Romano, in folio; and "The Tombs of the Dukes of Mantua," in large folio, after Michael Angelo.

Of Philip de Sorge, Sericcus, or Sytius, very little is known. Strutt ſpeaks of the few prints which we ſhall venture to aſcribe to him, as being the production of two artiſts: Roſt and Huber are more probably in the right, in aſcribing them to one. Sericcus ſtudied under Cornelius Cort, and afterwards ſettled at Rome, where it is probable, from the ſcarcity of his works, he died at an early period of life; but neither the time of his deceaſe, nor that of his birth, have been mentioned.

His ſtyle of engraving, evidently formed upon that which we may term the Italian ſtyle of Cort, is open, vigorous, and free; but his knowledge of the figure was inferior to that of his maſter, and his chiaroſcuro, though not diſcordant, not very forcible.

We are acquainted with no other of his works than a ſet of twenty-eight half-length figures of the popes in chronologic ſucceſſion, from the year 204 to 1568, the year in which they were publiſhed; they are in ſmall folio, and executed with the graver only, in a ſtiff, ſlight manner. Pope Pius V. ſurrounded with emblematical figures, deſigned by Sericcus himſelf, and engraved in a ſtyle ſuperior to the former. "Judith beheading Holofernes," in folio, after Julio Clovio; "The Angel warning St. Joſeph to depart into Egypt," from C. Cort, of the ſame ſize as the original; "St. Francis receiving the Stigmatics," in large folio; "St. Jerome before a Crucifix in the Deſart," ſuppoſed to be from Mutian, in large folio; "The Virgin and Infant Chriſt," known by the appellation of "The Virgin of Silence," inſcribed "Dormiente puero Jeſu divina Mens vigilat," with the name of Philip Sericcus, dated 1566, in large folio; a large folio print of "Our Saviour on the Croſs," with the Virgin and St. John the Evangeliſt, on either ſide at the foot of the croſs, after Michael Angelo; and a large folio print, which is attributed to Soye, although it bears the name of Cort, repreſenting "Prometheus chained to a Rock," from Titian's picture in the royal palace at Madrid.

John Ditmer, or Ditmar, was a native of the Low Countries, and born in the year 1538, or thereabouts. By this engraver we have a middling-ſized upright plate, nearly ſquare, repreſenting a figure of Chriſt ſeated on the clouds, with the ſymbolical animals, ſeen in viſion by the prophet Ezekiel, and which are the uſual attendants on the evangeliſts, and angels bearing the croſs, crown of thorns, &c. It is executed in a ſtyle greatly reſembling that of Cort, but coarſer, and by no means ſo well drawn as the works of that maſter generally are. This print is after Michael Coxie, and is dated in the year 1574, nor are we able to ſpecify more of the works of this engraver, who was apparently inſtructed in his art by Cornelius Cort.

Gerard de Jode was born at Antwerp in the year 1521, and died in the ſame city A.D. 1591. He was celebrated both as an engraver and geometrician, and was the ſon of Cornelius de Jode, a well-known geographer. Part of his youth was paſſed in the ſervice of the emperor Charles V., after which he gave up his attention entirely to the arts and ſciences. He engraved ſome geographical, and a great number of hiſtorical, plates, in the ſtyle of his contemporaries and countrymen, Wierix and the Collaerts, and Papillon ſays that he executed ſome meritorious engravings on wood.

He likewiſe eſtabliſhed at Antwerp a printſeller's ſhop, which, after his death, was carried on by his widow. Being hereditarily known as a geographer, in which ſcience he excelled, he was much encouraged by Ortelius, who was ſurnamed the Ptolemy of his age, and of whom we have ſpoken under the article ENGLISH *Engraving*. The principal works of Gerard de Jode, are a ſet of twenty-nine, of the portraits of the popes, in 4to. publiſhed in the year 1585. A Roman triumph, on twelve plates, after Hemſkerck, in 4to. A ſet of thirteen, intitled "Memorabilium, novi Teſtamenti, templo Geſtorum Icones tredecim elegantiſſimi ac ornatiſſimi. Antwerpia excudebat Gerard de Jode," in folio, with architectural back-ground, and a very large and well engraved print, executed on three plates of "The Crucifixion," after Michael Angelo.

Peter de Jode, the elder, was born at Antwerp A. D. 1570, and died in the ſame city in 1634. He was the ſon of the preceding artiſt, who inſtructed him in the knowledge of geometry and drawing, but he ſtudied engraving under Henry Goltzius, and afterwards travelled to Italy and to Paris, to improve his connections and complete his profeſſional ſtudies. In Paris he remained ſome time, and with the aſſiſtance of his ſon, executed ſeveral plates there, which were publiſhed by A. Bonenfant. He returned to Antwerp a few years after the commencement of the ſucceeding century, where he remained till the time of his death.

The engravings of the elder Peter poſſeſs great merit. He was an excellent draftſman; his chiaro-ſcuro is not inferior to that of the age in which he lived; and in his manual execution he uſed the graver alone, in a manner evidently founded on the neater ſtyle of Goltzius, but not with equal freedom, nor equal power of expreſſing the variety of ſubſtances which entered into the compoſitions from which his prints are engraven.

He engraved both portraits and hiſtory with ſucceſs, but did not excel in landſcape. From the whole of his works, which are ſomewhat numerous, the connoiſſeur may ſelect the following with advantage.

The *Portraits* of Henry du Puy, a Dutch philoſopher, in a circle ſurrounded by a ſerpent, in 4to.; John Boccacio, from Titian, in folio; Ferdinand, count palatine of the Rhine, in an oval, from Rubens, quarto ſize; Philip III., king of Spain, in an oval, from Rubens; Francis de Mello, count of Azumar; Ambroſe Spinola, ſurnamed the Great General, all of quarto dimenſions.

Hiſtorical, &c.—"The Virgin and Child," from Titian; "The Marriage of St. Catherine," both in quarto. A large folio print of a "Holy Family," in a mountainous landſcape, both from the ſame painter. Twelve prints of "The Life and Miracles of St. Catherine of Sienna," after Francis Vanni, in folio; "The Adoration of the Shepherds," likewiſe in folio; "Chriſt at the Houſe of Nicodemus," a night-piece, in large quarto; "The Decollation of St. John," in an oval, of octavo ſize, a rare print, from Rubens; "Our Saviour delivering the Keys to St. Peter," in folio; "The Coronation of St. Catherine," in folio. An allegorical ſubject of government, repreſented by a female crowning Prudence with a laurel wreath, in 4to. Another, of "The Five Senſes," in folio. The frontiſpiece to a book, intitled "Annals of Flanders," by M. Sueiro, repreſenting Flanders, perſonified, leaning on a pedeſtal, &c. &c. in folio, all from Rubens. Thirty-ſix prints in quarto, from the "The Life of Chriſt;" and "The Laſt Judgment," after a picture by John Couſin, in the church of the Minims at Vincennes. The painter has introduced his own portrait at the left hand ſide of the print. This is one of the largeſt prints in exiſtence, being engraved on twelve plates!

Peter de Jode, the younger, the ſon of him who is the ſubject of the preceding article, was born at Antwerp, according to Strutt and the foreign authorities, in the year 1606. He ſtudied under his father, whom he ſurpaſſed in taſte and facility of handling the graver, though he can ſcarcely be ſaid to have equalled him in the drawing of the naked. Our countryman, Strutt, though generally not deficient in accuracy of notice, has contributed to confuſe the chronology of this artiſt and his father. He ſays, "it does not appear that the younger de Jode went to Italy, but he certainly accompanied his father to Paris, where they engraved conjointly a conſiderable number of plates for M. Bonefant, and le Sieur l'Imago," which, if our author's report of the return of the elder de Jode from Paris might be credited, is making the ſon travel to Paris and engrave, before he was born; for Strutt, in his account of the father, expreſsly ſays, "he returned to Antwerp about the year 1601, where he reſided till the time of his death."

Perhaps the ſenior de Jode returned from his firſt journey in 1601, and afterward, as he did not die till 1634, made a ſecond journey to Paris, taking with him his ſon.

The prints of the junior de Jode are numerous, but very unequal in merit. Baſſan ſays of him, that in ſeveral of his engravings "he has equalled the beſt engravers, and in others has ſunk below himſelf." To which Strutt juſtly adds, "he was, without doubt, a very able engraver, but to place him (even in his beſt exertions) upon an equality with his contemporaries, Bolſwert, Pontius, and Vorſterman, is, in my opinion, eſtimating his abilities at much too high a rate."

Among his moſt eſteemed performances may be mentioned the following

Portraits of celebrated artiſts, &c. after the pictures of Vandyke, of ſmall folio ſize. Peter de Jode, junior, engraved by himſelf; James Jordaëns, painter of Antwerp; Cornelius Pœlenbourg, painter, of Utrecht; John Smellineux, painter, of Antwerp (the fleſh of which is etched); Adam Coſter; Andrew Colyns de Nolo, a ſtatuary of Antwerp; Genevieve d'Urphe, the widow of Charles Alexander, duke of Croye; Jane de Blois; Henry Liberti, an organiſt; John Tzerilaës, count of Tilly; Albert, duke of Friedland, and count of Wallenſtein; Diodorus de Tulden, profeſſor at Louvain; Antonio Trieſt, biſhop of Ghent; Charles Henri, baron of Metternich, in an ornamental border; Auguſtus Adolphus, baron of Trantorf, ſurrounded with an ornamental border, all of folio ſize; Thomas Ricciardi; Simon Vouet del, in 4to.; Erneſt, count of Iſembourg, chevalier of the golden fleece, a half-length portrait, in armour, after Th. Willeboorts, in 4to.; and a folio print, entitled "Petrus de Francavilla, Gall. Regiſ. Architect et Sculptor," after J. Bunel.

Hiſtorical Subjects.—"St. Auguſtine," biſhop of Hippona, crowned by Religion, with other acceſſory emblems, in folio; "St. Francis kneeling before a Crucifix," after Baroccio, in folio; "A Holy Family," where Elizabeth, St. John, and Zacharias, are explaining a book held by an angel, in large folio, from Titian; "An Emblem of Death," repreſented by an infant ſleeping upon the ground, with a ſkull lying by his ſide, a ſmall plate, lengthways, from Artemiſa Gentileſca; "The Viſitation of the Virgin," from a picture by Rubens, in the cathedral at Antwerp, in large folio, a very fine and rare print. A fine print of "The Three Graces," in large folio; "Venus riſing from the Sea," ſurrounded by nymphs and tritons, in large folio; "The Alliance of the Earth and Sea," perſonified by Cybele and Neptune, a plate of folio ſize, as a companion to that of "Plenty," by Theodore van Keſſel, all after Rubens; "St. Francis and St. Clara, worſhipping the Infant Chriſt, lying in the Manger," half figures, with the effect of night, in folio, after G. Seghers, the companion to which is "St. Peter denying Chriſt," engraven by And. de Paulis; "Chriſt diſcourſing with Nicodemus," half figures, with the effect of night, from the ſame painter; "The Nativity," from Jordaëns, a very fine and rare print, in large folio; "St. Martin of Tours expelling the evil Spirit from a Demoniac," very large folio; "Folly and Ignorance," half figures, a large folio plate, all from Jordaëns; "St. Auguſtin ſurrounded by Angels," a large circular plate, after Vandyke; "Rinaldo and Armida," a large folio plate, from the ſame maſter, being the companion to another plate, which Baillieu engraved after the ſame painter; "A Holy Family," where the infant Chriſt is held by St. Anne, after Abr. van Diepenbeck. An allegorical ſubject of "Peace," and "St. John the Baptiſt in the Deſart," from Van Mol, all large upright plates.

Arnold de Jode, the ſon of Peter de Jode the younger, was born at Antwerp in the year 1636, and was inſtructed by his father in the art of engraving. In his youth he migrated to England, but being no great proficient in his art, was not able to contribute much to the advancement of Engliſh engraving, though the art in this country was then at a low ebb.

He reſided here at the time of the great fire of London, as may be learned from an inſcription beneath his print of "The Infants Chriſt and St. John embracing each other," after Vandyke, which runs thus, "Arnoldus de Jode, ſculp. Londini, tempore incendii maximi." It may be worthy of note, that this engraving is dedicated to ſir Peter Lely, who was at that time the poſſeſſor of Vandyke's picture.

It ſeems not improbable, that the low ſtate of Engliſh taſte, and paucity of artiſts at that period, enabled Arnold to live with more profit and conſequent comfort in this country than in his own, for his talents were very indifferent, and by no means commenſurate to his early opportunities of acquiring profeſſional information.

It may be ſufficient to mention the following prints from his graver, of which the portraits will, generally ſpeaking, be found the beſt.

The *Portraits* of ſir Peter Lely, in large folio, from a picture by ſir Peter himſelf; Alexander Browne, (prefixed to his Ars Pictoria,) in ſmall folio, from J. Huyſmans; Catherine Howard, ducheſs of Lenox, &c. in folio, after Vandyke; cardinal Palavicini, in 4to. after Titian.

Hiſtorical, &c.—"Mercury inſtructing Cupid," in ſmall folio, from Correggio, engraved in London, and dated 1667; "A Magdalen," a half-length figure from Vandyke. The folio print after Vandyke, mentioned in his biography above; and a landſcape after L. de Vadder, in folio.

In the ſixteenth century, the orthography of proper names, as well as that of words, appears to have been extremely unſettled. On the continent, as well as in this iſland, men ſpelled variouſly, as they variouſly eſtimated the powers of letters, and Printing was as yet too young to have erected a ſtandard.

John Wierix, Wierx, Wierinx, or Wirings, (for thus capriciouſly has the orthography of this name varied from itſelf,) was born at Amſterdam, in the year 1550. His love for the arts appears to have manifeſted itſelf at a very early period of his life. We know not from whom he learned the firſt principles of drawing and engraving; perhaps he owed them, as well as his ſubſequent progreſs, principally to his own application and patient induſtry. He ſtudied the works of Albert Durer very attentively, and built his taſte upon them; but from too cloſe and ſervile a mode of copying them, he contracted a ſtiffneſs, of which he never diveſted himſelf. There is little or no originality in his prints. His genius ſeems to have been confined, and he was fearful of venturing beyond the bounds of a copyiſt. The incomparable neatneſs of his works executed with the graver only, gives them, however, a value with the curious collector, which is encreaſed by the correctneſs of his drawing, and the manner in which the extremities of his figures are marked, proves the great attention he muſt have paid to that part of his profeſſion. His works are exceedingly multifarious, conſiſting of devotional ſubjects of various kinds and ſizes; from which the following may be ſelected as affording, on the whole, the moſt ſatisfactory ſpecimens of his abilities.

Portraits of Rodolpho II. emperor of Germany; Philip William, prince of Orange, in 4to; Eleanor of Bourbon, princeſs of Orange; James I. of England, with his queen, whole lengths, a ſmall upright plate, very ſcarce; Philip II. of Spain; Catherine of Medicis, wife of Henry II.; Henry III. of France; and the counteſs of Verneuil, all of quarto dimenſions; the laſt is a companion to the portrait of Henry IV. engraven by Goltzius.

Subjects from his own Compoſitions.—A ſmall print of "Chriſt and the Virgin;" "The Reſurrection," in octavo; "The Jeſuit Martyrs," in 4to. with an explanation; an allegorical ſubject, called "The Penitent Heart," with Dutch inſcriptions; "The Magdalen," at the entrance of a cell, reading before a crucifix, a very beautifully finiſhed print, both of quarto dimenſions; an allegorical print, called "The Redemption of Man," in folio; and "The four Elements," of the ſame ſize.

Subjects from various Maſters.—A ſmall Satyr, from Albert Durer, engraven by Wierix at the early age of twelve, in 12mo; "Adam receiving the forbidden Fruit from Eve;" a ſmall upright plate, laboriouſly copied from the celebrated print of the ſame ſubject by Albert Durer. It is dated 1566, and Weirix has added his own age, which was only ſixteen; "St. Hubert at the Chace, proſtrate before a Crucifix," a very fine copy from Albert Durer, (whoſe cypher it bears,) in large folio; "St. Jerom in Meditation," a very good copy, done at the age of thirteen, in folio; "The Marriage of St. Catherine," after Dennis Calvaert, in quarto; "The Sacrifice of Iſaac," from M. de Vos; "Elias tranſlated to Heaven;" "Chriſt taken from the Croſs," after Otho Vænius; "The Laſt Judgment," from Michael Angelo, a fine copy from the print by Martin Rota; and another "Dead Chriſt," after Bernardino Paſſeri, all of folio dimenſions.

Hieronymus or Jerome Wierix, was alſo born at Amſterdam in the year 1551, and is believed to have been the brother of John, of whom he learned the principles of drawing and engraving, and imitated his ſtyle with ſo much preciſion, that it would be a matter of the utmoſt difficulty to diſtinguiſh the works of the one from thoſe of the other, were it not for the marks with which they are inſcribed. The prints of Jerom poſſeſs the ſame extraordinary neatneſs, which we admire in thoſe of John, are as correctly drawn, equally deficient in taſte and freedom, and equally the reſult of careful labour.

Jerom Wierix marked his plates with his initials, or a monogram, which will be found in our ſecond plate of thoſe uſed by the engravers of the Low Countries. His works are ſtill more numerous than thoſe of his elder brother; and thoſe moſt worthy of eſteem, are the following.

Portraits of the emperor Charlemagne, in octavo, decorated with imperial ornaments; Henry of Bourbon, king of Navarre; queen Elizabeth of England; Sigiſmond III. of Poland; Alexander Farneſe, duke of Parma; and ſir Francis Drake, all of very ſmall ſize; John Coropi Becani, a phyſician, holding a ſkull, in folio; De Conſtain, and G. Oberſchie Delpheus, alſo in folio.

Subjects from his own Compoſitions.—"St. Francis," in 12mo.; "St. Cecilia," in quarto; "St. Anthony, held by the Devil," in 12mo.; "St. Bruno," in octavo; "St. Charles Borromeus," of the ſame ſize; "St. Anthony and St. Francis, to whom the Virgin preſents the Infant Chriſt;" "The Holy Virgin ſuckling the Infant Jeſus;" "The Virgin ſtanding on a Creſcent, with the Holy Infant ſurrounded with Rays of Glory," both in 12mo.; "The Miraculous Conception;" "The Death of Lucretia;" "The four Monarchies of the World," on four quarto plates; "Chriſt on the Croſs ſuſpended from a Vine, ſurrounded by four Saints," all of quarto ſize; another "Chriſt on the Croſs, in the midſt of a Vine, ſurrounded with Rays of Glory," the crucifix is ſupported on a bunch of grapes, which is held by the two Iſraelitiſh ſpies of the bible, an odd conceit, in 8vo.

Subjects from various Maſters.—"A dead Chriſt, ſupported upon the Lap of the Virgin," after John Mabuſe; "Chriſt receiving little Children," from Criſpin van den Broeck; "Chriſt on the Croſs," at the bottom of which is introduced the king David, St. Paul, and St. John the Baptiſt, after the ſame maſter; "A Holy Family," where St. Catherine

therine is introduced kiſſing the feet of the infant Jeſus, after Dennis Calvaert; "The Death of the Virgin," from Otho-Vænius; "Chriſt at the Table of Simon the Phariſee," after the ſame painter, all of folio dimenſions; "Death and Satan," combating for a tree, while a ſaint and the holy Virgin are imploring Jeſus Chriſt to preſerve it, after H. van Balen, in octavo; "The Globe of the Earth near its Deſtruction, upheld by Jeſus Chriſt and the Virgin," in octavo; "The oppoſite Roads to Heaven, and to the Infernal Regions," in quarto, from the ſame painter; "Our Saviour crowned with Thorns," after G. Moſtaert, in folio; "Jeſus Chriſt on the Croſs, worſhipped by two Angels, in the Clouds," on one ſide of the croſs is introduced the Virgin, and on the other St. John, whilſt the Magdalen embraces the croſs; (this is eſteemed the fineſt print from the graver of Jerom;) "Enoch tranſlated to Heaven," after M. de Vos, in folio; "The Death-bed of the Juſt," in large folio, from Amb. Franck; "Jeſus baptiſed by John," after H. Hondius, in folio, a fine engraving; "The Viſions of Daniel," after Van Haecht, in quarto; "Jupiter deſcending to Danae, in a Shower of Gold," from the ſame painter: a very capital print, after Lucas Romanus, of "The Reſurrection of Chriſt," in large folio; and another, from the ſame painter, of "The Scourging of Chriſt," which Strutt pronounces one of his largeſt and beſt engravings, though not ſo neat as his other works.

Antony Wierix was the younger brother of Jerome and John, and, in general, adopted the ſame neat and laboured ſtyle of engraving, eſpecially when he worked upon ſmall ſubjects; but ſome of his larger prints are executed with more freedom; which, of courſe, adds greatly to their intereſt, in the eſtimation of perſons of taſte. Antony drew as correctly as his brother, and employed his graver upon the ſame ſort of ſubjects; often indeed working conjointly with Jerome. We ſhall mention the following

Portraits, (all of which are very ſmall,) pope Clement VII.; Philip Emanuel, of Lorrain, duke of Mercœur; Iſabella, of Auſtria, daughter of Philip II. of Spain; Robert Bellarmin, cardinal; and Albert of Auſtria, archbiſhop of Toledo, and governor of the Low Countries, in quarto.

Subjects from his own Compoſitions.—Saints "Thereſa," in octavo; and "Sebaſtian," in folio; "St. Dominic receiving a Roſary from the Holy Virgin;" "The Virgin Mary;" and "The Marriage of St. Catherine," both in 12mo.; "The Litany of the Virgin," in eight leaves, of octavo ſize; "The Virgin and Child, to whom the eternal Father diſplays the Inſtruments of the Paſſion," in 12mo.; "The purified Souls," with French and Latin verſes, in octavo; "Chriſt ſurrounded with the Repreſentations of the Sufferings of various Martyrs," in quarto; "The Emblems of future Rewards and Puniſhments," in octavo; and "St. Jerom praying, accompanied by two Angels," in quarto; one of the beſt engravings by Antony Wierix.

Engravings from various Painters.—"Abraham ſacrificing Iſaac," and "The Adoration of the Kings," both in folio, and from M. de Vos. Four plates in quarto, repreſenting the Hiſtory of the prophet Jonas. "Reſignation," perſonified by a female, faſtened to a rock, holding a crucifix, while an angel crowns her with laurel, from J. de Backer, in folio; "A Repoſe during the Flight into Egypt," where St. Joſeph is repreſented holding a bunch of grapes, after Cam. Procacini, in folio, executed in a bold broad ſtyle; "The Death of St. Francis," in folio, from the ſame painter; and "The Life of Chriſt," to which is added "The Death and Aſſumption of the Virgin Mary," with explanations, forming a ſet of fifty-nine prints in folio, engraved conjointly by the three brothers, John, Jerom, and Antony.

Abraham de Bruyn, or Brun, was born at Antwerp in the year 1540; and eſtabliſhed at Cologn. On account of the ſmallneſs of his productions he has been ranked in that claſs of artiſts, which is diſtinguiſhed by the appellation of the *little maſters,* and ſeems hardly to have merited even the diſtinction which he attained; for his prints are evidently rather the productions of labour and aſſiduity, than of genius. The lights in them are ſcattered and unharmonized, which deſtroy the effect, and give them a cold, metallic appearance, and his drawing is incorrect. It is true, Rembrandt had not yet dawned, and inattention to the chiaroſcuro has been termed by the apologiſts of ſuch artiſts as Bruyn, "rather the fault of the age, than the profeſſor;" and notwithſtanding theſe defects, the works of this artiſt are much ſought after by connoiſſeurs. The two monograms, which he affixed to his prints, will be found in our ſecond plate of thoſe uſed by the engravers of the Low Countries; and his beſt engravings are entitled as follows:

Portraits of the elector palatine, Philip Louis, and Ann his wife; Albert Frederick, duke of Pruſſia; William, duke of Juliers, and Mary his ducheſs; John Sambucus, phyſician (a wood engraving); "Carolus nonus Francorum Rex;" and Anne of Auſtria.

Hiſtorical, &c.—"Moſes and the burning Buſh," in quarto; "The Four Evangeliſts," "Chriſt and the Woman of Samaria," and "A Philoſopher," with a ſcroll, both in octavo. A ſet of ſeven ſmall plates of "The Planets," and another ſet of "The Five Senſes;" a folio print, entitled "Imperii ac Sacerdotii ornatus, diverſarum gentium veſtitus;" another of the ſame ſize, entitled "Diverſarum gentium armatura equeſtris, 1577;" a ſet of forty-nine, inſcribed "Omnium fere gentium imagines," &c. quarto ſize. Seventy-ſix plates, of figures of knights on horſeback, in octavo. A ſet of friezes, of the various modes of hunting and hawking, marked with his two cyphers. Twelve plates of animals, in quarto; "Pyramus and Thiſbe," after Franc. Floris; "The Reſurrection of Lazarus," from Criſpin vanden Broeck, both in quarto; and a ſet of ſmall arabeſque ornaments.

Nicholas de Bruyn was born at the ſame place with the former artiſt, of whom he was the ſon, and of whom he learned the rudiments of his art; though he did not imitate him either in his ſtyle of engraving, or the ſmallneſs of the prints which he executed. He rather copied the ſtyle of Lucas Jacobs of Leyden, whoſe works he appears chiefly to have ſtudied; and engraved large plates, which he executed entirely with the graver, in a very neat but laboured ſtyle. His prints evidently prove, that he had more fertility of invention than taſte, and he wanted judgment to ſelect ſuch forms only, as were beautiful or ſuited to the occaſion. His compoſitions are generally crowded with figures, but from the following cauſes his effects are feeble; the lights are too much diffuſed, and the breadths of ſhadow by no means ſufficient to relieve the principal objects from thoſe at a diſtance; in conſequence of which, the whole appears confuſed and unfiniſhed. His drawing is carefully attended to; but it is rather mannered than correct. The heads of his figures are frequently very expreſſive; yet, amidſt all the diſadvantages which this artiſt laboured under, much ſterling merit is conſpicuous in his productions. The cyphers, with which he marked his plates, will both be found in our ſecond plato of thoſe uſed by the engravers of the Low Countries: and amongſt his works we ſhall ſelect the following as being moſt worthy of notice.

From his own Compoſitions.—"Adam and Eve in Paradiſe,” in large folio ; “Adam and Eve eating of the forbidden Fruit ;” “The grand Feſtival of the Jews, after ſix Years Bondage ;” “The King Balac, communing with the Prophet Balaam ;” “The Prophet Jeremiah,” in a landſcape ; “The Viſion of Ezekiel ;” “David and Goliah ;” and “Abigail meeting David ;” both with landſcape backgrounds ; “Solomon and the Queen of Sheba :” “Solomon adoring the Idols ;” “The Dream of Nebuchadnezzar ;” “Daniel in the Lion's Den ;” “Suſannah and the Elders ;” “Suſannah juſtified ;” “Two old Men ſtoned to Death ;” “The Nativity of our Saviour announced to the Shepherds ;” “The Adoration of the Eaſtern Kings ;” “A Repoſe during the Flight into Egypt ;” “The Slaughter of the Innocents ;” “St. John preaching in the Deſart ;” “Our Saviour preaching on the Mount ;” “The Centurion imploring the Help of Jeſus Chriſt ;” “The Entry of Chriſt into Jeruſalem ;” “Our Saviour on his way to Mount Calvary ;” “The Crucifixion ;” “The Reſurrection ;” “St. Paul preaching ;” “St. Hubert perceiving a Crucifix between the Horns of a Stag ;” “Orpheus charming the Animals with his Lyre.” Peaſants, with their children, regaling ; a landſcape, into which is introduced lions, tygers, and ſtags ; a large company of Spaniards in a foreſt ; all theſe are of large folio ſize ; a ſet of ſix prints, in octavo, for goldſmiths, from fables ; twelve plates of animals for a book of quadrupeds ; and two ſets of thirteen each, of birds and fiſhes.

Subjects from various Maſters.—“St. John preaching in the Wilderneſs,” from Lucas of Leyden ; “A Miracle performed at the Tomb of St. James,” a Spaniſh apoſtle, from the ſame painter ; “The Golden Age,” from Abr. Bloemart ; this is conſidered as his fineſt print, and was admirably copied in a ſmall circle by Theodore de Brye ; “Abraham ſacrificing Iſaac,” after Giles Coninxlo ; “The Predictions of the Prophet Iſaiah ;” “The Judgment of Midas,” a fine landſcape, with figures, all from the ſame painter ; a village fair, from Dav. Vinckenbooms ; a landſcape, with a caſtle ; a view of a garden, with buildings, and figures dancing, both from the ſame painter ; a ſtag hunt, after John Breughel ; a fine landſcape, into which is introduced the ſubject of “Moſes defending the Daughters of Jethro,” after Hans Bol. ; “St. Cecilia,” accompanied by other ſaints, copied, with ſome alteration, from Raphael ; “The Four Seaſons,” from M. de Vos ; and an armed knight on horſeback, preceded by an allegorical figure on horſeback, and followed by the devil on foot, copied from what is commonly termed “The Worldly Man” of Albert Durer ; all are of folio dimenſions.

The family of the Sadelers make a very conſiderable figure in the annals of engraving : yet are they, unleſs we ſhould except Giles, leſs illuſtrious by the character of their works as engravings, than worthy of notice on account of their number, ſubjects, and the period at which they were performed.

Hans or John Sadeler was born at Bruſſels, A.D. 1550. His father is believed to have been an armourer, or workman in iron and ſteel ; for the firſt employment that is known to have been exerciſed by John, was to engrave ornaments, &c. upon thoſe metals, in order to their being inlaid with the precious metals. Hence Florence le Comte terms him a *damaſquineur* of iron ; a word which probably, at that time, was the proper technical denomination of that particular branch of the armourer's profeſſion, and which is perhaps derived from Damaſcus, where arms have been fabricated with ſimilar ornaments from a very early period.

It appears, however, that our artiſt did not confine himſelf to the ſcroll-work and heraldic ornaments, which were prevalent at the time, but applied himſelf with requiſite diligence, at an early period of life, to the ſtudy of the human figure, of which he evinced an accurate knowledge ; though, in conſequence of early tuition, and the Flemiſh and German examples which had been placed before him for imitation, he drew in a ſtiff and mannered ſtyle.

From theſe early ſhackles, however, which, till Rubens appeared, Flanders unwittingly forged for all her ſons, Sadeler in a great meaſure emancipated himſelf, when he came to ſtrengthen his faculties by breathing the purer atmoſphere of art that circulated in Italy.

He did not at once travel from Bruſſels to Italy, but publiſhed ſeveral of his earlier engravings at Antwerp ; from whence, in the year 1588, he went to Frankfort, and continued to travel over great part of Germany, in order to obtain inſtruction from the beſt maſters who were then living in that country. At Munich he remained a few years, where his merit being made known to the duke of Bavaria, he was very graciouſly received ; and that nobleman made him a preſent of a chain of gold. From Munich he went to Verona ; from thence to Venice, and afterwards to Rome ; but not meeting with the encouragement he expected from the pope, he returned to Venice, where he eſtabliſhed himſelf, and died in that city of a fever, in the year 1600. It is uncertain from whom he firſt learned the art of engraving ; but it appears that he availed himſelf of the inſtructions of a variety of maſters. His earlieſt productions have much of that ſtiffneſs, not only in drawing, but in point of manual execution, which eclipſes the merit of the old engravings of the German ſchool. It is true, that after he reſided in Italy, he made a conſiderable improvement in his ſtyle of engraving, eſpecially in the landſcape parts of his plates ; but he never entirely diveſted himſelf of the habit he at firſt acquired. He worked with the graver only, in a clear neat ſtyle ; but his plates were never highly finiſhed. We ſee in them, however, the hand of a very able artiſt, much correctneſs of drawing, and great expreſſion. His engravings are exceedingly numerous ; and though a complete collection of them is rarely to be ſeen, detached prints and ſets of prints are by no means uncommon. They are uſually marked with his initials combined in a cypher, for which ſee *Plate* II. of thoſe uſed by the engravers of the Netherlands. The following are thoſe which are held in moſt eſtimation.

Portraits.—Orlando Laſſus, maſter of the chapel of William, duke of Bavaria, in 8vo. ; Sigiſmond Feyerabend, a famous printer of Frankfort-on-the-Maine, in 4to. ; George Hoefnagle, an artiſt of Antwerp, and one of the coadjutors of Ortelius the geographer, an engraving of merit, in 4to. ; her royal highneſs Mary de Medicis, queen of France and Navarre ; Charles, prince of Sweden and duke of Sudermania ; Chriſtopher, baron of Teuffenpach, from J. ab. Ach., all in 4to. ; a three-quarter portrait of Herdeſianus, a celebrated juris conſulte, with twelve Latin verſes, in folio ; a profile of Martin Luther, in folio ; Otho Henry, count of Schwarzenberg, and counſellor of William of Bavaria, ſitting at a table, in large folio ; an hiſtorical portrait of Clement VIII., in an oval ; and St. John Capiſtranus, a monk of the order of St. Francis, both of folio ſize.

Various Sets.—“The Creation of the World,” commencing with the forming of the ſun and moon, and ending with the exile of Adam and Eve from Paradiſe, in a ſet of eight, after Criſpin Vanden Broeck ; a ſet of ſix, containing the hiſtory of Adam and Eve, and Cain and Abel, after Michael Coxie ; ſixteen ſubjects from the book of Geneſis, with Latin verſes, from Martin de Vos ; “The

Life of Chriſt,” from the ſame painter; a ſet of hermits, engraven conjointly by the two Sadelers, from the ſame painter. This ſet is much eſteemed, partly on account of the romantic variety of the back-ground landſcapes. A ſet of twelve landſcapes of the months of the year, from P. Steevens; “The four Parts of the Day,” after Theod. Bernard; “The four Seaſons,” with Latin verſes, after H. Bol, all of folio dimenſions.

Hiſtorical Subjects.—“The Virgin and holy Infant aſleep, and an Angel,” from Carracci, in 4to.; “The Feaſt of Dives,” after Baſſan; “Jeſus at the Houſe of Martha;” and “Jeſus with the two Diſciples at Emmaus.” Theſe three prints are commonly known among collectors by the appellation of “Sadeler's Kitchens.” “The Angel appearing to the Shepherds,” a night-piece; three plates of “The Nativity,” treated in different ways, all of folio ſize, from Baſſan, and a fourth of the ſame ſubject from Polidore de Caravaggio, in large folio; “St. Jerome praying, in his Cell, before an Image of the Virgin;” “Mary Magdalen praying in a Cell,” both very fine engravings, after Giles Moſtaert; “The patriarchal Family of Enoch,” in a very fine landſcape; “St. Roch and his Dog, with two Pilgrims,” both in folio, from the ſame painter; “Jeſus calling little Children,” in large folio, from J. de Winghe; “Bacchus ſeated on a Tub, accompanied by Love and Muſic;” “St. Paul at Corinth, at the Houſe of Aquila,” all in large folio, from the ſame maſter; “The Annunciation,” from Pietro Candido; “The three Maries at the Sepulchre;” and “St. Mary the Egyptian,” all in 4to.; “The Laſt Supper,” in folio; “The Virgin and Infant Chriſt, worſhipped by St. Stephen and St. Lawrence,” in large folio, all after Candido; “The Martyrdom of St. Urſula,” in large folio, from the ſame painter; “The Nativity,” after Hans von Achen, in 4to.; “The Death of our Saviour;” “The Virgin and Infant Jeſus, with the Magdalen kiſſing his Feet, behind them is St. Joſeph,” both in 4to.; “The Virgin and Infant Chriſt ſeated on a Throne, with the two St. Johns and Angels,” in folio, after the ſame painter; “A Repoſe during the Flight into Egypt,” from Chriſtopher Schwarz, in folio; “The Crucifixion,” with the Virgin and St. John at the foot of the croſs; “The Paſſion of our Saviour,” in ſeven large folio plates; “The Laſt Judgment,” in large folio, a very capital print; “A Courteſan ſitting by a Fountain, playing the Lute, wiſhing to attract the Attention of a Youth, whom a Sage is conducting another way,” in folio, all from Schwarz; “The penitent Magdalen,” from Frederic Suſtris, in folio; “Jeſus appearing to the Magdalen as a Gardener,” in folio; “The Annunciation,” in 4to.; a whimſical compoſition of “A holy Family,” with angels in the air, carrying the materials for the church of Jeſuits at Munich, in folio; “Hercules between Vice and Virtue, with Jupiter in the Clouds,” in large folio, all from Suſtris; “The good Shepherd,” from H. Bol; “The mercenary Shepherd,” from the ſame; “The four Seaſons;” a landſcape, where three herons are introduced in the air, from Paul Bril; “The four Seaſons,” from Bol; a pair of landſcapes, and a mountainous landſcape, with a caſtle on a rock, all after Bril, in folio; “Man ſurpriſed by the Advent of the Deluge,” and “Man ſurpriſed by the Arrival of the Day of Judgment,” a companion to the former, both from Th. Bernard, in large folio, two of the moſt celebrated and beſt engravings by this artiſt; “The Son of God ſitting at the right Hand of his Father, in the Clouds, attended by the Holy Ghoſt, the Archangel Michael, and other Angels,” after a picture by Antonio-Maria Viani at Munich, a very fine and rare print; and “A View of the City of Venice and Bucentaure,” both in large folio.

Raphael Sadeler the elder, was born at Bruſſels in the year 1555, and was the younger brother of John. Like him, Raphael was originally a *Damaſquineur* of iron and ſteel, a profeſſion which is now become obſolete; and like him, travelled through Germany to Italy for his improvement in art, and finally ſettled at Venice.

Whether Raphael followed John, or the brothers accompanied each other to Italy, is uncertain; but he continued to reſide at Venice, having a joint ſhare, as is believed, with his brother, in a commercial eſtabliſhment there, till the time of his death, which happened in the year 1616.

When he was about the middle period of life, it was found that his application to engraving had weakened his ſight; painting, he thought, required leſs optical exertion, and in this art he ſought and found refuge, till, the ſtrength of his eye-ſight returning, he reſumed the graver.

With his ſucceſs as a painter, we are not acquainted. His engravings greatly reſemble thoſe of his brother; he underſtood the human figure exceedingly well; his extremities are in general ſkilfully marked, and his hiſtorical heads are characteriſtic and expreſſive. His portraits too, of which he executed ſeveral, poſſeſs a conſiderable ſhare of merit.

The Sadelers, John and Raphael, often worked in conjunction, and produced a great number of plates. Separate portraits of them of quarto dimenſions, were engraved and publiſhed by Cornelius Waumans, with French inſcriptions beneath.

Of the engravings of Raphael, the following, generally ſpeaking, will be found moſt worthy of ſelection.

Portraits.—Paulus V. Pont. Max. in ſmall folio; St. Charles Borromeus, cardinal, in folio; Erneſt, archbiſhop of Cologn, in folio; Leopold of Auſtria, biſhop of Salzbourg, and Paſſau, after H. Keſſel, in 4to.; Leopold, archduke of Auſtria, biſhop of Ratiſbon, in folio; John Dietmar, abbé of Furſtenberg, in folio; Hypolyte, Guarinonius, Dr. of Medicine, in 4to.; Philip de Monte, muſical director to the emperor Rodolph II., in 8vo.; Ferdinand, archduke of Auſtria, in a 4to. oval; and Charles-Emanuel, duke of Savoy, on horſeback; after John Carrara, in large folio.

Hiſtorical, from various Maſters.—Four ſubjects from the Life of the Holy Virgin; 1. The Salutation. 2. The Viſitation. 3. The Marriage. 4. The houſhold Management of the Virgin, in 12mo. A ſet of twenty-eight from the Life and Paſſion of our Saviour, in 12mo.; “Mary Magdalen at the Sepulchre, with Sts. John and Peter,” after Jod. de Winghe, in 4to.; the voluptuous life of Sardanapalus, ſurrounded by his women, in 4to; “Lot and his Daughters,” in a fine landſcape, in large folio, both after the ſame painter; “A Holy Family,” conſiſting of the Virgin and Child, Elizabeth introducing the infant St. John, St. Joſeph reading, an angel, and two half figures, in folio, from Hans von Achen; “The Entombing of Chriſt,” in an oval, of folio ſize; “Two Angels in the Sepulchre, with the Body of our Saviour,” in folio; “The Reſurrection,” inſcribed “Chriſti de morte triumphus,” a circular print, in folio; (theſe three prints are very much eſteemed;) “The Magdalen in a Cell,” with a croſs in her hand, reading a book, ſupported by a ſkull, in 4to.; “Love careſſing the Muſes of Painting and Muſic,” in 4to.; “The Judgment of Paris,” a grand compoſition, all after Von Achen, in folio; “The Nativity of our Saviour,” after Matth. Kager, in 4to.; “St. Cunégonde, atteſting his Innocence;” and “St. Elizabeth relieving the Poor,” both in folio, and from the ſame painter; “The Virgin and Child,” with St. Joſeph, and two angels preſenting fruit, in ſmall folio ; a half figure of the Virgin, with the holy infant on a cuſhion, in 4to. ; “The Virgin and Child crowned,” in folio, both after Candidus ; “St. Francis,” (in the back-ground is a figure proſtrate before a crucifix,) in folio ; and “The Immaculate Conception,” both in folio, and after Candidus ; “The Virgin ſeated under a Canopy,” preſenting the infant Chriſt to a high-prieſt, accompanied by many other figures, in large folio, from the ſame painter ; “The Reſurrection of Lazarus,” after J. Rotenhamer, in folio ; “The Marriage of St. Catherine,” in a landſcape, from Henry Goltzius, in folio ; “God appearing to Cain, after the Murder of Abel,” from M. de Vos ; “The Dead Chriſt,” attended by the three Maries, St. John, and two angels holding torches, after Stradan ; “Venus, Bacchus, and Ceres,” inſcribed “Sine Cerere et Baccho friget Venus. Gil. Coignet inv. ;” “The Uncertainty of Life,” exemplified by Death ſeizing a lady at a grand repaſt, after Stradanus ; “Chriſt on the Croſs, attended by St. John and the two Maries,” from the younger Palma, all of folio ſize ; “The Virgin ſuckling the Infant Jeſus,” ſurrounded by a garland of flowers, in 4to. from Carracci ; “A Holy Family,” where the infant Jeſus has one knee on his cradle, and the other on his mother's lap, while St. John preſents him a little croſs : the back-ground preſents a mountainous landſcape, in folio, from Raphael. A fine circular print of “The Annunciation,” a poetical compoſition, after F. Zuccaro, in folio ; “The Adoration of the Kings,” in folio, after Baſſan ; “Jeſus at Table with the Pilgrims to Emmaus,” after the ſame painter ; a female milking a cow, and giving drink to a little boy, in folio, known by the appellation of “The Little Milk-woman,” in folio ; “The Four Seaſons,” in folio, engraved by Raphael in conjunction with his brother John, all from Baſſan ; “The Four Seaſons,” after J. Stradan, in folio. Six landſcapes, ornamented with rocks, wood, and water, after P. Steevens, in 4to. Two wild landſcapes, after Matth. Bril, in folio. Four landſcapes, with the hiſtory of the good Samaritan, in folio, from P. Bril. Four landſcapes from the ſame painter, in folio. Another ſet of four, after the ſame. A ſet of ſix emblematical figures, inſcribed “Amor,” “Nuptia,” “Labor,” “Honor,” “Arma,” and “Venatio,” after Martyn de Vos. A ſet of four allegorical ſubjects, on the four temperaments of man, in folio, from de Vos. A ſet of ſaints, entitled “Bavaria ſancta,” and “Bavaria pia,” in folio, after Matth. Kager, engraved by Raphael the elder, and his ſon of that name. And “The Battle of Prague,” engraved on eight plates, in folio, extremely rare, and marked with the name of Raphael Sadeler.

Egidius, or Giles Sadeler, was born at Antwerp A.D. 1570, and died at Prague in 1629. He was the nephew and diſciple of the two preceding artiſts, and following their ſteps, travelled through Germany and Italy, reſiding awhile in thoſe cities where art flouriſhed, for his improvement.

He was afterwards invited to Prague by the emperor Rodolphus II. who gave him a penſion, which was afterwards continued by his ſucceſſors, the emperors Matthias and Ferdinand II. He handled the graver with more facility, taſte, and freedom than his uncles, and repreſented the textures of his objects with more feeling than had hitherto been diſplayed, unleſs by the very firſt artiſts of the German ſchool.

He treated portraits and hiſtorical ſubjects in a broad free ſtyle, and harmonized and oppoſed his lights and ſhadows in ſo judicious a manner, that it produced forcible effect, without blackneſs.

He generally drew correctly, but in the ſubjects he engraved after Spranger, the contours of his figures, in conformity with the extravagant ſtyle of that maſter's deſign, are overcharged ; he excelled both in portrait and landſcape ; and was called by his contemporaries the phœnix of engraving. The following remarks from the pen of Watelet, which he intended ſhould be applied to the whole family, are more particularly applicable to Giles. “It is aſtoniſhing the ſucceſs with which the Sadelers have engraved landſcape with the graver ; the old trunks of trees have all the freedom of the pencil, and playfulneſs of etching ; and it is impoſſible to repreſent, in any better way, falls of water, rocks, and the depths of foreſts : the various weeds and plants which are introduced on the fore-grounds are extremely like nature, and the buildings and back-grounds are executed with ſo much taſte, that it repreſſes our regret for the diſcouragement of etching.” From the numerous engravings of this maſter, the following will be found worthy of ſelection.

Portraits.—Burckhard de Berliching, privy-counſellor of the emperor Rodolphus II. ; Chriſtopher Guarinonius Fontarus, phyſician to the emperor Rodolphus, a very excellent and rare print ; John George Gædalmann, juris conſulte ; Joachim Huber, counſellor ; Jacob Chimarrhæus, grand almoner to the emperor ; the cardinal of Dietrichſtein, biſhop of Olmutz ; Otto de Starſchedel, counſellor to the elector of Saxony, all of quarto ſize ; William Angelle, plenipotentiary to Henry IV., in folio ; John Matthew Warenfels, counſellor ; Adam, baron of Trautmanſdorf ; Siegfried de Kolonitſch ; Ferdinand de Kolonitſch ; the three ambaſſadors from the ſophi of Perſia to the emperor Rodolphus, *viz.* Mechti Kuli, Beg Sinal Chaen, and Cuchein Ollibeg, all in folio ; Torquatus Taſſo, a very rare print, in 4to. ; Octavius Strada, antiquary, in 4to., rare ; Peter Breughel, the elder, in folio ; Martin de Vos ; Sigiſmond Bathori, prince of Tranſylvania ; Michael Voivode of Walachia, in an oval ; Charles de Longueval, count of Buquoi, all in folio ; buſt of the emperor Matthias, ſurrounded with allegorical figures and inſcriptions ; a pair of the emperor Matthias, a three-quarter figure, and its companion, the empreſs Anne, both in large folio ; a large upright print of the emperor Rodolphus on horſeback ; the emperor Ferdinand II. on horſeback, with various emblematical figures and inſcriptions, in two large plates, joined ; an allegorical ſubject on the marriage of the emperor Ferdinand with Eleanor of Mantua, in folio ; and an allegorical ſubject on the protection given to the fine arts by the emperor Rodolphus, a very fine print, in large folio.

Subjects from his own Compoſitions.—A ſet of twelve, of angels with the inſtruments of the paſſion of our Saviour, in ſmall 4to. ; a ſet of four, of the Evangeliſts, in 4to. ; a ſet of fifty-two views in Rome, entitled “Veſtigi delle Antichita di Roma,” in folio ; a landſcape and figures, a rare print, in 8vo. ; “The Burning of Troy,” an etching in 4to. ; a building with niches, introducing the four ſeaſons ; “Charity,” with three children, both in folio ; “Narciſſus admiring himſelf in a Fountain,” in large folio ; “Pan and Syrinx preparing to bathe,” in folio ; “St. Sebaſtian dying, with the Angel extracting the Arrows from his Side,” in large folio ; “St. Dominic receiving the Inſtitutions of his Order ;” “St. Peter and St. Paul ;” “The Scourging of Chriſt ;” “The Crucifixion,” all in large folio ; and a grand compoſition of “The Hall of Prague,” on two plates, a very capital engraving.

Hiſtorical, &c. after various Maſters.—“The holy Virgin ſuckling the Infant Chriſt,” from a picture by Raphael, in the Florentine Gallery, known by the appellation of “Madonna della Segiola;" "The Angel appearing to the Shepherds," after Baſſan, in folio; "St. Chriſtopher bearing the Infant Chriſt on his Shoulder," in folio; "The Murder of the Innocents," in large folio, from Tintoretto; "The Call of St. Peter," after F. Barroccio; "Chriſt carried to the Tomb," a fine print, arched at the top, from the ſame painter; "The Scourging of Chriſt," from Joſeph d'Anpinas; "The Martyrdom of St. Sebaſtian," after the younger Palma; "The rich Man in Hell, and the poor one in Heaven," from the ſame painter; "Angelica and Medora," writing on the bark of a tree, from Carlo Caliari, all in large folio; "Eſclavonia," a young female, elegantly apparelled, from Titian, in folio; an allegorical print on the death of the wife of Spranger, accompanied with a medallion; "The three Maries going to the Sepulchre;" "The Arts and Sciences triumphing over Ignorance and Barbariſm;" "Hercules and Omphale;" "Venus and Cupid," all in large folio, after Spranger; "The Annunciation," after de Witt, in large folio; "Reward," a winged figure, ſtanding on a globe, inſcribed "Dat Deus omne Bonum;" an obeliſk with the armour of the count of Mansfeld, inſcribed "Sum Umbra Alarum Aquilæ," both in large folio; two buſts of angels, after Albert Durer; two fine heads of youths; "The Virgin and Child," in a landſcape, ſurrounded by animals; in the back-ground is introduced the Annunciation of the Shepherds, engraved with great delicacy; "Chriſt bearing the Croſs," all after Albert Durer, in folio; "Judith with the Head of Holofernes," from H. von Achem; "The Adoration of the Shepherds;" "The Virgin and holy Infant, careſſing the little St. John," all in folio, from the ſame painter; "Minerva introducing Painting to the Muſes," a grand compoſition, in the taſte of Spranger, in large folio, from Ab. Ach.; and four ſubjects from the Life of the Virgin, *viz.* "The Annunciation," "The Viſitation," "The Circumciſion," and "The Aſſumption," after J. Speccard, in folio.

Landſcapes.—A ſet of fifteen, from John (commonly called Velvet) Breughel, in folio, in which are introduced, 1. St. Jerome before a crucifix. 2. A repoſe during the flight into Egypt. 3. Tobit with the angel. 4. Our Saviour tempted in the wilderneſs. 5. St. Francis ſtigmatiſed. 6. A fiſh-market on the ſea-coaſt. 7. A view of a gulf, with company on the ſhore. 8. A ſtage-coach driving. 9. A windmill and village on the banks of a river. 10. A company of gypſies. 11. A ſtone and a wooden bridge, with two pilgrims. 12. Two travellers, one of whom is repoſing. 13. A woody landſcape. 14. Soldiers deſcending a mountain. 15. A ferry-boat.

Various, from Paul Bril, in folio.—A mountainous landſcape, into which is introduced a repoſe during the flight into Egypt; "A Hermit reading in his Cell," in a landſcape; two bridges of wood and ſtone; a mountainous landſcape, ornamented with cattle and figures; ſix views in Italy, with buildings and cattle; ſix landſcapes, into which are introduced the twelve months of the year, very capital engravings.

Landſcapes from Roland Savery.—A ſet of ſix views in Bohemia, with mills, water, and wood, in ſmall 4to.; another ſet of ſix, in Bohemia, with cataracts, travellers, &c. in ſmall folio; another ſet of ſix: 1. Villagers regaling under a trellis-arbour. 2. Buildings on the banks of a canal. 3. A ſtag-hunt. 4. Labourers on the top of a mountain. 5. A goat-herd repoſing near a caſcade. And, 6. A warrener, in folio. A ſet of five grand landſcapes, from the mountains of Tyrol, in folio, with cataracts, figures, &c.; and two others, of rock and foreſt ſcenery, alſo from the mountains of Tyrol.

From Pietro Stephani.—A ſet of four rich landſcapes, of the ſeaſons, in large folio; a ſet of eight fine landſcapes, with wind-mills, figures, &c. in large folio; and another ſet of twelve, in folio, of the months of the year.

Of the ſame family, but of merit ſomewhat inferior, were Jooſt or Juſtus, Philip, and Raphael Sadeler the younger, who were ſeverally inſtructed by their parents, and worked mechanically in the ſame ſtyle, merely multiplying the number of prints, without advancing in the ſmalleſt degree the general claims or capabilities of their art.

Juſtus was the ſon of John, and his beſt performances are certain portraits of the family of Gonzague, and an odd ſort of Dutch "Holy Family," from Rottenhamer, wherein the holy Virgin is repreſented ſwaddling the infant Saviour, while an angel is ſtrangely buſied in warming his linen.

Raphael Sadeler, the younger, was the ſon of the Raphael whom we have mentioned above, and occaſionally aſſiſted his father in his profeſſion, particularly in engraving the ſet of Bavarian ſaints. He alſo engraved "Venus and Adonis," a ſmall upright, from Titian, and "The four Evangeliſts," from P. Candidus, with other devotional ſubjects.

Philip was the degenerate ſon of Giles. A Mark Sadeler has alſo been mentioned, but is believed to have been only the publiſher of the works of his more ingenious relations.

Among the caprices of fortuitous biography, it has been the fortune of ſome who have benefited mankind, to have their merits paſs unrecorded. Von Londerſel, on the contrary, though not of firſt-rate talent, has been celebrated under two names, both by Papillon and by Strutt.

He appears to have been a native of Holland, born about the middle of the ſixteenth century, and to have been chiefly engaged in the execution of letter-preſs engravings, in a neat and delicate ſtyle, reſembling that of Virgil Solis, and which are marked ſometimes with one and at other times with the other of the two monograms, which will be found in *Plate* II. of thoſe of the ſchool of the Low Countries.

It is not unlikely that theſe *two* marks may have given riſe to the ſeparation of his works into thoſe of Ahaſuerus Landfeld, and Ahaſuerus Londerſel. That he was related to the John Von Londerſel, of whom we ſhall treat hereafter, is highly probable. From the ſmallneſs of his productions, of which the greater number adorn the books that were publiſhed at Antwerp about this period; he is claſſed among *the little* maſters, but his engraving of "The Laſt Supper" is on a ſomewhat larger ſcale.

Among the books which he thus decorated, are the 4to. edition, in the French language, of "The Travels of Nicholas de Nicolay into Turkey," printed at Antwerp in 1576, and the large Herbal of Matthias de Lobel. Detached ſubjects from the holy ſcriptures are ſometimes to be met with, which probably belong to a bible, in which Londerſel at leaſt aſſiſted in the production of the engravings.

Charles de Mallery was born at Antwerp A. D. 1576; it is not known of whom he learned the rudiments of drawing and engraving, but from the great reſemblance his ſtyle bears to that of the two Wierixes, it is probable he ſtudied in their ſchool. He was a very laborious artiſt, and engraved a great number of devotional ſubjects, animals, and book ornaments.

He worked with the graver only, and ſo exceedingly neat, that he, in ſome inſtances, equalled the moſt laboured performances of Jerom and Anthony Wierix. But then he did not draw ſo correctly; ſo that with inferior powers as an *artiſt*, he ſeems to have poſſeſſed the ſame ſhare of patience and attention, and manual ſkill. He had the honour of having his portrait twice painted by Vandyke, both were ſucceſsful pictures, and the prints after them by Vorſterman and

Morin, are well known. In the collection of the abbe Marolles were three hundred and forty-three of the engravings of Mallery; among the beſt of which may be mentioned “The Adoration of the Kings,” in 12mo.; “The youthful Saviour,” in a landſcape, accompanied by two angels; “The Canaanitiſh Woman;” “A Crucifix,” held by a man ſurrounded with allegorical figures; “St. Francis;” and “St. Jacintha,” in 12mo.; “The Holy Family,” accompanied by a Magdalen, in 4to.; “Chriſt among the Doctors,” in 12mo.; various heads of Chriſt, the Virgin Mary, the apoſtles, ſaints, &c. Some of the plates, for the great hunts by Stradan, which were produced in conjunction with the Galles, Collaerts, &c. in 4to. The hiſtory of the ſilk worms (which were brought by two monks into Europe), on ſix middling-ſized plates, lengthways, from J. Stradan, entitled “Vermis Sericus;” a buſt of “St. Anthony,” in an hiſtorical border, after Stradan; the fable of “The Man, his Son, and his Aſs, going to the Fair,” in four 4to. plates; and various plates of horſes, for a book entitled “De la Cavalerie Françaiſe,” in 4to., from the ſame painter.

Having already treated of the education and general merits as an artiſt of Paul Bril, of Antwerp, who performed ſome ſpirited etchings of landſcape ſcenery about the period now under our review, it remains but to mention ſuch of his etchings as are held in moſt requeſt among connoiſſeurs. Theſe are all of folio dimenſions, and are known by the following deſignations: a pair of views in the Campania of Italy, with rocky fore-grounds, adorned with buildings, &c. dated 1590; another pair, inſcribed “Paulus Bril inv. et fec. Vicenzo Cenoiformis Romæ;” another view in the Campania, of the upright form; four landſcapes belonging to a ſet, of which the remainder are engraved by Nieulandt. Sandrart mentions alſo a large and grand engraving by this artiſt, of which the ſubject is a view in the Campo Vaccino. For further information reſpecting this artiſt, ſee the article BRIL in our fifth volume.

Chriſtopher Van Sichem was born in Holland in the year 1580, and reſided chiefly at Amſterdam. He was inſtructed in the principles of engraving by Goltzius, from whom he copied ſome good portraits. The merit of his engravings on copper, conſiſts principally in the neatneſs of their executions, but thoſe on wood, after his maſter, are engraved in a bold ſtyle, and often poſſeſs a good effect, though he wanted taſte. His monogram will be found in our ſecond plate of thoſe uſed by the engravers of the Low Countries.

The moſt conſiderable work he executed is intitled “Iconia Hæreſiarcharum,” &c. It conſiſts of a great number of ſmall upright plates, of the principal reformers of the church, is engraved from his own deſigns, and was publiſhed at Amſterdam in 1609.

On Copper.—A profile of Johannes Calvinus Nouioduni, holding a book, ſurrounded with an hiſtorical border; David Georgius Delphis, in Batavia, pernicioſiſſimæ ſectæ auctor; Durch Chriſtop Von Sichem, *Formſchneider* und *Kupfirſtecher* (*i. e.* cutter of wood, and engraver of copper); Rob. Dudleus, Leyceſtriæ comes; Francis Valeſius, dux Alençon; the emperor Charles V. in the imperial coſtume, inſcribed “Carolus quintus Imperator Cæſar Auguſtus;” and queen Elizabeth, in regal attire; all of quarto dimenſions. The two latter portraits have been by ſome, attributed to Charles Van Sichem. Chriſtopher alſo engraved the whole-length portraits of the earls of Holland and Zealand, in folio, from drawings by himſelf.

On Wood.—A ſet of twelve hiſtorical ſubjects, in 12mo. rare; “Eſther before King Ahaſuerus,” in 4to. from Lucas of Leyden; “The Adoration of the Shepherds,” after Ab. Bloemart; “The Circumciſion,” after H. Goltzius; “Judith with the Head of Holofernes,” all in 4to.; “St. Cecilia playing on the Organ,” and four other figures ſinging; buſt of a man, with a hat and feathers, all from the ſame painter; buſt of an African prince, with a helmet ornamented with diamonds and feathers, from J. Matham; a ſet of four, repreſenting Judith, Siſera, David, and Sampſon, from H. Goltzius; and a ſet of four, repreſenting the Evangeliſts, with a hiſtory of their lives in Dutch; very meritorious prints: all the latter are of folio dimenſions.

The baron Heinneken mentions two other Dutch engravers of the name of Van Sichem (*viz.* Cornelius and Charles); and Papillon and Baſſan, the latter copying and magnifying the error of the former, has given ideal exiſtence to a third.

Cornelius is often confounded with Chriſtopher, but was of inferior talent. He was of the ſame family, and flouriſhed about forty years afterwards.

Of laborious induſtry, and as if pleaſureable ſtimuli rarely reached his mind, he ſcraped together not fewer than 600 ſubjects of figures of holy perſonages, ſcripture hiſtories, and legendary tales, which he engraved in a ſtiff and heavy ſtyle, but many of them were copies from prints.

Charles was alſo of the ſame family, and engraved both on copper and on wood, but his prints merit not much attention. Their ſeveral monograms will be found in *Plate* II.

Jacques de Gheyn, or Ghein, the elder, was born at Antwerp in the year 1565, and died in 1615. He learned the elements of painting of his father, who was a painter on glaſs; and engraving he ſtudied under Henry Goltzius. He ſucceſsfully imitated the manner of his maſter, and worked with the graver only, in a bold free ſtyle, which manifeſts the great command he had of that inſtrument. He drew correctly and frequently with much taſte; but all his works want effect, from the lights being ſcattered, and too equally powerful; neither are the maſſes of ſhadow ſufficiently broad, nor well harmonized. The number of his engravings amount to one hundred and ſeventy. He likewiſe painted flowers and ſmall figures with conſiderable ability. The monogram of this artiſt will be found in *Plate* II. of thoſe uſed by the engravers of the Low Countries. Among his works the following are moſt worthy of notice.

Portraits.—Tycho Brahe, the celebrated Daniſh aſtronomer; Abraham Gokevius, a famous antiquary of Amſterdam; Hugo Grotius, the ſtill more famous philoſopher; and Philip de Marnex, a diſtinguiſhed Calviniſtic reformer, all in 8vo.; Coſmo de Medicis, who is here called “The Father of his People,” a circular print; Sigiſmond Malateſta, a military officer; and Joannes Baſilowitſch, autocrator of Ruſſia, all in 4to.

Subjects from his own Compoſitions.—“Vanity,” repreſented by a female figure at her toilet; “Mary Magdalen,” a ſmall oval; two ſmall medallions of Mars and Venus; “A Gipſy telling a young Woman her Fortune,” in folio; “The Statue of Laocoon and his Sons,” in large folio; “A Lion couchant,” with a landſcape back-ground, a very rare oval print, in folio. A ſet of ten, very rare and celebrated prints, in ſmall folio, of Maſques. The twelve firſt Roman emperors, a ſet of circular prints in quarto, very much ſought after; “The Sabbath, or Rendezvous of Sorcerers and Sorcereſſes;” a large folio print, engraved on two plates.

Subjects after various Painters.—The Paſſion of our Saviour, a ſet of fourteen, engraved in conjunction with his pupil Zechariah Dolendo, after Van Mander, in octavo; “The Twelve Sons of Iſrael,” half-length figures, after Karl van Mander, in quarto; two emblematical ſubjects, on the folly of thoſe people who ſpend their time and money in purſuit of pleaſure, on two large plates; “The Erection of Babel, and Confuſion of Languages,” in large folio; “The Adoration of the Trinity,” in folio; “The Judgment of Midas,” in large folio; “The Prodigal Son,” a very fine print, in large folio. all from Karl van Mander; “The Crucifixion,” a grand compoſition; and “The Apple of Diſcord thrown among the Gods,” both in large folio, and after Vanden Broeck. A ſet of four, in circles, of the Evangeliſts, after H. Goltzius, in quarto; “The Empire of Neptune,” a circular print, in folio, after Guil. Telcho. A ſet of twelve, reckoned among the very beſt of the engravings of our artiſt, of the guards of the emperor Rodolphus II. after Henry Goltzius; “The Annunciation,” after Abr. Bloemart; “A Repoſe during the Flight into Egygt,” in a circle; “Chriſt preaching to the Multitude;” and “The Miracle of the Loaves and Fiſhes,” (of the oval form,) are all in folio, and after the ſame maſter; “Daniel in the Lion's Den,” and “Diana changing Actæon to a Stag,” after Th. Bernard, in folio; and “Polyphemus, Acis, and Galatea,” in ſtill larger folio, after Cornelius de Harlem.

Jacques de Ghein, the younger, was of the ſame family with the preceding artiſt, and was born at Antwerp in the year 1610. He travelled to Italy, and, as is ſuppoſed, became the diſciple of Antonio Tempeſta, whoſe ſtyle of etching he imitated with no ſmall ſucceſs: he ſometimes worked in conjunction with Coryn Boel, and marked his prints with his name at length, ſometimes with the addition of “Junior.”

Among his works may be mentioned with diſtinction, the portraits of Francis I. at the battle of Pavia, after A. Tempeſta; and that of the emperor Charles V. on horſeback, accompanied by his general officers, at the battle of Muhlberg, both in folio. He alſo engraved, in concert with Coryn Boel, the plates for “The Life of the Emperor Charles V.” after Tempeſta.

Guillaume de Ghein was alſo a native of the Low Countries, but of what part is uncertain, and was born ſome time about the year 1610. Preſumptively he was of the ſame family with Jacques. He travelled to Paris and ſtudied there, or, at leaſt, practiſed engraving, under J. de Blow, for whom he engraved two, *viz.* “Spring,” and “Summer,” of the four ſeaſons, perſonified ſomewhat ridiculouſly, by female figures attired in the French coſtume of the age of Louis XIII. Here alſo he engraved the portrait of Louis XIV. when a youth; he is repreſented on horſeback, and attired for the chaſe; and that of the duke Bernard, of Weymar, alſo on horſeback; both are of large folio dimenſions, and engraved in a ſtyle which bears ſtrong reſemblance to that of Abraham Boſſe.

Louis de Vadder was born at Bruſſels in the year 1560. He was the ſtudent of Nature alone: at leaſt he has acknowledged no other inſtructor, and no other has been recorded; and painted and etched landſcape with much ability: he was particularly ſucceſsful in his repreſentations of Morning, and often introduced the riſing ſun diſſipating the dank vapours of Night, and tinging the tops of the mountains, and other lofty objects, with golden luſtre. His ſtyle of etching is ſpirited and free, much reſembling that of Van Uden; and among his beſt prints will be found a ſmall village ſcene. The ſame ſcene, with falconers preparing to ſet forth on their morning's diverſion; and a folio landſcape, with the effect of a ſtorm; which, in addition to the name of Vadder, bears that of Vorſtermans; from which circumſtance it may be preſumed that the latter artiſt either aſſiſted in etching it, or worked upon the plate afterwards with the graver.

Gilbert van Veen, or Vænius, was born at Leyden in the year 1566, and died at Antwerp in 1628. He was the brother of Otho Vænius, a celebrated painter of portraits and hiſtory, who was the inſtructor of Rubens.

Gilbert worked with the graver only, in a ſtyle greatly reſembling that of Cornelius Cort; and from the number of engravings that he produced after the Italian maſters, it has been inferred that he travelled with Otho into Italy. His engravings are ſlight, but his outline is good; his heads expreſſive, and his hands and feet marked in a ſtyle that ſhews the ſoundneſs of his knowledge, and, as Strutt ſays, does him honour.

In the year 1612, we find him living at Antwerp, where, in the courſe of that year, he publiſhed “The Emblems of Horace,” after his brother's deſigns; and ſhortly after, a ſet of plates, of which the ſubjects are taken by Otho, from the “Life of St. Thomas Aquinas,” a meritorious work, engraved under the influence of a ſuperintending ſimplicity, perfectly homogeneous with the ſtyle of his brother's deſigns, and which ſhewed that they were brothers in mind, as well as by conſanguinity.

The principal works of this artiſt are the *Portraits* of Erneſt, duke of Bavaria, in a medallion, ſupported by Fame; John of Bologna, and Alexander Farneſe, after Otho Vænius, ſurrounded with allegorical figures, all of folio ſize.

Of his *Hiſtorical Works* may be mentioned, “The Emblems of Horace,” in quarto; “The Emblems of divine and profane Love;” and “The Life of St. Thomas Aquinas,” all after Otho Vænius; “The Four Seaſons,” from Raphael del Colle, in folio; “The Marriage of Iſaac and Rebecca,” in a frieze, compoſed of five folio plates, after Balth. Peruzzi, a very rare and capital work; “The Viſitation of St. Elizabeth,” in folio, from Baroccio; and “Our Saviour crucified, attended by the Virgin and St. John,” in large folio, after the ſame maſter.

Bartholomew Dolendo was born at Leyden A.D. 1566, and became the diſciple of Henry Goltzius. He worked entirely with the graver in an open ſtyle, ſomewhat reſembling the ſlighter works of his maſter, but was much his inferior, both as an engraver and draftſman; yet it is ſaid, that Gerard Douw learned the firſt principles of drawing from Dolendo.

He marked his engravings with one or other of the cyphers which may be ſeen in *Plate* II. of thoſe uſed by the engravers of the Low Countries, and his moſt eſteemed productions are “The Prophet Jonas thrown into the Sea,” which is companion to “The Prophet Jonas aſleep under his Gourd,” in circles; “A Dutch Village Fete,” in quarto; “Adam and Eve receiving the forbidden Fruit,” after Karl van Mander, in quarto; “Jeſus appearing to Mary Magdalen as a Gardener,” in folio, from his own compoſition; “The Holy Family,” and “St. John preaching in the Deſart,” both in folio, after M. Coxie; “Pyramus and Thiſbe,” after C. vanden Broeck, in quarto; “Jupiter and Ceres,” after B. Spranger, in large folio; and “The Aſſumption of the Holy Virgin,” alſo in large folio.

Zachariah Dolendo was born at Leyden in the year 1567, he was related to the preceding artiſt, and learned the elements of his art of Jacques de Ghein. He drew correctly, and was, in no reſpect, inferior to his maſter. We have, by his hand, a number of portraits which are equal to thoſe of

Wierix; his monogram will be found in *Plate* II. of thoſe uſed by the Low Country engravers.

From his works we ſhall ſelect the following, as being moſt worthy of eſteem:—William, prince of Orange, a half-length figure in armour, in a quarto oval, and finely engraved; "Andromeda chained to a Rock," from his own compoſition; "The Virgin ſeated on a Throne, crowned by two Angels," after Jac. de Ghein, both of quarto ſize; "The Crucifixion," in large folio, from the ſame painter; "Adam embracing Eve, whilſt ſhe receives the Apple from the Serpent," after Spranger; "St. Martin dividing his Mantle between two Beggars," from the ſame painter, in quarto; "The Continence of Scipio," a circular print, from Ab. Bloemart, both in quarto; and a ſet of "The Heathen Gods and Goddeſſes," from H. Goltzius. His naked Andromeda is a well-drawn figure, with the head and extremities marked in a maſterly ſtyle. Of the two Dolendos, who were probably brothers, it may ſafely be aſſerted, that Zachariah was the ſuperior artiſt. The time of his death has eſcaped notice: if that of his birth has been truly regiſtered by Huber, he could have been only in his fourteenth year (which is ſcarcely credible) when he produced his excellent portrait of prince William of Orange, for the print bears the date of 1581.

The family of Bloemaert attained a juſtly founded celebrity as engravers, during the period which is now under our review: for an account of them the reader is referred to the article Bloemaert, in our fourth volume.

James Matham was born at Haerlem in the year 1571. As we have already ſtated, he became the ſon-in-law and pupil of Henry Goltzius, in conſequence of his widowed mother marrying that diſtinguiſhed artiſt during the adoleſcence of James. Adviſed, no doubt, by his tutors, he travelled to Italy to complete his ſtudies, and in that country produced a conſiderable number of engravings: yet after his return he continued to work under the eye and the direction of Goltzius, and though he produced many valuable prints, they poſſeſs little originality as engravings, being executed in the ſtyle, or rather, in the *manner* of his father-in-law, whom, however, Matham never equalled in correctneſs of outline, or in taſte, or in the ſcience which enabled Goltzius to adapt his powers to the ſeveral occaſions which called them forth. In ſhort, though his manual command of the graver, which was the ſole inſtrument of his art, evinced extraordinary ſkill, yet, like moſt imitators, in ſeizing the groſſer part of the art of Goltzius, he let the eſſence eſcape. His numerous engravings, however, have been valued by moſt collectors, and are principally as follows.

Portraits.—A buſt of Philip Winghius, after H. Goltzius, in octavo; a buſt of T'leeſt al van den Velde, in an hiſtorical border, in quarto; and Nicolas Bulius, alſo in quarto; Abraham Bloemaert, in folio, after Paul Morelſen; Michael Angelo Buonaroti, in folio; Philip William, prince of Orange, after Mirevelt; and Henry of Naſſau, prince of Orange, both in large folio.

After various Italian Maſters.—"The Statue of Moſes," a ſitting figure, after Michael Angelo; and the "Statue of Chriſt," from the ſame maſter, both in folio; "A Holy Family," where the Virgin is repreſented carrying the infant Chriſt, accompanied by St. Anne, after the picture of Raphael, which was preſented to Charles II. of England, by the republic of Holland; "Mount Parnaſſus, with Apollo, the Muſes, and the Poets," both in large folio; "A Holy Family," accompanied by St. Catherine, after Titian, in folio; "The Alliance of Venus, Ceres, and Bacchus," from the ſame painter; "The Viſitation of the Virgin," a rich compoſition, after F. Salviati, in large folio; "The Saviour's Feet anointed," a circular print, after Thaddeus Zuccaro; "Chriſt on the Mount of Olives," both in folio; "The Nativity," and "The Aſſumption of the Virgin," grand compoſitions from the ſame painter, in very large folio; "The Adoration of the Kings;" "Chriſt healing the Sick;" "The Reſurrection of the Widow's Son," all grand compoſitions, after Zuccaro, of large folio ſize; and "The Viſitation," after P. Veroneſe, a circular print, alſo in large folio.

Various ſubjects, after Goltzius.—"The Fall of our Firſt Parents;" "The Holy Family," with St. Elizabeth; "Chriſt on the Croſs," at the foot of which is St. John and the Virgin; "Chriſt appearing to the Magdalen, in the Garden," all of folio dimenſions; "Jeſus at Table with his Diſciples at Emmaus;" "St. Luke painting the Virgin," in large folio; "Venus requeſting Cupid to aim an Arrow at Pluto," in quarto; "The Loves of the Gods," *viz.* 1. Jupiter and Europa. 2. Phœbus and Leucothœ. 3. Mars and Venus. And 4. Hercules and Dejanira, engraved as a ſet; "The four Seaſons," in circles; "The three Chriſtian Virtues," Faith, Hope, and Charity, all in folio; "The ſeven Cardinal Virtues," in quarto; and "The Seven mortal Sins," in folio; "The Picture of Cebes," or "The Type of Human Life," a very large compoſition, engraved on three plates, in a very fine ſtyle.

Hiſtorical, after various Painters.—"Abraham diſmiſſing Hagar," in folio; "The Annunciation," in half figures; "The Adoration of the Shepherds," all in folio; "The Parable of the Sower," with a landſcape back-ground, in large folio; "The Virgin in a Glory," and her head ſurrounded with ſeven ſtars, the crown of immortality, in folio; "St. Veronica and St. Suaire, with two Angels," in large folio; "St. Stephen kneeling;" "The Loves of Jupiter and Danae;" and "The Loves of Cupid and Pſyche," all in folio, from Ab. Bloemaert; "Sampſon aſleep on the Lap of Dalilah," after Rubens, in large folio; "The Holy Women, weeping over the dead Body of Chriſt," after Jer. Franck, in folio; "The Crucifixion," after Albert Durer, known by the appellation of "The Grand Calvary à l'accolade," large and rare; "Venus aſleep, ſurpriſed by Satyrs," after Rottenhamer, in quarto; and a ſet of five very rare prints, after Peter Van Aertſen, (called by the French Peter the Long); namely, 1. The Poulterer and Fruiterer. 2. Six Women and a Man, ſurrounded with Proviſions of all kinds. 3. The Kitchen of the wicked rich Man. 4. Jeſus and his Diſciples, in the Kitchen at Emmaus. And 5. The Toaſter; of which ſet it is very difficult to meet with good impreſſions.

Theodore Matham was the ſon and pupil of the preceding artiſt, and was born at Haerlem in the year 1600. He travelled into Italy, where he ſtudied in the ſchool of Cornelius Bloemaert, and in conjunction with him, Perſyn, Natalis, and other artiſts, he engraved the ſtatues of the Juſtinian palace. He did not work with the graver only, but ſometimes made uſe of the point; moſt of his works conſiſt of portraits, many of which are executed in a manner which does honour to the artiſt; among his works we ſhall mention the following as being moſt worthy of the notice of the collector.

Portraits.—Michael le Blon, agent of the queen of Sweden, after Vandyke; Jooſt van de Vondel, a Dutch poet, after Sandrart; Jodocus Larenus, a reforming miniſter; Vopiſcus Fortunatus Plempius, doctor of medicine; D. Gerardus Voſſius, Canonicus Cantuarienſis, after Sandrart;

Caſpar Barlæus, doctor of medicine; four fine portraits, after John Spilberg; *viz.* 1. Philip William, count palatine of the Rhine; 2. Wolfgang William, count palatine; 3. Catherine de Medicis, and 4. Stephen Vacht, dean of Sarten; Claude Saumaiſe, after Dubordieu; Henricus Regius, Philoſ. et Med. from H. Bloemaert, all of folio ſize; and D. Leonardus Marius Grezanus, in large folio, from Moyart.

Hiſtorical, &c.—“The Virgin and Child, with St. John,” after Baſſan; for the collection of engravings from the pictures in the cabinet of M. Reynot; “A Holy Family,” a grand compoſition, after Joachim Sandrart, in large folio; “Sainte Begga, the Daughter of Peſſin, duke of Brabant,” from Van Eyck, in folio; “Actæon metamorphoſed into a Stag,” in folio; “The Body of Chriſt, taken from the Croſs by St. John and Joſeph of Arimathea,” a very large plate; and “The Allegory of Virgil,” from Jooſt van Vondel, in quarto.

Adrian Matham was alſo of Haerlem, related to Theodore and James, and born ſome time about the beginning of the ſeventeenth century, but he was, on the whole, inferior to thoſe artiſts in merit. He worked with the graver only, imitating the elder de Ghein, but was always behind him, nor can it be neceſſary to dwell on his demerits.

He engraved part of the plates for the large folio volume, which was publiſhed at Antwerp in 1628, and entitled “Academie de l'Eſpée;” “The Golden Age,” from Goltzius, in large folio; “An old Man preſenting his Purſe to a young Female,” (a large upright) from the ſame maſter; “A Group of itinerant Muſicians,” after A. Vander Venne, in folio; “A Combat between ſix groteſque figures, with culinary Implements,” from the ſame painter: his other works are leſs worthy of notice.

He alſo engraved portraits, among the beſt of which are thoſe of Pieter Bor Chriſtiaenſz, a Dutch hiſtorian, after Frank Hals; and D. Sibrandus Sixtius Oiſtervirius, after N. Moyart, both in folio.

Herman Muller was a native of Holland, but we know not the preciſe time or place of his birth. If he frequented the ſchool of Henry Goltzius, which appears very doubtful, though it is aſſerted by Strutt, it muſt have been before the peculiar ſtyle of that artiſt was formed, and conſequently before his migration to Italy. He worked in conjunction with Cornelius Cort, in the earlier part of the career of that artiſt, for Jerome Cock. The ſole inſtrument of his art was the graver, which he handled with tolerable preciſion, but not much freedom; and in his beſt works his drawing is performed with care. In his later works, he aimed at the bold and free ſtyle of Goltzius, which had by this time excited the ſurpriſe of moſt of his contemporaries and the admiration of ſome, but in this endeavour our artiſt was not very ſucceſsful.

His engravings are numerous and not uncommon; they are marked with one or other of the three monograms, for which ſee our *Plate* II. of thoſe uſed by the engravers of the Netherlands. Among them may be diſtinguiſhed “The three Deſtinies,” and “Cleopatra,” after Cornelius de Harlem; “Lucretia,” after C. Kettel, (an upright) “St. Cecilia,” in which plate it may be ſeen he has attempted to embolden his ſtyle. A ſet of four of “The Cardinal Virtues,” after Martin Hemſkerk; another ſet of “The ſix Commandments of God,” illuſtrated by ſubjects from bible hiſtory, from the deſigns of the ſame painter, and ſome other bible ſubjects which range in ſets, with certain works from the gravers of the Sadelers and Galles, from J. Stradan and M. de Vos, of various folio dimenſions.

John Muller, of the ſame family, was an artiſt of more vigorous powers. He was born in the year 1570, as is ſuppoſed at Amſterdam, but how he ſtood related to Herman is not known. His vigour, however, as an artiſt, was not wiſely employed, like that of an Hercules; but rather extravagantly laviſhed; he ſwaggered like a giant of romance. Studying under Henry Goltzius at his worſt period, he learned to exceed even his exceſſes. He caught the enthuſiaſm of that great artiſt, but fell ſhort of him in judgment and variety. “The modeſty of Nature,” was with Muller as with Spranger, entirely out of the queſtion, and the more he could “Out-herod Herod” in his manual execution and ſtyle of deſign, (eſpecially when engraving after Bartholomew Spranger,) the better he appears to have pleaſed himſelf.

Hence ſome of his extravagancies are ſcarcely leſs ludicrous than others are ſeriouſly ſurpriſing. Watelet ſays of him, that “he handled the graver with the greateſt freedom, and will ever be worthy of the attention of thoſe artiſts who wiſh to diſtinguiſh themſelves in the mechanical part of engraving; but they muſt learn to ſubdue the audacity of his ſtyle. It is very difficult to employ leſs work than Muller, in rendering the textures of objects, and he always worked his plates up to a good tone. He underſtood the human figure well, but from engraving much after Adrian van Vries and Bartholomew Spranger, acquired a mannered habit of drawing, which particularly diſcovered itſelf in his hands and feet.”

To this eſtimate of his merits, Strutt adds, “the facility with which he handled the graver, for he worked with that inſtrument only, cannot be ſufficiently expreſſed; his works muſt be ſeen to convey a proper idea of it to the mind, yet if in freedom of execution he equalled his maſter, in every other requiſite he fell far ſhort of him,” &c.

That Solomon Muller was of the ſame family with Herman and John, as Strutt has conjectured, appears very doubtful, if not altogether an error. He ſometimes wrote his name Miller, and is ſo utterly deſtitute of the talent and enthuſiaſm of the Mullers, that he appears, from his ſmall Bible prints, which were produced about the period now under our review, rather to have copied the worſt of the Wierixes, with equal neatneſs, but with deeper dulneſs.

Of the engravings of John Muller, the moſt diſtinguiſhed are the

Portraits of Bartholomew Spranger, a kindred ſpirit, whom Muller terms, in the inſcription beneath, “M. Pictor celeberrimus,” it is dated in 1597, is in folio, and after Joab ab Ach; Eyerhardus Reidanus, comitis Guilhelmi Naſſavoy Conſiliarius; Maurice, prince of Orange; John Neyen, of Antwerp, laying his hand on a ſkull; Ambroſe Spinola, the celebrated general, in large folio, both from Mirevelt; Chriſtian IV., king of Denmark, from Iſacks; Albert, archduke of Auſtria, from Rubens, and its companion, Iſabella, infanta of Spain, from the ſame painter, in large folio.

Subjects from his own Compoſitions.—“The Baptiſm of Chriſt, celebrated in Heaven,” in folio; “An Ecce Homo,” ſurrounded by angels, a circular plate, in large folio; “Balthaſar's Feaſt,” and “The Adoration of the Kings,” two very capital plates, in large folio, very much ſought after by connoiſſeurs; “Chilo, the Spartan Philoſopher,” and “Harpocrates, the God of Silence;” two heads as large as life, engraved in a very bold, vigorous ſtyle.

Subjects from various Maſters.—“Hagar in the Deſart, comforted by an Angel,” in quarto; “Lot and his Daughters,” in large folio, almoſt ſquare; “The Nativity,” with eight Latin verſes, in large folio; “The Holy Family,” attended by two angels, in folio; “A young Hero, conducted by Hercules and Scipio to the Temple of Glory,” in quarto; “Venus attended by Nymphs and Satyrs,” in folio; “A Satyr dreſſing the wounded Foot of a young Fawn,” in quarto; “Venus and Mercury,” with four Latin verſes, in folio; “Ceres, Bacchus, and Venus, before a Fire,” in large folio; “Mercury and Minerva arming Perſeus,” a very fine engraving, in large folio; “The Goddeſs Bellona,” engraved on two large plates, and dedicated to the archduke Matthias; “Pſyche contemplating Cupid aſleep,” in large folio, all from B. Spranger; “The Reſurrection of Lazarus,” after Ab. Bloemart, a very capital print; “The Murder of Abel,” after Cornelius of Haerlem; “The Diſcomfiture of Irus, before the Suitors of Penelope,” in large folio; “Arion mounted on a Dolphin,” in large folio; “Fortune diſtributing her Gifts,” a large and grand compoſition, engraved on two plates, all from Cornelius of Haerlem; “The Martyrdom of St. Sebaſtian,” after Jean von Achen; a very large engraving, performed on three plates, of “The Rape of the Sabines,” from a compoſition in wax by Adrian van Uries; “Mercury and Pandora,” in large folio, from a group in bronze, by the ſame extravagant artiſt; and a ſet of ſeven circular plates, entitled “The Works of Creation,” after Henry Goltzius.

Paul Moreelſe, or Moreelſen, was born at Utrecht in the year 1571, and died in the ſame city in 1638. He ſtudied painting under Michael Mirevelt, whom he ſoon equalled, and ſucceeded in portraits, hiſtorical ſubjects, and architecture; the latter is ſufficiently teſtified by the gate of St. Catherine, in the city of Utrecht, which was built from his deſign. He ſtudied during ſome time in Italy, and we have by him ſome excellent wood cuts in chiaroſcuro, executed on three blocks; the firſt for the outline, which is cut in a very ſpirited ſtyle; the ſecond for the dark ſhadows; and the laſt for the demi-tints. Theſe prints have a light airy appearance, the hatchings by this artiſt being performed with great delicacy. They are drawn in a ſlight, but maſterly manner, and the union of the ſeveral tints produces an agreeable effect. He uſually marked his plates with a monogram, which will be found in our ſecond plate of thoſe uſed by the engravers of the Low Countries.

Of the engravings on copper by this artiſt we are only able to ſpecify the two following, which are both in folio. “Cupid with ſeveral dancing Figures,” and “The Death of Lucretia.”

John Saenredam was born at Leyden in the year 1570. He ſtudied the elements of engraving ſucceſſively under Henry Goltzius and James de Gheyn. Poſſeſſed by the infatuation in favour of clear and ſleek lines, which was faſhionable at the time, he appears never to have reſorted to etching, but executed his plates, which are ſomewhat numerous, with the graver alone. He handled that inſtrument, however, with great facility, and his ſtyle is at once free, clear, neat, ſoft, and delicate, but his chiaroſcuro is deficient in vigour.

He appears to have underſtood drawing better than he always practiſed it, as may be ſeen by comparing the plates which he has engraved after his own compoſitions, with thoſe which he has executed after pictures by other maſters. The outlines in the former are generally much more correct, and they are for that reaſon ſought after by connoiſſeurs with more anxiety.

Some of his prints are large. Their number is eſtimated by Florent le Comte at one hundred and thirty-two, which they probably ſomewhat exceed: among them we ſhall mention the following as being moſt worthy of the notice of the collector. The artiſt uſually affixed to them one or other of the two monograms, given in our ſecond plate of thoſe uſed by the engravers of the Netherlands.

Portraits.—Carl van Manden, after Goltzius, in quarto; John Céſarée, painter and philoſopher, a rare print, in folio; John de la Chambre, writing maſter, after Franc. Hals; and Peter Hogebert Hornanus, a poet and phyſician, ſurrounded with allegorical figures, after C. van Manden, both in folio.

Subjects from his own Compoſitions.—“Suſannah and the Elders,” a ſmall oval; “Deborah ſtanding at the Foot of a Rock,” perhaps ſinging or meditating her celebrated canticle, in folio; “Hercules, between Minerva and Venus,” a folio print, nearly ſquare; “Lycurgus giving Laws to the Spartans,” and exemplifying the advantages of good education, from the habits of two dogs, in folio; “The wiſe and fooliſh Virgins,” on five plates, with nine Latin verſes; very capital, and executed in ſo delicate a ſtyle, that the plate ſoon wore under the hand of the printer, and it is therefore difficult to meet with a good impreſſion; in folio. A large allegorical ſubject, relating to the government of the ſeven United Provinces under the houſe of Orange, repreſented by a proceſſion attended by Concord and other political virtues, in large folio. Another allegorical ſubject, relating to the government of the Low Countries by the infanta Iſabella. That princeſs herſelf is repreſented ſtanding under a tree on the right hand. Both very rare prints. And a repreſentation of a large whale, which was thrown upon the coaſt of Holland, with thirty-two Latin verſes; a very fine and rare print.

Subjects after various Painters.—“The Fall of our firſt Parents,” in quarto, after Henry Goltzius; “Lot and his two Daughters,” in folio; “Judith with the Head of Holofernes;” “Suſannah ſurpriſed by the Elders;” The ſix penitent women of the New Teſtament, *viz.* 1. Mary Magdalen. 2. The Woman of Samaria. 3. The Woman of Cana. 4. The Woman taken in Adultery. 5. The Woman with the Hemorrhoids. And 6. The paralytic Woman: with Latin explanations; in quarto. A ſet of three, 1. Ceres, worſhipped by Labourers; 2. Venus, worſhipped by Lovers; and 3. Bacchus, worſhipped by Drinkers, in large folio; very fine and rare prints. “The Union of Ceres, Bacchus, and Venus,” in folio; “Venus and Cupid,” in quarto; “Diana, with her Nymphs,” in a ſet of three plates, each containing two figures; “Diana diſcovering the Incontinence of Caliſto;” “Andromeda delivered by Perſeus;” “The Five Senſes,” in quarto; “The Seven Planets;” the three marriages, *viz.* “The Marriage for Intereſt;” “The Marriage for Paſſion,” and “The Marriage of true Affection,” in quarto; a painter drawing the portrait of a female kneeling before a mirror, known by the name of “The Painter,” in folio; all from Henry Goltzius. “The Life of Adam and Eve,” after Abr. Bloemart, on ſix plates, in folio. The hiſtory of the prophets Eliſha and Elijah, four folio plates. “Elijah with the Widow of Sarepta;” “The Annunciation of the Shepherds,” both in large folio; “The Prodigal Son,” with a landſcape background, in folio; “Vertumnus and Pomona,” and “The Rape of Ganymede,” both in large folio; all from Abraham Bloemart. “Mars and Venus,” with four Latin verſes, from P. Iſaacs, in quarto; “The Bath of Diana,” from Moreelſen, commonly called “The Great Bath of Diana,” to diſtinguiſh it from the former one after the compoſition of Saenredam himſelf; “Judith putting the Head of Holofernes in a Bag held by her Servant,” in folio, from Lucas of Leyden; “Deborah nailing the Head of Siſera,” in folio, from the ſame painter; “The Meeting of Eleazar and Rebecca,” after Carl van Mander, in large folio; “David with the Head of Goliah” on his ſword, from Lucas of Leyden; “The Daughter of Herodias dancing at the Feſtival of Herod,” after C. van Mander; “The Nativity,” a grand compoſition; and “Paul and Barnabas refuſing the Sacrifice of the Inhabitants of Lyſtra,” a grand compoſition, all in large folio, after the ſame painter; “Adam and Eve in the terreſtrial Paradiſe,” in folio, from Cornelius of Haerlem; “Suſannah and the Elders;” “St. John preaching in the Wilderneſs;” “Paris and Oenone cutting their Names on the Bark of a Tree;” “Angelica and Medora engraving their Names on a Beech Tree;” “Vertumnus and Pomona;” all in folio, from the ſame painter. “The Grotto of Plato,” a celebrated parable, ſhewing that moſt mortals prefer darkneſs to light, with twelve Latin verſes, from C. of Haerlem, in large folio; a very fine print, both in compoſition and execution. A wounded general, carried by his ſoldiers, formerly ſuppoſed to be Scipio, but as the coſtume of the figures is Grecian, and not Roman, it is more probably “The Death of Epaminondas;” it is engraved after a drawing by Goltzius. “The Redemption of Rome by the Dictator Camillus,” after a drawing by Goltzius; both of folio ſize. In the latter print, the characters of the Romans and Gauls are finely contraſted. A ſet of eight folio plates, dedicated to the duke of Aqueparte, of “The Hiſtory of the Unfortunate Niobe and her Children,” from the drawings of Goltzius after Caravaggio; with Latin verſes, very rare. The pictures form a frieze in the palace of Buffal, at Rome. “The Entombing of Our Saviour,” after Michael Angelo; and “Our Saviour at the Houſe of Levi the Publican;” executed on five plates, from the pictures of Paul Veroneſe in the church of St. Paul at Rome, of large folio ſize, and very rare.

Peter Serwouters, or Sherwouter, was born at Antwerp in the year 1574, where he always reſided. He worked in a clear neat ſtyle with the graver only, but without much taſte. His plates are not ſufficiently finiſhed to produce a pleaſing effect, nor accurate enough to bear critical examination.

From among his works, which are not numerous, the following may be diſtinguiſhed as leaſt unworthy of the notice of the collector. A ſet of ten ſubjects of Chaſes, after D. Vinckenbooms, in ſmall folio, lengthways; “The Fall of our firſt Parents,” of which the artiſts of the Netherlands appear to have thought their countrymen could not be too often reminded. In the preſent inſtance, French and Dutch verſes lend their aid in impreſſing the religious leſſon, and the whole forms a large folio print. “Sampſon killing the Lion;” “David killing the Bear;” and an emblematical plate, repreſenting in the front a Dutch merry-making, with figures dancing, and a cottage in the back-ground, from the door of which a man and his wife are iſſuing forth to oppoſe a man with a drawn ſword; all in folio, from the ſame painter. Serwouters alſo engraved part of the plates for Thibault's “Academie de l'Eſpée,” in folio, publiſhed at Antwerp A. D. 1628. The monogram which this artiſt ſometimes affixed to his prints will be found in *Plate* III. of thoſe uſed by the engravers of the Low Countries.

John von Londerſeel was born at Bruges in the year 1580. He worked entirely with the graver, in a ſtiff dry ſtyle, greatly reſembling that of Nicholas de Bruin, whoſe diſciple he probably was. However, his prints are not without ſome ſhare of merit; and are ſought after by connoiſſeurs.

He marked his plates in various ways, ſometimes with his initials, combined as in our *Plate* IV. of the monograms, &c. uſed by the engravers of the Low Countries, or, at other times, J. Lond. or J. Londer fec. Among his works, we ſhall ſelect the following as being moſt worthy of the attention of the collector. The theological virtues, Faith, Hope, and Charity, perſonified by female figures, with a landſcape back-ground; the Five Senſes characteriſed by figures, ſeated in a landſcape, both in large folio, and apparently from his own deſigns. A woody landſcape with hunters; and one with the fable of Apollo and Daphne, both in folio, from Jac. Savery; “The diſobedient Prophet devoured by a Lion;” “Tobit journeying with the Angel;” “Jacob tending the Flocks of Laban,” with landſcape back-grounds; “St. John in the Wilderneſs,” all in large folio, and after G. Hondecoter; “The good Samaritan;” “The blind Warrior;” “The Woman with the Hæmorrhage;” and “Abraham ſacrificing Iſaac,” all after Giles Coninxloo. A perſpective view of the interior of the church of St. John de Lateran at Rome, after Hendrick Arts, (a painter with whoſe name we are otherwiſe unacquainted.) The following are all after D. Vinckenbooms; “Saul anointed King of the Hebrews;” “The Rape of Tamar;” “The Prophet foretelling to Jeroboam the Diviſion of his Kingdom;” “Suſannah ſurpriſed by the Elders;” “The Temptation in the Wilderneſs;” “The Saviour praying on the Mount of Olives;” “The Maries approaching the Holy Sepulchre;” “Diana and Actæon;” and “The Pleaſures of Summer.” The latter is a meritorious landſcape, and they are all of large folio ſizes.

John Bara, or Barra, was a native of Holland, born A.D. 1572. He emigrated to England, and in the year 1624 was reſiding in London. His ſlender talents, however, merit not much attention. His inſtrument was the graver, and that only: his *work* may be truly ſo termed, being entirely without the vivaciouſneſs of art, and characterized by all the tameneſs and coldneſs of manual labour, in which reſpect the worſt imitator of the worſt of the Sadelers did not outdo him.

Of the engravings of Barra, it may be quite ſufficient to mention the

Portraits of prince Maurice of Naſſau and Orange; Charles II., elector of Saxony; Joachim, count of Ortemberg; and Lodovicus, duke of Richmond and Lenox, the latter of which was engraved in this country.

Hiſtorical Subjects, &c.—“Phaeton's fatal Requeſt to Apollo,” introduced in a landſcape, of folio ſize. Four other landſcapes in quarto, in which are introduced the pilgrims to Emmaus, and different events in the hiſtory of Tobit. Two hiſtorical landſcapes from the ſtory of “Suſanna and the Elders;” “The Parable of the Sower;” “Herodias receiving the Head of John the Baptiſt,” all in quarto. The laſt ſubject is from J. van Achen. “Time and Truth” is from Paulus ab Eſtatis, and is a ſmall upright, as is alſo “Bathſheba at the Bath.”

Nicholas, or Claus Coeck, is ſcarcely more worthy of notice than him whom we have juſt diſmiſſed. He was of Leyden, born in the year 1576, and, according to the baron Heinneken, ſtudied under Frank Floris, though his engraving appears rather to contradict this, and to point to Cornelius Cort as his maſter.

Of his works, which are not numerous, it may be ſufficient to name “The Four Elements,” perſonified by half-length figures, and “The Judgment of Midas,” all after Carl van Mander, and of folio dimenſions.

Giſbert van Breen, or Van Brecht, was born in Holland ſome time about the year 1576. He worked entirely with the graver, and is ſuppoſed to have been the diſciple of

James de Gheyn. His engravings are not deſtitute of merit, though inferior to thoſe of his maſter.

From among them the connoiſſeur may with advantage ſelect the *Portraits* of James I. of England, his queen, and the young prince of Wales, on the ſame (folio,) plate. A ſet of ſix ſmall prints of "The Life of a Libertine," preſumptively from his own compoſitions. "The Marketers with Fowls and Eggs," after Clauſe Coeck; "Envy ſtripping the Clothes from the Back of a Lady," after the ſame author, both in ſmall folio. A ſatirical print, wherein certain perſons are buſily employed in waſhing an angry jack-aſs. A pair, in the firſt of which two young libertines are diſſipating their wealth, and in the ſecond are reduced to want and miſery, in quarto, and after Van Mander. An inſtrumental concert, after Sbraſſen. A ſet of ſmall friezes of ſea-ports, with ſhipping, &c. after C. Nicolai.

Whether the Nicholas, or Claus, Braen or Breen, who is mentioned by Baſſan, was related to the preceding artiſt, we know not. They have by ſome writers been confounded together; but Nicholas appears to have been of the ſchool of Saenredam, and was the author of a ſet of four ovals from compoſitions by himſelf, of which the ſubjects are, Samſon, Siſera, Judith, and David, (David is here the ſtripling, and bears the head of Goliah). He alſo engraved "A Penitent Magdalen," after James Matham, in folio; and "Chriſt conducted to Calvary," alſo in folio, and after Tintoretto.

William van Swanenbourg, or Swanenburch, was born at Leyden in the year 1581. He was the diſciple of Saenredam, and did honour to his maſter and himſelf, by the freedom and vigour of his engraving. Abram Boſſe recommends his prints to ſtudents in the art, on account of the beauty of his touch: yet it muſt be confeſſed that the drawing of Swanenbourg is mannered and defective; and if ſtudents ſhould imitate, where it is applicable, the boldneſs of his handling, and his dexterity of touch, they ſhould aſpire to purer delineations of form.

He affixed to his engravings a monogram, for which, ſee *Plate* II. of thoſe uſed by the engravers of the Netherlands.

We ſhall ſpecify the following prints from the graver of Swanenbourg, as being moſt worthy of the attention of the connoiſſeur.

Portraits.—Abraham Bloemart, in an ornamented border; Janus Hautenus, ſecretary of Leyden, both in 4to.; Daniel Heinſius, profeſſor of Leyden; John Heurnius, doctor of medicine at Leyden; John William, duke of Cleve; Maurice, prince of Orange and Naſſau; Erneſt Caſimir, count of Naſſau, from P. Moreelſen, in large folio; and Petrus Jeanninus, eques, hanc maximi viri effigiem ex vultu expreſſit Michael Mirevelt, &c. in folio.

Hiſtorical, &c. after various Painters.—"Jacob defrauding his Brother out of Iſaac's Bleſſing;" and "The Reſurrection of Our Saviour," both from P. Moreelſen, in large folio. A ruſtic feſtival at the entrance of a village, after Vinckenbooms, in large folio. "The Judgment of Paris," from M. Mirevelt; "Perſeus reſcuing Andromeda," after Saenredam, in folio; "The Adoration of the Shepherds," after Abr. Bloemart, in ſmall folio; "The Six Penitents," in folio, *viz.* Saul, St. Peter, St. Paul, Zaccheus, Judas Iſcariot, and the Magdalen. "St. Jerome in the Wilderneſs;" "The Repentance of St. Peter." Three ſubjects emblematical of Piety, Riches, and Vanity, in ſmall folio, all from Bloemart. "Lot and his Daughters;" and "Jeſus at Table with the Pilgrims at Emmaus," both from Rubens: and a ſet of fourteen, commencing by "Jeſus Chriſt carrying the Croſs," and ending with "The Laſt Judgment," entitled "Thronus Juſticiæ. Hoc eſt optimus Juſticiæ tractatus electiſſimis quibuſque exemplis judiciariis aeri inciſis illuſtratus. Joachim Uytenwael, pinx. G. Swanenburch, ſculp. 1605, 1606."

Cornelius Boel was born at Antwerp in the year 1576. He was of the ſame family with Peter Boel, the eminent painter of animals and flowers, but ſtudied engraving apparently in the ſchool of the Sadelers. He made little uſe of any other inſtrument than the graver, which he handled with ability in a clear and neat ſtyle.

Boel engraved a ſet of ſmall oval plates for the fables of Otho Vænius, which were inſcribed with Latin, Engliſh, and Italian verſes, and publiſhed at Antwerp in 1608. "The Laſt Judgment," from a compoſition by himſelf, in ſmall folio, and the portrait of Henry, prince of Wales, in an ornamented border, and of quarto ſize.

From this latter plate, and the inſcription beneath the frontiſpiece to the large folio Bible, which was publiſhed here by royal authority in the year 1611, which inſcription runs, "C. Boel fecit, in Richmont;" it is inferred that our artiſt viſited England about the middle period of his life. But his principal and great work was a ſet of eight large plates, from Antonio Tempeſta, of which the ſubjects are "The Battles of Charles V. with Francis I."

The family of Hondius or de Hondt was numerous, and ſome of them of diſtinguiſhed merit in the arts. Joſt, or Jodocus, was the ſon of Oliver Hondius, a very ingenious artiſt of Ghent, where, in the year 1563, our artiſt was born, and where he paſſed his youth in the ſucceſsful ſtudy of ſome branches of the mathematics; but the inteſtine commotions which agitated that city, about the period that Joſt attained the age of manhood, occaſioned him to ſeek refuge in England.

Here he followed various purſuits, as various occaſions called forth and developed the variety of his talents. He made mathematical inſtruments, fabricated types for letterpreſs printing, and engraved maps and charts. Here alſo he married in the year 1586, and had ſeveral children. He afterwards removed to Amſterdam, and died there A.D. 1611.

Jodocus alſo engraved a few portraits, which are neatly executed, though in other reſpects their intrinſic merit is not conſiderable: among them are the celebrated Engliſh navigators, Thomas Cavendiſh and ſir Francis Drake. The latter is a large plate, and is commended by Strutt.

From an artiſt, however, ſo variouſly employed as Hondius was, no man expects exquiſite engravings; the place of his reſidence being England, and the time, the cloſe of the fifteenth and the commencement of the ſixteenth centuries. He ſometimes marked his plates with the cypher, which may be ſeen in *Plate* III. of thoſe of the engravers of the Low Countries; and at others, with a *hound* barking, and inſcribed "ſub cane vigilante;" which hound is, in fact, a pun upon his family name.

Beſide what we have mentioned above, Jodocus engraved the charts for Drake's Voyages, and ſeveral of the maps for Speed's Collections, in large folio, which latter are in general embelliſhed with figures; and Florent le Comte mentions, among the works of this engraver, a large perſpective view of London, publiſhed at Amſterdam in 1620; but Strutt very reaſonably infers a miſtake either in the engraver's name, or the date of this print.

Henry Hondius the elder, ſo called in contradiſtinction to him of whom we ſhall ſpeak hereafter, was born at Duffel in Brabant, A.D. 1576, and died at the Hague in 1610. Whether he was the ſon or brother of Jodocus has been diſputed, but is not known.

He appears to have ſtudied in the ſchool, and to have contracted the ſtiffneſs of Jerome Wierix, but poſſeſſes not his correctneſs. His principal engravings are the

Portraits of Cornelius Cort, Henry de Cleve, Giles Coninxloo, and Hans Holbein, (all painters;) John Bugenhagen, Philip Melancthon, John Wickliffe, John Knox, John Calvin, and Jerome Savonarole, (celebrated reformers,) all in 4to.

Hiſtorical, &c.—“The Judgment of Solomon,” and “The Woman taken in Adultery,” both after Carl von Mander; “A Flemiſh Recreation;” a ſet of five engravings, repreſenting the celebration of St. John's day, at Meulebeck, near Bruſſels, by healing the ſick, both from P. Breughel the droll; and “Muſarum Officia,” or the Muſes giving a concert on mount Parnaſſus, an agreeable compoſition, though the expreſſion of the heads is rather common, after Th. Zucchero, all of folio dimenſions.

Henry Hondius the younger is, with better reaſon than Henry the elder, believed to have been the ſon of Jodocus, and to have been born in London,—according to Huber,—in 1580, which is unfortunately four years before,—according to Strutt,—his father was married. He is ſuppoſed by Strutt to have ſtudied under his father, and to have applied himſelf with diligence to the art of engraving. His prints are neat, but diſcover little art.

Beſide finiſhing ſome plates which had been begun by Jodocus, the following are enumerated among his works.

Portraits of Bernard, duke of Saxe Weymar, in folio; a large head of queen Elizabeth; James I. of England, dated 1608; William, prince of Orange, after Alex. Cooper, dated 1641; Ferdinand, emperor of Germany, in 4to., dated 1634; and ſir Francis Drake, in folio.

Landſcapes, hiſtorical Subjects, &c.—A ſet of the four ſeaſons, after Paul Bril, dated 1643; another ſet of the four ſeaſons, conſiſting of landſcapes, adorned with various architecture, after P. Stephani, both in folio; a ſet of twelve landſcapes of the months of the year, in which are introduced ſeaſonable occupations and diverſions, in large folio; two prints repreſenting drunken peaſants, with landſcape back-grounds; two groteſque ſubjects of fools, &c. both after P. Breughel; “Chriſt going to Emmaus;” and “The Shipwreck of St. Paul,” a companion to the former, both from Giles Moſtaert, all of folio ſize; “Tobit fiſhing, attended by an Angel;” “St. John the Baptiſt preaching in the Wilderneſs;” and a view of the Hague, a rare print, all from Giles de Saen, in large folio.

The younger Henry viſited Holland about the time of his arrival at manhood, or a little before, and reſided at the Hague. Here he engraved the view of that town, which we have mentioned above; and here, in the year 1600, was born his ſon William or Guillaume Hondius.

William acquired the rudiments of engraving under his paternal roof; from whence he removed to Dantzic, and to the Hague, and became diſtinguiſhed by the merit of his portraits, of which he engraved a conſiderable number.

His cypher may be ſeen in *Plate* III. of thoſe of the engravers of the Low Countries; and his moſt remarkable portraits are thoſe of himſelf, after Vandyke, with the addition of “Chalcographus Hagæ Comitis;” Francis Frank the younger, painter of Antwerp, after the ſame maſter, both in folio; prince Maurice of Auſtria, an excellent print, probably from a drawing by Hondius himſelf; Ladiſlaus IV. of Poland, inſcribed “W. Hondius fecit 1637;” Theodore ab Werden Burgio; Berhard, duke of Saxe Weymar, all preſumptively drawn by himſelf; Henry Cornelius Longkius, after Mytens; Jean Caſimir, king of Poland; Charles, prince of Poland and biſhop of Breſlau, both after D. Scultz; and Louiſa Maria de Gonzague, queen of Poland, after Juſte d'Egmont, bearing the name and addition of “Wilhel Hondius Chalcographus Regius,” from which it appears that our artiſt enjoyed the honour of being engraver to the king of Poland.

Abraham Hondius, the juſtly celebrated painter of animals, was of the ſame family with the preceding artiſts; for whoſe biography and general merit as an artiſt, ſee HONDIUS, ABRAHAM. He etched a few plates in a ſlight, ſpirited, and painter-like ſtyle, yet with ſome degree of neatneſs, of which the ſubjects are the huntings of various beaſts of chace; theſe afford very ſtriking examples of animal expreſſion, eſpecially when their paſſions are rouſed to fury. His folio prints of “A Boar Hunt,” and “The Chace of a Wolf,” are, in this reſpect, admirable works, and are probably his beſt productions in this mode of art.

With the ſixteenth century aroſe the genius of Rubens, which has gilded the fine art of the Netherlands with unfading glory, and even tinged with its radiance the ethics and theology of Europe. His biography and extraordinary merits as a painter will be treated under the article RUBENS, *Sir* PETER PAUL. He etched a few plates, of which the merits are not tranſcendental, though they evince the powerful and free hand of a maſter; but he effected a revolution in painting, and indeed may be ſaid to have given a new conſtitution, more eſſentially free than that which preceded it, to the arts of his country, as our ſubſequent pages, devoted to the progreſs of engraving in the Low Countries, will atteſt.

The etchings of Rubens are performed in a ſlight and bold ſtyle, from his own compoſitions: “St. Francis d'Aſſize receiving the Stigmata,” in 4to.; “The penitent Magdalen,” ditto; “St. Catherine,” with the inſtruments of her martyrdom, &c. deſigned for a ceiling, and one of the beſt of the etchings of Rubens, of folio ſize; “The communication of Light,” a ſmall upright: the plate being afterwards finiſhed with the graver, either by Paul Pontius or Lucas Vorſterman, impreſſions of the etching, as it came from the hand of Rubens, are exceedingly rare and valuable. The compoſition conſiſts of a boy lighting a candle at another, which is held by an old woman. Theſe, and the portrait of an Engliſh miniſter, a ſmall head, in an oval border, are all the prints with which we are acquainted, proceeding from the etching-needle of this very diſtinguiſhed maſter.

With the vigorous and original powers of Rubens, cooperated by the fine taſte of Vandyke, and rouſed by the trumpet that ſounded forth their fame, Bolſwert, the Vorſtermans, and Pontius girded their loins, and leaped forth candidates of high enterpriſe and extraordinary promiſe, in the race of hiſtorical and portrait engraving.

The beſt of the engravers of Italy, with Marc Antonio at their head, had added truth of character to exquiſite purity of outline. The heroes of the German ſchool, led on by Martin Schoen and Albert Durer, had expreſſed the textures of the various ſurfaces or ſubſtances which adorn the face of nature, with nice diſcrimination; and had made ſome ſucceſsful approaches toward a vigorous and harmonious chiaro-ſcuro. It remained for Bolſwert, Pontius, and the Vorſtermans, the champions of the Netherlands, to poſſeſs themſelves of their trenches, and complete the circumvallation of engraving: and this they accompliſhed, aided by the commanding judgment and exquiſite taſte, and ſtimulated alſo by the ſucceſsful example, of Rubens and Vandyke.

To deeper and richer tones than had heretofore been produced,

duced, they added a talent of rendering local colour in the abſtract, which they poſſeſſed and exerciſed in enviable perfection.

Lucas Vorſterman the elder was born at Antwerp, A.D. 1580, and at firſt ſtudied painting in the ſchool of Rubens; but, counſelled by his maſter, who had remarked the true bent of his genius, he quitted the pencil for the graver. He greatly diſtinguiſhed himſelf as an engraver before he quitted the Low Countries, in particular by the production of his print of “The Adoration of the Eaſtern Kings,” after Rubens; which is pronounced by Huber to be one of the fineſt engravings that was ever executed, and is indeed a print of tranſcendent merit. But Vorſterman is of the number of thoſe artiſts who were attracted to the court of London, by the taſte and patronage of Charles I.; and as he contributed largely to the advancement of Engliſh engraving, the reader will find ſuch of the ſubſequent events of his life, as are of importance to art, detailed, and accompanied by a general eſtimate of his merits, in our account of the *Origin and Progreſs of* ENGLISH *Engraving*. A more copious liſt of the beſt works of ſo diſtinguiſhed an artiſt than we were then enabled to offer, is now ſubmitted to the admirers of legitimate engraving.

Lucas commonly ſigned his plates with a cypher, for which ſee *Plate* III. of thoſe uſed by the engravers of the Low Countries.

Portraits after Vandyke.—Peter de Jode; Charles de Mallery; James Callot; Theodore Galle; Wenceſlaus Coeberger; Deodatus del Mont; Peter Stevens; John Van Mildert; Hubertus Vanden Eynden; Lucas Van Uden; Cornellius Sachtleven; Horatius Gentileſcius; and John Livens, all diſtinguiſhed artiſts, in folio; Iſabella Clara Eugenia, infanta of Spain; Gaſton, of France, duke of Orleans, brother to the king of France; Ambroſius Spinola, governor-general of the Low Countries; Wolfgang William, count palatine of the Rhine, and duke of Bavaria; Francis of Moncade, count of Oſſona; Nicolas Fabricius, of Peireſe; Alfonſo Perez de Vivero, count of Fuenſalds; Thomas Howard, earl of Arundel, all of folio dimenſions; Nicolas Roccokxius, an amateur of Antwerp; one of the fineſt portraits of Vorſterman, in large folio.

Portraits after various other Maſters.—A buſt of Plato, after an antique marble; buſt of Seneca the philoſopher, alſo after an antique; a pair of Coſmo of Medicis, and Lorenzo of Medicis, in circular borders; pope Leo X., an octagon plate; Juſtus Lipſius, Iſcanus; and Claudius Maugis, abbé of St. Nicholas, from Ph. de Champagne, all of 4to. ſize; John de Serres, after N. Van der Horſt, in 4to.; Conſtantine Hughens, ſecretary to the prince of Orange; John Livins, del.; a buſt of the emperor Charles V. and the conſtable of Bourbon, both from Titian, in folio; another of the emperor Charles V., after a copy by Rubens, from Titian; Charles de Longueval, count of Buſquoi, after Rubens, a very fine and rare print, in large folio.

Hiſtorical, after various Painters.—“The Holy Family,” on a black ground (engraved in England), after Raphael; “The Entombing of Chriſt,” and “St. George on Horſeback,” both from the ſame painter, in folio; “Chriſt in the Garden of Olives,” after Caracci, in large folio; “The Virgin and Holy Infant,” worſhipped by two pilgrims, in folio, after Michael Angelo; “The Adoration of the Shepherds;” the ſame ſubject differently treated; “The Adoration of the Eaſtern Kings,” a very fine and rare print; a repetition of the ſame ſubject, all in large folio; “The Holy Family,” accompanied by St. Anne; another “Holy Family,” where the infant Chriſt careſſes his mother; “The Virgin and Holy Infant”, accompanied by St. John; “Cæſar's Tax, or the Tribute Money,” all in folio; “The Deſcent from the Croſs,” in large folio; (the beſt impreſſions of this plate are inſcribed C. Van Merlen); “The Angel appearing to the Holy Women at the Sepulchre of Chriſt,” in folio; “St. Francis receiving the Stigmatics;” “The Martyrdom of St. Lawrence,” both in large folio; “Mary Magdalen throwing away her Jewels;” the frontiſpiece of a book, intitled “A general Eccleſiaſtical Hiſtory, from the Birth of Jeſus Chriſt to the Year 1624,” in folio, all after Rubens. “The Flagellation of our Saviour,” in large folio, after G. Seghers; “The Death of St. Francis,” after the ſame painter; “St. Ignatius of Loyola;” “The Fable of the Satyr and his Gueſt, who blew hot and cold with the ſame Breath,” after Jac. Jordaens, in large folio; “The Chace of a Bear,” after Snyders; and “A Vocal Concert” of ſix perſons, among whom a girl is playing the guitar, after A. Colter, both of folio dimenſions.

Contemporary and compeering with the elder Vorſterman, were the Bolſwerts. The biography of theſe was inſerted in our fourth volume before our preſent arrangement in ſchools was determined on (ſee BOLSWERT, ADAM, or BOETIUS, and SHELTIUS); but of the works of artiſts ſo illuſtrious, it has been judged proper to add a more copious liſt for the information of collectors, omitting thoſe which are already before the reader in vol. iv. The monograms with which theſe artiſts ſeverally marked their performances, may be ſeen in our third plate of thoſe uſed by the engravers of the Low Countries.

Works of Boetius a Bolſwert.—The portraits of Adam Saſbout, with the motto “Omnia Vanitas;” a pair of ditto of John Bergman, (a celebrated Jeſuit,) kneeling before a ſkull; and St. Aloïſe Gonzaga, kneeling before a crucifix, both in folio; Guillaume Louis, comte de Naſſau, and (its companion) the corpſe of the ſame nobleman lying in ſtate, dated 1618, and after M. Mirevelt, in folio; a ſet of ſeventy-ſeven ſmall plates, from deſigns by Bolſwert himſelf, done to accompany “The Life of Chriſt;” another ſet of ſmall book plates, alſo from his own deſigns, engraved for a myſtical work, entitled “Le Pelerinage.”

Hiſtorical Subjects after various Maſters.—“The Adoration of the Shepherds,” after Abr. Bloemart; “A Repoſe during the Flight into Egypt;” both in large folio. A ſet of four landſcapes, and fourteen plates of animals, in 4to. both from the ſame maſter; “Jeſus at the Houſe of Martha and Mary,” a rich compoſition, after J. Goiemar, a very large plate, very much ſought after; “Death and Time, conquering Men and Animals,” in folio, after D. Vinckenbooms; “Adam and Eve in the terreſtrial Paradiſe,” ſurrounded with animals, a very fine engraving from the ſame painter. Theſe three prints are very rare, and much ſought after by collectors; and “The Judgment of Solomon,” a large folio plate, after Rubens.

The moſt eſteemed works of *Sheltius a Bolſwert*, omitting thoſe mentioned in the Cyclopædia, vol. iv. and beginning with his *landſcapes*, are as follow:—The landſcapes of Sheltius are indeed very ſurpriſing performances. When we conſider the pictureſque ruggedneſs of his rocks, and boles of trees, and the freedom and looſeneſs of his foliage, it ſeems ſcarcely credible that ſo high a degree of excellence in this department of the art ſhould have been attained by the uſe of the graver alone; yet in all his landſcapes not a line of etching appears. Nor is our wonder leſs excited when we contemplate the tones, rich or exquiſite as the various occaſions required, which Bolſwert has here produced, more perfectly vibrating with thoſe of the original pictures: we had almoſt ſaid than thoſe of any other landſcape-engraver whatever. But certainly, in this reſpect, no engraver has ſurpaſſed him.

A large landſcape, wherein is introduced a lion-hunt, with a cavalier overthrown and another coming to his reſcue. This is one of the fineſt engravings of the whole ſet. A grand mountainous ſubject, with romantic falls of water, into which is introduced the effect of a ſtorm, and the fable of the hoſpitality of Philemon and Baucis towards Jupiter and Mercury. The companion to which is a ſea-ſtorm and ſhipwreck; the fore-ground is occupied by mariners who have eſcaped the wreck, and are kindling a fire on the ſhore. (This print is commonly called the "Tempeſt of Eneas.") A foreſt-ſcene, into which is introduced the fable of Meleager and Atalanta; the champaign of Malines, with haymakers; a large landſcape, with animals in a ſtable, and a female filling a pig's-trough with food. (This laſt, completing the ſet, is engraved by P. Clouet.) A landſcape with ruined edifices, and two women carrying baſkets in the fore-ground. Ruins on a plain, with various ruſtic figures. A landſcape, in the fore-ground of which is a wooden bridge, with a ſhepherd and flock. A champaign country, with two women in the fore-ground, one of whom carries a baſket, and the other a rake; a rainbow is repreſented in the clouds. Sun ſet, with a man bringing horſes to water, and a landſcape, with the effect of moon-light.

Devotional Subjects, &c. from his own Deſigns.—"The Infants Chriſt and St. John playing with a Lamb;" "The Virgin and Infant aſleep;" "The Virgin ſuckling the Holy Infant;" "A Statue of the Virgin, with her Hands croſſed on her Boſom;" all in 12mo. "The Virgin and Child in the Air, attended by Angels and Cherubim;" "The Virgin careſſed by the Infant Chriſt, with St. Joſeph." Twelve figures of ſaints, half-length. Another ſet of twelve of ſaints, all in 8vo. "A Hermit proſtrate before a Croſs;" "The Mother of Grief, piercing her Boſom with a Sword;" "Jeſus Chriſt triumphing over Death;" both in folio. "St. Barbara, a Virgin-Martyr;" "St. Staniſlaus Koſka, kneeling before an Altar;" "St. Francis Borgia;" "St. Alphonſo Rodriguez;" "Robert Bellarmin, at a Bureau;" "Leonard Leſſius;" all in large folio. "The reſigned Death of a Saint," and "Dreadful Death of a Sinner," two folio prints. An emblematical ſubject, relating to prince Ferdinand, the governor of the Low Countries, in large folio. "A Theſis," dedicated to Sigiſmond, kind of Poland, on two large plates. The frontiſpiece, and five other plates for Thibault's Fencing Academy, in large folio, and a rare print, entitled "The Diſpute between the Fat and the Lean," in large folio.

Portraits after ſir Anthony Vandyke.—Sheltius a Bolſwert; Andrea Van Ertvelt; Martin Pepyn; Adrian Brouwer; and John Baptiſta Barté; (all diſtinguiſhed artiſts;) Juſtus Lips, an hiſtorian; Albert, prince of Aremberg, Barbanſon, &c.; Maria Ruten, the wife of Vandyke; Margaret of Lorrain, ducheſs of Orleans; William de Vos; and Sebaſtian Vrank; painters, all of folio dimenſions.

Hiſtorical Subjects after Vandyke.—"Maria Mater Die, or the Virgin in Extaſy," in folio; "The Virgin with the Infant Chriſt on her Knees, attended by St. John, and an Angel with a Crown," in large folio; "The Virgin contemplating the Infant Chriſt on her Lap, accompanied by a Saint holding a palm Branch;" "The Virgin ſeated, with the holy Infant aſleep in her Arms, with St. Joſeph," both of folio ſize; another "Holy Family, attended by Angels;" "The Elevation of the Croſs on Mount Calvary;" "Chriſt on the Croſs," at the foot of which are St. Dominic and St. Catherine of Sienna, both in large folio; and "A Drunken Silenus, attended by Bacchanals and Satyrs," in folio.

Hiſtorical, after various Maſters.—"Chriſt on the Croſs," with St. John and the holy women at the foot, after Jordaëns; "Argus lulled to ſleep," with Mercury preparing to behead him; "The Infant Jupiter," with a nymph milking the goat Amalthea, accompanied by a ſatyr playing the tambourine, both in large folio. The two latter are the fineſt of Bolſwert's engravings after Jac. Jordaëns. A family concert, inſcribed "Soo D'Oude ſongen, Soo pipen de Jongen." "Pan holding a Baſket of Fruit, accompanied by Ceres crowned with Wheat, and a Figure blowing the Horn," both in folio, and from Jordaëns. Impreſſions of the latter are become very rare; "The holy Salutation," after Gerard Seghers. "The Return from Egypt," where the Infant Chriſt appears walking between St. Joſeph and the Virgin; "The Virgin appearing to St. Ignatius of Loyola;" "St. Francis Xavier tempted by Satan, and comforted by the Apparition of the Virgin and Child;" "The Denial of St. Peter," in an aſſemblage of ſoldiers, playing at cards; and its companion, "The Smokers," two very capital prints in large folio, after G. Seghers; "A Concert," after Theodore Rombout, being the companion to one of the ſame ſubject engraved by Vorſterman, after Coſter; "The Virgin and holy Infant," (who holds the globe of the earth,) after Eraſmus Quelinus; "The Communion of St. Roſe," after the ſame painter; "The Body of Chriſt on the Lap of the Virgin," after Diepenbeck; and "The Crucifixion of three Jeſuits at Japan," after the ſame painter, all of large folio dimenſions.

Hiſtorical, &c. after Rubens.—"The Annunciation," the beſt impreſſions of which are marked with the name of Vanden Enden; "The Return from Egypt;" "The Executioner giving the Head of St. John the Baptiſt to Herodias," in folio; "Chriſt crucified between the two Thieves," in folio; "A Crucifixion," wherein a ſoldier is piercing the ſide of Chriſt; St. John and the Virgin are ſtanding at the foot of the croſs; a very beautiful engraving, executed in a bold ſtyle, in large folio; "A Crucifixion," with the city of Jeruſalem in the back-ground; and another engraving of the ſame ſubject, both in large folio; "The Body of Chriſt on the Lap of the Virgin, with St. Francis," in large folio; "The Reſurrection," and "The Aſcenſion of Chriſt," two large folio plates; "The Trinity," where Chriſt is repreſented dead, a fore-ſhortened figure ſupported by the Deity; "The four Evangeliſts," in large folio; "The Triumph of the Church," a large folio plate nearly ſquare; "The Deſtruction of Idolatry," a large print lengthways, on two plates; "The Fathers of the Church, ſurrounding St. Clare, with the Sacraments," a large folio plate nearly ſquare; "The immaculate Conception of the Virgin," a circular print in large folio; another "Aſſumption of the Virgin," where a diſciple raiſes a ſtone at the mouth of the ſepulchre; "The Virgin embraced by the Infant Chriſt," "The Infant Chriſt on a Table careſſing his Mother;" "The Virgin, with the holy Infant on her Lap, holding a Globe and Sceptre;" "The Holy Family," where the infants Chriſt and John are playing with a lamb; and four other engravings of the ſame ſubject, in large folio; "St. Franeis Xavier ſtanding before a Crucifix," in folio; and its companion "St. Ignatius of Loyola," before the name of Jeſus, ſurrounded with rays of glory; "St. Cecilia playing on the Organ," a diſtinguiſhed plate, the firſt impreſſions of which are inſcribed G. Hendrix. Thoſe where the name of Witdoeck is ſubſtituted for that of Bolſwert are retouched, and of very inferior value. "St. Thereſa interceding at the Feet of Chriſt, for the Souls in Purgatory," in large folio. Nymphs and ſatyrs laden with fruit and game, half figures, commonly called "The Return from the Chace," in folio. "A drunken Silenus," ſupported by a ſatyr, and another figure. The impreſſions, with the name of Bolſwert only, without the addreſs, are the earlieſt and beſt. "The Continence of Scipio," in large folio. Thoſe impreſſions are the beſt with the name of Hendrix. "A triumphal Arch," in honour of Ferdinand, cardinal-infanta of Spain, and governor of the Low Countries, in large folio, and "Jeſus Chriſt, the two Virgins, four Angels, and many other holy Perſons," engraved by S. a Bolſwert and Corn. Galle, and inſcribed with the name of Hendrix, in folio.

Paul de Pont, or Pontius, the third of our celebrated chalcographic triumvirate of the Netherlands, was born at Antwerp A. D. 1596, and became the diſciple of the elder Vorſterman, both maſter and pupil being at the time befriended and improved by the frequent counſel and advice of Rubens. The beſt works of Pontius, and which form the baſis of his well founded celebrity, are free graphic tranſlations from the originals of that great maſter, in the accompliſhment of which he united preciſion of touch, with a nice perception of form, character, and expreſſion. His manual power and command of the graver was ſcarcely inferior to that of his contemporary Bolſwert, and if in taſte he was inferior to Vorſterman; in a juſt and even penetrating obſervation of the peculiar merits of the picture before him, and the principles upon which thoſe excellencies were produced and connected, he was inferior to neither. Care, obſervation, feeling, were pre-eminently his; and hence the truth and vigour of his hiſtorical heads. Genius, and profound knowledge of the human figure, certainly belonged in higher degrees of perfection to Vorſterman and the Bolſwerts.

In commenting on the productions of this illuſtrious triumvirate, a foreign critic of eminence dwells with juſt emphaſis on the neglect and the importance of aſcertaining what ought to be eſteemed *principle* in engraving, as well as in all other arts that are with propriety ſo termed; and when we call to mind, and apply the well-founded aphoriſm of Hippocrates, that "art is long, life ſhort, opportunity fleeting, and even experiment, ſometimes fallacious," it may well ſeem extraordinary that among the critics and connoiſſeurs of the Low Countries, nothing was done towards aſcertaining and publicly explaining the merits of theſe admirable engravers, and that in any part of Europe, ſo little has been done in this art toward aſcertaining principle at all. The art of the ſtatuary, and the ſiſter art of painting, have been cultivated, and have flouriſhed under the mild and cheering influence of ſettled laws; their actual progreſs, as well as occaſional retrogradations, are known and underſtood: while engraving has been doomed to the undetected endurance of the wildeſt anarchy; of licentious and contradictory practice; and merit, demerit, and mediocrity, have alike had their hour of idle gazing, and have alike fleeted from that ſteady critical comment which ſhould have marked the ſtages of the progreſs of the art.

Some writers have idly aſſerted that Rubens occaſionally worked on the plates of theſe artiſts. The fact is, (as we have reported in our ſhort notice of the etchings of this maſter), that Rubens had ſo little pretenſions of this kind, indeed was ſo far from poſſeſſing any power over the graver, that the few touches that were wanting after corroſion, to the completion of his plates, were ſupplied by his friends Vorſterman, Bolſwert, or Pontius. The error has originated from its having been the cuſtom of theſe artiſts, for Rubens to reviſe and touch from time to time upon trial-proofs that were taken to aſcertain the engraver's progreſs: in doing which, as theſe engravers worked after Rubens and Vandyke, with the freedom and fellow-feeling of friends, not with the ſervility of ſlaves, it was ſometimes found neceſſary to vary the chiaroſcuro from the original pictures, in order that when the local colours were abſtracted, the ſpectator's perceptive faculties ſhould be impreſſed or operated upon, in a ſimilar manner, and conſequently his mind affected in the ſame way, as by the combinations of colour with light and ſhade in the original pictures: for, paradoxical though it may appear, it is clear that theſe men of genius thought and felt thus upon the ſubject, nor is it leſs clear to thoſe who ſtudiouſly compare the engravings of theſe maſters with Rubens' original pictures, that they were right in ſo thinking.

The following engravings, from the hand of P. Pontius, are deſervedly held in conſiderable eſtimation.

Portraits after Vandyke.—Paul Pontius, engraved by himſelf; ſir Peter Paul Rubens; James de Breuck, architect; John Wildens; John vans Raveſtein; Palamede Palamedeſſen; Theodore Vanloo; Theodore Rombouts; Gerard Honthorſt; Henry van Balen; Adrian Stalbent; Gerard Segher; Simon de Vos; Daniel Mytens; Gaſpar de Crayes; and Martin Pepyn; all celebrated artiſts of Antwerp. Gaſpar Gevartius, juris-conſulte; and Nicholas Rockok, magiſtrate of Antwerp; John van den Wouwer, counſellor to the king of Spain; Cæſar Alexander Scaglia, abbé of Staphard; Guſtavus Adolphus, king of Sweden; Mary of Medicis, queen of France; Emanuel Frocas Perera, count of Feria; Francis Thomas, of Savoy, prince of Carignano; John, count of Naſſau, general to the king of Spain; Don Alvarez, marquis of Santa Cruz, and governor of the Low Countries; Don Carlos, of Colonna, (a Spaniſh general;) Don Diego Philip de Guſman, marquis of Leganez, and Spaniſh general; Mary, princeſs d'Aremberg; Henry, count de Berghe; Cornelius van den Geeſt; and Balthaſar Gerbier, miniſter from the court of Spain to that of England, all of folio dimenſions; Frederic Henry, prince of Orange; and Francis Thomas of Savoy, prince of Carignano, both in large folio.

Portraits after Rubens.—Sir Peter Paul Rubens; Gaſpar Gevaerto, juris-conſulte; Ladiſlaus Sigiſmond, prince of Poland and Sweden, all in folio; Philip IV. king of Spain; and its companion, Elizabeth of Bourbon, his queen, (the beſt impreſſions of theſe portraits are before the name of G. Hendrix, was inſerted;) Elizabeth Clara Eugenia, infanta of Spain; Ferdinand, cardinal, infanta of Spain, and governor of the Low Countries; Gaſpar Guſman, duke of Olivares, a very fine portrait, done from a copy by Rubens, of a picture of Velaſquez, all in large folio; and a ſet of three, in folio, very fine and rare portraits, of Chriſtoval, marquis of Caſtel-Rodrigo; Manuel de Moura Cortereal, marquis of the ſame place; and a Spaniſh lady, adorned with a necklace of precious ſtones; the mother of Manuel of Caſtel-Rodrigo.

Portraits from various other Painters.—Raphael d'Urbino, in the coſtume of his age; Ambroſius, count of Hornes, after F. de Nys; Abel Servien, count de la Roche des Aubins, and miniſter plenipotentiary to the court of Munſter, after Anſ. van Hulle; and John de Heem, a painter of Utrecht, after John Lyvins, all of folio dimenſions.

Hiſtorical Subjects, after Rubens.—"Suſanna ſurpriſed by the Elders;" "The Adoration of the Shepherds," (a circular plate,) both in large folio; "The Slaughter of the Innocents,"

Innocents,” a very large print, lengthways, on two plates; “The Preſentation in the Temple,” a fine plate; “Chriſt bearing his Croſs;” an allegorical piece, known by the appellation of “The Chriſt of the Clenched Fiſt,” becauſe one of the angels who are overthrowing Sin and Death has his fiſt clenched, a very fine engraving; “The Madre Doloroſa, or Dead Body of Chriſt on the Lap of the Holy Virgin,” and “The Deſcent of the Holy Ghoſt, or Miracle of the Cloven Tongues,” all of large folio ſize; “The Holy Spirit ſubduing the Fleſh,” (an allegorical ſubject,) a very rare print, in folio: a large folio print, called “Rubens's Epitaph,” from a picture in the church of St. James, at Antwerp. The ſubject is a religious allegory, in which Rubens himſelf appears in the character of St. George. A head of Chriſt, in an oval, of folio ſize; “The Aſſumption,” in large folio; “The Coronation of the Virgin,” one of the latter engravings of Pontius, in folio; “The Virgin ſuckling the Infant Jeſus,” a rare print, in octavo; “The Holy Family,” where the Infant Jeſus is careſſing his mother, half-length figures; “Chriſt appearing to St. Roch,” with “Eris in peſte Patronus” inſcribed on a banner, a fine print, and engraved from a picture which is eſteemed among the very fineſt of the works of Rubens; a very large and rare engraving, in which real and allegorical perſonages are oddly aſſociated, à la Rubens, for the ſake of complimenting the princes of the houſe of Auſtria and the Cordeliers; and a very large upright print, of “The Diſpute between Neptune and Minerva,” dedicated to pope Urban VIII.

Hiſtorical, &c. after various Painters.—“The Flight into Egypt,” after Jac. Jordaens, (the beſt impreſſions of the engraving are before the name of Bloteling was inſerted;) “The Feſtival of the Kings” after the ſame painter, a fine engraving; “The Adoration of the Kings,” after Gerard Seghers, all in large folio; “The Virgin and Holy Infant, accompanied by St. Anne,” in folio; “St. Francis Xavier, proſtrate before the Virgin and Child,” a circular print; “St. Sebaſtian, and an Angel drawing an Arrow from his Side,” all from G. Seghers; “The Dead Body of Our Saviour on the Lap of the Virgin,” or, “Madre Doloroſa,” after Vandyke, all in large folio; “St. Hermanus Joſeph,” from a picture painted for the Jeſuits of Antwerp, and now in the royal gallery at Vienna; “St. Roſalia, receiving a Crown from the Infant Jeſus,” both from the ſame painter, in folio; “The Holy Family,” after John van Hack; and “The Entombing of Chriſt,” after Titian, in large folio.

Of merit very inferior to that of his father, was Lucas Vorſterman the younger: he was born at Antwerp in the year 1600, and learned the elements of engraving under his paternal roof. He alſo practiſed the art of drawing portraits from the life. But though he ſcarcely reached above mediocrity in either art, his productions, of which the following are thoſe moſt worthy of eſteem, are ſought after by the curious.

Lucas Vorſterman, the father, from Ant. Vandyke, in folio; “The Virgin Mary,” ſhe is repreſented in the clouds, and ſurrounded by angels; “Chriſt crowned with Thorns, and mocked by the Jews,” both in quarto, after Vandyke; “The Trinity,” after Rubens, in folio; the fable of “The Satyr and his Gueſt, who blew hot and cold,” in large folio, nearly ſquare, after Jacques Jordaens; part of the plates for the large folio “Treatiſe on Horſemanſhip,” by the duke of Newcaſtle; ſeveral of the plates from the gallery of the archduke Leopold, at Bruſſels, which were publiſhed by David Teniers, the younger: and part of the collection of drawings of Nicholas Lanier, a muſician and amateur of the reign of Charles I. This latter ſet is, perhaps, the beſt part of the works of the younger Vorſterman.

Peter Soutman was born at Haerlem in the year 1580; or not long afterward, and became the diſciple of Rubens. Beſide etching and engraving, he painted both hiſtory and portraits with ſucceſs, and was patronized, not only in Flanders, but alſo in Germany and Poland.

We have a great number of prints by this artiſt, both from his own compoſitions and thoſe of other painters, particularly his great maſter, Rubens. They are for the moſt part etched, and with great ſpirit, not all in the ſame ſtyle, but under the influence of the different notions and feelings which from time to time appeared to have prevailed, as he endeavoured to explore the capabilities of a new art, in which the practice of his predeceſſors and contemporaries ſhewed him that there remained much to diſcover. He is like an early voyager, who ſometimes warily coaſts the lands which others have touched at before him, and ſometimes with better hopes and bolder navigation puſhes forth into unknown regions, obſcurely guided by the dubious bearings of the headlands which he fancies he has deſcried. Watelet ſays his ſtyle is, in ſome inſtances, contrary to the theory of the art, though as no ſyſtem of principle was then ſettled, or is even yet aſcertained, he can only mean that in thoſe inſtances it is oppoſite to the practice of certain engravers, whoſe works had obtained the praiſe of ſuch reputable and eſtabliſhed connoiſſeurs as Watelet himſelf. He continues, “but his prints always convey an idea of the ſoftneſs of fleſh, and the colouring of the pictures from which they are taken. He engraved in a pure ſtyle, with the ſame merits and faults as I have remarked in his etchings.” And Strutt, with perhaps a perception ſomewhat clearer of Soutman's intentions, informs his readers that “Soutman ſeems to have aimed at giving a ſtriking effect, by keeping all the maſſes of light broad and clear; but by carrying this idea too far, almoſt all his prints have a ſlight unfiniſhed appearance, though the engraving is, in itſelf, ſufficiently neat. There is the ſtyle (of drawing) of the maſter in the treatment of the heads and other extremities of his figures,” &c. &c.

For the ſake of not diſconnecting thoſe artiſts who moſt diſtinguiſhed themſelves by their attainment of that particular merit which moſt ſtrongly characteriſes the ſchool of the Netherlands, and who ſhould therefore be contemplated together, we have placed Soutman a little behind his chronological rank; but it ſhould be recollected to his credit, that Vorſterman was his fellow pupil, and that, in all probability, the enterpriſing prow of our artiſt, and the beacons he ſet up, at once ſtimulated and taught Pontius and the Bolſwerts when and where to launch forth, and how to traverſe, with leaſt danger, the unfathomed ocean of their art.

Of the engravings of Soutman, it may be ſufficient, in this place, to mention the following.

Portraits.—Joannes Wolferdus de Brederod, gener. Marſchalcus Belgii confederati; Gerard von Honthorſt pinx; the armouries of Orange Naſſau, ſurrounded with trophies and allegorical figures; the frontiſpiece to the portraits of the counts of Flanders; Soutman pinx. et ſculp.; the emperor Adolphus of Naſſau; the empreſs of Ferdinand II., queen of Hungary and Bohemia, both from Van Sompel; John the Intrepid, count of Flanders; and Philip IV. king of Spain and the Indies, all in large folio.

Hiſtorical, &c.—“The Fall of the Damned,” a large upright, after Rubens, the early impreſſions of which are known from thoſe ſubſequently printed, by their having been taken before the addreſs of the junior Bouttats was inſcribed beneath the plate; "The Defeat of the Army of Sennacherib by the exterminating Angel," alſo after Rubens, and in large folio; "Jeſus giving the Keys to St. Peter," from Raphael; "The miraculous Draught of Fiſhes," from Rubens, all in large folio; "The Laſt Supper," a very long print, engraved on two plates, from the celebrated picture of Da Vinci, in the refectory of the Dominicans at Milan, engraved through the medium of a drawing by Rubens; "Chriſt on the Croſs," after Rubens, of which plate it is very uncommon to find a good impreſſion; "Chriſt laid in the Sepulchre." The firſt impreſſions of this plate being very faint, Widoeck worked afterwards on the plate, to give it more effect. "The Creation of a Biſhop," all in folio; "The Rape of Proſerpine;" "The Triumph of Venus," in large folio; and "A drunken Silenus," ſupported by a ſatyr and a negreſs, all after Rubens; "The Grand Sultan on Horſeback," attended by his principal officers at the head of his army, in folio, from a picture by Soutman himſelf; a ſet of four large hunting pieces, namely, the chace of a lion and lioneſs, ditto of a wolf, ditto of a boar, and ditto of a crocodile and hippopotamus, engraved on two plates, all after Rubens; "A couchant Venus," after Titian; and "St. Francis kneeling before a Crucifix," from Michael Angelo, both of folio ſize.

Sneyders was flouriſhing at this period, and contributed to the advancement of engraving by a book of animals, which he etched with a degree of truth and animation correſponding with what we behold with ſo much pleaſure in his pictures. His etchings conſiſt, we believe, of ſixteen plates, which are not all of the ſame dimenſions. For the biography of this extraordinary artiſt, ſee the article SNEYDERS, FRANCIS.

John Vrediſnan Friſius was born at Leuwarde in the year 1527. He was an architect of ſome talent, as well as an engraver; and is the deſigner of the arch erected at Antwerp, in honour of the triumphal entry of Charles V. and his ſon. The principal engravings of the elder Friſius are contained in a book of ſepulchral monuments, which are preſumptively from his own deſigns. The work was publiſhed at Antwerp, A.D. 1563. His ſtyle conſiſts of a coarſe and heavy mixture of etching, with the work of the graver.

Related to the above artiſt were John Eillart Friſius and Simon Friſius: the former is the author of ſome few portraits, among which are thoſe of Henry IV. of France, and Henry of Naſſau, prince of Orange; both of which are folio dimenſions.

But Simon Friſius was an artiſt of abilities very ſuperior to thoſe of his relatives. He was born at Leuwarde in Frieſland, A.D. 1580, and learned the rudiments of engraving of Eillart, or of Vrediſnan. He handled the etching-needle with great taſte and facility; and his etchings are now become rare, and are much ſought after. Abram Boſſe ſays, "Simon Friſius handled the point with great freedom, and his hatchings poſſeſs the firmneſs and neatneſs of engraving." He adds, (what we do not very well underſtand,) that "this artiſt made uſe of a ſoft kind of varniſh, ſuch as is uſed by refiners in the ſeparation of metals."

He ſometimes ſubſcribed his plates with "F. fecit;" and at others, with his initials "S. F.:" and his beſt prints are a ſet of heads of the ſybils and ſaints, in 4to., from his own deſigns; a ſet of portraits, after H. Hondius, in ſmall folio; a large collection of folio landſcapes, after Matthew Brill, entitled "Topographia variorum Regionum;" two landſcapes, from Henry Goltzius, of which the ſubject of one (of 4to. ſize) is a cottage and figures on the ſea-ſhore, the other is an architectural landſcape in folio, with figures, in the introduction and execution of which Friſius was particularly excellent; another landſcape, in which is introduced the ſtory of Tobit and the angel, after P. Laſtmann; another, with the flight into Egypt; and a very rare landſcape, delicately engraven, wherein are buildings and ruſtic figures, in large folio.

James Fouguieres and Jodocus de Momper, or Mompert, were both born at Antwerp in the year 1580. For an account of their merits as landſcape painters, ſee their names reſpectively. Both occaſionally practiſed with ſucceſs the art of etching; working from their own compoſitions. Fouguieres' etchings are not numerous, and conſiſt of ſmall landſcapes: Mompert's are ſomewhat larger, and one in particular, which is now become rare, is a large folio landſcape, a rocky ſcene, and etched in a very bold ſtyle, quite in the extreme of boldneſs.

Adrian Stalbent was alſo of Antwerp, and contemporary with Fouguieres and Mompert. He reſided for ſome years in England, from whence he returned rich; though it may reaſonably be ſuſpected whether, at this period, his riches could have been obtained in this country by painting and etching landſcapes. He, however, continued to paint and etch in the city of Antwerp, until he attained to upwards of fourſcore years of age.

Of his etchings, the beſt with which we are acquainted is a folio landſcape of the ruins of a magnificent Engliſh abbey, with ſheep on the fore-ground: it is inſcribed "Adrianus van Stalbent fecit in aqua forti."

James William Delff was the ſon of William James, of whom we have ſpoken in our account of the *Origin and Progreſs of* ENGLISH *Engraving*. He was born in the year 1619, at Delft, and died in the ſame city in 1661. He learned the elements of painting and engraving of his father, whoſe ſtyle he always copied, and which, with the ſimilarity of their names, has occaſioned their works to be often confounded. He engraved a ſet of portraits in ovals, of folio ſize, of which the following are the moſt remarkable: Charles I. of England; queen Elizabeth; Ferdinand II. emperor of Germany; Frederick, palatine, king of Bohemia; Frederick Henry, prince of Orange, count of Naſſau Katzenellenbogen; Guſtavus Adolphus, king of Sweden; James, king of England; Louis XIII. of France; Axel Oxenſtiern, a Swediſh miniſter; Philip III. of Spain; Philip IV. of Spain; Ambroſius Spinola; and Vladiſlas IV. king of Poland.

John Savary, or Savery, was born at Courtray in the year 1580. He ſtudied engraving under Hans Bol, reſided during moſt part of his life at Amſterdam, and was related to John and Roland Savery, who were both painters, and to Solomon Savery the engraver, of whom we ſhall next proceed to ſpeak.

The following engravings are all we can ſpecify by the hand of this artiſt, who was alſo a landſcape painter: a ſet of ſix mountainous landſcapes, with figures, in 4to., after Nic. de Clerc; a ſtag hunt, with a landſcape back-ground, in folio; the ſtory of Sampſon killing the lion, introduced in a landſcape, in large folio; and a woody ſcene, with a waterfall, in folio.

Solomon Savery is believed to have been a native of Amſterdam: the time of his birth we have not aſcertained; but as his engravings were produced from the year 1620 to 164[illegible], he was perhaps the ſon and pupil of John Savery, whom we have juſt diſmiſſed. He is ſuppoſed to have paſſed ſome years of his life in England; a ſuppoſition which appears to be confirmed by the circumſtance of his principal works being portraits of the public characters of this country. But be this as it may, his merits were very conſiderable. He handled his graver with taſte, and a degree of ſkill which had not then been exceeded; and expreſſed the textures of the various objects, which he repreſented, with nice diſcrimination; of which his portrait of John Speed the hiſtorian, among ſeveral others, affords a pleaſing and ſatisfactory proof. His portraits are probably his beſt performances, though his hiſtorical ſubjects are not without a conſiderable ſhare of merit.

Among theſe may be diſtinguiſhed king Charles I., wherein Savery appears to have engraved the face from a picture by Vandyke, and to have added the high-crowned hat, and compoſed the other accompaniments; Thomas, lord Fairfax, and Speed the chronicler, of which we have ſpoken above, have alſo their heads covered with hats, to which circumſtance our engraver appears to have been partial, as giving effect to the faces of his portraits, and affording ſcope for the exerciſe of his manual power over his graver.

His beſt hiſtorical works are, “ Chriſt expelling the Money-changers, &c. from the Temple,” in large folio, from Rembrandt; ſeventeen plates for Ovid's Metamorphoſes; and a ſeries of ſmall plates of frieze proportions, of “ The Entry of Mary de Medicis into Amſterdam.”

James de Bie, or de Bye, was born at Antwerp in the year 1581, and not only diſtinguiſhed himſelf as en engraver, but alſo as a draftſman and an antiquary. He ſtudied engraving in the ſchool of the Collaerts, and ſucceſsfully imitated their ſtyle; finiſhing his plates entirely with the graver in a neat, clear, and determined manner.

De Bye drew correctly. The heads of his figures poſſeſs conſiderable accuracy of character and expreſſion, and their hands and feet are well marked; but from his lights being ſo much ſcattered, and his ſhadows ſomewhat feeble, his chiaroſcuro is by no means powerful. His prints, however, may rank with thoſe of the beſt early Flemiſh maſters. He, with his contemporary Battiſta Barbe, aſſiſted the Collaerts in engraving “ The Life and Paſſion of Chriſt,” from Martin de Vos. The work conſiſts of fifty plates, of which N° 18, (“ The healing of Peter's Mother-in-Law,”) and N° 30, (“ The Reſurrection of Lazarus,”) are fine ſpecimens of the abilities of de Bye, eſpecially the latter.

He alſo engraved the medals of the Roman emperors, from the cabinet of the duke d'Arſchot, which were originally publiſhed in the year 1617, and of which an edition was reprinted at Berlin in 1705; a medallic hiſtory of the kings, queens, and dauphins of France; another ſet of the portraits of the kings of France, from Clovis to Louis XIII., conſiſting of ſixty-four plates, of which fifty-eight are portraits; the genealogy and portraits of the houſe of Croix, on ſixty folio plates; the portrait of Francis I. of France, in folio, after M. de Vos; and a ſet of metaphyſical perſonifications from his own deſigns, publiſhed at Paris in 1643, with explanations by J. Baudouin.

Mark and Nicholas de Bye were of the ſame family with our artiſt, but are not worthy of much notice as engravers. Mark performed ſome etchings, after P. Potter and M. Gerard; and Nicholas engraved portraits, among the beſt of which is Charles IX. king of France.

Peter Laſtman was born at Haerlem in the year 1581. He was an hiſtorical painter of merit, and is reported to have been one of the inſtructors of Rembrandt. Laſtman etched ſeveral plates after his own compoſitions, in a very good taſte, which are at preſent very rare: of theſe we can only ſpecify two, the ſubjects of which are “ Judah and Tamar,” introduced into a landſcape, in ſmall folio; and a female veiled, reclining in a bower, in 4to.

Nicholas Laſtman was the ſon of Peter, and born at Haerlem in 1619. He was inſtructed in the elements of painting, and the general rudiments of art, by John Pinas; and it is probable he learned engraving from Saenredam. Among other things, he engraved the portrait of Carl von Mander,” after Saenredam, in 4to.; “ Our Saviour in the Garden of Olives,” after his father, in large folio; “ St. Peter delivered from Priſon by the Angel,” after J. Pinas; and its companion, “ The Martyrdom of St. Peter,” both in ſmall folio; “ The Good Samaritan,” from a picture by himſelf, is probably his chef-d'œuvre. The ſtory is introduced in a very pictureſque landſcape, towards the right ſide of which appears a ſtone-bridge over a river, along which the uncharitable prieſt and Levite are walking. “ This print is very little known, though it deſerves great attention from the taſte and beauty of the execution.” So ſays Huber: but what we have not witneſſed, we cannot confirm; and what we have ſeen from the graver of Laſtman, though neat, are taſteleſs productions.

For the biography and extraordinary merits, as painters, of the two Teniers, ſee the articles TENIERS, DAVID, the elder, and the younger. They each produced ſeveral etchings from their own compoſitions, which go to ſhew that very great painters may poſſibly make but indifferent engravers. By this is not meant that their etchings are devoid of fire and freedom; but that they fall ſhort of what might naturally be expected from the high reputation which is juſtly attached to the name of Teniers, and particularly in that paſtoral elegance of touch and handling, which confers poetic charms on their *painted* village feſtivities, in ſpite of the caprices of faſhion, and the royal French taſte of Louis XIV., who, when an admirable picture of the younger Teniers was placed before him, is reported to have turned round and ſaid to his firſt valet-de-chambre, “ Qu'on m'ôte ces magots!” which of courſe was echoed in the applauſes of the whole French court.

The etchings of the Teniers find, however, a very proper and indeed indiſpenſable place in the port-folios of thoſe connoiſſeurs, who collect the productions in fine art of the Netherlands. As both the father and ſon marked their prints with the ſame cypher, which will be found in *Plate* III. of the monograms, &c. uſed by the engravers of the Low Countries, it is not eaſy to diſtinguiſh them; but the following are generally aſcribed to Teniers the elder: “ A Pilgrim, with his Staff and Chaplet,” in 12mo.; “ A Peaſant ſeated, applying a Plaſter to his Hand;” “ A Peaſant ſeated at Table, with a Crutch and Glaſs;” another peaſant with a fur hat on; and one with a pipe; “ An old Woman, with a Chaplet; and “ An old Man and Dog;” “ A Man with a Staff;” a ſet of four, of peaſants, half-length; “ A German Kitchen;” another ſet of peaſants, ſmoking and playing at bowls, all of octavo ſize; and a quarto print, called “ The Bowl Players.”

And to the junior Teniers are aſcribed, “ A Peaſant ſmoking,” he is ſeated on a cheſt, and in company with another; a landſcape, with cottages and peaſants converſing; another landſcape, with four peaſants converſing; “ Villagers ſeated round a Fire, inſide a Cabin,” with the effect of moon-light, all in 8vo.; two prints of peaſants travelling; “ Peaſants ſhooting at a Mark;” “ The Temptation of St. Antony;” “ A Flemiſh Feſtival;” “ A Village Entertainment;” three heads, apparently portraits, namely, an old man with an hour-glaſs, an old man playing on a flute, and a lady holding a flower, ſmall upright plates; “ The Inſide of a Cottage,” with a dead calf hanging up, and a man and a woman ſtanding by the ſide of it, a ſmall plate lengthways.

John Baptiſta Barbé was born at Antwerp in the year 1585. He ſtudied engraving in the ſchool of the Weirixes, and after attaining a competent maſtery of the graver, and ſucceſsfully imitating the dry and elaborate neatneſs of his inſtructors, he travelled to Italy for improvement.

No artiſt of that day, with genuine profeſſional objects in view, could travel to Italy altogether in vain. Barbé made conſiderable improvement in his knowledge and taſte of forms, but was not able to emancipate himſelf from the ſhackles of his earlier education.

Accordingly we find that in his latter engravings, though his figures are drawn with tolerable correctneſs, and his extremities well marked, his chiaroſcuro is flat and powerleſs, and his manual execution painfully neat, dry, and inſipid He worked with the graver only; ſometimes deſigning and inventing his own ſubjects; and at others, working after the originals of other maſters.

Of the former kind are “The Annunciation,” inſcribed “Spiritus Sanctus;” “The Nativity,” inſcribed “Peperit Filium;” “The Arrival of the holy Virgin and St. Joſeph at Bethlehem;” “The holy Virgin and Child,” ſurrounded by a garland of flowers, and inſcribed “Beatus Venter,” &c.; “Jeſus Chriſt on the Mount of Olives;” “Our Saviour with the Diſciples at Emmaus;” “The Crucifixion,” inſcribed “Protie Fili mi,” &c.; “St. Ignatius kneeling before an Altar;” and a ſet of four emblematical ſubjects, entitled “The Chriſtian Virtues,” all of ſmall dimenſions.

After various other Maſters.—Barbé engraved “The Holy Virgin ſitting at the Foot of an ancient Monument, with the Infant Chriſt and Joſeph,” in ſmall folio, after J. B. Paggi, (one of his beſt prints); another “Holy Family,” in 4to. after Rubens, alſo in the improved ſtyle of our engraver, and certainly a meritorious work; the proof impreſſions of which (taken before the name of Rubens was inſcribed on the plate), are rare, and bear a high price. A ſet of twenty-four in 12mo. of the Life and Miracles of Father Gabriel Maria, founder of the Annonciades, after Ab. van Diepenbeck; and “The Holy Virgin ſeated on a throne with the Infant Chriſt,” after Franciſco Frank, in ſmall folio, and eſteemed one of the maſterpieces of our artiſt.

William van Nieulant was born at Antwerp in the year 1585. He became the diſciple of Roland Savery, but after quitting his maſter he went to Rome, and reſided three years in that city with his countryman Paul Bril. He afterwards returned to the Low Countries, and took up his reſidence at Amſterdam, where his pictures were held in high eſtimation, and where he died in the year 1635.

Nieulant etched ſeveral plates of landſcapes, both from his own deſigns and thoſe of Paul Bril. They are executed in a ſlight free ſtyle, and often worked upon afterward with the graver, to harmoniſe the lights, and ſtrengthen the maſſes of ſhadow.

Among the etchings of this artiſt, the following are held in moſt eſteem, *viz.* a ſet of ſixty, of views in Italy, ornamented with figures. Two landſcapes with ruins, into one of which is introduced the ſtory of the good Samaritan, and in the other Tobit and the angel, both in folio, from P. Bril. Two marine ſubjects, one with ſhepherds on the ſea-ſhore, and the other with veſſels, and a fortreſs on a rock, from the ſame painter; “The Ruins of the Temple of Juno, in the Capitol;” “The Ruins of the Temple of Venus;” “A View of the Triumphal Arch of Septimus Severus,” all in folio; and the three bridges acroſs the Tiber, with views of the city of Rome, engraved on three large plates, from his own drawings.

William ſhould not be confounded with Adrian van Nieulant, a landſcape painter of ſome eminence, who was likewiſe a native of Antwerp, and who died at Amſterdam in the year 1601.

Peter Holſtein was born at Haerlem in the year 1582, and reſided in Holland at the commencement of the ſeventeenth century. He occaſionally practiſed the art of painting on glaſs; but was chiefly an engraver of portraits, among the chief of which are a ſet of twenty-ſix of the plenipotentiary miniſters of Munſter; John Saenredam, and Jacob vander Burchius, both in ovals; Fabius Chiſi, a negotiator for peace from Weſtphalia, afterwards pope Alexander VII.; John Erneſt Pictoris, a counſellor of the elector of Saxony; all of 4to. ſize; John Huydecooper, burgomaſter of the city of Amſterdam; John Reyner, hiſtoriographer for Munſter; Conſtantius Sohier; and Albert Vinkenbrink, a ſculptor of Amſterdam; all in folio.

Cornelius Holſtein was likewiſe born at Haerlem in the year 1620, and was the ſon of the preceding artiſt, of whom he learned the elements of art. He painted hiſtory with a moderate degree of ſucceſs. He likewiſe engraved ſome ſubjects from his own deſigns, and ſeveral of the plates for the cabinet of Gerard Reyniſt, a magiſtrate and connoiſſeur of Amſterdam. Yet of his engravings we are able to name only the following: a bacchanalian ſubject, of children at play, forming a long frieze, engraved on ſix plates, a very rare print; and a female ſeated, ornamented with jewels, ſuppoſed to be the portrait of Iſabella, marchioneſs of Mantua, from a picture by Correggio, or Julio Romano; engraved on a large folio plate for the cabinet of Reyniſt.

Peter van der Borcht was born at Bruſſels in the year 1540. The period of his life has not been recorded, but he appears to have reſided in his native city, except, perhaps, occaſionally in that of Antwerp, till ſome years after the commencement of the ſucceeding century.

He acquired ſome reputation in landſcape painting, but applied himſelf to etching with ſtill greater aſſiduity, and produced a conſiderable number of prints, moſt of which may be properly termed hiſtorical landſcapes. They are etched with little care, in a rough and licentious kind of ſtyle, and the figures which are introduced are by no means correctly drawn.

Though the works of this artiſt manifeſt great fertility of invention, they evince no very profound knowledge of compoſition, nor perception of the ſuſceptibilities of the engraver's art, and, therefore, but little judgment. He uſually marked his prints with his initials, or a monogram, which will be found in our third plate of thoſe uſed by the engravers of the Low Countries.

Of the numerous works of this artiſt, it may ſuffice to mention the following:—The Hiſtory of Elias and Elijah, in ovals of 4to. ſize. A ſet of landſcapes, with ſubjects from the New and Old Teſtaments, in 4to. Rural feſtivals, in folio; a company of archers regaling; a peaſant's wedding, both in folio. A landſcape with the hiſtory of Hagar and Iſhmael, in large folio; a folio print, entitled “Emblemata ſacra e præcipuis utriuſque Teſtamenti hiſtoriis concinnata;” and a ſet of one hundred and forty plates, from Ovid's metamorphoſes, in 4to.; printed and publiſhed at Antwerp by Theodore Galle.

Henry van der Borcht, the elder, was born at Bruſſels, A.D. 1583, and died at Frankfort in 1660, where his family were obliged to ſeek an aſylum from the political troubles which agitated their native country. His father, on diſcovering

ing his taſte for the arts, placed him under Giles Valkenbourg, from whom he learned the rudiments of art, and whom he afterward accompanied to Italy.

Italy was at that period at once the grave and conſervatory of ancient art; and ſculptural wonders were every day dug from the ruins of the claſſical ages. The knowledge and opportunities of vander Borcht during his reſidence in that country, enabled him to form a collection, which the Engliſh earl of Arundel had afterward the honour of purchaſing.

From Italy our artiſt returned to Frankenthal, where he reſided ſome time, and afterwards migrated to England, but finally returned to the Netherlands. His portrait was engraven by Hollar, from a picture by his ſon, who, being of the ſame name as his father, is often confounded with him; but the engravings which are moſt generally aſcribed to the former, are "The Holy Virgin and Child," after Parmegiano, engraved at London in 1637, in ſmall folio. "A Dead Chriſt, before the Entrance of the Sepulchre," in 4to. after a copy by Parmegiano from Raphael's original, in the Arundelian collection. And a ſet of twenty-two in ſmall folio, of which the ſubjects diſplay the entrance of the elector palatine Frederic, with Elizabeth, the princeſs royal of England, into Frankenthal. It was accompanied with deſcriptions by Miroul, and was publiſhed in the year 1613.

Henry vander Borcht, the younger, was born at Frankenthal in the year 1620, and was the ſon of the preceding artiſt. At an early period of life he appears to have diſcovered talents both as an artiſt and an antiquary. The earl of Arundel, when on his travels, found Henry at Frankfort, and ſent him into Italy to Mr. Petty, who was then collecting art and antiquities for his lordſhip, and hence he was retained in the ſervice of that nobleman as long as he lived.

After the death of his patron, Van der Borcht was employed by the prince of Wales, (afterwards Charles II.) and lived in eſteem at London, but afterwards returned to Antwerp, where he died at an advanced age. The portrait of Vander Borcht, the younger, was engraved by Hollar, after J. Meyſens, and his monogram will be found among thoſe of our engravers of the Low Countries.

The following engravings, which are chiefly from the Arundelian collection, are attributed to him. "Abraham entertaining the three Angels," after Louis Caracci; "The Infant Chriſt embracing St. John," copied from a print by Guido; "A female Figure offering a Cup to another who is kneeling," after Correggio; and "Apollo and Cupid," in an oval; all of 4to. ſize. This artiſt uſed a monogram, for which ſee our *Plate* III. of thoſe uſed by the engravers of the Low Countries.

Count Henry Goudt, of whom we ſhall next treat, is among the rare inſtances that art may boaſt, and that Fortune in her caprice has allowed us to exhibit, the tenour of whoſe life and purſuits is in direct hoſtility to an ungenerous and immoral maxim, which, promulgated by the proud and unfeeling among lax philoſophers, has obtained but too much credit and currency throughout Europe.

The maxim to which we here allude, is, that the goadings of the iron (which ſophiſtry has miſnamed the golden) ſpur of neceſſity is indiſpenſable to the due progreſs of genius. Count Goudt was born in affluent circumſtances, and of a noble family, and yet became a great artiſt, as well as an exemplary man.

Among that claſs of ſociety, toward which meritorious profeſſors of the fine arts are allowed to look for patronage and encouragement, are ſome—always more conſiderable from their rank and infectious example, than from their numbers—that would juſtify the perverſion of riches and of reaſoning, by perverting Nature alſo, and who, miſtaking what might poſſibly be applicable to the exertions of mere manual induſtry, for the ſprings of mental expanſion, imagine, and inculcate with all the luxurious languor of infinite complacency, that the plants of genius thrive beſt in a rugged ſoil; that the chilling damps of poverty ſupply the ardours of talent; that ſtarvation is the very pabulum of ability; and that mind ſoars the higher for being chained to the earth. Before theſe intellectual arithmeticians of exquiſite feeling and refined liberality, proceed to calculate by what inverſe ratio of diſcouragement the apotheoſis of genius may be conſummated in the extinction of its final ſpark, it might be well for them to attend to the leading traits which mark the life of this diſtinguiſhed engraver.

Henry de Goudt, knight of the palatinate, and uſually called (but whether by courteſy or by right we are ignorant) count Goudt, was born of a noble family at Utrecht, in the year 1585.

Among the few profeſſions which, from the ſtate of European manners and philoſophy, are allotted to gentlemen of a certain rank, young Goudt obſerved, that in the army officers were, by the very nature of the tenure by which they held their commiſſions, obliged to reſign the nobleſt characteriſtic of their nature as men,—namely, the privilege of judging for themſelves; and reſign it too, in caſes touching the lives and liberties of others, which of all poſſible caſes are the moſt intereſting and important to minds of feeling. Young, and active-minded, but tender-minded, as he was, he could not but perceive, that ſoldiers became at once, from the eſſential nature of military ſervice, that degraded rank of beings, which philoſophic patriotiſm itſelf reluctantly glances at, and almoſt fears to call the ſlaviſh inſtruments of the deſtruction of their fellow men. A ſtate of ſociety, and a principle of mental and corporeal occupation, which converts the horror of philanthropy into the baſis of merit; which requires that men, for the ſake of being termed military officers, and the falſe glory that accrues from it, ſhould abdicate their own natural rights and powers of reaſoning on the juſtice of the cauſes of national quarrel in favour of hereditary rulers, however feeble-minded, or ignorant, or ill adviſed, was not, could not be, the voluntary choice of a mind attuned to the harmonies of art and nature.

In the church, our uncontaminated youth ſaw, that though religion was not denied to be an affair between individual man and his Creator, yet that no public teacher might think and act for himſelf, unleſs he voluntarily embraced the trammels of epiſcopacy, without incurring the reproach and the penalties of heterodoxy.

The law was repulſive, inaſmuch as principle was rather overwhelmed and endangered, than recognized and refreſhed, and ſuſtained, in acts of memory and the ſophiſms of rhetoric.

Of the ſtudy and practice of medicine, Goudt might with juſtice think much more favourably: yet, to produce good, was better than to remedy evil. But in preferring and following the proper objects of imitative art, to which it may have been, that the natural bent of his genius ſtill more inclined him than this proceſs of ratiocination, he anticipated the lofty, and independent, and virtuous, ſatisfaction of contributing the utmoſt of his pleaſurable exertions, free from the reſtraints of human tyranny, to the pleaſure and improvement of his countrymen: and as he could do this with dignity and delight, he heſitated not long in reſolving to become an artiſt; and with this view, and ample means of accompliſhing his object, he ſet forth on his travels to Italy, at that time the great hieropolitan temple, the ſanctified centre of pilgrimage, where, from all parts of the civilized world, met the devotees of art.

The wonders of Rome, the miracles of art which he there beheld, called forth all his enthuſiaſm; but taught him to hope humbly. He applied himſelf with aſſiduity to the practical ſtudy of art; and drew diligently in the Roman ſchools: but under what maſter he learned the rudiments of engraving is not known. Nor is it ſurpriſing that the progreſs of his improvements was rapid; for this will ever be the caſe where the mind of a ſtudent is operated upon by pleaſurable ſtimuli alone, and is free from the reſtraints and pecuniary obſtructions by which the advancement of a large majority of artiſts is ſadly retarded.

In this great metropolis, ſurrounded and pervaded as it is by an highly ſalubrious atmoſphere of art, every mind devoted to ſuch purſuits, freely inſpires and imbibes what is congenial to its nature. Adam Elſhiemer of Franckfort, of whom we have treated in vol. xiii., had been ſtudying there for ſome years when our young artiſt arrived, and the admiration with which he beheld the works of that great painter, gradually brought them acquainted.

Another circumſtance contributed much to increaſe their intimacy. The misfortunes of Elſhiemer had been pitied, but not relieved. Goudt had the happineſs of releaſing him from priſon, and of becoming at once the firm friend, pupil, and generous benefactor of the man in the world, to whom, of all others, he looked up with the moſt heartfelt reverence.

From this period he ſtudied under the direction of Elſhiemer, and appears to have excluſively devoted himſelf to the taſk of engraving after his pictures. We know not of a ſingle work of Goudt's that is engraved after any other maſter.

From this period, too, his peculiar talent for engraving began to develope itſelf. By comparing nature with the exquiſite productions of his maſter, he formed an original ſtyle of engraving, in moſt (though we think not in all) reſpects perfectly homogeneous with that of Elſhiemer's painting, and which diſcovers deep and clear inſight into the recondite energies of the engraver's art. No man before Goudt had produced thoſe bright, ſudden, and powerful effects of chiaro-ſcuro, which we behold with ſo much gratification in his fire, moon, and torch, lights, from which the engravers of the preſent, and of after ages, may ſtudy with advantage. No man, like Elſhiemer, had dipped his pencil in the depth of night, and in the dawn of morning. And no man before Goudt, and ſcarcely any ſince, has been able to ſuggeſt, in his engravings, the ſhades between dubious and poſitive colour which then prevail.

His "Aurora" is, in this reſpect, a perfect maſter-piece. The ſcene is a bird's-eye view, or rather a view from an eminence, over a hilly and extenſive country: but the freſhneſs of a ſummer's morning, at the early hour of day-break, is rendered with poetic felicity. It is, in the words of Gray, an

———" incenſe-breathing morn."

And the charmed ſpectator ſees the miſts exhaling, and liſtens with a poet's ear to the hymn of inanimate nature.

All had hitherto been enjoyment with count Goudt. As Virtue beckoned him forward, Pleaſure attended his ſteps, and ſtrewed his path with flowers. But earth is not heaven, and ſublunary happineſs is rarely of long continuance. It was the ill fortune of our artiſt to live during the Aurora of rational philoſophy, when ſir Francis Bacon had not ſhone forth, and myſtery and credulity were not diſſipated. He remained at Rome as long as Elſhiemer lived; but on his return to Utrecht, a ſuperſtitious female, by whom he was beloved, the Medea of the town, believing in the occult virtues of herbs and minerals, when combined with judicial aſtrology, to controul or inflame the paſſions, adminiſtered, at an entertainment, what was termed a love potion, which ſhe fatally believed would have the effect of fixing his affections on herſelf; and thus literally poiſoned his cup of delight. He was from this time afflicted with a ſpecies of delirium, or idiotiſm, of the moſt melancholy character, under which he languiſhed for ſome conſiderable time, and at length died in his native city, at the age of forty-five.

It has been remarked as extraordinary, but is probably only an ordinary denotation, and reſult of the maſter-paſſion, that though the mind of Goudt was loſt to every other intereſt; yet, when fine art became the ſubject of converſation, he would diſcourſe upon it in a very rational manner.

By thoſe who do not narrowly examine his prints, it will ſcarcely be credited that the graver was the ſole inſtrument of his art, ſo remarkably looſe and free is his delineation of the forms of uncultivated objects. A ſtriking inſtance of this, may be ſeen in the vine-leaves, and other foliage, near the door of the cottage where Ceres is drinking from a pitcher. His effects are always powerful, and his ſhadows produced by neat and numerous croſs-hatchings; ſo that in very dark receſſes he ſometimes has not fewer than five courſes of lines. In commenting on the above print, Strutt obſerves, that, "conſidering the preciſion with which he executed his engravings, the freedom of handling the graver, which may be diſcovered in them, is very aſtoniſhing. The weeds, and other parts of the fore-ground in that admirable print of Ceres, are very finely expreſſed. The heads of the figures are correctly drawn, and the other extremities are managed in a judicious manner. The powerful and ſtriking effect of this engraving cannot be properly deſcribed. The very deep ſhadows are perhaps rather too ſudden upon the ſtrong lights in ſome few inſtances; but in the fine impreſſions this is by no means ſo conſpicuous as in thoſe after the plate had been re-touched."

His engravings, from the elaborate neatneſs and care beſtowed on them, could have been but ſlowly produced; when we reflect, too, that his object was to excel other men in the merit, not the number of his prints; that he followed this art only for the pleaſure it afforded, and did not engrave when his mind was not attuned to the purſuit, it will not appear ſurpriſing that the number of his performances ſhould be ſo ſmall.

The following ſeven are generally enumerated as being the whole of his works; they are all after the paintings of his friend Elſhiemer; but the collection of Mariette contained nine, which, at a public auction at Paris, were ſold for two hundred and ſeventy livres.

1. The Ceres mentioned above, in ſmall upright folio, which is by ſome diſtinguiſhed by the title of "The Sorcery;" 2. The Flight into Egypt, in folio; and a landſcape (with ſmall figures) in which the effects of fire-light and moon-light are contraſted with great ſkill; the ſtars alſo ſhine forth, and the *via lactea* is faintly diſcernible. 3. Another landſcape, in ſmall folio, in which the angel and Tobit are introduced. The weeds on the fore-ground of this engraving, and the branches of the trees in front, as well as the foliage and weeds hanging from them, are beautifully expreſſed. On this print an obſervation has been made which is applicable alſo to ſeveral paſſages in the other engravings of Goudt; namely, that he fails in the diſtant woods, which gradate one

from another, and require that freedom of determination which etching alone can give.

Of the ſubject of “Tobit and the Angel,” there are two prints by this maſter. In the firſt, Tobit is dragging the fiſh along; in the ſecond, which is of 4to. ſize, he holds the fiſh under his arm, whilſt, with Raphael, he is croſſing a ſtream of water by means of ſtepping-ſtones. 5. Baucis and Philemon entertaining Jupiter and Mercury, in 4to. dated 1612.

6. The Aurora, upon which we have commented above, and 7. A very ſmall oval print of “The Decollation of St. John the Baptiſt,” are all the engravings, by this maſter, with which we are acquainted, and the laſt, which is of the leaſt intrinſic value, is by far the ſcarceſt. Perhaps the additional two that were in the collection of Mariette were nothing more than juvenile attempts of our artiſt.

Of Robert Vander Voerſt, the meritoriuos rival of Vorſterman, we have already treated at ſome length. (See ENGLISH *Engraving, Origin and Progreſs of.*) He was a native of Arnheim, and born in the year 1596.

Michael Natalis was born at Liege in the year 1589. He was inſtructed in drawing by Joachim Sandrart, but learned the rudiments of engraving at Antwerp of Charles Mallery. From Antwerp he travelled to Rome, where he joined Cornelius Bloemart, Theodore Matham, and Regnier Perſyn, (all artiſts from the Low Countries), and aſſiſted them in completing the ſtatues and buſts of the Juſtinian gallery, conſiſting of one hundred and fifty prints. Stimulated by emulation, and aſſiſted in his ſtudies by Bloemart, Natalis now made conſiderable progreſs in his art. He engraved many other plates from the pictures of the great maſters of Italy; and after his return to Flanders, was invited to Paris, where he reſided a conſiderable time. Natalis engraved ſomewhat in the ſtyle of Bloemart: his prints have merit; yet the ſquare-grained mode of execution, to which he was partial, does not happily expreſs fleſh or drapery, but is rather adapted to the repreſentation of ſtone.

When he quitted this open ſquare manner, which was very ſeldom, his prints were mellow and ſoft; but the heads of his figures want character, and the other extremities are but indifferently drawn. He frequently combined his initials in a monogram, for which, ſee *Plate* III. of thoſe uſed by the engravers of the Netherlands. His portraits are the moſt eſteemed productions of his graver, from which we ſhall ſelect the following as being moſt worthy of the reader's attention.

Portraits.—Joſephus Juſtinianus Benedicti Filius; Jacob Catz, a Dutch poet; Eugenius d'Alamond, biſhop of Ghent, in large folio; Maximilian Emanuel, elector of Bavaria, after his firſt maſter; Joach. Sandrart; and Frederic, count of Merode, both in large folio; Gabriel Maria, theologiſt, from Abr. van Diepenbeck; Erneſtine, princeſs of Ligne, and counteſs of Naſſau, from Ant. Vandyke; and the marquis del Guaſt as Mars, with his miſtreſs, in the character of Venus, after Titian, all in folio.

Hiſtorical, after various Maſters.—“The Holy Family,” from Raphael, in large folio; “The Virgin and Child, with Joſeph ſeated behind, leaning his Head on his Hand,” after Andrea del Sarto, in folio; “The Holy Family,” a grand compoſition, from Pouſſin, in large folio: the firſt impreſſions are before the nudity of the infant was covered with linen. “The Extacy of St. Paul,” from a picture by the ſame painter, belonging to the cabinet of the kings of France; “The Holy Family, with Angels ſcattering Flowers over the Head of the Infant Chriſt,” from Seb. Bourdon; “The Marriage of St. Catherine,” from the ſame painter, all in large folio; “St. Bruno at his Devotion,” after Bertholet Flemel; “The Aſſembly of illuſtrious Eccleſiaſtics,” a large print, lengthways, engraved on four plates, from the ſame painter; “Mary waſhing the Feet of Our Saviour,” from Rubens, a large folio plate; “The laſt Supper,” in folio, from Diepenbeck; “St. Francis,” in large folio; “St. Henry;” and “St. Cunegonde,” in folio; and an allegorical Theſis, dedicated to the emperor Ferdinand III., on two large plates, all from the ſame maſter.

John Valdor was born at Liege in the year 1590, and reſided during the greater part of his life at Paris. He does not appear to have been a man of any genius, or of much talent: he wanted that animation which is neceſſary to form a great artiſt; inſtead of which, in him was ſubſtituted a painful laborious attention to the neatneſs and preciſion of the mechanical part of his plates, and in this reſpect he has ſucceeded, ſo as in ſome inſtances to excite our ſurpriſe. In France he engraved part of the plates for a book, entitled “The Triumphs of Louis the Juſt,” a work which conſiſts of forty-nine engravings, and which was printed at Paris A.D. 1637, in one folio volume; the few following are likewiſe by his hand, all ſmall upright plates; “Jeſus filius Dei;” “Ecce Ancilla Domini;” “St. Catharine;” “Regnum Mundi;” “Jeſu Chriſti;” “Virgo Gratia Valentina Miraculis Clara;” “The Head of St. Ignatius of Loyola,” the face of which is ſo neatly executed, that the dots which blend the lights with the ſhadows, are hardly perceptible to the naked eye: and “A Holy Family repoſing,” in folio, from Herm. Swanevelt.

Cornelius Schut was born at Antwerp, A.D. 1590, and died in the ſame city in 1660. He was the diſciple of Rubens, and painted hiſtorical and poetical ſubjects with much ſucceſs. Schut likewiſe handled the point in a very free ſpirited ſtyle, reſembling that of Caſtiglione, but bolder and more determined. The drawing of the naked parts of his human figures is often incorrect, but the characters of his heads are generally expreſſed in a maſterly manner. From his numerous etchings we ſelect the following:—A ſet of one hundred and thirty-three prints of various ſubjects and dimenſions, from his own deſigns; four Virgin Maries, half-length figures, in 12mo.; “The Holy Family, accompanied by St. John;” “The Virgin and Holy Infant;” “Chriſt on the Mount of Olives;” “The Virgin ſurrounded with Rays of Glory, and worſhipped by the Saints of Paradiſe,” all in folio; “Mars, Venus, and Flora,” a ſmall upright oval; and its companion, “Bacchus, Ceres, and Pomona;” “A Sacrifice to Venus;” “The Triumph of Peace,” and “The Triumph of Neptune,” all of folio ſize; and “The ſeven liberal Arts,” a ſet of eight middling-ſized plates, lengthways.

This artiſt is ſometimes confounded with his nephew Cornelius Schut, who was director of the Academy at Seville, and a portrait painter of ſome reputation; but the latter is not known to have engraved at all.

Cornelius de Wael, or Waal, was born at Antwerp in the year 1594, and died at Genoa in 1662. His father was a painter, and he learned the elements of art under his paternal roof; but afterwards travelled to Italy, and ſtudied under various maſters. He painted battles, landſcapes, and hiſtorical ſubjects, with great ſucceſs; and was patroniſed both by Philip III. and the duke of Arſchot.

De Wael engraved ſeveral of his own compoſitions in a very ſpirited ſtyle; his figures have much expreſſion, and are very correctly drawn, and his chiaroſcuro is better than that of the majority of his contemporaries. Among his beſt etchings are, a ſet of ſeven, intitled “Ilbri. D.D. Guilielmo Vander Stradan, venuſtas haſche imagines, C. de

Wael amoris dicat." 1. Repreſents a fountain playing on ſome figures who are running to avoid it. 2. Hunters halting at an inn door. 3. Peaſants beating an overladen aſs. 4. A quack doctor ſhewing ſpecimens of his ſkill at the door of a tavern. 5. Peaſants before an alehouſe door. 6. A man on an aſs, and ſpectators laughing at him. 7. An aſſembly of people of rank of both ſexes; and a tennis-court with peaſants fighting; a ſmall plate lengthways.

Cornelius had a nephew, John Baptiſta de Wael, who engraved ſeveral of the pictures of his uncle, and among them "The Life of the Prodigal Son," in eight ſmall upright plates.

Lucas Van Uden was born at Antwerp in the year 1595, and became a very diſtinguiſhed painter and engraver of landſcape. He was inſtructed by his father, who was alſo an artiſt, but, by his accurate obſervation of nature, Lucas ſoon ſurpaſſed him in merit. He particularly ſtudied, and was happy in repreſenting, the various effects of ſun-ſhine, from the firſt dawn of morning till his light feebly glimmers in the evening horizon. Rubens ſaw his landſcapes with admiration, and ſometimes peopled them with figures, while Van Uden returned the favour by occaſionally painting the landſcape back-grounds of that great maſter. His ſkies and diſtances are beautifully clear and finely toned, while of his trees it has been ſaid that their foliage was ſo looſely pendant, that it ſeemed ſwayed by the motion of the air.

Van Uden etched many of his own compoſitions, and ſome few plates from thoſe of other painters, with great delicacy, ſpirit, and freedom. Huber thinks that his prints merit not leſs praiſe than his pictures. Among them may be diſtinguiſhed three pair of ſmall, but beautiful, landſcapes, conſiſting of village ſcenery adorned with trees and figures. A landſcape of paſtoral character, on the fore-ground of which is a piping ſhepherd with his flock. A landſcape with a wooden bridge and two windmills. A landſcape adorned with travellers, with a woody fore-ground, and the city of Antwerp in the back-ground. A landſcape with figures carrying a litter, in folio. Four fine landſcapes after Rubens, in ſmall folio, the earlieſt impreſſions of which are without the name of the painter. 1. A landſcape, and figures converſing. 2. Cows in a river, and a man bringing horſes to drink. 3. A landſcape, with water, cows, and figures. And 4. A landſcape, in which are two women with baſkets. A landſcape, into which a holy family is introduced; and another with the good Samaritan, both in folio, after Titian.

Of that well-known and very diſtinguiſhed artiſt, Jacques Jordaens, we have already treated as a painter in our nineteenth volume. (See JORDAENS.) His biographers have ſtated, that his early marriage prevented that journey to Italy, which was at the time eſteemed an almoſt indiſpenſable part of the education of an artiſt. Whatever cauſe kept him at home, taught him to depend leſs upon other men, and more upon nature and himſelf, and to this it is probable, that if we owe his low choice of ſubjects, we owe alſo the vigour by which his productions are characterized.

His etchings are haſtily performed, but glow with the fire, and teem with the intelligence of a maſter. According to Hecquet, who has favoured the public with a catalogue raiſonée of the works of Jordaens, they are thirty-three in number, and Huber has juſtly regretted "that they are not more numerous, as they rank with the fineſt productions of the Flemiſh ſchool."

In collecting theſe etchings, which are all from compoſitions by Jordaens himſelf, the connoiſſeur will bear in mind, that the earlieſt and beſt impreſſions are inſcribed with the words "cum privélegio."

Of the thirty-three prints mentioned by Hecquet, we are only able to enumerate "The Flight into Egypt," dated 1652; "Jeſus Chriſt expelling the Money-Changers from the Temple;" "The Deſcent from the Croſs;" "Mercury beheading Argus;" "Jupiter and Io;" "The Infant Jupiter ſuckled by the Goat Amalthea;" "A Peaſant arreſting an Ox by the Tail, amidſt a great Concourſe of Spectators." Theſe are all in ſmall folio, and engraved in the courſe of the ſame year, namely 1652. "Saturn devouring his Children;" a very rare 4to. plate, without any name or cypher, is alſo attributed by moſt connoiſſeurs to the hand of Jordaens.

John Percelles, the pupil of H. Cornelius de Vrooms, was born at Leyden in the year 1597. His ſon Julius was a native of the ſame city, and both excelled in painting and engraving ſhipwrecks, and other marine ſubjects. From the circumſtance of the works of the father and ſon being marked with the ſame initial letters, ſome confuſion has ariſen; nor is it known whether to attribute the twelve ſmall ſea views which bear theſe initials, to John or Julius.

Another ſet of twelve in folio, of which the ſubjects are the Dutch navy, are etched in a ſomewhat broader ſtyle, and are moſt likely the performance of the elder Percelles, being inſcribed "Notatæ a famoſiſſimo Navium Pictore Johannes Percelles," without any ſeparate mention of the engraver's name.

Roland Rogman, or Roghman, was alſo born at Leyden in the year 1597, and died there in 1685, or 1686. He was an original artiſt; he ſtudied under no maſter, but formed his ſtyle, both of painting and etching, from the ſtudious contemplation of nature only. His pictures are ſpoken of with great commendation, and he etched ſeveral landſcapes, which conſiſt chiefly of views in Holland and the Low Countries, in a ſketchy, but maſterly ſtyle.

Among them may be diſtinguiſhed "A View of the Caſtle of Zuylen," in folio; a pair of ditto with bridges and canals, &c. in 4to. A ſet of four mountainous landſcapes and figures, in 4to.; and another pair of town views, in folio

Gertrude Rogman is believed to have been of the ſame family with Roland, after whoſe pictures ſhe executed ſeveral engravings, among which is a ſet of four in ſmall folio, of the domeſtic occupations of the fair ſex.

The family of Van de Velde are of great celebrity in the annals of fine art. Eſaias, or Iſaiah, was born at Leyden, A.D. 1597. He became the diſciple of Peter Deneyn. With what talent he painted landſcapes and battles will be ſpoken of in our biography of VAN DE VELDE, as a painter. His etchings, which are executed with conſiderable firmneſs and intelligence, are rare, and, what is much better, are of intrinſic value. A landſcape, with peaſants drinking on the fore-ground, in folio. Another of quarto ſize, with a bridge and round-tower, in which is introduced a ſhepherd and ſhepherdeſs tending their flocks. Another, with cottages among ruined architecture; and another of paſtoral character, with a ſhepherd's hut near the fore-ground, of folio dimenſions, are all we are able to enumerate of the engravings of Iſaiah Van de Velde. He ſometimes combined his initials in a monogram, which will be found in *Plate* III. of thoſe uſed by the artiſts of the Low Countries.

John Van de Velde, brother of Iſaiah, was born in the ſame city, and in the following year; and though a painter of great merit, is, perhaps, better known by his excellent engravings; which are numerous, and are executed in two diſtinct and very different ſtyles.

The etchings he produced are very bold and determined. The lights are kept broad and clear; but perhaps the ſhadows may, in ſome inſtances, want ſtrength; however, the hand of the ſkilful maſter is evident in all of them; and the ſmall figures which are occaſionally introduced, prove the goodneſs of his taſte, by the ſpirited manner in which they are executed.

His other ſtyle of working was with the graver, aſſiſted occaſionally with the dry point; theſe prints are exceſſively neat and laboured, and reſemble thoſe of count Goudt in the vigour of their general effects; they conſiſt chiefly of ſcenes by candlelight, and ſuch ſubjects as require great depth of ſhadow; yet, with all the merits which they poſſeſs, they are not, on the whole, equal to his etchings; for whatever advantages may appear to be gained in neatneſs and toning, are loſt in their want of that ſpirit, lightneſs, and freedom by which his etchings are characteriſed.

The following will probably be found moſt worthy of the attention of the connoiſſeur: beginning with his portraits: John Van de Velde, himſelf, in large quarto; Jacob Matham, from P. Soutmans; John Torrentinus, a very fine and rare print, in large quarto; John Crucius, a clergyman of Haerlem, of the ſame ſize; Michael Middelhoven, F. Hals, pinx. in quarto; John Acronius, theologian, in folio; Jacob Zaffius, archdeacon of Haerlem, in folio, both from the ſame painter; John Oven, (engraved in mezzotinto); John Iſaccius Pontanus, hiſtorian, both in 4to.; Charles, duke of Troppau and Jaegerndorf, in folio; Oliver Cromwell, a very rare portrait, in large folio; and Lawrence Coſter, of Haerlem, with a long Latin inſcription, in 4to.

Hiſtorical Landſcapes.—“The Adoration of the Kings,” after P. Molyn. In this engraving the effect of night is well managed. “The Magic Lanthorn,” after the ſame painter; “The good Samaritan;” “An Old Woman frying Pancakes, and Boys eating them,” all in ſmall 4to.; “A Peaſant and his Wife going to Market, at Day break, with Cows and Goats,” in folio; a landſcape with ruins, and a cow-herd tending cows, in octavo; “The Mountebank expoſing his Medicines,” a capital print; “The Gameſters,” with a ſtriking candle-light effect, both in folio; “A village Feſtival,” a very rich compoſition; two landſcapes, one repreſenting buildings and travellers by moonlight, the other ſun riſe, and travellers; two landſcapes, one with figures fiſhing by moonlight, and villagers warming themſelves by a large fire, the other travellers by ſun-riſe, in folio; four ſubjects from the Hiſtory of Tobit, in 4to.; the four parts of the day, very beautifully finiſhed plates; the four elements, after W. Bugtenwegh, in folio, with very fine effects; the four ſeaſons, in large folio; a different compoſition of the ſame ſubjects, in large folio; the twelve months of the year, in quarto; another ſet of the ſame ſubjects, engraved in a broader ſtyle; a champaign country in Holland, with robbers attacking a coach at the entrance of a wood; a champaign in Italy, with buildings and water, after P. Molyn the younger, or the chevalier Tempeſta, both in large folio; an open country, with ruins and travellers, in folio; the bridge of St. Mary at Rome, in large folio; a view of the caſtle of Bruxelles, a very large and rare print; and a ſet of landſcapes, intitled “Playſante Landſchappen,” all of folio dimenſions.

Adrian Van de Velde was born at Amſterdam, A.D. 1639, and died in the ſame city in 1672. He was the nephew of John, whom we have juſt diſmiſſed, and the diſciple of Wynants. As a painter he will be treated of in a future volume.

To ſpeak of him as an engraver, we have, by this maſter, a ſet of twenty etchings, executed in a very free and ſpirited ſtyle, of cattle and peaſantry. Another ſet of ten plates of groups of cows and other domeſtic animals, with a bull for the title page; three plates of ſheep; the return from hunting, in quarto; a large landſcape, lengthways, and a ſmaller one of the ſame form, enriched with hiſtorical figures, both rare prints, but the latter by much the rareſt.

John Miel was born in a village, near Antwerp, in the year 1599, and died at Turin in 1664. He learned the rudiments of art of Gerard Seghers, and afterwards travelled to Italy for improvement, where he ſtudied in the ſchool of Andrea Sacchi.

By contemplating the beſt works of the Italian maſters, he by degrees emancipated himſelf from the trammels of his earlier education, and formed a ſtyle of art for himſelf, in which the general characteriſtics of thoſe of Flanders and Italy, were happily blended.

The talents of Miel, and the reputation which followed and brightened their exerciſe, induced Charles Emanuel, duke of Savoy, to invite him to Turin. Under the patronage of this nobleman he remained five years, and the duke was ſo fond of our artiſt, that he inveſted him with the order of St. Maurice, and preſented him with a diamond croſs of great value; notwithſtanding which favours, he languiſhed in vain to return to Rome. Rome was the place where he had beheld thoſe objects that firſt expanded his mind with the pleaſures of art. Hence his wiſhes to return thither, and hence the regret which is by ſome ſuppoſed to have ſhortened his days. If he gained honours, he had ſacrificed liberty and independence at their ſhrine, and did not, therefore, enjoy them.

Miel etched ſeveral plates from his own compoſitions in a very maſterly ſtyle: and the figures which he occaſionally introduced are drawn with great ſpirit and freedom.

Among theſe are “The Aſſumption of the Virgin Mary;” “The Holy Family;” four paſtoral ſubjects, with ſhepherds and cattle, beautifully executed, in quarto, and an unknown number of battles and ſkirmiſhes for Strada's Wars of Flanders.

Philip Verbeck, or Verbecq, a Dutch engraver of ſlender talent, was born ſome time about the cloſe of the ſixteenth century. He is chiefly remarkable for having etched ſome plates in a ſcratchy manner, which bears inferior reſemblance to the ſtyle of Rembrandt.

Inferior, as is this reſemblance, it has led ſome collectors into the error of purchaſing his works and placing them in their Rembrandt portfolios. Gerſaint firſt informed them of their miſtake, and by comparing Verbecq's etchings with thoſe of Rembrandt, not only the name or cypher of the former artiſt may be obſerved, but the dates alſo of his engravings, which ſhew that he was anterior to Rembrandt, and therefore, at leaſt, not a copyiſt.

The following are all we are able to ſpecify from the hand of this artiſt, and which are much ſought after. “Eſau ſelling his Birth-right;” “An eaſtern King, ſeated on his Throne, with a Suppliant kneeling before him,” both in 4to; “A Shepherd, ſeated at the Foot of a Tree;” a buſt of a young lady in a bonnet and peliſſe; and a three-quarter portrait of a nobleman in a tartan and feathers, (companion to the above,) all in ſmall ovals.

Rodermondt, Rottermondt, or Rottermans, with whoſe Chriſtian name we are unacquainted, was alſo of Holland, and born in the year 1600. He etched ſeveral portraits and ſome other plates much in the manner of the preceding artiſt, and with at leaſt equal freedom and ſpirit. Among theſe are ſir William Waller, major-general of the parliamentary army, with a battle in the back-ground, after C. Janſen; John the ſecond, a celebrated Latin poet, a very rare print, inſcribed "Joannes ſecundus Hagienſis Poeta. Rodermont fecit," in large 4to.; a three-quarter view of a man with a curly beard, (this print, which is not above mediocrity, is in the ſtyle of Rembrandt: by Gerſaint it is attributed to Verbecq, and by Bartſch to Rodermont); and "David praying," with his harp and turban beſide him, in 4to.

Peter van Sompel, or van Sompelin, was born at Antwerp in the year 1600; and became the pupil of Soutman, whoſe ſtyle he always copied. He drew correctly, and treated the naked parts, and eſpecially the extremities of the human figure, with intelligence. He engraved in a neat laboured ſtyle, eſpecially his portraits after Vandyke and Rubens, among which the following will be found moſt worthy of notice.

Portraits.—Paracelſus, the celebrated phyſician, in folio; the emperor Adolphus of Naſſau, in large folio; Marianna de Bavaria, wife of the emperor Ferdinand; Henry, count of Naſſau, and Philip of Naſſau, prince of Orange, both in large folio; and all from Soutman. The emperor Charles V., from Rubens; cardinal Ferdinand, brother of Philip IV. governor of the Low Countries, from Vandyke; Iſabella Clara Eugenia, infanta of Spain; Gaſton John Baptiſt, duke of Orleans, brother of Louis XIII. and Margaret his wife, all from Vandyke. Philip the Hardy, duke of Burgundy, from Van Eyk; Frederic Henry, of Naſſau, from G. Honthorſt; all of large folio dimenſions.

Hiſtorical Subjects.—"Chriſt on the Croſs," a large upright plate, arched at the top; "Chriſt dining with the Pilgrims at Emmaus," in folio, nearly ſquare; "Erichtonius in the Baſket, diſcovered by Aglaurus and his Siſters," all from Rubens, and "Ixion deceived by Juno," from the ſame painter; all in large folio.

William de Leeuw was born at Antwerp, A.D. 1600, and flouriſhed in the Netherlands in 1650. He was a pupil of Soutmans, but did not engrave in his ſtyle; inſtead of which he employed ſhort playful ſtrokes, which produced a pictureſque effect, united with a tolerably good chiaroſcuro. Moſt of his engravings are from Rubens or Rembrandt, but in a ſet of large landſcapes after Nieulandt he has quite altered his manner of execution, and engraved the ground and ſky in a manner ſo delicate, that it requires good eyes to diſtinguiſh it from a tint of Indian ink.

De Leeuw commonly marked his prints with his initials, or a monogram, which will be found in *Plate* III. of thoſe uſed by the engravers of the Low Countries. The following are a ſelection of his beſt works: "Lot and his Daughters," in folio (the beſt impreſſions of this plate are before the name of C. Dankerts was inſerted); "Daniel in the Lion's Den," in large folio; the Holy Virgin kneeling, ſupported by angels, commonly called "The Virgin of Grief," a very rare print, in folio; "The Martyrdom of St. Catherine," a very fine and rare print, all after Rubens, and a ſet of four chaſes, from the ſame painter, namely, the chace of a lion and lioneſs; ditto of a wolf; ditto of a wild boar; ditto of a crocodile and hippopotamus; all in very large folio. "Tobit and his Wife," in folio, from Rembrandt. This print is executed in a very good taſte, and has a fine effect. "David playing the Harp before King Saul;" a half-length profile of Rembrandt's wife, both in large folio: the portrait of a female veiled, at the bottom of the print "Marianne" is inſcribed in capital letters; all after Rembrandt. A young man habited in a cloak, and a hat and feathers, in ſmall folio; "St. Francis meditating," a half-length profile, from Livens, in folio. And the following ſet in large folio, from Nieulandt, which are very rare and beautifully executed. A view in the Tyrol, with water, caſcades, and travellers. Another ſcene in the mountains of Tyrol, with travellers on horſeback; to the right a high mountain is crowned with the ruins of a temple, and on the plain below is a hermitage and two figures. A landſcape of the ſame character as the former, with wood and water; cows feeding on a plain and the effect of ſun-ſet. And another with fiſhers, and men on horſeback: on an eminence towards the right is a church, and on the plain below a village and ſheep feeding.

John Louys, or Loys, was born at Antwerp, A.D. 1600, he was the diſciple of Soutman, and engraved chiefly after the pictures of Rubens and Vandyke. There is a very fine engraving by him, with a powerful chiaroſcuro, of "The Reſurrection of Lazarus," from J. Livens, which is generally and juſtly regarded as his maſterpiece. From among the works of this artiſt, the following are moſt worthy of ſelection.

Portraits.—Philip the Good, duke of Burgundy, from Soutman; Lous XIII. of France, from Rubens, and its companion, Ann of Auſtria; Philip IV. king of Spain, from Rubens, and its companion, Elizabeth of Bourbon, his queen; and Francis Thomas of Savoy, prince of Carignano, from Ant. Vandyke; all of large folio dimenſions.

Hiſtorical, &c.—"The Reſurrection of Lazarus," (which is mentioned above;) "The Repoſe of Diana, or the Return from the Chace," from Rubens; "The Inſide of a Flemiſh Cottage, with a Woman ſcouring a Cauldron," after Oſtade; "Peaſants regaling," and "The Cheſnut Seller," after the ſame maſter, all in quarto; and "The Interior of a Dutch Kitchen," in which the principal object is a dead pig hanging up; in folio, after W. Kalf.

Jonas Suyderhoef, of Leyden, was another of the diſciples of Soutman, born in the ſame year with the preceding artiſt, but of very ſuperior abilities.

Suyderhoef purſued the ſtyle of engraving which had been invented or adopted by his maſter, but, by degrees, far ſurpaſſed him in the ſoftneſs and beauty of his finiſhing. He had the art of uniting great force, as well as harmony of chiaroſcuro, with conſiderable neatneſs of execution, and, where his ſubject required it, with great exactitude of detail. His engravings are juſtly held in eſteem by the experienced collector, and by all men of taſte. His portraits, of which he executed a conſiderable number, are exceedingly beautiful, and probably, on the whole, ſuperior to his hiſtorical works. His practice was, to bring them very forward in the etching, and afterwards ſtrengthen them, where deeper ſhadows were required, with the graver; imparting to them, at the ſame time, amenity of tone, and greater accuracy of reſemblance. Perhaps we ought to except from this general preference, his "Treaty of Munſter," after Gerard Terburgh, which is truly an hiſtorical engraving, though it conſiſts of an aſſemblage of the portraits of the moſt celebrated ſtateſmen of Europe, and of the age when that important treaty was concluded. The exquiſite picture, from which this plate was engraven, which form its rare merits, and its importance as a diplomatic and hiſtorical event, ought always to adorn a royal or a national gallery, was lately brought to this country, by Mr. de la Hante, and is probably ſtill in Pall-mall, in that gentleman's poſſeſſion. Not only the perſon and dreſs of every plenipotentiary who was preſent on that memorable occaſion, are here pourtrayed with the utmoſt delicacy of finiſh, but the place of meeting alſo, with every minutiæ of coſtume.

The profeſſional diligence of Suyderhoef was ſcarcely inferior to his extraordinary merit: this merit has, to a certain extent, been appreciated through Europe, and fine impreſſions of his beſt works are, in conſequence, become extremely rare. Mariette's collection of his works amounted to one hundred and eleven: nor are we certain that Mariette had collected the whole. From among theſe, it may be uſeful to diſtinguiſh the following, as thoſe which are more eminently worthy of the reader's notice.

Portraits.—Maximilian, archduke of Auſtria, in large folio; Philip III. of Spain, in ſmaller folio; Albert, archduke of Auſtria, and governor of the Netherlands; and his ducheſs, Iſabella Clara Eugenia, infanta of Spain, in large folio, all after ſir P. P. Rubens; Charles I. of England, and his queen Henrietta Maria; and Francis de Moncado, count of Orſonna, all in large folio, and after Vandyke; the emperor Maximilian I. and his empreſs Maria, both in folio, and after Lucas of Leyden; duke John, and duke Charles of Burgundy, after Soutman, of large folio dimenſions; Aidus Swalmius, an old man with a long beard, from Rembrandt; René Deſcartes, the celebrated philoſopher, from F. Hals; Van Bloemaerts, a half-length, ſeated at a table, with books and a crucifix; beneath is a long Latin inſcription, after Van Spronck: Mark Zucrius Boxhornius, of Bergenopzoom, profeſſor at Leyden, from Dubordieu; Adrian Heerebond, profeſſor of philoſophy, from the ſame painter; Jacob Maeſtertius, juris conſulte at Leyden, from Van Negre; Andreas Rivetus, profeſſor of theology at Leyden; Claude Saumaiſe, a famous critic, both from the ſame maſter; Noah Smaltius, a celebrated ſurgeon of Haerlem, after Th. Pas; Albert Kuperus, doctor of medicine at Leyden, after D. Bailly; John Coccejus, profeſſor of theology at Leyden, from De Vos; Conſtantine, tutor of prince Maurice of Naſſau, after Baudrigeen; Abraham Heydanus, a ſhepherd of Leyden, from Schooten; Daniel Heinſius, a Dutch hiſtorian, from Marck; Anna Maria Schurman, celebrated for her taſte and knowledge of the arts and ſciences, from J. Livens; John Beenius, theologian, from J. Vliet; Julius de Beyme, profeſſor of law at Leyden; and Pierius Winſemius, profeſſor of hiſtory, both without the painter's names, and all of folio dimenſions.

Hiſtorical, &c. after various Maſters.—"The Fall of the Damned," a large upright print, engraved on two plates, from Rubens; "The Virgin Mary, with the Infant Jeſus embracing her," in quarto; "A Bacchanal," a ſmall plate, lengthways; "A drunken Bacchus, ſupported by a Satyr and a Moor," a ſmall upright plate, half figures; "The Chace of the Lions," in large folio, very fine and rare, all after Rubens; a compoſition of "Satyrs playing with Tygers," the beſt impreſſions of which have a forcible and fine effect, after De Laer, in large folio; "The Return from a Country Excurſion," in large folio, after Berghem; "The Concluſion of the Peace at Munſter," containing the portraits of all the plenipotentiaries who were there aſſembled, a large folio plate, after Terburgh, very fine and rare; "A Quarrel of Dutch Peaſants," in large folio, after the ſame painter; another "Quarrel of Peaſants," after Van Oſtade, containing many figures; "The four Burgomaſters of Amſterdam," a folio plate after Th. Keyſer; "Three Old Women regaling," from the ſame maſter, in an oval of folio ſize; "Three Peaſants ſeated, one of whom plays the Violin," a fine and rare print in folio; "Peaſants gaming," in folio; "Peaſants regaling at the Door of an Alehouſe," in folio, all from Van Oſtade; "The enraged Drinkers," in large folio, from De Witt; "Peaſants quarrelling," in folio; and "Peaſants dancing at an Alehouſe," commonly called "The Ball," in large folio, all after De Wit.

William de Butenweg, or Van Buytenweck, was born at Rotterdam in the year 1600, and always reſided in that city. He painted converſational ſubjects and landſcapes. He likewiſe etched, in a good ſtyle, ſome few ſubjects from his own deſigns, of which we are able to mention only the following.

A pair, repreſenting "Young Villagers carrying Poultry to Market;" a ſet of ſeven, of "The Coſtume of Noblemen;" a ſet of ſix, of "The Coſtume of Ladies," all in octavo; and a ſet of ten landſcapes with ruins, trees, and figures, entitled, "Verſcheide Landſckapjes." Buytenweg marked his plates either with a monogram, which will be found among thoſe of the engravers of the Low Countries, or with his name at length.

George Henry Scheyndel, or Van Schiendel, was a native of Holland, the contemporary of Buytenweg, and we preſume was, like him, eſtabliſhed at Rotterdam. He engraved in a very neat, ſpirited ſtyle, very nearly reſembling that of Callot. His landſcapes poſſeſs great merit, and are ornamented with excellent little figures.

Scheyndel marked his prints with his initials G. V. S. We have, by him, "A Company of Peaſants, ſeated before a Houſe Door;" another "Company of Peaſants, with a young Pig and Chickens;" "A Dentiſt, at a Fair;" "The Execution of a Criminal," all in 12mo.; "A Village Fair," in octavo; another "Village Fair, with a Conjuror," of the ſame ſize; a winter landſcape, with ſkaiters; a landſcape, with a water-fall; another landſcape, with a bridge, figures, and animals; a ſet of four views of a caſtle, one of which has alſo a windmill; a ſet of eleven landſcapes, with Dutch inſcriptions, all in quarto; a ſet of the coſtume of the Grecians and Turks, in octavo; and a ſet of the habits of the countrywomen of the ſeveral cantons of Holland, twelve ſmall upright plates, from Buytenweg.

Peter de Molyn was born at Haerlem in the year 1600. For an account of his merits as a painter, as well as thoſe of his more celebrated ſon, ſee the article MOLYN, &c.

Molyn etched ſome few plates from his own compoſitions, in a good taſte, which are chiefly remarkable for their ſtriking effects of chiaroſcuro, and are very much ſought after by connoiſſeurs. A ſet of four landſcapes ornamented with very good figures, in folio; another ſet of four fine landſcapes, with cattle and figures, in large quarto; the ſtar of Bethlehem, with a very fine night effect, and the ſame ſubject otherwiſe treated (though not leſs ſucceſsfully,) both in folio; compriſe perhaps the whole of his etchings. All, except the laſt, are marked P. Molyn fecit.; but by ſome writers the two latter are ſaid to be by J. van de Velde.

This artiſt marked his engravings with his initials, in the form of a monogram, which will be found in our *Plate* III. of thoſe uſed by the engravers of the Netherlands.

The works of this artiſt have been confounded by Strutt with thoſe of his ſon Peter Molyn the younger, who is better known by his cognomen *Tempeſta*.

The younger Molyn was alſo a native of Haerlem, born in the year 1637, and, according to ſome of his biographers, was the pupil of Snyders, whoſe manner of painting he at firſt imitated.

Either the whirlwind of his violent paſſions, or, as ſome have expreſſed it, his genius, which led him to the ſtudy of ſtorms at ſea and other diſmal ſcenes, obtained for him the diſtinctive addition of *Tempeſta;* he was otherwiſe nicknamed *Pietro Mulier*, for a much worſe reaſon, but which ſtill has reference to the ungovernable and tempeſtuous character of his mind. He cauſed his wife to be aſſaſſinated, in order that he might be at liberty to marry a young lady of Genoa, with whom he was paſſionately in love.

However villainous this crime, and however incompatible with the purſuits of art, Molyn ſtands convicted of the full amount of its enormity. He was diſcovered, ſeized, impriſoned, tried, and capitally condemned. The greatneſs of his merit, however, as an artiſt, cauſed his ſentence to be mitigated. He ranſomed his life with the loſs of his liberty, endured an impriſonment of ſixteen years, and in all probability would have ended his days in captivity, but that the bombardment of Genoa by Louis XIV. afforded him an opportunity, which he failed not to embrace, of eſcaping to Placentia.

During his confinement, he conſoled himſelf with his profeſſional purſuits, and probably executed ſome of the engravings which have been aſcribed to him. Of theſe we are only able to particulariſe one which is in a ſtyle reſembling that of the elder Molyn and John van de Velde, the ſubject is a maſquerade by candle-light, with a ſort of mock proceſſion in the back-ground. Tempeſta died in the year 1710.

Albert Flamen was born in the year 1600, but in what part of Flanders we are unable to ſay. He acquired ſome reputation as a painter of landſcape and ſtill-life, but from the number of excellent prints he produced, is better known as an engraver. At one period of his life he reſided at Paris.

His prints are for the moſt part etchings, performed in a maſterly and ſpirited ſtyle, and finiſhed with ſmall aſſiſtance from the graver. They are marked with the monogram which may be ſeen in our *Plate* III. of thoſe uſed by the engravers of the Low Countries, and conſiſt principally of four ſets of various fiſh, with landſcape back-grounds, of ſea-ports, &c. engraved on forty-eight plates; a ſet of ſeven landſcapes and figures; a ſet of four views of Conflans, Pernay, Marcouſſi, and the Port à l'Anglois, all in large quarto; and a folio print of the encampment at the Fauxbourg de St. Victor.

Claas, or Nicholas, Wieringen, was born at Haerlem ſome time about the commencement of the ſeventeenth century. He was ſent to ſea in his youth; employed much of his time in ſtudying marine objects; and after making a few voyages, ſettled on ſhore, and became a painter and engraver of ſhipping and other marine ſubjects.

His prints conſiſt of etchings which diſplay much talent and feeling for art, and the ſubjects of which are ſea views and landſcapes, either drawn from nature or engraved from his own compoſitions; a ſet of ſix landſcapes of village ſcenery, with ruſtic figures, &c. in quarto, are very excellent plates, and are all we are able to ſpecify of the works on copper of this maſter.

Contemporary with Wieringen was Claas, or Nicholas, Moojaert, or Mooyaert of Holland, the happy imitator of Elſhiemer, and the inſtructor of Berghem, Vander Does, Koningh, and Weenix. The name of this artiſt has been variouſly ſpelled, and his hiſtory is obſcure; Baſſan firſt calls him Nicolas Moojaert of Amſterdam, and afterward Claas Moyard, a Dutch painter.

He etched ſeveral plates in a ſtyle bearing ſome reſemblance to that of Rembrandt, and as far as is known, worked entirely from his own compoſitions. Among his beſt prints are a ſet of ſix plates of animals, etched in apparent imitation of Swaneveldt; “Lot and his Daughters,” in that of Elſhiemer, and a landſcape with cows and ſheep, of various quarto dimenſions.

Chriſtian Louis Moyart was a native of the Netherlands, the time and place of whoſe birth are not known, but who was reſiding and practiſing engraving in the city of Amſterdam in the year 1630.

Among a few other works of no very extraordinary merit, he produced a ſet of monſtrous allegorical compliments, of folio dimenſions, wherein Hercules and Minerva appear quite out of their element, and which is entitled “An emblematical Hiſtory of Queen Mary de Medicis.” Moyart marked his plates with a monogram which will be found in our *Plate* III. of thoſe uſed by the engravers of the Low Countries.

Mathew Montagne, otherwiſe Plattenberg, was born at Antwerp in the year 1600, and died at Paris in 1666. He went at an early age to Italy, and made a long ſtay at Florence, where he engraved in concert with his countryman John Aſſelin. From thence he journeyed to Paris, where, for reaſons which we are unable to ſtate, he changed his name from Plattenberg, to Plattemontagne, and afterwards to Montagne. He painted ſhipping, ſea-views, and landſcapes, in a very good ſtyle, and acquired great reputation.

Montagne likewiſe etched ſome few plates of landſcapes and ſea-views, from his own pictures, in a ſtyle reſembling that of Fouquieres; of which the principal are as follow; a landſcape with buildings and figures; a ſea-port, with veſſels and figures, both of folio ſize; a pair of circular prints, one repreſenting veſſels on the ſea, and a light-houſe on a mountain; the other a landſcape with wood and water; a pair of landſcapes, one of which is ornamented with figures cutting wood; the other a canal with watermen, and a village, all in folio; and another pair, one of which has a village, trees, and three ſmall figures on the fore-ground; the other conſiſts of ruins and trees, without figures, in quarto; they are all marked M. Montagne in. et fec.

Nicolas Montagne, the ſon of Mathew, was born in the year 1631, and died at Paris in 1706. He ſtudied painting under Philip Champagne, to whom he was related; and engraving under Morin, whoſe ſtyle he improved upon. He painted portraits and hiſtory with ſucceſs, and in 1681 he was choſen profeſſor of painting of the Royal Academy at Paris. The moſt conſiderable work he engraved was a ſet of portraits, on which we find his name inſcribed, Nicolas de Plattemontagne. He drew the human figure very correctly, and his plates poſſeſs a very agreeable effect; we ſhall mention the following only, “Oliver de Caſtella,” a lieutenant-general, killed at the ſiege of Tarragone in 1644, in large folio; “St. Genevieve,” a whole length figure, after Ph. de Champagne, in folio; and “A dead Chriſt,” from the ſame painter; the figure is finely drawn, and the fleſh executed with dots only, but the back-ground and drapery are finiſhed with ſtrokes in a bold and free ſtyle, and is altogether a print of conſiderable merit.

William Akerſloot was born at Haerlem ſoon after the commencement of the ſeventeenth century. Under whom he ſtudied is not known, nor are his works entitled to rank above mediocrity.

He engraved portraits and hiſtorical ſubjects, and among others the following; Frederic Henry, prince of Orange, in folio; Amelia, princeſs of Orange, between her daughters, with a caſtle and figures in the back-ground, both after A. van der Venne; “Chriſt in the Garden of Olives,” after H. Hondius; “Chriſt loaded with Chains,” after P. Molyn; “The Denial of St. Peter,” after the ſame painter; and a large cartouche, with veſſels on the ſea, all in folio.

Moſes Uytenbroeck, ſurnamed Little Moſes, was born at the Hague in the year 1600. It is preſumed he was the diſciple of C. Poelenbourg, in whoſe ſtyle he compoſed, and ſometimes ſo exactly imitated him, that his pictures have been ſold for the works of that artiſt. He painted landſcapes, which he uſually embelliſhed with ſubjects taken from the Greek and Roman poets. We have by this maſter many engravings of landſcapes from his own compoſitions, they are executed in a taſteful ſpirited ſtyle, but the figures which he ſometimes introduced are incorrectly drawn. We ſhall mention the following as being moſt worthy the notice of the collector; "Diana diſcovering the Incontinence of Caliſto," in 4to.; and its companion, "A Female ſhowing to her Child Tobit blind, ſeated at the Door of his Houſe," very beautiful engravings; "Hagar in the Deſart comforted by an Angel;" "Mercury and Argus," both in 4to; a ſet of "The Hiſtory of Tobit," in four landſcapes; a ſet of ſix landſcapes with hiſtorical figures; a ſet of ſix landſcapes ornamented with buildings, figures, and animals, in the ſtyle of Poelenbourg; a ſet of four with ruins and figures, all of quarto dimenſions; three landſcapes with various animals, in quarto, nearly ſquare; "The Flight into Egypt," a paſtoral and poetic ſubject, of a ſhepherd and his flock entertained by a muſe; a ſhepherd and ſhepherdeſs taking refuge in a cave, from a violent ſtorm; another paſtoral ſubject, with a ſhepherd in the antique dreſs ſeated, ſurrounded by animals, all in large quarto; and a folio print of Hercules preventing Cacus from ſtealing his cows and horſes, the figures in which are in the antique ſtyle; theſe two laſt prints are very rare.

J. G. Blecker, or Bleker, was born at Haerlem ſome time about the year 1606. He engraved a conſiderable number of prints, both from his own compoſitions and thoſe of other maſters, in an intelligent and ſpirited ſtyle.

Blecker marked his plates in various ways, which has given riſe to miſtakes, for Heinneken calls him John Gaſpar, and Florent le comte, Cornelius; which has led our countryman Strutt into the error of making two artiſts of the name of Blecker, one of whom he calls Cornelius, and gives him the monogram, for which ſee our third plate of thoſe uſed by the artiſts of the Netherlands. The following are among the beſt of his works.

From his own Compoſitions.—A landſcape with the meeting of Jacob and Rachael; a landſcape, into which is introduced the meeting of Abraham's ſervant with Rebecca. He has, in this inſtance, worked upon the etching to harmonize it (eſpecially upon the heads of his figures) with the point of the graver, ſcratching upon the copper, in a ſtyle ſomething like that which Worlidge afterwards adopted; but he has by no means ſucceeded. "Two Peaſants travelling in a Cart;" another engraving of the ſame ſubject; "A Carriage ſtopping before an Inn door, with Horſes feeding;" "A Peaſant ſeated, obſerving a Girl, who is milking a Cow," all of folio ſize; a landſcape with animals; another landſcape, with a woman on horſeback, both in 4to.; and two others, in which animals and a piping ſhepherd are introduced, both in folio.

The following are after Poelenbourg.—"Jacob and Laban parting their Flocks;" "The Lyſtrians attempting to ſacrifice to Sts. Paul and Barnabas" both in large folio; and "Chriſt on the Croſs," at the foot of which appears the Virgin and diſciples, in folio, three very capital engravings.

The Viſſchers, whom we now approach, were a very diſtinguiſhed family of artiſts, and who, by the number and extraordinary merits of their engravings, have conferred much honour, and no ſmall advantage, on their country.

Cornelius Viſſcher was born in Holland, A.D. 1610, he was the diſciple of Soutman, but ſoon ſurpaſſed him in merit. M. Watelet truly ſays, (in his Dictionary of Engravers,) that very few artiſts combined etching and engraving with ſo much taſte, or ſo well imitated with the graver alone, all the playful pictureſqueneſs of the point, as Cornelius Viſſcher. He drew with great taſte, and the compoſitions which he made for many of his engravings, ſufficiently prove the extenſiveneſs of his genius, and his powers of combination. His etchings are free and delicate; but his works with the graver muſt excite the admiration of every taſteful beholder. His mode of performance with that inſtrument was as ſingular, as the effect he produced was pictureſque and beautiful. Among the engravings from his own compoſitions that of "The Rat-Catcher," "The Bohemian Woman," "Gellius de Bouma," and "The Cat," deſerve the preference; in the Bohemian, the rough freeneſs of the etching needle is finely contraſted with the ſhining ſmoothneſs of the lines produced with the graver. The portrait of Bouma is yet more exquiſite and ſurpriſing, his old and wrinkled ſkin being engraved in a manner which is peculiarly characteriſtic of the laxity and feebleneſs of the decaying muſcles and ſhrivelling integuments of old age, particularly about the cheeks and temples; the noſe (ſays Huber) appears like fleſh itſelf, and the mouth, which is partly concealed by the beard, ſeems to be alive, as do alſo the eyes, the execution of which is beautifully clear, and expreſſive of the dimmed brightneſs of a mind which time is eclipſing. The ſame nice feeling, accuracy of diſcrimination, and power over the inſtruments of his art, marks the execution of his celebrated Rat-catcher, in which the ſhining face as well as negro features and complexion of the young African, are admirably depicted, and the maſter rat-catcher with his furred cap, and highly characteriſtic habiliments, rat cage, &c. and, above all, his animated phyſiognomical countenance, which together mark the profoundeſt of adepts in the myſteries of his craft, are expreſſed with that broad and general, and therefore ſtrong, reſemblance to nature, which all eyes muſt have ſeen, and is finiſhed with the utmoſt vivacity of touch.

Cornelius was an engraver of truly original powers; he was a man of a ſelf-willed character of mind, and perhaps ſhould not have endeavoured to copy the feelings, and transfuſe the forms, which had originated in the minds of other artiſts. It is acknowledged that his engravings after the Italian painters, are of inferior merit to thoſe which are after nature and his own compoſitions; the plates which were executed for "the cabinet of Reynſt," are among his earlier performances, nor did he ſucceed ſo well as Vorſterman, Pontius, and the Bolſwerts, in engraving after Rubens; yet he claims to be ranked among the firſt artiſts of his country, for genius always ſhould be eſtimated, not by its freedom from defects, but by the dimenſion of its merits.

Among his beſt works, the collector may reckon the following; thoſe who would ſee a more copious catalogue, may conſult Baſſan's Dictionary of Engravers.

Portraits.—Cornelius Viſſcher, in a ſugar-loaf hat; another portrait of Viſſcher, with the ſame kind of hat, and a cloak, both in 4to.; Andrea Deonyſzoon, called among print dealers, "the man with the piſtol," becauſe a ſmall carbine or piſtol with ſeveral gun locks appears in the background; this print is one of the fineſt, and the moſt rare, of the engravings of this maſter, but perhaps the very ſcarceſt of all, and certainly the moſt intrinſically valuable of his portraits, is that of Gellius de Bouma, miniſter of Zutphen, aged ſeventy-ſeven years; William de Ryck, an oculiſt of Amſterdam: this portrait, and the preceding, are ſometimes called "The great Beards," and are uncommonly fine, all of folio ſize; a biſhop ſeated at a table, with a crucifix, &c. half length; John Merius, the paſtor of Spanbroeck, both in large folio; Cornelius Voſberg, the paſtor of Spaerwouw, in folio, a very fine and rare print; John Wachtelaer, an eccleſiaſtic of Utrecht, in large folio; William van-den Zande, theologiſt, in an oval border; Adrian

Motman, accompanied by cherubs, a ſkull, and a cenſer; John Boelenſz, in an oval border, with "Sanctitate et Doctrinâ" inſcribed on a ſtreamer; Adrian Pauw, knight of the order of St. Michael; David Peiterz de Vries, chief maſter of the artillery in the Dutch States, very rare; Joſhua Vondel, a Dutch poet, half length, all of folio ſize; Jacob Weſterbaen, lord of Brandwick, &c. half length, in an oval border, octavo ſize, very rare; Alexander VII. ſovereign pontiff, with the motto "Juſtitia et Veritate" on a cartouch ſupported by children; Coppenol, commonly called the writer, becauſe he holds a pen; Peter Scriverius, a philoſopher of Haerlem, (of this engraving it is uncommon to meet with a good impreſſion); John de Paeſs, holding a purſe, and a cartouch, on which is written his occupation of an exchange broker, all in folio; an etching of an old woman, commonly ſuppoſed to be the mother of Viſſcher; another portrait of the ſame perſon, with a bonnet on, both of quarto ſize; Robert Junius of Rotterdam, a clergyman, in an oval border, "Palmidas pinx." in folio; Conſtantine Huygens, nobleman of Zuylichem, father to the celebrated mathematician of that name, a fine and rare print; a buſt of Peter Gaſſendi, in an octagon border, with Latin verſes; both in 4to.; William of Naſſau, ſon of Frederic Henry, prince of Orange; Mary, eldeſt daughter of Charles I. wife of the former, both in large folio, from Hondthorſt; Chriſtiana, daughter of Guſtavus Adolphus, and queen of Sweden; Frederic William, elector of Brandenburg; Charles Louis, palatine of the Rhine, and elector of Bavaria; Charles II. of England, all after Hondthorſt; Janus Douza, lord of Northwick, and of ſome celebrity as a philoſopher, all of large folio dimenſions. And two very rare portraits, which we do not find ſpecified in the catalogue of Hecquet, *viz.* Francis William, biſhop of Oſnabruck; and Louis Cutz, theologian, both in ovals, of 4to. ſize.

Hiſtorical, &c. from his own Compoſitions.—"The Four Evangeliſts," half lengths, with attributes, in folio; "The Pancake Woman," a large folio plate, the beſt impreſſions of which are before the name of Clement de Jonghe was affixed to it; the ſecond beſt, before that of John Viſſcher. It was afterwards retouched by Baſſan, and the name of John Viſſcher eraſed; but the laſt impreſſions are eaſily diſtinguiſhed from the firſt by their palpable inferiority. "The Rat-Catcher," the firſt impreſſions of which were taken before the name of Clement de Jonghe was affixed to it; "The Bohemian or Gypſey Woman," with three children, to one of whom ſhe gives the breaſt, all in large folio; the name of Viſſcher, in the earlieſt impreſſions of the latter plate, is upon the margin at the bottom. It was afterwards obliterated to make room for the inſcription, and affixed to the upper part of the plate; "The Interior of a Cabaret," with a party of five men ſmoking and drinking, in folio; "The Antiquary," repreſenting an amateur in his cabinet, looking over his curioſities, in large folio. By ſome this is miſtakenly ſaid to be from a picture by Reynſt, and others attribute it to Correggio. Charles Guſtavus, king of Sweden, and his queen, accompanied by a great crowd of perſons, and an old man reading a paper; "The Coronation of the Queen of Sweden," inſcribed "Carolus Guſtavus:—Hedwig Eleonora;" all of large folio ſize; a boy holding a candle, and a girl with a mouſe trap, in which is a mouſe: this print is uſually called "The Mouſe Trap," in 4to. A figure lying on a tomb, above which Chriſt appears with cherubs, beneath is a bas-relief with two genii placing a ſerpent on a ſkull crowned with laurel; above is inſcribed "Fortiter, ſed ſuaviter," in large folio. A cat ſleeping, with a rat before her, in 4to; a cat ſleeping upon a napkin, a very ſmall plate lengthways. This print is exceedingly rare, and at the auction of Mariette's collection, it ſold for the ſum of three hundred and ſixty-one livres.

Hiſtorical, &c. after various Italian Maſters.—"The Angel commanding Abraham to quit his Country, and ſojourn in the Land towards which he points," from Baſſan; "Abraham at Sichem, and God appearing to him in a Dream," from the ſame painter; "Suſannah and the Elders," from Guido. The buſt of a woman with her hand upon her breaſt, a very fine print, thought to be from Parmegiano, all in folio; "Chriſt carried to the Tomb;" "The Reſurrection," after P. Veroneſe, inſcribed "Ego et Pater unus ſumus," in large folio; "The Holy Family," where the infant Chriſt is on the lap of the Virgin, and St. John preſents fruit; thought to be from Palma; "The Holy Family," in which the infant Chriſt is playing with flowers on the lap of his mother, and in the back-ground is Tobit brought by an angel; and another "Holy Family," where St. John preſents a pear to the infant Chriſt, both without the painters names, and all of folio dimenſions.

Subjects from Flemiſh Maſters.—"The Laſt Judgment," after Rubens, a fine engraving, on two large folio plates; "The Holy Virgin and Infant Chriſt ſurrounded by Angels," after the ſame painter, in large folio; "St. Francis d'Aſſiſe receiving the Infant Chriſt from the Virgin," in large folio; "Achilles diſcovered by Ulyſſes at the Court of Lycomedes," in large folio. At the time Viſſcher engraved this plate he was under the direction of Soutman. A boy lighting his candle from that of a woman with a baſket, in large quarto; all from Rubens. A man playing the violin, accompanied by five children, from Van Oſtade, a very fine engraving, of which it is very difficult to find a good impreſſion. An etching of the ſame ſubject, marked "A. Van Oſtade pinx. C. Viſſcher fecit. aqua forti." The interior of a ſmoking-room, with ſix men, a woman, and two children; all in large folio. The beſt impreſſions of this plate are before the names of Viſſcher and Oſtade were inſerted. A ſmoking-room, with two men and a woman drinking; a man and woman in a public houſe, on whoſe faces drunkenneſs and vulgarity are depicted moſt admirably; both from Oſtade. A party of five men in an alehouſe, one of whom plays the violin, whilſt the others ſing, from Ad. Brouwer, both in folio. A ſurgeon performing an operation on a man's foot, in folio; from the ſame maſter. Three very fine prints, after P. van Laer; *viz.* 1. The piſtol-ſhot, or the coach robbed; in folio. 2. An attack on a convoy. 3. The lime-kiln; both the laſt in large folio. A party of hunters on horſeback, with hounds, &c. from P. de Laer; and its companion, a man ſeated on the banks of a river, in which women are waſhing. A landſcape with a moonlight effect, which expoſes two robbers making off with their booty, after having knocked down a man; and its companion, a rural ſubject of a man and woman tending ſheep, both in large folio, from de Laer; and two ſets of four folio plates, each after Berghem, of which the ſubjects are landſcapes, adorned with ruins and ruſtic figures.

The merits of John Viſſcher, as an engraver of landſcape, cattle, and ruſtic figures, were not leſs original and extraordinary than thoſe of his brother Cornelius. He was born at Amſterdam in the year 1636, and has been ſpoken of as a painter as well as an engraver. His pictures we have not ſeen, and his engravings alone are ſufficient to entitle him to the fame he ſo juſtly enjoys.

With artiſt-like regard to the demands of the claſs of ſubjects which chiefly engaged his abilities, a much larger portion of his engravings is performed with the etching-point than in thoſe of Cornelius, which inſtrument he handled with the utmoſt freedom and pictureſque playfulneſs. Berghem, of whom we ſhall preſently ſpeak, and of whom we have treated in vol. iv. was a paſtoral painter, and no man to this hour has tranſlated the poetry of Berghem's painting, with more ſucceſs than John Viſſcher, unleſs Laurent, an Engliſh engraver, who died young at Paris, might be excepted.

Trees, eſpecially thoſe of thorny-charactered foliage, ſuch as Berghem painted; broken ground; the rough hides of cattle, in all their wild varieties; moſſy rocks, and the crumbling ſurfaces of ruined edifices, he treated with ſingular feeling and felicity, blending a painter's and almoſt a naturaliſt's knowledge of the details of the forms of ſuch objects, with an engraver's taſte and manual power of execution. Shallow brooks, in which, diſturbed by fording cattle, the ſunſhine glitters, as long as prints can be preſerved, will continue to ſparkle with the merits of Viſſcher, while his deeper ſtreams and lakes reflect the meridian glow of his reputation.

Middiman, as well as many other modern engravers, appear to have formed their ſtyles of etching graſſy ground, and rocks patched with lichens, from contemplating the prints of this maſter, and no man better than he imparted truth of character and animal expreſſion to cows, horſes, aſſes, goats, ſheep, and all the various tribes of domeſtic animals which his great maſter Berghem delighted to paint, and therefore painted ſo well; or diſplayed on paper with a readier hand the ruſticities of Oſtade.

The portraits of John Viſſcher, with which we ſhall commence our liſt of his ſuperior performances, ſhew that he occaſionally handled the graver with ſcarcely leſs freedom and taſte than the etching-needle.

Portraits.—John de Vitenbogaert, from a drawing by Viſſcher himſelf, in quarto; Peter Proclius, a miniſter of Amſterdam, after Van Noort; Thadeus Lautman, paſtor of La Haye, after J. de Bane, both in folio; Abraham vonder Hulſt, vice-admiral of Holland, in large folio; Petrus Paulus Rubens, an etching from Vandyke; Michael de Ruyter, admiral of Holland, H. Berckmans pinx.; both in folio; a man with his hair dreſſed, after C. Viſſcher, in quarto; and a negro ſhooting an arrow from a bow, after the ſame maſter, in folio.

After Oſtade.—A company of peaſants under a trellis-work, gaming; “Ruſtic Economy,” where a man is winding off cotton, and his wife ſpinning it; “A ruſtic Party,” compoſed of two ſmokers, and an old woman and child; “Peaſants rejoicing;” “A Skirmiſh before the Door of a Tavern;” “A Peaſant's Wedding,” inſide of an alehouſe; and a drunken peaſant putting his hand on the boſom of a woman, all of folio dimenſions.

After Berghem.—Several peaſants dancing in a cottage, commonly called “The Ball,” in large folio; a beautiful landſcape, ornamented with figures and animals, and its companion, a mountainous landſcape, with a man and horſe travelling; “Summer,” in large folio; a landſcape, with a man clad in goat's-ſkin, on horſeback, in folio; and its companion, a girl milking a goat, in a landſcape; a pair of paſtoral ſubjects, in one of which is a ſhepherd meditating, in the other a woman milking a goat, and a piping ſhepherd. The four parts of the day, Aurora, Meridies, Veſper, and Nox, beautiful landſcapes, in large folio. A ſet of four large folio etchings of landſcapes, in which the figures introduced are; 1. A man on a mule. 2. A woman. 3. A ſhepherd guiding his flock. And 4. A mule loaded with pea-hens. A ſet of ſix landſcapes; 1. Men ſhoeing an aſs. 2. Two women and a dog, one of whom is carrying a ſack. 3. A ſhepherd on an aſs, driving his ſheep. 4. A woman carrying faggots, and a peaſant on horſeback. 5. A peaſant on an aſs leading a cow. 6. An old man with a beard, ſitting againſt a wall, in folio. A ſet of four, the title-page of which is a monument or tomb. 2. A ſhepherd playing the bag-pipes. 3. A ſhepherd and his dog fording a brook. And, 4. A boy carrying faggots; in folio. Another ſet of landſcapes, of which the title-page is a fountain or watering-place for cattle, with a woman milking a goat. 2. A ſhepherd wrapped in his cloak, with a ſtick. 3. A ſhepherd ſeated on a hillock, and another in paſtoral converſation. 4. A woman on an aſs, and a girl ſtanding beſide her; all in folio. Four other ſets, of various numbers, of landſcapes, with ſimilar ruſtic figures introduced; all of folio dimenſions. And the ornamental decorations of various geographical charts, for which Berghem ſupplied the deſigns.

From other painters of cottage ſcenery, he engraved a ſet of eight prints of figures and animals, after H. du Jardin; a ſet of four large folio prints, after P. de Laer, which have been attributed by ſome to Cornelius Viſſcher, though with better foundation, by others to John. They conſiſt of 1. A party of beggars playing at cards, ſurrounded by a crowd of ſpectators. 2. A woman on horſeback guiding cows, near whom is a man who has diſmounted to drink out of his hat. 3. An hoſtler buſied at an inn-door; near which is a ſtable with horſes feeding. 4. A forge, with a man ſhoeing a horſe, and others converſing.

After P. Wouvermans.—A victualling tent, and horſemen ſtopping to drink; another victualling-tent, with men carouſing; horſemen diverting themſelves before their tents, and, as uſual in the compoſitions of Wouvermans, a white horſe with trappings; all in large folio. A ſet of four in folio, of 1. The marſhalling of an army, with a horſe on the fore-ground. 2. A victualling tent. 3. A party of travellers. 4. A riding-ſchool.

A ſet of twelve after G. van Goyen, of landſcapes and ſea-pieces, enriched with various buildings and figures, in quarto; and another ſet of twelve wild landſcapes, and marine ſubjects in Italy, after Herman Swaneveldt, which are very intereſting, and adorned with figures; muſt conclude our liſt of the works of this meritorious artiſt.

Lambert Viſſcher, the brother of Cornelius and John, was born at Amſterdam in the year 1634, and died at Rome, whither he had travelled for improvement or employ, and where he engraved in conjunction with Bloemaert, Spierre, and others, from the pictures of Pietro da Cortona, in the palace of Pitti, at Florence. He engraved both portrait and hiſtory, working with the graver alone, but did not poſſeſs any very great ſhare of merit. The following are a ſelection of the beſt of his productions.

Portraits.—Staniſlaus Lubienitz, M. Scheitz pinx.; John Rutgerſius, counſellor of Guſtavus Adolphus, both of quarto ſize; Chriſtopher de Kannenberg, privy counſellor to the elector Frederic William of Brandenburg; Maria Thereſa of Auſtria, queen of France, from Van Loo; all in folio. Charles Rabenhaupt, baron of Sucha, and lieutenant-general of Holland; John de Wit, the diſtinguiſhed penſionary and patriot of Holland; and Cornelius Tromp, vice-admiral of Holland, F. Bol pinx.; all of large folio dimenſions.

Hiſtorical, &c.—“The Generoſity of Seleucus to Antiochus,” from P. da Cortona; and “Virtue delivering a young Man from the Embraces of Voluptuouſneſs,” in large folio, from the ſame painter.

Nicholas John Viſſcher was of the ſame family as the preceding artiſts, and born at Amſterdam ſome time about the year 1580. We have by him a conſiderable number of etchings, executed in a free agreeable ſtyle; he particularly ſucceeded in ſmall landſcapes, with figures and animals. He likewiſe engraved a few portraits, which he marked with his name at length, or ſometimes with a monogram, compoſed of C. and V. for Claus or Claas, being the Dutch abbreviation of Nicholas, and which will be found in *Plate* III. of thoſe uſed by the engravers of the Low Countries.

The following of his engravings are moſt worthy the attention of the collector. William Laud, Archbiſhop of Canterbury; Charles I. of England, in a large round hat, both in 4to.; John Calvin, in folio; Didier Eraſmus of Rotterdam, from Hans Holbein; James II. of England, and James, duke of Monmouth and Buccleugh, both in large folio.

Etchings.—"The Table of Cebes," an allegorical ſubject on human life, in large folio; "The Execution of the State Criminals, of the Sect of Arminians, at the Hague," in folio; two landſcapes with Dutch caſtles, in large folio; and a view of the caſtle and environs of Lovenſteyn, which was uſed as a priſon. At the bottom of the print is a perſpective view of the caſtle in the form of a frieze; and on each ſide a medallion. This is a folio print, very rare, and beautifully executed.

Peter Nolpe was born at the Hague, A. D. 1601. The circumſtances of his life are rather obſcure, but his works prove him to have been a man of talent. He is ſpoken of as a painter; but apparently his engravings are far more numerous than his pictures. He worked with the point and graver, and generally united them; but ſome of his plates are executed with the graver only, which inſtrument he handled with much more facility than taſte. He engraved portrait, hiſtory, and landſcape, but excelled moſt in the latter, for he was but imperfectly maſter of the human form, whereas his landſcapes poſſeſs a certain air of boldneſs and freedom, which manifeſt a practiſed hand, though not a mind of profound information.

The moſt valuable of his works are the portraits of John Adler Salvius, a miniſter plenipotentiary to the court of Sweden, in 4to. A ſet of eight horſemen, in 8vo.; very rare etchings. A ſet of eighteen etchings of beggars, in 4to. after Quaſt, of whom we ſhall ſpeak anon, and treated in his manner. "The Angel delivering St. Peter from Priſon," after J. V. Vucht, in folio; "Judah and Tamar," in a landſcape of large folio ſize. The ſame figures he afterwards introduced into a landſcape of a much ſmaller ſcale. "An Inundation," occaſioned by the burſting of a water-bank. This is a very ſcarce print, executed with much force. "Daniel in the Lion's Den," after Blanchard; "The Voyage of his Majeſty, the King of Great Britain, to the Coaſts of Holland." An emblematical print on the marriage of the prince of Orange, with the princeſs Mary of England. A ſet of ſix landſcapes, after Van Nieulant. Six ditto, which are eſteemed beautiful, after Rogman, all in folio. The remainder are of larger folio dimenſions. A view of the guard-houſe at Amſtel, near Amſterdam; eight of the months of the year, which are very beautiful, with fine effects. A ſet of the four ſeaſons; another of the four elements, from Peter Potter; "The Prophet Elias, with the Widow of Sarepta;" "St. Paul the Hermit fed in the Wilderneſs by an Eagle," both in large folio; and a very capital print, engraved on five plates, after C. Molyn the younger, of "The Cavalcade made by the Citizens of Amſterdam, on the Entrance of Mary of Medicis;" ſome of which he marked with a monogram which is copied in *Plate* III. of thoſe uſed by the artiſts of the Netherlands.

Peter Quaſt. There is a certain fanciful quaintneſs about this artiſt, of a diverting kind. The groteſque quirks of his morrice-dancing beggars are perfectly homogeneous with the twirling Q's in his various monograms, and makes us anticipate ſomething entertaining in the hiſtory of his private life, of which alas! we know nothing, but that he was born at the Hague in the year 1602, and was the intimate friend of Nolpe, whom we have juſt diſmiſſed.

He deſigned and engraved groups of peaſants, battles, beggars, and barbers' ſhops, and even in his battles there is ſomething allied to drollery. His talents, in many reſpects, were but little inferior to thoſe of Callot, with whom he was contemporary, and to whom, in the management of his tools and ſtyle of engraving, he bore a remarkable reſemblance.

The monograms of Quaſt may be ſeen in *Plate* III. of thoſe of the engravers of the Netherlands, and his principal works, are, "Fyf ſinnen te Koop," (or the five ſenſes) in octavo, dated 1638; the four ſeaſons, perſonified by groteſque figures, in quarto. A ſet of twelve plates of Capriccio and groteſque figures, in 8vo. Another ſet of Capriccio, of which the ſubjects are beggars, old women, and oddities, ſuperſcribed on the title page "Tis all vervart Gaeren:" this ſet conſiſts of twenty-ſix plates in 4to. Another ſet of ten quarto plates of beggars, with quizzical names and correſponding landſcape back-grounds; and a ſet of twelve plates in 4to. of whimſical modes and faſhions, in the taſte of the nobleſſe of Callot.

Francis Vander Steen was born at Antwerp, A. D. 1604, and having in his youth loſt the uſe of one of his legs by an accident, his parents thought of fine art as a profitable or pleaſant occupation; and if a correct judgment may be formed by his ſucceſs, moſt probably the former; for he obtained high patronage, though he poſſeſſed not much merit. The archduke Leopold aſſigned him a penſion, which was continued by Ferdinand III.

His engravings, however, of which the following are the chief, find their way into the port-folios of thoſe who collect the productions of this ſchool, either on account of their ſubjects or ſuppoſed merits.

Portraits.—Cornelius Cort, in 8vo.; Theodore Coornhaert, in 4to., both celebrated engravers; Andrea del Vaulx, or Vallenſis, profeſſor at the academy of Louvain, in 4to.; and George Sebaſtian Lubomirſki, count of Wiſniez, Herdt. del; in folio.

Hiſtorical, &c. after various Maſters.—"The Holy Family," where the infant John preſents flowers to Chriſt, from Titian; "The Holy Family," with St. Joſeph ſeated on a ſack. This ſubject is called in Italy "La Madonna del Sacco," from Andrea del Sarto, and has ſince been engraved by Bartolozzi and by Raphael Morghen. "The Dream of Michael Angelo," from Michael Angelo; "Soldiers playing at Cards," from Manfredi, all in folio; "A Man holding a Flaggon and a Cup, in company with another Man," in 4to.; "A Peaſant ſeated, reading the Newſpaper, whilſt an old Woman careſſes him with one Hand and holds a Pot of Beer in the other;" "A Village Party," of quarto ſize; "The Miſer and his Wife counting their Gold," in folio, all after Teniers; "A drunken Silenus ſupported by Satyrs and Bacchanals," from Vandyke; "A Cupid forming a Bow from the Club of Hercules," after Correggio, in folio. At the bottom of the print are two children, one of whom cries and the other laughs. "Jupiter and Io;" "The Rape of Ganymede." Theſe three engravings are very rare, from the pictures of Correggio in the gallery of Vienna, and at the ſale of Mariette's collection were ſold for two hundred and fifty livres. "The Martyrdom of eleven thouſand Virgins," engraved on four plates from the drawings of Van Hoy, after the original pictures by Albert Durer; "St. Pepin and St. Begue," half-length figures on the ſame plate, from drawings by Rubens, after the pictures by Van Eyck; and the portico of the picture gallery at Bruſſels, commonly called “The Gallery of Teniers,” from Van Hoy, all of folio ſize.

Hans or John Witdoeck, Withouc, or Witdouck, was born at Antwerp, A. D. 1604. He was among the number of artiſts who enjoyed the friendſhip and inſtructions of Rubens, and ſeems to have entirely devoted himſelf to engraving the pictures of that great maſter. Witdoeck did not well underſtand the human figure, for the naked parts are but indifferently expreſſed, the extremities are heavy, and the markings of the joints are not properly determined. Neither is the mechanical part of his engraving leſs exceptionable. It proves that he had very little command of the graver, or did not ſufficiently ſtudy that part of the art to produce a clear and agreeable effect. Notwithſtanding theſe faults, Baſſan has praiſed him, and the prints which he executed under the eye of Rubens in chiaroſcuro, poſſeſs a tolerable effect.

The following engravings from the hand of this maſter, are thoſe which are moſt worthy the notice of the collector. A pair of buſts of “Cicero” and “Demoſthenes,” in folio; “Melchizedeck preſenting Bread and Wine to Abraham and his Followers;” “A Nativity,” both in large folio, from Rubens. This latter plate underwent ſeveral alterations, chiefly to add to the effect. The firſt impreſſions are without the addreſs of Corn. Coeberch, the ſecond have the addreſs; after which the plate came into the hands of S. Bolſwert, who engraved on, and improved it very much. He effaced the name of Coeberch, and inſerted his own. “The Adoration of the Kings,” in large folio, from Rubens. This print likewiſe underwent ſeveral alterations in the effect. “The Elevation of the Croſs,” a large print lengthways, from Rubens, on three plates; “Chriſt at Table with his two Diſciples at Emmaus,” a large folio plate, nearly ſquare. There are ſome few impreſſions of this plate, with the addition of a tint from a wooden block; but theſe are very rare. “The Aſſumption of the Virgin,” a very fine and rare print, in large folio, of which thoſe impreſſions that are marked C. Van Mulen are retouched. “The Virgin and Infant Chriſt,” in an oval border; “The Holy Family,” where the Virgin is repreſented ſuckling the Infant Jeſus. The beſt impreſſions of this engraving have the addreſs of Moermans. Another “Holy Family,” here the Holy Infant is repreſented aſleep on the boſom of his mother, all of folio ſize; “St. Ildefonſe receiving a Chaſuble from the Holy Virgin,” a very fine and rare print, in large folio; “The beheading of St. Juſtus;” and “St. Cecilia,” both in large folio, and all after Rubens.

After Cornelius Schut.—“Judith and Holofernes;” “The Holy Family;” “The Virgin on a Creſcent;” “The Virgin ſeated in a Landſcape, ſurrounded by Angels;” “The Virgin and Chriſt, accompanied by St. John and Angels,” all in folio; and “St. Nicholas appearing to the Emperor Conſtantine, and delivering three Tribunes from Priſon,” in large folio.

Remoldus, or Rombaut Eynhouedts, was born at Antwerp in the year 1605, in which city he always reſided. His plates are executed with a firm dark point, and in a ſtyle which he had the art of varying and adapting to thoſe of the ſeveral painters after whom he engraved. His drawing, though not always equally correct, is very ſpirited, and his maſſes of light and ſhade very well preſerved. His principal engravings are after Rubens and Schut, but he likewiſe engraved ſome ſubjects for “The Cabinet of Teniers.”

We ſhall ſpecify the following from the hand of this artiſt: “A dead Chriſt,” after Palma the younger; “Chriſt riſing from the Tomb,” after the elder Palma; “The Adoration of the Kings,” after Rubens, very rare; “The Reſurrection of Chriſt,” from the ſame painter; “The Fathers of the Church,” and “St. Clare holding the Holy Sacrament;” all of folio ſize. “The Virgin ſeated, ſurrounded by Saints;” “The Chapel where Rubens was entombed,” in 4to.; “St. Gregory, between Prudence and Courage, leaning on a Staff;” above is a picture of the Virgin and Chriſt, and angels holding wreaths of fruit, after Rubens, in large folio. “St. Chriſtopher,” in folio, after the ſame painter; “St. Peter” and “St. Paul,” in folio; “Cambyſes, King of Perſia,” who having ordered an evil judge to be flayed alive, cauſed his ſkin to be ſpread upon the ſeat of juſtice, and placed the ſon of the culprit upon it, making him judge in his father's ſtead; a ſmall ſquare plate. “Peace and Happineſs,” Peace is crowned by Victory, and is ſupported by Power and Juſtice, accompanied by other allegorical figures, all after Rubens; “St. Ann,” in folio; “The Aſſumption of the Virgin;” and “The Martyrdom of St. George;” both in large folio, after Schut.

Peter Clouet, Clowet, or Clouvet, was born at Antwerp, A.D. 1606; he learned the elements of art in his native country, and afterwards went to Italy for improvement, where he ſtudied under Spierre and Bloemaert. He returned by way of Paris, where he remained and exerciſed his profeſſion for ſome time, but finally ſettled at Antwerp.

He worked entirely with the graver in a clear firm ſtyle, not a little reſembling that of P. Pontius. His prints are generally deficient in middle tints, and therefore in harmony, and though full of colour, and boldly engraven, from too equal a diſtribution of the ſhadows, and the lights being too much ſcattered, they loſe a great part of their effect. However, his prints, eſpecially thoſe after Rubens, are much ſought after. He exerciſed his art both on portraits and hiſtory; and the following is a ſelection of his moſt meritorious engravings:

Portraits.—Peter Aretin; Nicolas Coſſin; Thomas à Kempis; Ferdinand Cortez; Amerigo Veſpucci; and Francis de Malherbe; all of quarto ſize, and without the names of the painters. Michael Boudwyns, a phyſician of Antwerp; William Cavendiſh, duke of Newcaſtle, on horſeback, both in folio, from Diepenbeck; Chriſtopher Vander Lamen, a painter of Antwerp; Theodore Rogiers, a goldſmith of Antwerp; Charles Scribanius, a Jeſuit of Antwerp; Ann Wacke, holding a plume of feathers; and Henry Rich, count of Holland; all after Vandyke, in folio.

Hiſtorical, &c. after various Maſters.—“The Deſcent from the Croſs,” from Rubens, in large folio; “The Epitaph of Rubens,” in folio; “The Death of St. Antony,” a fine and rare print, in large folio; “St. Michael vanquiſhing the Devil,” in folio; “A Converſation between ſeveral Lovers in a Garden:” the beſt impreſſions have Flemiſh verſes beneath, but thoſe with French are likewiſe much ſought after. This converſation piece is a very fine and rare print, in large folio. A ſtanding female figure, in folio; a winterſcape, with a cottage, and the ſnow falling, belonging to a ſet of ſix, the other five of which were engraved by S. Bolſwert, all after Rubens. “The Virgin ſuckling the Infant Chriſt,” after Vandyke, in large folio; and “A Party at Table,” where the maſter and miſtreſs are crowned with laurel; “The Family of the Duke of Newcaſte,” after Diepenbeck, in folio.

Albert Clowet, or Clouet, was born at Antwerp in the year 1624. He was nephew to the preceding artiſt, and went to Italy to ſtudy under C. Bloemaert. During his reſidence at Rome he engraved a conſiderable number of plates, and among them ſeveral of the portraits for the Lives of the Painters, by Bellori, which were printed in that city, A.D. 1672. He always worked with the graver in a neat ſtyle, imitating, in his hiſtorical works, with tolerable ſucceſs, that of C. Bloemaert. His portraits are ſometimes in the ſtyle of Mellan, at others in that of F. de Poilly, and ſometimes in that of Nanteuil; though by no means equal in merit to the works of thoſe great maſters, either in drawing, effect, or mechanical execution.

Among various other *Portraits*, he has executed a collection entitled "Effigies Cardinal. nunc viventium," which were publiſhed at Rome by J. Roſſi. The following are likewiſe by him.

Nicolas Pouſſin; Antony Vandyke; the cardinal Azzolinus, from Vouet; cardinal Jacob Roſpiglioſi, from J. M. Morandi; cardinal Charles Roſetti; cardinal Francis William de Wartenberg; Maximilian, count of Wolfegg; and the medallion of pope Alexander VII. ſupported by the cardinal virtues; all of quarto dimenſions.

Hiſtorical, &c.—"St. John de la Croix," the firſt inſtitutor of the order of Carmelites; Lazaro Baldi, pinx. in large folio; "The Statue of the Happy Umiliana," after a drawing by Baldinucci; "The Sepulchral Monument of Pope Paul III." from Dom. Barriere, both in folio; "The Obeliſk placed on an Elephant, erected on the Place of Minerva," after G. L. Bernini, in large folio; "The Myſterious Conception of the Virgin," after P. Cortona, engraved on two plates, very fine and rare; "A Combat of Horſe-Soldiery," after Jac. Courtois; and a large print, engraven on four plates, of "The Battle of Joſhua," after William Courtois, brother to the preceding artiſt.

A much more extraordinary artiſt is now to be introduced to the reader's notice. Of wild, vigorous, and original powers, both as painter and engraver, Paul Rembrandt Gerretz, or Van Rhyn, gave a new impetus to art, and effected a revolution in taſte, of which the effects will long continue to be felt.

The profeſſor Fuſeli, by a grand metaphor, which ſpeaks whole pages in praiſe of the talents, powers, and influence of our artiſt, ſays, that the frantic pilgrimage of painters to Italy ceaſed at the apparition of the two meteors of art, Peter Paul Rubens and Rembrandt Van Rhyn. Both Fuſeli and the profeſſor Opie (who was too ſoon, alas! loſt to his country) have juſtly eſtimated and deſervedly praiſed the merits of Rembrandt as a *painter*, and they will doubtleſs be not leſs faithfully reported in this work, when the writer, to whoſe pen is confided our biography of painters, ſhall arrive at his name. In this place he will be treated as an engraver; yet if the preſent writer ſhould any where be thought to trench on the province of painting, let it be recollected, that of two arts ſo intimately connected as painting and engraving, and which call forth and exerciſe the ſame energies of mind, how difficult, how almoſt impoſſible it is, to write ſeparately and to write well.

Rembrandt was the ſon of Herman Gerretz, a miller of the neighbourhood of Leyden, and was born A.D. 1606, in his father's mill, which ſtood on the banks of the Rhine, between the villages of Leyerdorp and Koukerk. A ſpot which became intereſting from being the birth-place of ſo great an artiſt as Rembrandt, became doubly intereſting when brought to our view by the magic of his pencil. A picture of this mill, which was once in the Choiſeuil Collection, is now in the gallery of William Smith, eſq. M.P. for Norwich. It repreſents a very early hour of morning, and perhaps the figures which are introduced may have other local alluſions, of which the meaning is now loſt, to the time and circumſtance of his birth.

Finding that he poſſeſſed an enquiring and capacious mind, Herman ſent young Rembrandt to the college at Leyden, where his reigning paſſion for fine art, and his diſinclination for all other ſtudies, were ſoon manifeſt. Other maſters were accordingly provided to inſtruct him in the elementary principles of art; and Rembrandt ſtudied ſucceſſively under Van Scootens, Peter Laſtmann (an engraver of whom we have already treated), James Penas, and James Van Zwanenbourg.

How a man of ſo great genius came to ſeek inſtruction from ſo many maſters, it were difficult to ſay, and ſtill more difficult to think that they did not encumber his progreſs; but, perhaps, to the variety of their advice, we may in part owe the originality of Rembrandt. He did not, probably, remain long enough under the direction of any one of them, to trammel his habits, or overwhelm or ſtultify thoſe feelings and perceptions of nature, which are the genuine and free inlets to lofty and original attainments in art.

Hence Rembrandt has been compared to Shakeſpeare; and hence, like another wild poet whom "*Leyden* aids no more, with many-languaged lore," and who voluntarily

"——— leaves the lofty Latian ſtrain,
Her ſtately proſe, her verſe's charms,
To hear the claſh of ruſty arms;"

he allowed that the ancients were "pretty fellows in their day," but would point with ſarcaſtic air to the walls of his ſtudy, which were hung round with ſuits of armour, rich ſtuffs, and the pictureſque dreſſes of various ages and nations, and ſay "theſe are *my* antiques."

Both Rembrandt and his wife have been accuſed of an over-weening fondneſs for money. She ſold his engravings that he might not be interrupted in his profeſſional purſuits; and underſtanding the "tricks" of printſellers, was too much of a "traveller" to allow herſelf to be impoſed upon by them. It is ſaid that a conſiderable fortune was thus acquired, which devolved to an only ſon, Titus, to whom nature was as niggardly in her gifts, as ſhe had been prodigal to the father. The mean propenſities of Titus have been mentioned, and his inability to avail himſelf of his father's inſtructions in art; but the amount of his fortune has never been ſtated, and has probably, by unreflecting readers, been much over-eſtimated.

One of the moſt valuable paragraphs in Strutt's Dictionary of Engravers, is that which he has written on the prints of Rembrandt; becauſe while it deſcribes their merits with the fellow feeling of an engraver, it marks the difference, which cannot be too ſtrongly marked, or too often repeated in the public ear, between mere rarity and intrinſic worth; the want of which diſcrimination, more, perhaps, than any other cauſe, has been the bane of engraving; retarding its progreſs, by keeping us too intent upon nominal and extrinſic value, and too regardleſs of thoſe intrinſic qualities, which, as men of taſte, ſhould alone engage our attention.

He ſays, "His prints, which are partly etchings, and partly engravings, performed with the graver in a ſingular manner, have all that freedom of touch, ſpirit, and greatneſs of effect, diſcoverable in his paintings, ſuppoſing them to be aſſiſted by the variety of colours. Conſidering the great quantity of etchings he made, we cannot ſuppoſe they ſhould be all equally well executed, or equal in value. However, (according to the common courſe of things, on which an imaginary value may be raiſed by accidental cauſes,) they are not always his beſt prints which produce the greateſt prices; but thoſe that are the ſcarceſt. Thus we frequently ſee a print of great intrinſic worth in itſelf, if conſidered as a beautiful ſpecimen of the abilities of an artiſt, thrown aſide for no other fault than that of being too eaſily obtained; whilſt another, which perhaps is rather a diſgrace than an honour to him, is purchaſed at an extravagant price, and anxiouſly preſerved becauſe it is unique. It is merely owing to this caprice, that ſo many trifling alterations in the prints of Rembrandt, rather than a proper examination of their real merit, increaſe or diminiſh the worth of the ſame print. I myſelf, commiſſioned by an eminent collector, gave ſix-and-forty guineas for the great Coppenol, with the white back-ground, that is, before it was finiſhed; when, the ſame evening, at the ſame ſale, I bought a moſt beautiful impreſſion of the ſame print finiſhed, diſtinguiſhed by having a black back-ground, &c. which had an addreſs to Rembrandt at the bottom, written by Coppenol himſelf (for he was a writing-maſter of Amſterdam, and this print is his portrait,) for fourteen guineas and a half. In the ſecond inſtance, I exceeded my commiſſion by the half guinea; in the firſt, I did not reach it by nearly twice ten guineas. It cannot be reaſonably ſuppoſed, that ſuch a difference could exiſt between two good impreſſions of the ſame plate; and, ſpeaking as an artiſt, I ſhould certainly have taken the laſt in preference to the firſt."

The "ſingular" manner of which Strutt ſpeaks, appears to have been ſhrewdly gueſſed at by Watelet and Bartſch, who ſay, that "it would be difficult to diſcover the way in which Rembrandt worked: he certainly made great uſe of the dry point, which he ſometimes ſcraped but ſlightly, and the burr partially ſtopping up, or blending with the lines, reſembled a waſh," yet poſſeſſed more warmth and richneſs. The dry point which Rembrandt uſed was either, as Strutt has ſuppoſed, the point of a graver, or it was ſuch a dry point, as has ſince, in our own country, been much uſed by Worlidge, namely, cylindrical ſteel wire, whetted to a triangular point.

But the great wonder of his art, as an engraver, is his chiaroſcuro. He ſeems to have been born to ſhew us how much intereſt could be excited in a print without drawing, or any attempt at rendering local colour in the abſtract, by mere dint of compoſition and chiaroſcuro, and chiefly of the latter. Or, more ſtrictly ſpeaking, to ſhew us with how little drawing, and how entirely without the refinement of ſelection, in regard to forms, a powerful chiaroſcuro may be kept together, and brought to operate on our imagination and judgment.

In the diſpoſition of his lines, he ſeems to have been guided by no principle, but the ſpontaneous feeling of the moment; yet a certain tact of mind always attended him, and imparted ſtyle to his works.

It was probably from this ſpontaneouſneſs of feeling, which in his prints ſtands inſtead of ſtudy, that we ſee ſo many variations in ſome of his plates; which appear to have been ſuddenly thought of, and promptly executed from time to time, juſt as his muſe inſpired. At leaſt, this is a more artiſt-like, as well as natural ſuppoſition, than that his own avarice, or that of his wife, prompted theſe alterations (which have become ſo great objects of connoiſſeurſhip) with the ſole view of obtaining the money which the additional ſale produced. What man who maintains the contrary opinion, has proved that Rembrandt altered his plates for the worſe? Yet this is abſolutely neceſſary to the ſupport of the mercenary ſide of the argument.

The genius of Rembrandt was univerſal, and whatever the ſubject of his engravings, whether hiſtory, landſcape, or portrait, all are marked by the ſame energetic truth; the ſame wild graces; the ſame forceful chiaroſcuro. He painted and engraved what he ſaw, and did not attempt to generaliſe his objects by any proceſs of abſtraction, or accommodate or qualify them, by what he might ſuppoſe others had imagined. The learned precepts of his predeceſſors, ſuch as that art ſhould render men as they ought to be, not as they are, were diſregarded or deſpiſed by Rembrandt, and ſo ſtrong is the internal evidence of his works, or ſo perſuaſive his powers, that no ſpectator can entertain a doubt that his portraits, whether of perſons or places, are tranſcripts of Nature, executed under a firm conviction that where ſhe was pictureſque, according to his view of the capabilities of art, ſhe was as ſhe ought to be.

The prints of this maſter are dated from the year 1628 to 1659: their number, when added to that of his pictures, is ſurpriſing, and atteſts at once his profeſſional diligence, and the rapidity of his powers. Mariette poſſeſſed three hundred and ſeventy-five ſubjects: Yever, of Amſterdam, and Gerſaint of Paris, in a deſcriptive catalogue which he formed, have enumerated more, and Mr. Daulby, of Liverpool, as the preſent writer has been informed, more ſtill: ſo that their preciſe number is probably not known. It is ſcarcely neceſſary to add that no engravings, in their rare ſtages, or fine impreſſions, have been ſought after with more avidity.

Of himſelf, Rembrandt has engraved no fewer than twenty-ſeven portraits, to diſtinguiſh which from each other, by means of words alone, might not be eaſy. One holds a pencil, and is more carefully finiſhed than the reſt: another is in a ſort of Perſian habit, with an oval border; in another, his wife alſo is introduced, and moſt of them are of quarto dimenſions.

From the reſt of his works, the following may be ſelected with advantage.

Subjects from the Old Teſtament.—"Adam and Eve in the terreſtrial Paradiſe," rare; "Abraham ſending away Hagar and Iſhmael;" "Abraham and Iſaac," arched at the top, all in quarto; "Joſeph recounting his Dreams to his Father, in the Preſence of his Brethren;" "Jacob mourning for the Loſs of Joſeph;" "Joſeph ſolicited by the Wife of Potiphar," in octavo; "Mordecai conducted in Triumph by Haman;" and "The Angel Raphael diſappearing before Tobit and his Family," both in large quarto.

Subjects from the New Teſtament.—"The Annunciation of the Shepherds," with a very myſterious ſentiment and powerful chiaroſcuro, in folio; "The Adoration of the Shepherds," in large quarto; "The Circumciſion of Chriſt," with an extraordinary good effect; "The Preſentation in the Temple;" "The Flight into Egypt," both in 12mo.; another "Flight into Egypt," executed in his more ſcratchy ſtyle, in quarto; another "Flight into Egypt," in the ſtyle of Elſhiemer, in folio, a very much eſteemed print; "The Holy Family," where the Virgin is repreſented ſeated in an eaſy chair, and ſhe and the Infant appear aſleep; "Jeſus preaching to the Multitude," all in quarto; "Cæſar's Tribute Money," in 12mo.; "Chriſt turning the Money-Changers out of the Temple;" "Chriſt and the Woman of Samaria," a circular print; another of "Chriſt and the Woman of Samaria," in quarto, a very fine brilliant-toned engraving; "The Reſurrection of Lazarus," a circular print, with a powerful effect, in large folio; "The Reſurrection of Lazarus," a ſmaller print than the former; "Chriſt healing the Sick," a famous print, known by the name of "The hundred Florins;" an "Ecce Homo," a very grand compoſition, and a very capital engraving; "Chriſt taken from the Croſs," attended by the Magdalen and the Holy Virgin, (a companion

companion to the former print;) “Jeſus Chriſt preſented to the People by the High Prieſt;” and its companion, “The Crucifixion of our Saviour,” all of large folio ſize; (there are many impreſſions of this engraving, with various alterations:) “The Entombing of Chriſt,” in quarto; “Chriſt with his two Diſciples at Emmaus,” in folio; engraved with broader ſtrokes than is common in his prints; “The Good Samaritan arriving at the Inn with the wounded Man;” a very fine engraving, in folio, “Saints Peter and John healing the paralytic Man;” “St. Philip baptiſing the Eunuch of Queen Candace;” and “The Death of the Virgin,” a very fine forcible engraving, both of folio ſize.

Pious Subjects.—“St. Stephen ſtoned;” “St. Jerome,” engraved when Rembrandt was in his meridian; “St. Jerome at Devotion,” all in octavo; “St. Jerome writing,” with ſpectacles on, in quarto; “St. Jerome,” an unfiniſhed plate, the compoſition of which is rich, and the finiſhed part admirable; “St. Francis at Devotion:” great part of this plate is unfiniſhed, and the prints are very rare.

Hiſtorical and Allegorical Subjects.—“The Hour of Death,” an allegory on the vanities of the world; “Youth ſurpriſed by the Arrival of Death,” repreſented by a young man and girl walking together, and a figure of death ſtarting on them; “Medea, or the Marriage of Jaſon and Creuſa,” repreſenting the interior of a temple and the ſtatue of Juno, a very careful engraving, in folio; “The Star of the Kings,” a ceremony uſed in Holland on certain nights, during which a lanthorn is faſtened to the end of a long ſtick. The print is in quarto, and has a ſtriking effect of night. A pair of “Lion Hunting.” A chace of lions, in one of which a Turk is combating a lion, and another hunter is overthrown; “The Wandering Muſicians,” commonly called “The Blind;” it repreſents an old man and boy playing the bagpipes. “The little Spaniſh Gipſey,” repreſenting an old woman in a wood, converſing with a young perſon of diſtinction; “The Rat-Catcher,” repreſenting an old man with a ſtick, accompanied by a boy with rats in a trap, all in quarto; “The little Goldſmith,” a man occupied in forming a ſmall figure of Charity, in 12mo. with a very fine tone; “The Pancake Maker,” an old woman frying pancakes, ſurrounded with children, one of whom is crying at a dog, in octavo, engraved in a very delicate ſtyle; “The Jew's Synagogue,” repreſenting two doctors of the law converſing; in the back-ground is a ſynagogue. “The Nail Cutter,” a young woman ſeated, and an old woman on the ground cutting her toe-nails, a very rare print; “The Schoolmaſter,” in octavo; “The Quack Doctor,” taking drugs from a baſket, in 12mo., a very ſparkling engraving; “The Peaſant, with his Wife and Child,” an unfiniſhed print; “The Jew with the Large Hat,” leaning on a ſtick, engraved in a free, but deciſive manner; “The Onion Woman,” repreſenting a miſerable old woman, with her feet on a chaffing-diſh, anxious to ſell a rope of onions, all in octavo; “The Aſtrologer,” an old man in a profound ſleep, ſitting at a table with a candle, a globe, and books: in his right-hand he holds a pen, and his ſpectacles in the other; a quarto plate, with a very fine effect. “The Philoſopher” in his apartment, contemplating a globe by candle light, has a very brilliant effect, in 12mo.; “A Man meditating,” ſeated at a table, above which a lamp is fixed againſt the wall, which throws a glimmering light on all around, in quarto; “The Perſian,” a man in a hat and feathers, with a cloak on, in octavo, engraved in a very delicate ſtyle; “The Skaiter,” a man ſkaiting with a bundle acroſs his ſhoulder, in octavo, a very free, delicate engraving, rare.

Beggars.—A beggar in rags, leaning on a ſtick; the profile of a beggar, in the ſtyle of thoſe of Callot; another in the ſame ſtyle; an old beggar woman ſoliciting charity. Lazarus Klap, a dumb beggar, ſeated on the ground, with his ſtick between his legs, in 8vo.: this is engraved in a broad ſtyle, and is very rare; a beggar ſeated on the ground, covered with rags, in his countenance is pictured extreme miſery; beggars at the door of a houſe receiving charity: the group is compoſed of an old man, a young woman with an infant at her back, and another child, in 4to. This print is the moſt intereſting, and the beſt executed of the whole ſet.

Various Figures, academical, &c.—A young man and female in bed, ſurrounded with curtains, very rare; a ſhepherdeſs ſeated at the foot of a rock, making a garland of flowers, and a young ſhepherd lying near her, playing the flute, in 4to., a very rare engraving; “The Draughtſman,” repreſenting a man drawing from a caſt of a female, ſurrounded with other models: this print in Holland is known by the name of “The Statue of Pygmalion;” and if it had been finiſhed as well as it was begun, would have been very fine, in folio; “The Bath,” repreſenting figures bathing, in 4to.; “The Woman and the frying Pan,” in folio; “Venus at the Bath.” It has been remarked, that Rembrandt was not very happy in drawing naked figures; but here he has given his Venus the character of a goddeſs, in large 4to.

Landſcapes.—A ſmall landſcape, engraved with great freedom, of trees and a houſe; “The Bridge of Six,” with figures on it, in folio; a view of Amſterdam, a very good engraving; a landſcape, with a village and ſpire, on the fore-ground of which is introduced a hunter with two hounds, very rare, in folio; a very rich and celebrated landſcape, known by the name of “The three Trees,” with the effect of rain, in folio; a very highly finiſhed landſcape, into which is introduced a girl with pails, and a dog; a landſcape, with wood, water, and buildings: this engraving is very rare and ſingular, being waſhed with Indian ink, which gives it the appearance of a drawing. A pair of landſcapes, one with a coach in it, with a view of a city and two windmills; the other is a mountain ſcene, with wood and water, in 4to., in the form of friezes, both waſhed with Indian ink; a landſcape, arched at the top, of a village, with peaſants before a cottage in the fore-ground: it has a very grand effect. Another village ſcene, arched at the top, with a ſquare tower introduced, and two ſmall figures ſeated on the ground; a landſcape, with two cottages, and animals feeding on a meadow; on the fore-ground a figure is introduced drawing: this engraving is known by the name of “The Landſcape Painter.” A landſcape, executed with the dry point, called “The Cluſter of Trees,” among which is introduced a ſoldier's hut; a landſcape, arched at the top, known by the name of “The Hay Stack,” towards the right is a village and wood, and a flock of ſheep guided by a ſhepherd, all in 4to.; a large landſcape of an oblong form, repreſenting a cottage with a ſtream running before it, over which is a wooden bridge, and a country girl croſſing it: in the back-ground is a town, and a river, which winds to the fore-ground, where a man is introduced angling, with a child beſide him; its companion is a landſcape of the ſame ſize and form, of a canal and a large tree, by the ſide of which a cottage is repreſented with two children at the door: in the back-ground is a village and a windmill. “The Obeliſk,” a very well finiſhed landſcape, of a circular form, of an obeliſk and a village, with water, in 4to.; “The Windmill, or Birth-place of Rembrandt,” with his father's houſe; a view of the champaign of the receiver Utenbogaerd: towards the right hand of the print is a canal, with buildings, and two villages in the back-ground, both in large 4to.

Portraits of Men.—An old man, with a long grey beard, a very fine portrait, though left unfiniſhed at the death of Rembrandt. G. F. Schmidt purchaſed the plate and finiſhed it. A man with a chain and croſs, in the act of writing; John Antonides vander Linden, profeſſor and doctor of medicine at the univerſity of Leyden, in his robes of ceremony, a very fine portrait; James Silvius, clergyman of Amſterdam, in robes trimmed with fur, ſeated at a table, all in 4to.; a young man ſeated, meditating: he has on a robe trimmed with fur, in 8vo.; the Jew Manaſſeh Ben Iſrael, a commentator on many of the viſions of the prophets: he is repreſented with a pointed beard, and a hat with a large round border. Doctor Fauſtus, (whom Gerſaint calls Fautricus,) a profile, down to the waiſt, is dreſſed in a robe, and wears a white hat: he is in the act of examining magical characters, a very rare portrait. Renier Anſloo, an anabaptiſt, ſeated before a table, writing, with a hat on: his gown is bordered with fur. This is the moſt finiſhed and the fineſt portrait we have from the point of Rembrandt. Clement de Jonge, a print-ſeller, ſeated in an eaſy chair, with a hat on, and his hair plaited: this plate is arched at the top. Abraham France, an amateur of engravings, ſeated at a table, examining a print; the elder Haring, with a leathern cap on; the younger Haring, ſon of the preceding, ſeated; John Lutma, a famous goldſmith of Groningen, one of the fineſt portraits of Rembrandt: he holds in his hand a little figure of metal, all in 4to. John Aſſelin, a painter of Antwerp, known in Holland by the name of "Crabbetje," or little John: it is a half-length portrait, with long hair, and a hat on: before him is a table, with a palette and books, in folio. Ephraim Bonus, a Jewiſh phyſician, with a hat on, in the act of deſcending a ſtair-caſe This is one of the beſt of Rembrandt's portraits, all in 4to. Utenbogardus, a miniſter of Holland, in an oval, on an octagon plate: he is ſeated at a table, with an open book before him, and has on his head a leathern cap, in folio. John Cornelius Silvius, in an oval, around which is inſcribed "Spes mea Chriſtus. Johannes Cornely Sylvius. Amſtelodamo bat. functus S. S. Miniſt. aos 45 et 6 menſes. In Friſia, in Tyemarum et Phirugum aos 4," &c. Utenbogaerd, the banker and receiver of the ſtates of Holland, commonly called "the gold-weigher;" the little Coppenol, the Dutch writing-maſter; the great Coppenol, both very rare prints, all in folio; the lawyer Tolling, a very fine and rare portrait: he is repreſented ſeated at a table with books, in large 4to. The burgomaſter, John Six: this celebrated portrait is very rare, and ſold at Mr. Groſſe's ſale, ſome years ſince, for five-and-thirty guineas. It is ſaid, there is an impreſſion of this plate without the names of the burgomaſter or Rembrandt, in folio.

Ideal Heads of Men.—An eaſtern figure, with a little cap on, and ſhort hair, covered with a fur gown; a profile, with a turban on; an eaſtern figure, with a long beard, in a turban, very rare. Theſe are all marked "Rembrandt Venetiis, 1635:" and it is ſaid that he ſo marked them, to make the amateurs believe that he had been at Venice. Buſt of a man with a ſhort curly beard, in a black gown; buſt of an old man, with a long beard, whoſe head is reclining as if he ſlept; an old man, with a long grey beard, and very little hair on his head, habited in a long robe, in 8vo.; a young man, half-length, in profile; buſt of an old man, with a ſquare cut beard, with a velvet cap on; a man, with muſtachios, half-length, with a hat on, and a gown trimmed with fur; a half-length portrait of a man ſeated, at an eaſel painting, inſcribed "W. Droſt," moſt probably the portrait of Rembrandt's pupil, Droſt, very rare; the buſt of a young man, with long hair, engraved on a white ground, ſuppoſed to be Titus, the ſon of Rembrandt, in 4to., rare; a half-length profile of a man, with the phyſiognomy of a negroe, with a turban on, in 4to.; a philoſopher, with a ſable, a long ſquare bearded head, with a fur cap on.

Female Portraits.—A three-quarter view of a young Jeweſs, ſeated, in folio; the little Jeweſs, newly married, three-quarter, with long hair hanging on her ſhoulders; two portraits of old women, in black veils, very highly finiſhed, in 4to.; "The Reader," a young woman ſeated at a table, reading, a very good engraving; and its companion, an old woman, reading, in 4to.; a half-length profile of a lady with her hair dreſſed with beads, in 8vo.; an old woman, with her hair dreſſed in the eaſtern ſtyle, ſeated. It is engraved in ſo delicate a ſtyle, that a clear impreſſion is ſeldom met with. A buſt of the mother of Rembrandt, with her hair dreſſed, in a black veil; an old woman aſleep, reſting her head on her hand, dreſſed in a turban; buſt of an old woman, three-quarters, in a black veil, engraved in a broad ſtyle, in 12mo., very rare; the profile of a young girl in a hat: ſhe holds a baſket acroſs one arm, and a purſe in the other hand. A nearly profile head, in a veil turned up, and a feather, in 8vo.; an old woman with ſpectacles, a half-length profile, reading, a very ſpirited engraving, and very rare.

Studies and Sketches, &c.—Several ſtudies engraved on the ſame plate, among others we diſcover a head of Rembrandt himſelf; a clump of buſhes, ſurrounded with a wall, a horſe, and ſeveral heads, very rare; ſtudy of ſix heads, among which is the wife of Rembrandt; ditto of five heads of men; ditto of three female heads, a very ſpirited engraving; a plate of ſtudies of various heads and figures; ſet of ditto, among which we diſtinguiſh the head of Rembrandt, with other figures: this is very freely engraven, and is one of the rareſt of the ſtudies of Rembrandt. A very taſteful unfiniſhed engraving of various objects, and a tree, very indefinite, in 12mo.; profiles of three old men's heads, in 8vo. All the preceding are of quarto ſize.

Doubtful Subjects.—"King David kneeling, at Devotion, crowned;" "A Repoſe during the Flight into Egypt," with the effect of night; the Holy Family are ſeated on a bank at the foot of a tree, to which is faſtened a lanthorn, which caſts a glimmering light over the whole ſcene, in octavo. "Jeſus Chriſt taken to Calvary," a very rich compoſition; "A Skirmiſh, or Village Fair," a very fine engraving, in a ſlight ſtyle; on the fore-ground is a rat-catcher holding a baſket on the end of a long ſtick, with rats in it. A buſt of a man, with a bandolier on his ſhoulder, with a double claſp of precious ſtones; "The Pen maker," an old man ſeated at a deſk, with ſpectacles on, mending his pen; "The young Scholar," ſeated on a ſtone at the foot of a tree writing, very rare; buſt of an old man laughing, with a little hat on: this is executed entirely with the dry point, and finiſhed in a very good ſtyle, all in 4to. Klaas van Ryn ſeated, with a long beard, inſcribed on the margin with his name, in 12mo.; and three dromedaries, followed by two camels, with eaſtern trappings, engraved in a free ſpirited ſtyle.

John Lievens, Livens, or Lyvyns, was born at Leyden in the year 1607. He became the pupil of George van Schooten, and afterwards of Peter Laſtman. He excelled principally in painting portraits, but likewiſe executed ſome hiſtorical pictures with great ſucceſs. In the year 1630, he came into England, where he reſided three years, and painted the portraits of Charles I., the queen, the prince of Wales, and ſeveral of the nobility. Lievens made a conſiderable number of engravings and etchings, ſomewhat in the ſtyle of Rembrandt, ſcarcely leſs pictureſque, but coarſer, and in general leſs finiſhed; but he always managed his chiaroſcuro ſo as to produce a very good effect.

Adam Bartſch informs us, that Lievens drew more correctly than Rembrandt, (which he might eaſily do,) but did not engrave in ſo pictureſque a ſtyle; thoſe plates which he meant to finiſh highly he executed with a very delicate touch, and ſometimes he uſed to hatch ſo cloſe, that the aquafortis bit his lines nearly into a blot; for inſtance, thoſe which are on the fore-ground of "The Reſurrection of Lazarus." It does not appear that this artiſt made much uſe of the dry point, but frequently uſed the graver to ſtrengthen the ſtrokes. His print of St. Jerome is ſtrongly retouched with that tool, and two of his fineſt portraits, thoſe of Daniel Heinſius, and Jacques Gouter, are wholly executed with the graver; they are in a very pictureſque ſtyle, and bear ſome reſemblance to etching. He marked his prints either with his initials, or his name, which he ſometimes ſpelled Lyvyns. The following are a ſelection of thoſe engravings by this maſter, which are moſt worthy the notice of the collector.

Portraits and Heads.—Doctor Ephraim Bonus, a half figure ſeated; Jooſt, or Juſtus Vondel, a Dutch poet; Daniel Heinſius, profeſſor of hiſtory and politics at Leyden; Jacobus Gouter, the Engliſh muſician, a half figure, with a lute, all in folio; an old man with his head ſhaved and a long beard, taken for the portrait of Conrad Leonard, an early preacher of the goſpel in Greece; the profile of an old man, with a long beard; buſt of a man with a turban on, very fine, after Rembrandt; ditto of a man, with long hair; half-length figure of a woman, with long hair; buſt of a young man, with an open robe, in the ſtyle of Rembrandt, all in quarto; ditto of a man, with a bonnet on, in the taſte of Rembrandt, in 12mo; profile of an old man, with a ſhort beard; profile of an old man, with a long and pointed beard; a half-length portrait of an old man ſeated, all in quarto; buſt of an old man, with a ſhort beard and bald head, in octavo; ditto of a Perſian, with a cap and robe; ditto of a man, with curly hair; profile of a man, with a hat on; ditto of an old man, with a little cap on; ditto of an old woman, with a veil on, in the ſtyle of Rembrandt; ditto of a young woman, with a pearl ornament on her head; profile of a woman, with her hair falling on her ſhoulders; head of a young woman, with the character of a negro, all in 12mo.; buſt of a Capuchin, with a long pointed beard, and a hat and mantle, in folio.

Hiſtorical, &c.—"The Virgin and Infant Chriſt," with St. Joſeph, and various other figures, in octavo; "The Virgin and Infant Chriſt," to whom ſhe preſents a pear; "The Reſurrection of Lazarus," a grand compoſition, in folio; "St. John the Evangeliſt ſeated at the Foot of a Tree, with a Book," in quarto; "St. Jerom ſeated in his Cell, holding a Crucifix and a Skull," in folio; "St. Francis in his Cell, meditating," in large quarto; "The Anchorite," or St. Francis, differing very little from the preceding engraving, in quarto; "St. Anthony ſeated, with a long Beard, and a Capuchin Cowl," in folio, very rare; "Mercury and Argus," in large quarto; "Jacob performing a Sacrifice;" an eaſtern figure in a cloak; buſt of a man in eaſtern attire, with a chain round his neck, in folio, both on ſhadowed grounds; buſt of a man with long curly hair falling on his ſhoulders, in large 4to.; an engraving of three trees, without any back-ground, in folio: both theſe engravings are executed on wood, but do not poſſeſs any great ſhare of merit. "Death ſtriking two Peaſants," who are repreſented gaming and quarrelling, of folio ſize.

Eraſmus Quellinus was born at Antwerp in the year 1607, and died in the ſame city, in the cloiſter to which he had retired in 1678. He ſhewed an inclination early in life for the arts, and ſtudied under Rubens: he became an hiſtorical painter of conſiderable merit, and likewiſe executed ſome landſcapes in a very maſterly ſtyle. Quellinus etched ſome plates from his own compoſitions and thoſe of Rubens, of which it may be ſufficient to ſpecify the following: Eraſmus Quellinus, which was publiſhed with an account of his life in the French language, in quarto; a folio landſcape, with a dance of ſatyrs and children, rare; "Sampſon killing the Lion," in quarto, from Rubens; and "The Holy Virgin and Child," in folio, after Rubens.

Hubert Quellinus was born at Antwerp in 1608; he was of the ſame family as the preceding artiſt, and brother to Artus Quellinus the ſculptor. Hubert engraved ſomewhat in the ſtyle of Soutman, bringing his plates very forward in the etching, and finiſhing them with the graver in a very neat pleaſing ſtyle.

He uſually marked thoſe plates which he engraved from the ſculpture of his brother with the initials of Artus, as well as his own. The following are ſelected from the works of this artiſt as being moſt worthy of attention.

A ſet of the ſtatues which his brother Artus executed in marble, for the Stadthouſe of Amſterdam, after the drawings of John Bennokel, in a folio volume. The portrait of Artus Quellinus, alſo in folio; a fulſome piece of adulation offered to Philip IV. of Spain, who is repreſented on his throne, ſurrounded by allegorical virtues, &c.; "The Judgment of Solomon;" "The Legiſlator Zaleucus redeeming the Penalty of his Son;" "The Province of Holland," perſonified and ſurrounded with emblematical figures; and a ſet of twelve plates of naval and military triumphs, and other decorative ornaments of the Stadthouſe at Amſterdam, all of folio dimenſions.

Theodore van Thulden, of Dutch anceſtry, was born at Bois-le-Duc in the year 1607; but became the diſciple of Rubens, whom he accompanied to Paris, and aſſiſted in his grand undertaking of the Luxembourg gallery.

He painted a few other pictures which are deſervedly held in eſteem, and etched a conſiderable number of plates in a firm, clear, and determined, but ſlight ſtyle.

In his praiſe as an engraver, much cannot be ſaid. His chiaroſcuro is but feeble; to expreſſion of the textures of ſubſtances, he gave little heed, and his drawing is ſo mannered, that the ſpectator of obſervation eaſily traces in his prints the ſame hand, though working after very different maſters.

He engraved the principal events in the life of St. John of Matha, in a ſet of twenty-four ſmall folio plates, from pictures with which he adorned the church of the Mathurins at Paris; "The Hiſtory of Ulyſſes," on fifty-eight ſmall plates, from the pictures of Primaticcio at Fontainbleau; "The triumphal Entry of the Infanta Ferdinand into the City of Antwerp," on eight folio plates, after Rubens; a ſet of ſix ſmaller plates, from the parable of "The Prodigal Son," after the ſame maſter, beſide other works of inferior importance.

Janus, or John Lutma, was a goldſmith of Amſterdam, who diſtinguiſhed himſelf by the invention of a new mode of art, which had its day of novelty, and was for a time popular among ſuperficial connoiſſeurs; it was termed *Opus Mallei*, being performed with a *hammer*, and ſmall pointed punches, which made an impreſſion upon the copper, and by being repeated as occaſion required, the ſhadows were formed either darker or fainter, at pleaſure. The burr, which was neceſſarily raiſed upon the ſurface of the copper by ſuch an operation, was not entirely removed by the ſcraper; and in the early impreſſions, is the means of producing a ſoft and agreeable effect. He engraved four plates in this ſtyle, which are as follows: Janus Lutma; John Lutma, his father; the poet Vondel; and P. C. Hooft, the hiſtorian, all of them in folio, and apparently from his own drawings.

John Lutma, the ſon of the preceding artiſt, was born at Amſterdam, A.D. 1609. He was likewiſe a goldſmith, and executed ſome few plates; among others the following: the portrait of John Lutma the father, habited in a robe bordered with ermin, holding ſpectacles and a pencil; portrait of himſelf, ſeated at a table, drawing; he has on a broad brimmed hat, which overſhadows his face: this print is very rare, both in folio; and a view of a large fountain with ſtatues, and the Antonine column, with ſome other ruins at Rome. It is firſt etched in a coarſe, bold ſtyle, and the ſhadows are worked upon with a fine mezzotinto tool. The effect produced by this mixture is confuſed and heavy, but not altogether diſagreeable to the eye.

James Lutma was of the ſame family, and alſo reſided at Amſterdam; by this artiſt we have a ſet of twelve middling-ſized upright plates of ornamental ſhields and foliage, etched in a neat ſtyle and finiſhed with the graver; likewiſe the portraits of the three Lutmas, marked "John Lutma of Oude inv. James Lutma fecit, aqua forti."

Adrian Brouwer, ſo celebrated for his attainments in art, and his wild and immoral habits, executed a few plates about this period, of ſuch ſubjects as he uſually painted. (For his biography, ſee the article Brouwer.) His principal etchings, which are executed with much ſpirit, freedom, and taſte, and are generally ſubſcribed with his initials, are, a party of four peaſants, inſcribed "T'ſa orienden," &c.; a ruſtic dance, where a female is playing the flute, inſcribed "Luſtig ſpell," &c. both in folio. Three peaſants ſmoking, inſcribed "Wer aent ſmoken," in ſmall folio; a drunken party of four ruſtics; two peaſants in converſation; a droll ſmoking party, conſiſting of a man, a woman, and an ape, inſcribed "Wats dit voor en gedrocht," &c.; a ruſtic baker making cakes, a circular print; a peaſant lighting his pipe, and a ſet of ſix of male and female peaſantry; all of quarto dimenſions.

Solomon Koninck was born at Amſterdam in the year 1609, and was the ſon of Peter Koninck, a celebrated connoiſſeur and jeweller of that city, who at the age of twelve placed his ſon under David Colyn, to learn the rudiments of drawing; he afterwards ſtudied ſucceſſively under Francis Vernando and Nicholas Moyart, and became a painter and engraver of ſome eminence. He etched ſeveral ſubjects in the ſtyle of Rembrandt, after his own deſigns; of which the following conſtitute the more eſtimable part. A head in profile, of an old man with a long beard; ditto of an old man, in eaſtern attire, with muſtachios; a companion to the preceding, but engraved in a much more delicate manner; a three-quarter buſt of an old man with a furred hat; an old man ſeated in an eaſy chair, at devotion, a very fine engraving; buſt of a venerable looking old man, with a beard; and a landſcape with cottages, all of quarto ſize.

Nicholas Berghem alſo performed ſome etchings about this time, which conſiſt chiefly of what may be termed Italian and Dutch paſtorals, and beam with taſte and intelligence. It is believed that all his prints are ſolely the reſult of aquafortis and the etching-point, and that his plates were never touched with the graver. They are all from his own compoſitions, and for the moſt part appear like tranſcripts from the ſketch-book, wherein he drew animals from nature.

The etchings of Berghem, like his pictures, delight by the ſound and intimate knowledge of drawing and chiaroſcuro, which they diſplay or imply; and the exquiſite feeling which every where attends his touch, and which ſeems almoſt, ſpeaking without figure or hyperbole, like actual contact between mind and its object.

Theſe are the qualities which impart ſuch truth of texture and character to his various domeſtic animals, whether rough or ſmooth-coated; ſuch pictureſqueneſs to his graſſy grounds and earthy and rocky banks, and ſuch importance to his trifles.

For the biography of this artiſt, ſee Berghem, Nicholas. In conformity with our general plan, we ſhall here add ſome account of his principal engravings, referring thoſe who may wiſh for more particular information, to the catalogue of Henry de Winter, which was publiſhed in Holland in the year 1767.

Six ſets in ſmall quarto, of ſix prints each. Theſe are performed with all the fire and fervour of Berghem, and each ſet conſiſts of five plates of animals, and an appropriate title-page, by which the ſet is known, *e. gr.* there is "The Milk-man" ſet, "The Shepherdeſs" ſet, "The Goatherd" ſet, &c. &c. The title-pages are all inſcribed with the following words, which ſhew that they are, as we have before ſurmiſed, the probable contents of the ſketch-book in which our artiſt was accuſtomed to draw from nature; *viz.* "Animalia ad vivum delineata et aquaforti ceri impreſſa ſtudio et arte Nicolai Berchemi." A ſet of five folio landſcapes, which are diſtinguiſhed from each other by the figures and cattle which are introduced, and which are as follow: 1. A Peaſant ſeated playing on the Flute. 2. A Group of Cattle, with a Woman and Child croſſing a Rivulet. 3. A Shepherd, with Sheep and various Cattle. 4. A ruſtic Girl on an Aſs, ſtopping for Refreſhment at an Alehouſe Door. 5. A Shepherd on horſeback, reading to a Woman on an Aſs, as they ſlowly travel. A ſet of four, in quarto, *viz.* 1. A Landſcape, with Oxen, and a Woman milking a Cow. 2. Another with three Horſes and two Cows, with a Shepherd in the Back-ground. 3. Another with two Cows, and ſome Goats. 4. Another with an Aſs, Goats, and a Shepherd; and a ſet of ſix ſmall plates, which are very rare, and uncommonly fine, of heads of rams and goats.

Detached Subjects of Berghem.—A cow, in folio, the earlieſt impreſſions of which have the name of Berghem in italics; a famous print of a cow watering, in folio; a landſcape with two cows lying down, and another ſtanding on the foreground; a landſcape with cows, and a man on an aſs; a landſcape, with a ſhepherd on an aſs, driving goats, in the back-ground a woman is introduced with a baſket on her head, all in folio; a woman waſhing her feet in a brook, and a man behind her leaning on a ſtick, with other ruſtic figures and animals, in large folio; a landſcape, with a man ſtanding playing the flute, and a woman ſeated on the ground near him, a rare print, in folio; and its companion, a ſhepherd, and his wife ſeated ſuckling her child, a very rare print; and a boy ſeated on an aſs, ſpeaking to another boy, who holds a pair of bagpipes.

The beauty and value of the works of this maſter depend much upon the impreſſions, and early, good, and well preſerved impreſſions are now become very ſcarce.

The author of the Abecedario, miſled by the cypher of Berghem, which the reader will find in our *Plate* III. of the monograms of the engravers of the Netherlands, has fallen into the error of calling him Cornelius Berchem. Florent le Comte has alſo ſuppoſed that there were two artiſts of this ſurname, one of whom he calls Cornelius; whereas the letter C in Berghem's cypher ſtands for Claus, the common abbreviation of Nicholas among the nations of the continent.

Herman Zacht-Leeven, or Sachtleeven, was born at Rotterdam, A.D. 1609, and died at Utrecht in 1685. He was the diſciple of John van Goyen, and became a landſcape-painter of great celebrity. He etched ſome few plates in a free and intelligent ſtyle from his own compoſitions, of which the following are the beſt; a landſcape and cattle; a mountainous landſcape, with figures and water; both in quarto. A ſet of ſix landſcapes, the firſt of which is executed by Ag. Winter, and the remainder by Sachtleeven, in quarto; and a landſcape, with two elephants, in folio.

Cornelius Sachtleeven was the younger brother of Herman, mentioned in the preceding article, and was born at Rotterdam in the year 1612. He painted in the ſtyle of Brouwer and Teniers, commonly ſelecting ſuch ſubjects as village parties, ſoldiers regaling, &c.

This artiſt likewiſe etched ſeveral plates from his own compoſitions in a ſlight ſpirited ſtyle; amongſt which the following are thoſe which are held in moſt eſteem. "The Five Senſes," intitled "De vyf Sinnen, wt ghebelt door Cor. Sachtleeven." A ſet of twelve ſmall plates of animals; and a landſcape, with animals and a goatherd, of quarto ſize; executed in a broad and pictureſque ſtyle.

John George van Vliet was born at Delft in the year 1610; and was one of the moſt ſucceſsful of the diſciples and imitators of Rembrandt. He executed a conſiderable number of etchings, ſome of which poſſeſs great merit, particularly thoſe from the drawings and pictures of his great maſter. They are exceedingly powerful in effect; the ſhadows being dark, and the lights broad and clear; but his figures in general are very incorrect, the extremities badly marked, and the draperies heavy.

Van Vliet uſually etched his plates with a very delicate point, afterwards ſtrengthening them with aqua-fortis and the graver. His plates are well worthy the obſervation of ſuch artiſts as wiſh to make a proper diſtribution of light and ſhade an eſſential part of their ſtudy. At the ſale of Mariette, a complete ſet of his works was ſold for one thouſand and ſeventy-five livres. He commonly marked them with his name, or a monogram, which will be found amongſt thoſe of the engravers of the Netherlands. The following are the moſt worthy the attention of the connoiſſeur.

Portraits and ideal Heads.—Buſt of a man, from Rembrandt; an Oriental head, dreſſed in a turban, and diamond ornament; head of a warrior; profile of an old man, with his hands claſped, looking upwards; ditto of an old man with a grey beard and a leathern cap; ditto of a man with muſtachios, and a fur bonnet and mantle; all in folio. Buſt of an old man with muſtachios, habited in a mantle; Profile of an officer, with a hat and feathers, both in quarto; and a beautifully finiſhed plate of an old woman reading, her head is covered with drapery which falls on her ſhoulders, in folio; all from the pictures of Rembrandt.

Hiſtorical, &c.—"Lot and his Daughters," a folio print, in which the chiaroſcuro is remarkably well managed. "The Baptiſm of the Eunuch of Queen Candace," a grand compoſition, of which good impreſſions are very rare, in large folio; "St. Jerom kneeling, at Devotion," a very fine print; all from Rembrandt, and in folio. "St. Jerom reading," from a picture by Van Vliet himſelf; "Iſaac diſcovering his Miſtake in having given his Bleſſing to Jacob;" "Suſanna ſurpriſed by the Elders," both from Livens, in large folio; "The Reſurrection of Lazarus," from his own compoſition, in large folio. John Louys copied this print, and his copy is ſuperior to the original. "The Ballad-ſinger," who is repreſented in a village ſtreet, ſurrounded with ruſtics, in folio; "The Rat Seller," in quarto; four figures in Spaniſh attire, playing at trictrac; a woman and child liſtening to a man who is ſeated on a baſket turned upſide down; "The Philoſopher reading," with a remarkably fine effect; "The Mathematician writing by Candle-light," all in quarto; "An Orgie of Peaſants," a very good compoſition, of ſix figures, in folio; all from his own deſigns.

Ferdinand Bol was born at Dordrecht in the year 1610, but lived and died at Amſterdam, where his parents came to reſide when he was but three years old. He ſtudied in the ſchool of Rembrandt, and attained great celebrity as a painter of hiſtory and portraits. He executed a conſiderable number of plates in a bold free ſtyle; the lights and ſhadows are broad and powerful, which renders the chiaroſcuro of Bol particularly ſtriking; but his prints want that lightneſs of touch and admirable taſte which thoſe of Rembrandt poſſeſs in ſuch high perfection. The following are a ſelection of the beſt engravings of Bol, and are nearly, if not quite, as much ſought after as thoſe of Rembrandt.

Portraits and Heads.—Half-length portrait of a young man, with a hat on; portrait of an officer, both in 4to. Half-length portrait of a man, with a hat and feathers; a young woman with a cap and feathers, in an oval; both in 8vo. The woman and the pear, being a portrait of a young female in a veil, preſenting a pear, a very fine print, in 4to. An old man ſeated, habited in a fur robe, in large 4to., a rare print. A very ſpirited half-length engraving of an old man, with a cap on. And a buſt of an old man habited in a fur robe, in an oval of quarto ſize, very rare.

Hiſtorical, &c.—"A Philoſopher in his Study," with globes, books, &c. and a very fine effect; "A Philoſopher reading." An old man ſeated before a table, on which are placed globes and books. This print is commonly known by the name of "The Aſtrologer," all in 4to. A family in a room, conſiſting of a man, woman, and child ſucking, known by the name of "The Chamber of the Accoucheur" in folio; "Abraham's Sacrifice," arched at the top, in large folio; "Hagar and Iſhmael in the Deſart," in folio; "The Sacrifice of Gideon," repreſented at the moment when the angel lights the ſacrifice, in the back-ground is the altar of Baal, in 4to.; and "St. Jerom contemplating a Crucifix," in a circle of folio ſize.

The events of the life of Dirick or Theodore Stoop are very obſcure. He was born ſomewhere in Holland in the year 1610, or thereabouts, but how he acquired his great ability in painting and etching is not known. His etchings are from his own compoſitions, are performed in a very neat and pictureſque ſtyle, and are much and deſervedly celebrated, and highly valued.

His principal work is a ſet of twelve plates in ſmall folio, of which the ſubjects are horſes, dogs, and peaſantry, engaged in various rural occupations, and marked D. Stoop, fec.

Rodrigo Stoop was the younger brother of Theodore, and was born in Holland, A.D. 1612. According to the author of "An Eſſay towards an Engliſh School of Painters," the baptiſmal name of this artiſt was Peter, but he always placed the initial R before his family name, and is called Rodrigo by the continental writers. He came into

England with queen Catherine, and reſided here till the time of his death, which happened in 1686.

This artiſt engraved ſeveral plates, after his own compoſitions and thoſe of Barlow. They are executed with great ſpirit, in a ſtyle which does him much credit, but we can only ſpecify the following: A ſet of eight, views of Liſbon, dedicated to queen Catherine; another ſet of eight, repreſenting the proceſſion of queen Catherine from Portſmouth to Hampton Court, dated 1662; and ſeveral of the plates for Ogilby's edition of Æſop's Fables, publiſhed in 1678, after Barlow. Theſe are ſlight haſty performances.

Anthony van der Does was born at the Hague in the year 1610. He chiefly engraved portraits; if he was not the diſciple of Paul Pontius, he imitated his ſtyle; and although he never equalled that great maſter, yet his beſt engravings poſſeſs a conſiderable ſhare of merit. He engraved moſt of the plates for a collection of portraits of the illuſtrious men of the ſeventeenth century, publiſhed at Amſterdam, many of which are dated 1649. Among his beſt portraits are thoſe of Gerard Cock, a plenipotentiary to the court of Oſnabruck; George Wagner, plenipotentiary to the court of Oſnabruck, both in folio, after Anſelm Van Hull; Ferdinand, cardinal infanta of Spain, and governor of the Low Countries, after Diepenbeck, in large folio; the marquis of Caſtle-Rodrigo, after Rubens, in large 4to.; Francis de Mello, ſmall folio; Francis de Mello, on horſeback, in folio, from J. Boſſart.

And of his *Hiſtorical Prints*, the moſt eſteemed are "A Magdalen," half figure, in 4to., from Vandyke; "A Miracle performed by St. Francis," after Diepenbeck; "A Madonna and Child," after Eraſmus Quellinus; and "A Holy Family," from the ſame painter, both in folio. The Holy Family is accompanied by two angels, one of whom is ſtrangely employed in warming linen for the child, whilſt the other makes its bed. Of the remainder of this family of artiſts, we have already treated in vol. xii. See Does, Jacob and Simon, Vander.

An account of the lives and works of Cornelius Bega, and Leonard Cooghen, (which ſhould elſe have been introduced in this place,) will alſo be found under thoſe heads reſpectively. The plates of the former, impreſſions from which are much ſought after by connoiſſeurs, have recently been purchaſed and republiſhed by a foreign print merchant, with deſcriptions in the French and Dutch languages. They amount to thirty-four plates of humorous and vulgar ruſticity.

Edward Eckman, or Ecman, was born at Mechlin in the year 1610. He was a moſt excellent engraver on wood, and copied many of Callot's prints, even imitating the free ſtyle of that maſter with great ſucceſs. The diſtant parts of his engravings are very neatly executed; and the perfect forms of the ſmalleſt figures exceedingly well preſerved. Among other engravings by him, is the repreſentation of the fire-work upon the river Arno, from Callot, which Papillon, who has certainly judged well in this inſtance, calls an admirable print, adding, that it is impoſſible to find a more delicate engraving on wood.

Eckman engraved alſo from Louis Buſink, Abraham Boſſe, and others. The number of his prints is ſaid to be one hundred and five.

John Thomas was a native of Aſpres, and born in the year 1610. He was a ſucceſsful pupil of Rubens, and afterwards, in company with his fellow ſtudent Diepenbeck, went to Italy, where he met with great encouragement from the biſhop of Metz. In 1662 he was intitled firſt painter to the emperor Leopold, and had a conſiderable penſion allowed him by that prince.

Thomas etched ſeveral plates, in a bold, free, and ſpirited ſtyle, which are much ſought after by collectors, among which the following may be reckoned the beſt. "Mercury conducting a Ghoſt before Hecate;" "A Lady at her Toilette;" "A Shepherd careſſing a Shepherdeſs;" "A Satyr offering Violence to a Shepherdeſs;" all of 4to. ſize, from his own deſigns; and a paſtoral ſubject, compoſed of ſix figures, three men and three women, one of the former is playing upon the bagpipes, in folio; likewiſe from his own invention. The two latter are compoſed ſo much in the ſtyle of Rubens, that ſome authors have attributed their invention to him, but without foundation.

John Troyen, or Van Troyen, was a native of the Low Countries, and born A. D. 1610. He produced ſeveral etchings from the pictures of Italian maſters, collected by D. Teniers, for the gallery at Bruſſels. They are executed in a ſlight, coarſe, incorrect ſtyle, but his prevailing tones of light and ſhade are tolerably good.

The following are the beſt part of them. "Salome preſenting the Head of St. John to the Daughter of Herod," after L. da Vinci; "The penitent Magdalen;" after Correggio; "The Adoration of the Kings," after P. Veroneſe; "Jeſus Chriſt healing the Sick," from the ſame painter; four ſubjects of "The Seaſons," after Baſſan, all in folio; and a grand compoſition, in large folio, after L. Pordonna, of "The Entombing of Chriſt."

Peter Liſebetius, or Van Leyſebetten, was the contemporary of Van Troyen, and, like him, was employed in engraving part of the gallery of Teniers. His plates are executed in a coarſe and incorrect ſtyle; among them are a portrait of David Teniers, ſenior, in 4to., from Van Mol; "Diana repoſing," attended by an old woman, after Titian; "The Marriage of St. Catherine," after P. Veroneſe; "The Viſitation of Elizabeth," after Palma the elder; "The Virgin at Prayers, and St. John careſſed by the Infant Saviour," after the younger Palma; "Cupid preſenting Venus with Fruit;" and "Diana and Endymion," after Paris Bordonna, all of folio ſize. The two laſt are remarkably ill drawn, and the reſt reach not above mediocrity.

John Meyſſens, or Mytens, was born at Bruſſels in the year 1612. He learned the principles of painting from Anthony Van Obſtal, and afterwards became the diſciple of Nicholas vander Horſt. He painted both hiſtorical ſubjects and portraits, but was moſt ſucceſsful in the latter. He reſided at Amſterdam, where he publiſhed ſeveral collections of engraved portraits, not only from his own paintings but thoſe of Vandyke, and a variety of other maſters. Meyſſens engraved and etched, and we have by him a collection of portraits which he publiſhed in 1649. Proſper Merchand, in his hiſtorical dictionary, mentions a book of portraits by this artiſt, (likewiſe publiſhed by himſelf,) which is become very rare, on the frontiſpiece of which is the name of "Speckkraemer." They are in general greatly inferior to what might have been expected from his hand, and do not do him much credit as an artiſt. Of theſe mediocre performances, it may be ſufficient to ſpecify the following, which are rather valued on account of the pictures from whence they are engraven, than on account of the merits of the engraver.

Portrait of himſelf; Henry de Keyſer, architect and ſculptor; Guido Rheni; Daniel Seghers, Jeſuit, and flower painter, from Livens; Cornelius de Bie, from Eraſmus Quellinus; William de Nieulandt, painter, from the ſame maſter; Mary Ruten, the wife of Vandyke; "The Virgin and Child," half figures, from Titian, all in 4to. And

"Meleager preſenting the Boar's Head to Atalanta," from Rubens, in folio.

Cornelius Meyſſens was the ſon of John, and born at Antwerp, A. D. 1646. He learned the elements of art under his paternal roof, but removed from thence to Vienna, where he remained ſome years. He ſeems chiefly to have been employed by his father in engraving portraits, which he executed entirely with the graver in a ſtiff, taſteleſs ſtyle. His beſt prints have no great merit to recommend them, and the reſt are mere ſlovenly performances, evidently executed in a hurry. The moſt conſiderable work we have by this artiſt is a ſet of portraits of the emperors of the houſe of Auſtria, in folio, entitled "Effigies Imperatorum domus Auſtriacæ, delineatæ per Joannen Meyſſens, et acri inſculptæ per Filium ſuum, Cornelium Meyſſens." This proves, beyond contradiction, that he was the ſon of John, and not the nephew, as Baſſan affirms. His work of next importance is in folio, and entitled, "Les Effigies des Souverains Princes et Ducs de Brabant." In theſe he was aſſiſted by Peter de Jode, Waumans, Van Schupen, and other artiſts. Octavius, duke of Arenburgh; Antonius Barberinus, Cardinalis Camerius, both in 4to; Rinaldo Principe Eſtenſe, cardinale protettore della Corona di Francia, in folio; Giovanni de Witt, Signor di Linſchoten, &c. Penſionario di Olandia; Caſparus Keidtwerdius, Paſtor Eccleſiac Veſala, from B. D. Meyes; and David Conte di Weiſſenwolff, Signor di ſon et Enſegg; S. B. Van Dryweghen delt. all of folio dimenſions, may alſo be admitted into collections of the ſchool of the Netherlands.

Marc de Bye was born at the Hague in 1612, of a noble family; he paſſed ſome of the years of his youth in the army of the Dutch republic, and became a member of the Academy of Arts in 1664.

He learned the principles of painting of James vander Does, painted animals with all the truth and taſte of that maſter, and etched ſeveral ſets of plates, of which the ſubjects were wild and domeſtic animals, in a very neat ſpirited ſtyle, after Paul Potter and Marc Gerard.

The following may be ſelected with advantage from the reſt of his works: Two ſets of eight quarto plates, each of horned cattle, after P. Potter; another ſet in quarto, from the ſame painter; a ſet of eight, of goats and ſheep; a ſet of ſixteen, of goats; a ſet of ſixteen, of lions, bears, wolves, leopards, &c. after the ſame painter; and a ſet of ſixteen, of "The Natural Hiſtory of the Bear," in different countries, after Marc Gerard, very rare prints, in quarto.

Francis vanden Wyngaerde was born at Antwerp in the year 1612, and eſtabliſhed himſelf in that city as an engraver and print-merchant. His works prove him to have been a man of ability; his etchings are executed in a ſlight and free, but maſterly ſtyle, and are much ſought after by connoiſſeurs. Among thoſe which are the moſt worthy of attention, are the following:

"Sampſon killing the Lion," from Rubens, in 4to.; "Jeſus Chriſt appearing to Mary Magdalen in the Garden," in folio; "The Marriage of Thetis and Peleus," in large folio; a bacchanalian ſubject, where Bacchus is repreſented drinking from a cup, into which a bacchanal is ſqueezing grapes, a fine and rare print, in large folio; "Soldiers regaling in an Alehouſe;" all after Rubens. "The Entombing of Chriſt," after A. Vandyke, both in folio; "Achilles diſcovered at the Court of Lycomedes," after the ſame painter, in folio; "The Return from Egypt," in which the Holy Virgin appears in a ſtraw hat, from J. Thomas, a fine engraving, in large folio; "Peaſants ſmoking and drinking before an Alehouſe Door," from Teniers; "The Temptation of St. Anthony," from his own compoſition, a very rare print; two women, one of whom is contemplating a ſleeping infant by candlelight, after Callot; and its companion, a female leaning on a ſkull before a looking-glaſs, after the ſame maſter, all of folio dimenſions.

Reynier, or Remigius Nooms, better known by his cognomen Zeeman, was born at Amſterdam in the year 1612. He was originally a ſailor, but having an innate love and natural talent for fine art, he accuſtomed himſelf to imitate on paper what he ſaw, and by purſuing this mode of ſtudy in the ſchool of nature alone, gradually became a marine painter and engraver of conſiderable rank and ability.

It ſhould be known that the Dutch word *zeeman* is ſynonimous with ſeaman, or mariner. As the imitative powers of *the ſailor* diſcloſed themſelves, his countrymen could not but behold his productions with ſome degree of pleaſing wonder, nor was due encouragement withheld. At one period of his life he accepted an invitation to Berlin, and if we may judge from twelve of his engravings of ſhipping, &c. which were publiſhed here by Tooker, he reſided for a time in London, but finally returned to Amſterdam, where he executed a conſiderable number of plates from his own deſigns, in a bold and intelligent ſtyle. They conſiſt of ſhipping and marine views, ornamented with good figures, and cloſed by back-grounds, which are often beautifully executed and appropriately introduced.

Of theſe, the moſt important are, a ſet of eight naval ſubjects, entitled "Quelques Navires," &c. dated 1632, in 4to.; another ſet of ſix, of views of public edifices on the ſea-ſhore, and the yatch which travels between Haerlem and Amſterdam, in folio; a ſet of twelve, of ſhipping, naval arſenals, &c. in folio, publiſhed in London by A. Tooker; four Dutch ſea-ports, in folio, entitled "Raan Poortie;" "St. Antoni's Poort;" "Regiliers Poort;" "Saaghmeulins Poortie;" dated 1636. Another ſet of four, of Dutch ſea-ports, alſo in folio; "The Four Elements," in 8vo.; a pair of "The Fauxbourg of St. Marcian;" and "The Porch of St. Bernard," at Paris; a ſea-fight with ſhips on fire, and another marine ſubject, with two ſhips engaging, all of folio dimenſions, and from compoſitions by the engraver himſelf.

Henry Snayers, or Sneyos, was born at Antwerp in the year 1612, and always reſided in his native city. Of whom he learned engraving is uncertain, but he evidently imitated the ſtyles of P. Pontius and the Bolſwerts. His prints, as is believed, are the ſole production of the graving tool; he drew correctly, and much of the character, expreſſion, and ſpirit of the original pictures after which he worked, are infuſed into his tranſlations.

When engraving after Rubens, his prints, of which the following are the beſt, bear ſtrong reſemblance to thoſe of Scheltius a Bolſwert.

The portraits of Adam Van Oort, after Jordaëns, and prince Robert, count palatine of the Rhine, after Vandyke; "The Holy Virgin and Infant Saviour appearing to St. Alanus of Rupe," a rare print, in large folio, and preſumptively after a compoſition by Snayers himſelf; "The Holy Virgin ſeated and ſurrounded by Saints," in large folio; "The Fathers of the Church debating the Queſtion of Tranſubſtantiation," of very large folio dimenſions; "St. Francis d'Aſſiſe receiving the Sacrament of Extreme Unction," all after Rubens; and "Sampſon delivered to the Philiſtines," after Vandyke, alſo in large folio.

Alexander Voet, or Voert, the younger, was a native of Antwerp, and born in the year 1613. He was probably the diſciple of Paul Pontius, whoſe ſtyle he frequently imitated, but not with any very great ſucceſs. There is a want of effect, and an incorrectneſs of outline, even in his beſt works, though engraved very neatly. He executed a conſiderable number of plates, after Flemiſh maſters, but more particularly after Rubens; the beſt of which are as follows: "Judith and Holofernes," in large folio (the earlieſt impreſſions of which are before the name of C. Galle was inſerted); "The Return from Egypt," in folio; "The Virgin and Child," to whom angels preſent a baſket of fruit, in folio; "The Martyrdom of St. Andrew," a fine print, in large folio; "St. Auguſtin," rare, in large folio; "St. Agnes with a Lamb," in folio; "Seneca in the Bath, bidding Farewel to his Friends;" "Roman Charity," both in folio; "A Satyr with Fruit," accompanied by a bacchante, in large folio, all after Rubens; "Folly," after Jac. Jordaëns; "The Card-Players," after Corn. de Vos, both in large folio; and "Chriſt bearing the Croſs," a capital print after Vandyke, engraved on three plates.

Peter Baillu, or Balliu, was born at Antwerp in the year 1614. He learned the rudiments of painting in his native country, after which he went to Italy for improvement, where, in conjunction with other artiſts, he was employed in engraving the Juſtinian Gallery. On his return to Antwerp, in the year 1635, he was much patronized, and his engravings are, by many collectors, held in no ſmall eſteem. Huber claſſes him among the firſt engravers of his age. His works exhibit ſome talent in the art of expreſſing the textures of various ſurfaces, and his chiaroſcuro poſſeſſes conſiderable force; yet his heads are ſeldom expreſſive or beautiful; and the extremities are heavy and not well marked. He engraved both portrait and hiſtory, and executed his plates entirely with the graver. Among his moſt eſteemed works are the following:

Portraits.—Louis Péreira, and Claude de Chabot, envoys to Munſter, both in 4to. without the name of the painter; John Leuber, counſellor of Dreſden, from A. van Woeſbergen; pope Urban VIII. giving his benediction; the four heads of the church—St. Jerom, St. Auguſtin, St. Ambroſe, and St. Gregory, all in folio; Jacob Backer, a painter of Holland, in 4to.; and John Bylert, a painter of Utrecht, both from his own pictures; Albert, prince and count of Arenberghe, in large folio, from Vandyke; Lucy Peraye, counteſs of Carliſle; Anthony of Bourbon, count of Morel, ſon of Henry IV.; and Honorus Urphée, count of Novi Caſtellie, &c. all in folio, from Vandyke.

Hiſtorical Subjects after various Italian Maſters.—"Heliodorus chaſed from the Temple by Angels;" a very large upright print, engraved on two plates, after a drawing by Van Lint, from Raphael's picture in the Vatican; "A dead Chriſt lying on the Knees of the Virgin Mary;" a large upright plate from An. Carraci; "The Archangel Michael overcoming the Dæmon," after Guido; "The Reconciliation between Jacob and his Brother," after Rubens, all in large folio; "Chriſt in the Garden of Olives;" "The expiring Magdalen," ſupported by angels, both in folio; The Rape of Hippodamia, or the Combat of the Centaurs and Lapithæ," in large folio, all after Rubens; "A Holy Family," after Theodore Rombout, in folio; "Mary Magdalen and St. Francis at the Feet of Chriſt;" "The Virgin in the Clouds," both in large folio, from Vandyke; "Rinaldo and Armida," in large folio, after the ſame painter (the companion was engraved by P. de Jode); "Suſannah at the Bath," after Martyn Pepyn; "The Flagellation," after Diepenbeck; "Chriſt crowned with Thorns," after the ſame painter; "The Invention of the Croſs, before St. Helena," after Van Lint; "The Emperor Theodoſius holding the Croſs before St. Ambroſe," after the ſame painter, all in large folio; "Jeſus Chriſt faſtened to a Column," attended by angels, with the inſtruments of the paſſion, after John Thomas, in folio; and "St. Anaſtaſius ſeated in a vaulted Apartment reading," after Rembrandt, a folio print, with a fine effect of light and ſhadow.

John van Aken was born in Holland, A.D. 1614, and was the fellow-ſtudent of Bamboccio. He has frequently been miſtaken for John van Aachen, of Cologne, the latter of whom did not engrave.

The following etchings, from the hand of Van Aken, are free and maſterly, and in a ſtyle much reſembling that of J. Both.

A ſet of ſix horſes, with landſcape back-grounds, in 8vo. marked J. V. Aken, fecit. M. de Heinneken likewiſe cites the two following: a landſcape, where a horſe appears in the fore-ground ſaddled, and a man ſeated on the ground behind it, with only his back ſeen, and towards the left, another man with his hat on. This is very ſcarce; and four fine mountainous landſcapes, ornamented with figures, wood, and buildings, in folio, both marked with his name, to which is added fecit; and in the latter H.L. inventore.

John Almeloven was born in Holland in the year 1614. He was a painter as well as an engraver; the latter profeſſion he exerciſed chiefly for the bookſellers, but with great credit to himſelf. His etchings, of which the ſubjects are principally landſcapes, abound with freedom and intelligence. Of theſe it may be ſufficient to mention, in this place,

The *Portrait* of Giſbert Voetius, marked J. Almeloven, inv. et fec.; a ſet of twelve views of towns and villages, ornamented with figures; a ſet of ſix mountainous landſcapes, with figures, and the four ſeaſons, from Herman Saftleven, all in quarto.

Matthew Borrekens, or Borekens, was the contemporary and friend of the preceding artiſt, and reſided at Antwerp. He worked chiefly with the graver, in a neat ſtyle, reſembling in manual execution that of P. Pontius, but his drawing is far leſs correct.

The principal parts of his works are the copies he made from Bolſwert, and other eminent engravers, for Vanden Enden, of which the beſt are as follows:

Portraits of Auguſtus Carpzou, plenipotentiary of Frederic William, duke of Saxony, Anſelme van Hulle pinxit, in folio; Gerard Schepeler, plenipotentiary of the peace of Oſnabruck, from the ſame painter; the prelate Chriſtopher Buthens, after Diepenbeck, all in folio.

Hiſtorical Subjects, &c.—"Mary Magdalen embracing the Crucifix," accompanied by the Virgin and St. John, after Vandyke, in very large folio; "The Virgin ſtanding upon a Globe, treading on a Serpent," in folio, after Rubens; "St. Francis Xavier," and "St. Ignatius of Loyola," all in folio; "St. Barbara," in large folio, a very rare print; all from Rubens. "Jeſus Chriſt bound," ſurrounded with angels bearing the inſtruments of the paſſions; "The good Shepherd," "The Myſtery of the Maſs," both in large folio; and the frontiſpiece to "Butkins's Trophies of the Duchy of Brabant," in folio; all after Diepenbeck.

Andrea Stock was born in Holland, A.D. 1616, and reſided the greater part of his life at Antwerp. He was the pupil of Jacques de Gheyn, and imitated his ſtyle with tolerable ſucceſs. His profeſſional talent was of a general nature. He engraved portrait, landſcape, and hiſtorical ſubjects, but can ſcarcely be ſaid to have riſen above mediocrity.

His beſt prints are, the *Portraits* of Albert Durer, in 4to. after Thomas Vinidor de Bologne; Hans Holbein, from a picture by that maſter, in 4to.; Lucas of Leyden, from a picture by himſelf, in 4to.; Peter Snayers, after Vandyke, in folio; "Abraham ſacrificing Iſaac," a large upright, after Rubens; "The twelve Months of the Year," after John Wildens; and a ſet of eight landſcapes, after Paul Bril, all of quarto dimenſions. Theſe, with the "Académie de l'Epée" of Thibault, which was publiſhed at Antwerp, will probably afford ſufficient ſpecimens of the various talents of this engraver.

Antonio Waterloo was born among the ſcenes which he ſo admirably repreſented, in the ſuburbs of Utrecht, in the year 1618. The events of his life are very little known, but none who have taſte and ſenſibility to appreciate his merits, can read and reflect on that little, without wonder and regret. Though born to a comfortable patrimony, and bleſſed with an excellent genius, he died in a miſerable ſtate, as is reported, in one of the hoſpitals of Utrecht, at the age of forty!

This ſeems reproachful either to ſociety or to Waterloo himſelf: but reproaches may well be allowed to ſink in ſilence, when we know not where they ought to attach. Great talent is often eccentric, and, to all but the eye of philoſophy, will ſeem to ſhoot madly from the ſocial orbit: that the undeviating ſons of Commerce ſhould turn from a bright prodigy to a barometer or a weather-cock, is perfectly natural; meanwhile the meteor glares and expires. Earth is illumined, but are the merchants enriched?

Hundreds of dealers have amaſſed fortunes, and others will for centuries continue to amaſs fortunes by ſelling the works of an artiſt of our own country, who kept ſchool in Bunhill row, and diſpoſed of his Paradiſe Loſt for almoſt nothing. Hundreds have in like manner enriched themſelves by dealing in the works of Waterloo, who languiſhed and died in an hoſpital.

"Father forgive them, for they know not what they do," is a divine prayer, which intelligent Chriſtians, in pity to ignorance, cannot too often repeat. Neither know they whom, nor what, they neglect.

Averting our attention, then, from the private life—the frail and mortal part—of this great artiſt, to works that will live and be admired as long as engraving ſhall endure, we have to obſerve, that he was rather an engraver who occaſionally painted, than a painter who occaſionally engraved; for while his plates are numerous, his pictures are very few. For an account of his merits in the latter art, the reader is referred to the article WATERLOO.

If he had any tutor in engraving, it has eſcaped record. The woods, the winding roads and villages in the environs of Utrecht, appear to have been his ſtudy, and of many of theſe his etchings are faithful portraits, rendered with a maſter's hand and poet's ſenſibility. The frankneſs and beauty of his ſtyle, ſhew that he read the book of nature with intuitive readineſs; and that the character which was occult to others, was to him eaſy and familiar.

Gilpin ſays, that "Waterloo is a name beyond any other in landſcape. His ſubjects are perfectly rural. Simplicity is their characteriſtic. He ſelects a few humble objects. A coppice, a corner of a foreſt, a winding road, or a ſtraggling village: nor does he always introduce an offſkip. His compoſition is generally good, and his light often well diſtributed; but his chief merit lies in execution, in which he is a conſummate maſter. Every object that he touches has the character of nature; but he particularly excels in the foliage of trees."

But Waterloo ſometimes compoſes ideal landſcapes of a grand and impreſſive character, though ſtill under the influence of the ſame preſiding ſimplicity. The ſcenes to which claſſic romance, or the ſublimities of holy writ have ſtimulated his imagination, appear to have been produced with as little effort, as the foreſt glades, or ruſhy and ſecluded pools, overhung with alders, or pictureſque knolls, which he doubtleſs drew and etched, juſt as he ſaw them in nature.

Of this, his "Tobias and the Angel" may ſerve as an inſtance, of which the reverend writer above quoted has, in another place, written as follows. "The landſcape I mean is an upright, near twelve inches by ten. On the near ground ſtands an oak, which forms a diagonal through the print. The ſecond diſtance is compoſed of a riſing ground, connected with a rock which is covered with ſhrubs. The oak and the ſhrubs make a viſta, through which appears an extenſive view into the country. The figures, which conſiſt of an angel, Tobias, and a dog, are deſcending a hill, which forms the ſecond diſtance. The print, with this deſcription, cannot be miſtaken. The compoſition is very pleaſing. The trees on the fore-ground, ſpreading over the top of the print, and ſloping to a point at the bottom, give the beautiful form of an inverted pyramid, which, in trees eſpecially, has often a fine effect. To this form, the inclined plane on which the figures ſtand, and which is beautifully broken, is a good contraſt. The rock approaches to a perpendicular, and the diſtance to an horizontal, line. All together make ſuch a combination of beautiful and contraſting lines, that the whole is very pleaſing. The keeping is well preſerved. The ſecond and third diſtances are both judiciouſly managed. The light is well diſpoſed. To prevent heavineſs it is introduced upon the tree, both at the top and at the bottom; but it is properly *kept down*. A maſs of ſhade ſucceeds over the ſecond diſtance, and the water. The light breaks in a blaze, on the bottom of the rock, and maſſes the whole. The trees, ſhrubs, and upper part of the rock are happily thrown into a middle tint.

"Perhaps the effect of the diſtant country might have been better, if the light had been kept down; leaving only one eaſy catching light upon the town and the riſing ground on which it ſtands.

"The execution is exceedingly beautiful. No artiſt had a happier manner of expreſſing trees than Waterloo; and the tree before us is one of his capital works. The ſhape of it we have already criticiſed: the bole and ramifications are as beautiful as the ſhape. The foliage is a maſter-piece. Such a union of ſtrength and lightneſs is rarely found. The extremities are touched with great tenderneſs; the ſtrong maſſes of light are relieved into ſhadows equally ſtrong; and yet eaſe and ſoftneſs are preſerved. The fore-ground is highly enriched; and indeed the whole print, and every part of it, is full of art and full of nature."

Theſe remarks from the pen of Mr. Gilpin, on the Tobias of Waterloo, are ſo pertinent, and ſo applicable to the generality of his works, that it is only neceſſary to add that the mode in which theſe extraordinary prints were produced, is ſimply *etching*, which he is ſuppoſed to have worked up to ſo powerful an effect of chiaroſcuro with his etching needle, by mere dint of drawing and the various preſſure of his hand, as to render all *ſtopping out* (as it is termed) of his lighter tints, unneceſſary. His plates are believed to have been *bit in* (or corroded) at one operation of the aquafortis, and not to have been touched afterward with either graver or point.

Some of the foreign writers on art, to whom we are indebted for deſcriptive catalogues of the works of Waterloo, are, however, of a different opinion, and aſſert, that after the proceſs of corroſion, he ſtrengthened and enriched his tones, and eſpecially the boles and branches of his trees, with the graver.

The preſent writer, from the compariſons which he has been able to make between various impreſſions, and his knowledge of the manner in which engraved plates wear under the hand of the printer, is inclined to believe, that the darkeſt parts of Waterloo's plates, which are generally the overſhadowed boles and branches of his trees, would of courſe begin to wear firſt, (from the ridges of copper in ſuch parts being either exceedingly minute, or entirely corroded away) and would conſequently want retouching before any other parts began perceptibly to wear, which retouching was at that time always performed with the graver, the art of *rebiting* being unknown.

Hence, in collecting the works of this maſter, it is of the utmoſt importance to attend to the goodneſs of the impreſſions; for the demand for them has been ſo great, and the plates have in conſequence been ſo frequently retouched, that the latter prints are altogether unworthy of the name of Waterloo. You ſee in them, indeed, the general forms of the objects, but every trace of the elegant freedom and ſpontaneous grace of the maſter, is irrecoverably gone: back-grounds and fore-grounds are jumbled together, and in ſome inſtances nothing is left but a few ſtrong, ſtiff, unmeaning lines on a faint and unintelligible ground.

The high eſtimation in which the works of this juſtly celebrated landſcape engraver has ever been held, have occaſioned frequent republications of his plates, and Huber, Roſt, and Adam Bartſch, of the imperial library at Vienna, have written deſcriptive catalogues of them, of which the following liſt is an abridgment. The cypher which Waterloo ſometimes affixed to his etchings, may be ſeen in *Plate* I. of the monograms, &c. of the engravers of the Netherlands.

Views and Compoſitions.—A pair, of a ruined building, and a woody receſs with two peaſants. A ſet of four, *viz.* the hermitage; the paſſage of the rocks; the little waterfall; and the mountain bridge, all in octavo. A ſet of twelve, in quarto; *viz.* the fiſherman's return; the arrival of travellers at a country inn; the ruſtic well; the village mill; the village church; the caſtle on the bank of a river; the little bridge, with three anglers; the four peaſants; view on the road to Schevelingen; the fiſherman, (a river ſcene;) the two towers, (another river ſcene); and a paſtoral landſcape, on the fore-ground of which are a goat, ram, and ewe, which Bartſch has attributed to Marc de Bye. The mill dam, and the entrance to a foreſt, a pair in quarto, are two of Waterloo's early performances, coarſely executed, and evidently done before his powers had attained to maturity. Another ſet of twelve, of which the ſubjects are, 1. The fruit trees. 2. The church-yard. 3. The cottage. 4. A view on the ſea-ſhore, on the middle ground of which is a village ſpire. 5. Another view, with two fiſhermen. 6. Another view, with cattle and figures in a boat. 7. The traveller and two trees. 8. A paſtoral ſcene, with ſheep and a ſhepherd croſſing a bridge. 9. The deſerted village. 10. The inhabited village; three peaſants are here repoſing on a fore-ground hillock. 11. The ſentry box. And 12. The ſtone bridge. Another ſet of ſix, in quarto; *viz.* 1. A foreſt ſcene, with travellers. 2. A river ſcene, called "the little bridge." 3. Sheep fording a ſtream. 4. The boys and a dog, drinking at a brook. 5 and 6, Paſtoral landſcapes, with ſhepherds repoſing under trees, &c. A pair of cottage ſcenery, in quarto, with the effects of moonlight and twilight, of the upright form. A ſet of ſix, in quarto; *viz.* 1. The rock bridge, over a mountain torrent. 2. The travellers converſing. 3. A cottage ſurrounded with trees. 4. The oak, (under which a male and female peaſant are converſing.) 5 and 6. Views from nature, with travellers and their dogs. Another ſet of ſix, of the ſame dimenſions; *viz.* 1. The hermit's chapel. 2. The loaded aſs. 3. The ſleeping peaſant. 4. The ſtreamlet. 5. The mountains. And 6. The wooden bridge. Another ſet of ſix, denoted as follows: 1. The foreſt traveller. 2. The cottage, overſhadowed with trees. 3. The entrance of a wood. 4. The gate. 5. The knotty tree. And 6. The foreſt river. Two other ſets, in quarto, of ſix ſubjects, each conſiſting chiefly of rural and foreſt ſcenery. [It is to be remarked of theſe, and of Waterloo's works in general, that while their real merits and beauties reſide in the landſcape, collectors have, with little ſenſibility or reflection, denominated them from the figures which they contain, (which are the worſt parts of Waterloo;) ſo that a grand mountain ſcene with rocks and cataracts, is ſometimes known by the ſilly title of the boy and dog, or the milk-maid.] A ſet of ſix grand landſcapes of larger dimenſions, entitled, 1. The double caſcade. 2. The caſtle and cataract, or triple caſcade. 3. Rocks and mountains, with three figures on the fore-ground. 4. A wild mountain ſcene. 5. The grand waterfall. And 6. Cottagers at the foot of a mountain. Another ſet of ſix, *viz.* the temple, with a cupola and waterfall in the middle ground. 2. The rock bridge. 3. The large tree, with four figures. 4. Huntſmen in a foreſt. 5. A paſtoral ſcene, with a ſhepherd and his flock. 6. A watermill, with a cowherd and cattle. Another ſet of ſix, in large quarto; *viz.* 1. A plain, with clumps of trees. 2. The wildfowl hunter. 3. The return from the chace. 4. The traveller by twilight, a foreſt ſcene. 5. A river ſcene, with boys bathing. 6. A foreſt glade, with figures repoſing. Another ſet of ſix, in large quarto, all of which are views from nature, chiefly of villagers, but the names of the places have not yet been mentioned. A ſet of twelve beautiful landſcapes in ſmall folio; *viz.* 1. A garden ſcene. 2. Ruins of a city, with figures and cattle on the fore-ground. 3. The two bridges, (one of which is of ſtone, and the other of wood.) 4. The caſtle and rock. 5. The two travellers. 6. The city gate. 7. A river ſcene, with two ſtone bridges. 8. A ſhepherd conducting his flock acroſs a ſtone bridge. 9. A water-mill in a wood. 10. The ſkirts of a foreſt, with a falconer and greyhounds. 11. The pointed tower, a foreſt ſcene, with ſportſmen repoſing. 12. Another foreſt ſcene, with three large trees on the fore-ground. Another ſet of ſix, in large folio, of foreſt ſcenery, with rivulets and ruſtic bridges, all of which are believed to be views from nature, of places not named. Another ſet of ſix, in large folio, and of great beauty, which are numbered and named as follows: 1. A country-inn, with pedlars reſting. 2. A champaign country, with figures in converſation. 3. A woodland ſcene, with two very ſmall figures. 4. Two trees on the bank of a ſtream, with an open gate. 5. Another woodland ſcene, viewed from a corn-field. 6. A plantation of young trees, with a ſleeping ſhepherd on the fore-ground. A ſet of ſix large upright landſcapes; *viz.* 1. The large windmill, ſo called, but the mill itſelf is at a diſtance, and the near objects are an old houſe ſurrounded with trees, and on the left a wooden chapel. 2. A woodland ſcene, with two peaſants and a dog. 3. A mountain ſcene, with a road winding over a wooden bridge, towards a foreſt. 4. A village ſcene, with a woman and children repoſing on the fore-ground. 5. The entrance of a wood, with two travellers repoſing, and a horſeman advancing from among the trees. 6. Another woody ſcene, with a church ſpire in the diſtance. A ſet of ſix compoſitions in large folio, and of the upright form, with poetical ſubjects introduced from the heathen mythology; *viz.* 1. Alpheus and Arethuſa. 2. Apollo purſuing Daphne. 3. Mercury enchanting Argus. 4. Pan purſuing Syrinx. 5. Venus and Adonis. And 6. The death of Adonis. Another ſet of ſix hiſtorical landſcapes, in large folio, with ſubjects from the Old Teſtament; *viz.* 1. Abraham diſmiſſing Hagar and Iſhmael. 2. Iſhmael languiſhing in the deſart, is comforted by an angel. 3. The death of the diſobedient prophet. 4. Tobias and the angel, upon which we have commented at length. 5. Zipporah kneeling, executing the divine commands on the ſon of Moſes. And 6. The prophet Elijah fed by ravens in the wilderneſs; all of which are very grand compoſitions, and executed in the higheſt taſte of Waterloo.

Egbert van Panderen was born A.D. 1606. He reſided, during great part of his life, at Antwerp, but he often added the word Haerlemenſis to his name, from which we may infer that he was a native of Haerlem. He worked entirely with the graver, in a ſtiff formal ſtyle; and his prints have neither harmony of effect, nor correctneſs of drawing to recommend them. The following are ſelected from thoſe moſt worthy of notice: God, an angel, a man, and the Devil, or “The Hiſtory of Sickneſs and Medicine,” from Henry Goltzius, in quarto, very rare; “The Virgin Mary interceding with Chriſt for the Salvation of Mankind,” after Rubens, in folio; “The Four Evangeliſts,” half figures, after P. de Jode; “St. Louis, Biſhop of Thoulouſe,” after the ſame painter. Part of the plates for a large folio volume publiſhed at Antwerp, 1628, entitled “Academie de l'Epée,” by G. Thibault, all of folio ſize; ſix engravings of quarto ſize, of horſes, from Ant. Tempeſta; “Maurice, prince of Orange, on horſeback,” after the ſame painter, in large folio; and “Pallas,” “Juno,” and “Venus,” after Spranger, in circles of folio ſize.

Theodore van Keſſel was born in Holland, A.D. 1620, and, it is probable, was related to the Keſſels, who were painters of no ſmall repute in that country. His works, which are rather numerous, conſiſt chiefly of etchings; and (when he did not attempt to draw the human figure,) are by no means devoid of merit, but frequently are executed in a firm and free ſtyle. He etched a ſmall folio volume of vaſes and ornamental compartments, conſiſting of eight parts, from the deſigns of ſir Adam de Viane, with his portrait at the beginning. They were publiſhed at Utrecht by his ſon, Chriſtopher de Viane; and almoſt all the plates are marked with the monogram of the inventor, formed by an A and V joined together, and the initials of the engraver's names, T. V. K. to which f. or fec. is ſometimes added: theſe initials are commonly joined together in a manner repreſented in *Plate* III. of thoſe uſed by the engravers of the Low Countries. Several of the plates for the gallery of Teniers, and alſo the following, were executed by Van Keſſel; *viz.* an etching of the portrait of the emperor Charles V. after Titian, in quarto; “St. Gregory meditating,” a half-length figure, executed with the graver, T. Wilbontius inv.; “A Repoſe during the Flight into Egypt,” after Giorgione; “Chriſt and the Woman of Samaria;” “The Woman taken in Adultery,” both from Caracci; “Suſannah and the Elders,” after Guido; “The Holy Virgin worſhipped by Angels,” after Vandyke, all of folio dimenſions; an allegorical ſubject, repreſenting “Abundance,” in large folio; the companion to which was engraven by P. de Jode, both after Rubens. A ſet of four bas-reliefs, after the ſame painter, repreſenting 1. The triumph of Galatea. 2. A Triton embracing a ſea nymph. 3. A nymph in the arms of a ſea god. And 4. A fawn ſeated near a rock, with two children and a goat. “The Hunting of the Caledonian Boar,” a large plate lengthways, is from the ſame maſter: a man wheeling a barrow of peas and beans, with a man and woman driving cows, in the back-ground. A landſcape, the companion to the preceding, into which is introduced a girl with milk-pails, both in large folio, are alſo from Rubens. A ſet of battles and ſkirmiſhes of banditti, after P. Snayers, in folio, dated 1656, muſt conclude our ſelection from the works of this engraver.

Abraham Conrad, or Conradus, was a native of Holland, and born in the year 1620. Under what maſter he ſtudied is not known. He engraved hiſtory and portraits, but chiefly the latter; many of which are from his own drawings, and prove him to have been an artiſt of conſiderable ability.

His mode of engraving is various, and free from bigotry to any particular ſtyle: ſometimes he imitated that of Lucas Vorſterman with great ſucceſs, and at others, a ſtyle ſomewhat reſembling ſome of the heads by Rembrandt, but ſtill more reſembling that which has ſince been adopted by our countryman Worlidge; employing etching, or the work of the graver, or dry needle, as occaſion appeared to him to require.

The *Portraits* of Chriſtopher Love; Jacob Triglande, a profeſſor of the univerſity of Leyden; Thomas Mourios, of Canterbury, after D. Boudringeen; and Godefroid Hotton, paſtor of the French church at Amſterdam, after H. Moirmans; generally eſteemed the very beſt of the engravings of Conrad, all of folio dimenſions.

Of his *Hiſtorical* works, “The Flagellation,” and “The Crucifixion of our Saviour,” both in folio, and after Diepenbeck, are all we are able to ſpecify.

Having already treated of the biography of Bartolomeo, ſee BREEMBERG; it remains only to mention in this place, that the ſtyle of his etchings is ſcarcely leſs maſterly and intelligent than that of his pictures. They are much ſought after by collectors, and good impreſſions are by no means common. His mark, when he did not ſign his name at length, was B. B. F. and ſometimes two B's, in the way ſhewn in *Plate* IV. of monograms uſed by the engravers of the Netherlands.

We have by the hand of this artiſt, a ſet of twenty-four landſcapes, with figures and animals, entitled “Verſchiden verfallen Gebouden,” with an etching of the portrait of the artiſt, publiſhed in octavo, and alſo in quarto. Another ſet of twelve, entitled “Antiquités de Rome.” A landſcape, marked with his cypher. “Joſeph diſtributing Corn, during the Famine in Egypt,” in large folio; and its companion, “The Martyrdom of St. Lawrence.” There are many good copies from the two laſt ſubjects, particularly thoſe etched by Biſchop.

Henry Naiwinck, Naiwyncx, or Naiwikex, of Utrecht, according to ſome authors, was the diſciple of Bartolomeo. He was a landſcape engraver of conſiderable merit: he painted alſo, and in the cabinets of the connoiſſeurs of Holland, are drawings in Indian ink by this artiſt, which are performed with much care, and alſo with feeling and taſte.

His reputation, however, was chiefly founded on his etchings of landſcape. He caught the mantle of Waterloo: he was, perhaps, ſomewhat leſs free and painter-like, but with regard to evenneſs of tones, and what is termed engraver-like execution, improved on his prototype.

His works are faithful repreſentations of Nature, and the feeling and delicacy which every where accompanies his etching-needle, has occaſioned his prints to be much ſought after both by artiſts and collectors.

Of his etchings we are only acquainted with ſixteen, of which the earlieſt and beſt impreſſions are known to dealers by their having been taken before the name of Clement de Jonghe was inſerted as the publiſher; they form two ſets in large quarto.

The firſt ſet contains, 1. A foreſt-ſcene with a fore-ground of oaks. 2. A river-ſcene with trees, &c. 3. A rocky ſcene with wood and water. 4. A mountainous landſcape with a wooden bridge towards the left. 5. Another mountainous landſcape with wood and water. 6. A canal, or river, winding through a rocky country. 7. A river-ſcene with a village church in the back-ground. 8. Trees and water, with a mountainous diſtance.

The ſecond ſet conſiſts alſo of eight ſubjects of ſimilar general character, chiefly of mountain ſcenery.

Naiwinck always etched from his own pictures or drawings, and very rarely introduced any figures into his landſcapes.

Herman Swanevelt, or Swanefeld, ſurnamed Herman (*i. e. the Hermit*), of Italy, was born at Voerden, in Holland, A.D. 1620, and died at Rome 1690. He was the diſciple of Gerard Douw, but ſoon quitted the ſchool of that maſter, and migrated to Italy, where he placed himſelf for a while under the inſtructions of Claude of Lorraine.

But like all artiſts of original powers, he was much leſs indebted to any inſtructor for his acquirements, than to his own unremitting ſtudies from nature.

The recluſe life which he led in Italy, and the long and ſolitary rambles which he took in that claſſical and romantic country, for the ſake of enjoying nature, and contemplating landſcape at its pureſt ſources, obtained for him the cognomen of *the hermit*, which, generally ſpeaking, is well ſuſtained in his works, by the retired gloom of his choice of ſubjects.

For an account of his merits as a painter, the reader is referred to the article SWANEVELT. As an engraver, he was original, bold, and free, always working from his own pictures and drawings, which are either compoſitions or views from nature, and which he enriched with figures and cattle, that for drawing and appropriate introduction far exceed thoſe of his maſter Claude.

The general characteriſtics of his landſcapes are wildneſs and ſublimity. He has more of breadth and ordonnance, or the ſtudied graces of landſcape compoſition, than Waterloo, and more of mechaniſm in his mode of execution, but leſs of fine feeling and taſte. His chiaroſcuro is grander, but he poſſeſſes leſs ſenſibility to the ſimple graces of nature when viewed in detail. Swanevelt is more ſymmetrical and wiſely arranged, Waterloo more ſpontaneous. If Swanevelt is more epic, Waterloo is more paſtoral. The latter etched what was before him without any ſeeming effort; the former went abroad to *ſtudy*, and ſtudied with effect.

The engravings of Swanevelt are ſomewhat numerous, and are much ſought after; ſo that good impreſſions are by no means common. Thoſe moſt worthy of the attention of the collector are as follows:

A ſet of eighteen rural ſubjects, with figures and Italian buildings, in ovals, entitled "Variæ campeſtri fantaſiæ a Hermano Swanevelt invent. et in lucem editæ;" a ſet of thirteen Italian landſcapes, including a dedication to Gedeon Tallement, in ſmall quarto; a ſet of twelve Italian landſcapes, enlivened with figures, and entitled "Diverſes Veuës dedans et dehors de Rome, deſſinées par Herman van Swanevelt, dédiées aux Vertueux," in quarto; a ſet of ſeven, of domeſtic animals, with landſcape back-grounds, in ſmall quarto; a ſet of four mountainous landſcapes, enriched with figures of nymphs and ſatyrs, in 4to.; four landſcapes, into which are introduced hiſtorical ſubjects, *viz.* "Abraham receiving the three Angels;" "The Angel conducting Tobit;" "Elias in the Wilderneſs comforted by an Angel;" and "The Angel encouraging Tobit to take the Fiſh," all of quarto ſize; a ſet of ſix Italian landſcapes with figures; another ſet of the ſame number, with remarkable buildings and figures; four landſcapes, in each of which the Flight into Egypt is variouſly repreſented; four views of the Apennines, with ruſtic figures, all of folio dimenſions; a ſet of four landſcapes with figures and animals, in ſmall folio; ſix landſcapes, forming a ſeries, into which the hiſtory of Venus and Adonis is introduced, in large folio; and a ſet of four wild landſcapes, with legendary ſubjects, in large folio, *viz.* "St. Jerome meditating before his Cell;" "A Satyr offering Fruit to St. Anthony in the Deſart;" "St. Anthony regaling his Friend St. Pacome;" and "The Death of the Magdalen."

Aldert van Everdingen was born at Alkmaer, in Holland, A.D. 1621, and died in the ſame city in 1675. He frequented ſucceſſively the ſchools of Roland Savery and Peter Molyn, both of whom he ſoon ſurpaſſed. During a voyage in the North ſea, he was thrown by a tempeſt on the coaſt of Norway, where he reſided upwards of twelve months, and employed his time in ſtudying the wild and romantic character of the landſcape ſcenery of that country. He etched with the ſame picturesque feeling and taſte with which, as we have already ſtated (ſee EVERDINGEN) he painted, and among his works are a ſet of one hundred ſmall views in Norway, executed with admirable variety, peculiar characteriſtic wildneſs, and as much vigour of genius as the caſcades of Tivoli, by Salvator Roſa. Moſt of his engravings are of Norwegian ſubjects, and are marked ſometimes with his initials, and at others with his name at length.

Believing that there is, in our language, no deſcriptive catalogue of the works of this artiſt, we ſhall proceed to ſpecify thoſe moſt worthy of admiration.

A pair of ſmall oval landſcapes of rural character; a pair of very ſmall uprights, one repreſenting a foreſt with four figures in the Norwegian coſtume, the other a champaign country with a cottage; four ſmall mountainous landſcapes with figures and water; four, in octavo, etched in a very free ſtyle, of cottages and figures.

Another ſet of four, in octavo, of cottages and figures; three marine ſubjects with veſſels and figures, in 4to.

Six mountainous landſcapes, with figures, trees, windmills, cottages, &c. in 4to.

A ſet of three, in quarto, one repreſenting a windmill and ſluice; the ſecond a perſpective view of a village and church; the third is of wild character, with three peaſants and a dog on the fore-ground.

A pair, in quarto, one repreſenting a mountainous ſcene with fir trees and a hermitage; the other cottages and trees, with a ſwineherd and two hogs in the fore-ground.

Two woody landſcapes, of quarto ſize, in one are rocks on the fore-ground and cottages; the other is a cottage-ſcene, with a man and woman in converſation. The four laſt are (contrary to the cuſtom of Everdingen) lengthways.

A pair of landſcapes, in quarto, of rocky character, with fir trees and figures; in the ſecond two figures are ſeated at the foot of a rock, one of whom writes on a ſtone the name of Everdingen.

A pair of mountainous landſcapes; in one of them is a wooden bridge communicating from one rock to another; the other is a ſtone bridge communicating with very lofty rocks, acroſs which a pedlar is travelling, in the middle-ground a man is ſeated, who appears to be drawing.

A pair of woody landſcapee, in quarto, with cottages; on the road towards the left hand are two figures and a horſe; the other is a rocky ſcene with trees, in the back-ground is a view of the ſea.

A pair of ditto, with the effect of night; one of them is a rocky ſcene with a cottage and figures; the other is an immenſe pile of rocks crowned with wood, all of quarto ſize.

A pair of ditto, one of which repreſents a monument; the other a cottage and peaſants.

A pair of ditto, one is a farm-yard with poultry and figures; the other conſiſts of piles of various trees cut down for building, with two peaſants, all in quarto.

A foreſt ſcene, a river is winding through the fore-ground, over which an old oak ſpreads its horizontal arms. Of this engraving there are two ſets of impreſſions, one being leſs than the other by a third part.

A woody ſcene with cottages and figures, in the fore-ground is a waterfall with figures angling.

A beautiful caſcade formed down the ſide of a mountain by water which turns a mill; towards the right a peaſant is ſeated on the ſtump of a tree.

A large wooden bridge with a peaſant croſſing it; in the middle diſtance is a cottage and church ſpire, with a perſpective view of a town.

A mountainous landſcape with a watermill; on the fore-ground are three figures.

A mountainous ſcene; on the middle plain is a cottage with oaks and fir trees.

A landſcape ornamented with very taſteful figures; towards the right is a monument in the antique ſtyle, with columns of the Doric order.

And a landſcape, on the fore-ground of which is a Gothic temple, towards which a great number of figures of both ſexes are crowding; towards the right is a chapel ſurmounted with a ſtatue of St. Nicholas, all of large quarto ſize.

Theſe laſt eight prints are the moſt capital of the engravings of Everdingen. He likewiſe publiſhed a ſet of one hundred views in Norway, and a ſet of fifty-ſix octavo plates, from his own deſigns, from a book entitled "The Tricks, or Deceits of the Fox," which was written by Henry d'Alkmaer.

Nicholas Lauwers was born at Leuſe, in Hainault, in the year 1620, but eſtabliſhed himſelf and publiſhed his engravings at Antwerp. He emulated the merits of the ſchool of Rubens, and, as Strutt thinks, ſtudied under Paul Pontius, whoſe ſtyle of engraving he for the moſt part imitated, working with the graver alone. He was, however, by no means equal to that great maſter, either in his knowledge of forms, powers of delineation, or excellency of handling.

Lauwers engraved after ſeveral of the Flemiſh maſters, but his beſt prints are decidedly thoſe which are from the pictures of Rubens, of which the chief are as follow.

"The Adoration of the Eaſtern Kings," of the upright form; "The Ecce Homo," of the ſame form. (*Note.*—In the latter impreſſions of this plate, the name of Lauwers is eraſed, and that of Scheltius a Bolſwert ſubſtituted in its ſtead, which is probably the trick of ſome Dutch dealer, which has been put in execution, in order to enhance the nominal value of the impreſſions.) "The Deſcent from the Croſs," of the ſame form, and "A Dead Chriſt on the Lap of the Virgin Mary," all of folio dimenſions. "The Triumph of the New Law" is a very large and fine print, lengthways, which Lauwers has engraved on two plates, and is alſo after Rubens, as well as his portrait of Iſabella, infanta of Spain.

There are, however, ſome few exceptions to our general aſſertion that the beſt works of this maſter are after Rubens. His large print of "Baucis and Philemon entertaining Jupiter and Mercury," (which Strutt has miſtakenly attributed to his brother Conrad,) is after Jordaëns, and may certainly be claſſed among his very beſt productions. His "Holy Virgin and Child," and "St. Agabus," after Diepenbeck, and his "St. Cecilia," and "Interior of a Cabaret," after Seghers, have alſo conſiderable merit.

Conrad Lauwers was the elder brother of Nicholas, and worked much in the ſame ſtyle, with the graver only, but with ſomewhat inferior powers. He was born at Leuſe in the year 1613, but reſided principally at Antwerp.

The *Portraits* of Aërtus Quellinus, an architect, after J. de Decyts; Peter Verbrugghen, a ſculptor, after E. Quellinus; Marius Ambroſius Capello, biſhop of Antwerp, after Diepenbeck; and Father Antony Vigier, after J. Coſſiers, may be reckoned among the beſt works of Conrad. And his *Hiſtorical* prints of moſt reputation are, "The Prophet Elijah viſited by an Angel in the Deſart," a large upright folio; and "Chriſt bearing the Croſs," both after Rubens; "The Baptiſm of the Emperor and Empreſs of Monomotapa;" "The Great Crucifixion," after J. Coſſius, in large folio; and "The Holy Family," in a landſcape after Schiavone.

Coryn or Querin Boel, deſcended from Cornelius, and was related to Peter Boel, the painter. Probably, as there is only three years difference in the dates of their birth, he was the elder brother of the latter.

Coryn was born at Antwerp in the year 1622. He went to Bruſſels to work for the publication which is commonly called the Gallery of Teniers, which was produced under the patronage of the archduke Leopold. He worked with the graver and etching needle, but chiefly with the latter, his ſtyle of handling which, was coarſe, heavy, and by no means correct with regard to the forms of his objects.

Yet he had the addreſs to ſelect good originals to engrave from, and his works are *therefore*, we preſume, held in ſome requeſt. The moſt important of theſe are, "The Eagle of Jupiter tranſporting Ganymede through the Air," after Michael Angelo; a landſcape after Giorgione, in which are introduced a knight armed with a poignard kneeling before a female; "The Adoration of the Shepherds," after Titian; "Adam and Eve ſitting within an Arbour of Paradiſe," after Paduanino; "Venus and Adonis," after Schiavone; "The Rape of Europa," after Titian; "The Reſurrection of Lazarus," after the elder Palma; "Diana and her Nymphs bathing," after the ſame; "Perſeus delivering Andromeda," after Domenico Fetti, all of folio dimenſions. And, after Teniers the elder, "The Barber-ſurgeon Apes," and "Cats performing a Concert;" "The Village Fête," with Dutch peaſantry playing at nine pins; "The Interior of a Flemiſh Cabaret," with a joyous company of drinkers and ſmokers, all in folio; and a pair of 4to. ſize, of half-length figures of Dutch peaſantry.

Wallerant Vaillant, (who is ſlightly mentioned in our account of ENGLISH *engraving* as the coadjutor of prince Rupert,) was born at Liſle, in Flanders, A.D. 1623, and died at Amſterdam in 1677. He was the eldeſt of five brothers, who all of them attained ſome reputation in the arts. Wallerant went to Antwerp, and ſtudied under Eraſmus Quellinus; he excelled in portrait painting, and met with great encouragement; for having ſucceſsfully painted the portrait of the emperor Leopold, his occupation increaſed ſo rapidly that he ſoon acquired a competent income. He accompanied the Maréchal de Grammont into France, where he completed his fortune, and after a ſtay of four years returned to the Netherlands, and ſettled at Amſterdam. He was an engraver of merit, particularly in mezzotinto; and made ſome conſiderable improvement in that branch of art, but the grounds of his plates, when compared with modern productions in mezzotinto, were indifferently laid, and the lights uneven, particularly where they were much ſcraped. The moſt important of his works are as follow.

Portraits and Subjects from his own Deſigns.—His own portrait, and that of his wife, in oval borders, both in folio; prince Rupert; another half-length of prince Rupert, reading, both in 4to.; John Frobenius, a printer of Baſle, after Holbein, in folio; ſir Antony Vandyke, ſeated, in large folio; Siniac, a miniature painter, in ſmall folio; Hardouin de Pereſix de Beaumont, archbiſhop of Paris; Cornelius Stadus, rector of the Gymnaſe at Amſterdam; Conrad Hoppe, a reformer of Amſterdam; a young man ſeated, reading, ſuppoſed to be the portrait of Andrea Vaillant, (a fine and rare engraving); Baarent Graat, a painter of Amſterdam, all of folio dimenſions, (the firſt impreſſions of the latter plate were printed in brown;) Humphredus Henchman, epiſc. Lond. "An old Woman ſhewing a Letter to a young One;" "A young Man returned from Hunting, with a Hare and Wild Fowl," both in large folio; "Our Saviour kneeling, ſurrounded with Angels bearing the Inſtruments of his Paſſion," in 4to.; "St. Chriſtopher carrying the Infant Chriſt acroſs an Arm of the Sea," with the effect of night, in large 4to.; Leopoldus, Dei gratia. Roman; Joannes Philippus, Mogunt; Carolus Ludovicus, comes palat. Rheni et elect.; and Sophia, comit. palat. Rheni, all in folio; theſe four laſt portraits are executed with the graver, and are very rare.

Hiſtorical, &c. after various Maſters.—"St. Barbara," a half figure, after Raphael, in 8vo.; "Judith," after Guido, in large folio; "The Holy Family," after Titian; "The Temptation of St. Anthony," after C. Procaccini; buſt of a warrior, after Tintoretto; "St. Jerome," after a picture by Jac. Vaillant, all of folio ſize; "Venus lamenting the Death of Adonis," in large folio, from Eraſmus Quellinus; a group of three figures, after Terburgh, in folio; "A young Man painting at his Eaſel," after Metzu; "Two Boys," after Fr. Hals; "A Child careſſing a Dog," after Vandyke; "A Peaſant and his Wife," after Teniers; "The Prodigal Son," after Marc Gerard; "A Party of Gamblers," after the ſame painter; "Judith," and "Jael," from Gerard de Laireſſe; "A Party of Peaſants," one of whom is ſmoking, from Corn. Bega; "A Company of Peaſants," with a woman and child, after the ſame painter; "A Party of Peaſants ſinging," from Ad. Brouwer; "Two Peaſants ſmoking," from the ſame painter; "A Trumpeter Pigeon, delivering a Letter to a Lady," after Wil. Mieris; and "The Gold Weigher," after Rembrandt, all of folio dimenſions.

Bernard Vaillant was born at Liſle, and was the pupil of his brother Wallerant, whom he accompanied in his travels to Frankfort and to Paris. He gained conſiderable reputation as a crayon painter, and ſcraped ſome of his own compoſitions and portraits in mezzotinto, which he ſigned with his initials. Among them are the

Portraits of John Lingelbach, from Schwarz; Paul Dufour, after a picture by his brother; Eſaias Clement, miniſter at Rotterdam; Charles de Rochfort, miniſter of the French church at Rotterdam; Paul Duſon, a preacher at Leyden; and heads of St. Peter and St. Paul, all from his own drawings.

Andrea Vaillant was the youngeſt of the five brothers, and ſtudied engraving at Paris, after having learned the elements of art of his eldeſt brother. He engraved but few plates, among which are the portraits of Aloïſius Berilaqua, patriarch of Alexandria, in large folio; and John Erneſt Schraden, inſpector of the Gymnaſium at Berlin, in 4to.

Francis Pooſt was born at Haerlem in the year 1624, and learned the elements of art of John Pooſt a painter on glaſs. In 1647 he went in the ſuite of prince Maurice of Naſſau to America, where he reſided for ſome years, employing a large portion of his time in painting and drawing from nature. After his return to the Low Countries, he made a conſiderable number of etchings, in a maſterly ſtyle; among which is a ſet of views of Brazil, from his own drawings; "View of the Gulf of All Saints in America;" "View of Cape St. Auguſtin;" and "A View of the Iſland of Thamaraca," all in large folio; the three latter are very capital engravings, and are now become rare.

Cornelius Coning, or Koning, was born at Haerlem, A.D. 1624. He is among thoſe artiſts who are but little known, and who deſerve to be known better. We have ſome portraits of the illuſtrious men of the ſixteenth century, engraved by him in a firm and pleaſing ſtyle; but can only ſpecify the following few; Laurent Coſter, the printer of Haerlem, from J. V. Campen; Martin Luther, the reformer, both in large folio; Dierk Philius, theologian; Menno Simons; and Adrianus Tetrodius, of Haerlem, from P. Grebber; and ſome of the princes of Frieſland, after Andiceſſin, which we are not able to detail, all in folio.

Bernard Baleau, or Baillu, or Van Balen, was a native of the Low Countries, who flouriſhed at Rome during the latter half of the ſeventeenth century, but the events of his life are obſcure, and we are not acquainted with his birthplace; he worked entirely with the graver, in a heavy ſtyle, and his portraits, which are the chief of his works, have no great ſhare of merit, either with reſpect to drawing, or the execution of the engraving. The following are the moſt important.

Portraits of cardinal Urſini, who was choſen pope in the year 1672; Canute, king of Denmark, after C. Panig; "Our Saviour between St. Alcanta and Mary Magdalen," from Lazaro Baldi; "St. Mary Magdalen de Pazzio," from the ſame painter, all of folio ſize; "St. Peter of Alcantara, to whom the Virgin and Infant Saviour are appearing," from the ſame maſter; and the five ſaints canonized by Clement X. *viz.* "St. Cajetan;" "St. Francis Borgia;" "St. Philip Benitius;" "St. Louis Bertrandus;" and "St. Roſa, with the Infant Chriſt," all in large folio, after Ciro Ferri. This artiſt likewiſe engraved many of the plates for a work intitled "Effigies Cardinal. nunc viventium."

Paul Potter, the very celebrated painter and etcher of animals and landſcape, was born at Enkhuiſen in the year 1625. He was the ſon and diſciple of Peter Potter, a painter of inconſiderable talents, but is far leſs indebted for his extraordinary attainments to his father's inſtructions, than to his own aſſiduous ſtudy of nature. No artiſt has ſhewn more ſenſibility to the beauties of rural landſcape ſcenery, or more eaſy and thorough knowledge of the forms and colours of thoſe animals which conſtitute its moſt brilliant ornament; the ſtyle of none is more ſimple, original, and unſophiſticated; the genius of none ſhone with a brighter ray, for the ſhort day of his glory, over the paſtoral and domeſtic ſcenery of his native country. He died at Amſterdam A.D. 1654, at the early age of twenty-nine years.

The works of Paul Potter are held in very high eſtimation. His etchings are greatly and juſtly admired for the taſte, ſpirit, and ſimplicity of ſtyle which are diſplayed in them ; and collectors often pay large ſums for fine impreſſions of them.

His prints are original works, *i. e.* done immediately from his own compoſitions and ſtudies from nature, and are not numerous. But we are uncertain whether or not the following ſhort liſt contains the whole of his engravings.

A ſet of five, in ſmall folio, of various horſes, with landſcape back-grounds. A ſet of eight, in quarto, of cows and bulls, &c. A mountainous landſcape, with a peaſant driving cattle, a very fine and rare print, in folio. Another very beautiful landſcape, in which a ſhepherd, ſurrounded by his flock, is playing on his pipe, alſo of folio dimenſions ; and a ſet of ſmall plates of plants and flowers.

Nicholas Ryckmans, or Richmans, was born at Antwerp in the year 1620. He was probably the diſciple of P. Pontius, whoſe ſtyle he imitated, or rather tried to imitate. He worked with the graver only, in a neat but ſtiff manner, and the outlines of the naked parts of his figures (the extremities eſpecially), are exceedingly incorrect. The following are among the beſt of his works, which the merit of Rubens, rather than his own, have recommended to public notice. “The Adoration of the Wiſe Men,” from Rubens, in large folio ; the firſt impreſſions of which are prior to the inſertions of the addreſs of either Gaſper Huberti, or Corn. van Merlen. “The Entombing of Chriſt ;” “A Head of Chriſt ;” and “The Holy Family,” very rare, all in folio ; “Ulyſſes diſcovering Achilles at the Court of Lycomedes,” in large folio ; “Our Saviour and his Thirteen Apoſtles,” half figures, on a ſet of fourteen leaves, in quarto, all after Rubens : and a work, intitled “Palazzi di Genova, raccolta e deſignati da P. P. Rubens.” It is divided into two parts, repreſenting the plans, elevations, and ſections of the principal palaces and churches at Genoa : the firſt part contains ſeventy-two plates, and the ſecond ſixty-ſeven. It was firſt printed at Antwerp in 1622, and reprinted in 1652, and is of large folio dimenſions.

Cornelius van Caukerken was born at Antwerp, A. D. 1625, where he eſtabliſhed a print-ſhop of reſpectability, and engraved ſeveral plates from Rubens and other maſters. He worked entirely with the graver, in a heavy, laboured ſtyle, without much taſte. He uſually croſſed his ſecond ſtrokes ſquarely upon the firſt, which mode of engraving requires more exquiſite handling of the graver than Caukerken poſſeſſed, to render the effect agreeable. His lights are generally too much covered ; and his drawing is very defective. However, ſome of his beſt prints are by no means devoid of merit : among which number the following may be reckoned.

Portraits.—Peter Snayers, of Antwerp, from Van Heil ; Tobias Verhaect, a landſcape painter, from Otho-vænius ; Peter Meerte, a portrait painter of Bruſſels ; Robert van den Hoeck, a painter of camps, from Gonzales Coques ; John de Carandolet ; Francis de Faino, baron de Jamajo ; Charles van den Boſch, biſhop of Bruges, in an oval, without the names of the painters, all of quarto ſize ; and Charles II. of England, with a back-ground by Hollar, in large folio.

Hiſtorical, &c. after various Maſters.—“A dead Chriſt lying on the Ground, with his Head on the Lap of the Virgin,” after Caracci ; “A dead Chriſt, ſupported by the Holy Virgin and St. John,” after Vandyke ; “The Deſcent of the Holy Spirit ;” “Charity with three Children,” both from the ſame painter ; “Roman Charity,” after Rubens, a plate much to be preferred to the other engravings of Caukerken, and of which it is uncommon to find good impreſſions ; “St. Anne and the Virgin,” after Rubens, in folio, a rare print ; “The Martyrdom of St. Lievin,” biſhop of Ghent, after Rubens, in large folio (thoſe impreſſions are the beſt with the addreſs of Hollander) ; and “A Female ſuckling a Child,” in folio, from Ab. Diepenbeck.

Philip Fruytiers was born at Antwerp in the year 1625. He was originally an oil painter, but afterwards preferred water-colour, and greatly excelled in miniature painting. His works chiefly conſiſt of portraits and converſations, which he executed in a very maſterly ſtyle. His heads are very expreſſive, and his draperies well drawn. Rubens was ſo much pleaſed with this painter, that he and his family ſat to him ; and the picture of them, which he painted, was conſidered as his maſter-piece.

Fruytiers likewiſe excelled in etching, which he performed in an intelligent ſtyle, worthy of a great painter ; and generally produced powerful effects of chiaroſcuro. His engravings are not numerous, nor are we able to ſpecify more than the following

Portraits of Godofredi Wendelini, a philoſopher of the ſeventeenth century, in folio ; Marcus Ambroſius Capello, biſhop of Antwerp ; Jacob Edelherr of Louvain, both in large folio ; Hedwige Eleonora, queen of Sweden ; and an emblematical ſubject on the birth of the Virgin, in folio, all from his own pictures.

For an account of the merits of John Fyt as a painter, ſee vol. xvi. part ii. He flouriſhed at the period which is now under our review, and etched ſome few plates of animals with his accuſtomed feeling and vigour, of which the following is a liſt. A ſet of eight, in quarto, of various animals. And a ſet of ſeven, compriſing the title, with a dedication to Don Carlo Guaſco, marcheſe di Solerio, &c. &c. of dogs, with landſcape back-grounds, in ſmall folio. Few painters have produced etchings in a more feeling and animated ſtyle than this ſet is executed.

Henry Bary was a native of Holland, born A.D. 1626. His ſtyle of engraving ſeems to have been formed from ſtudying the prints of Cornelius Viſſcher ; and the imitation appears moſt evident in his portraits ; eſpecially thoſe which he has executed in his neateſt manner. In drawing, taſte, and harmony of chiaroſcuro, he is frequently deficient ; yet ſometimes he has diſcovered much mechanical ſkill, and ſeems to have handled his graver with facility. One of his beſt and moſt finiſhed prints is “Spring and Summer,” perſonified by two children, a ſmall upright plate, from Vandyke, and executed as a companion to the “Autumn and Winter,” engraved by Munichuyſen, after G. Laireſſe. This plate is executed entirely with the graver, in a clear neat ſtyle, and ſhews his management of that inſtrument in the moſt ſtriking light. Among the beſt of his remaining engravings are the following.

Portraits without the Names of the Painters.—Dirk and Walter Grabeth, painters on glaſs ; Adrian Heerebond, a philoſopher ; Hieronymus van Bevernink ; Didier Eraſmus of Rotterdam, all of quarto ſize ; Wilhelm Joſeph, baron of Ghent, and admiral of Holland ; Rombout Hagerbeets, both in folio ; Anitius Manlius Severinus Boetius, in quarto ; Jacobus Taurinus ; the count John of Waldſtein, both in folio ; and the ducheſs de la Valiere, in large folio.

Portraits ſigned with the Names of the Painters.—Hugo Grotius, after Michael Janſon Mireveldt ; Cornelius Ketels, the painter, from a picture by himſelf, both in quarto ; Jacob Backer, the painter, after G. Terburgh, in an oval of folio ſize ; John Schellhammer, miniſter of Hamburgh ; John Zas, a reformer of Gouda, from Chr. Pierſon ; Jacob Batelier ; and Arnold Guſtermans, from Weſterbaen, all in folio ; Michael de Ruyter, the Dutch admiral, after F. Bol ; admiral Vlugh, after B. vander Helft, both in large folio ;

Leo van Altzema, a Dutch hiſtorian, after J. de Banc, in large folio; and George de Mey, a celebrated theologian, after Coan Diemen, in folio.

Hiſtorical, &c.—"Neptune," a quarto plate, engraved from Bary's own compoſition. An allegorical title page to a work by Leo van Aitzenea, after Seemer, in folio. A woman ſuckling an infant, without the painter's name, and perhaps deſigned by himſelf. A pair of peaſantry, in quarto, after A. Brouwer; the country houſe-keeper, after P. van Aerſten, in folio. A pair, intitled "Take Care of the Water!" and "Wine makes the People inſolent," after F. Mieris, each inſcribed alſo with four Dutch verſes, in folio; and "A Youth dreſſed in a Hat and Feathers," after G. Terburgh, alſo in folio.

John Munnickhuyſen, or Munichuyſen, was a native of Frieſland, born A. D. 1636. He reſided at Flanders, and executed a conſiderable number of meritorious works with the graver, among which are the following

Portraits of Hendrick Dirckſen Spiegel, a burgo-maſter, a very fine engraving, from J. M. Limburg; Francis Burmann, profeſſor of theology at Utrecht, from C. Maas; Gerard Brandt, preacher at Rotterdam, from M. Muſcher, all in folio; Peter Zurendonk, rector of the Latin ſchool of Amſterdam, from David Plaats, in large folio; John van Wayen, preacher at Middleburg; Daniel Gravi, a clergyman of the ſame place, from Z. Blyhof, both in large folio; Peter van Staveren, a clergyman of Leyden, from Wilhelm van Mieris, in folio; admiral Van Tromp, of Holland, a fine portrait, from D. A. Plaſſe, in large folio; and the companion to Bary's "Spring and Summer;" repreſenting "Autumn and Winter," perſonified by children, after Vandyke.

Hercules Zeghers, or Zegers, was born at Utrecht in the year 1625. He is ſpoken of by the author of "Lives of the Dutch Painters, &c." (Deſchamps), as having been an artiſt of fertile invention, but an unfortunate exemplification of the ſcriptural text, that "the race is not to the ſwift, nor the battle to the ſtrong, nor riches to men of underſtanding, nor favour to men of ſkill."

He both painted and engraved landſcape. The above writer ſays, that his compoſitions are very rich, and much varied; and that he commonly repreſented very extenſive ſcenes, with far diſtant horizons, but met with no patronage or encouragement. Nor was he a whit more fortunate, in this reſpect, in his etchings, which ſoon iſſued forth from the retail ſhops, as wrappers to other commodities.

The preſent writer has not ſeen any of the works of Zeghers, and is inclined to think that Deſchamps may have overrated his merits. It is not eaſy to believe that at Utrecht, in the ſeventeenth century, good prints would have been depreciated to the value of waſte paper; or if a ſolitary inſtance or ſo, of ſuch depreciation had occurred, that very circumſtance would have advanced meritorious engravings to ſome public notice, which muſt have led towards appreciation, and have finally benefited the artiſt, however obſcure, in ſpite of the crafty practices of the print-dealers.

That Deſchamps was not very obſervant as a connoiſſeur, nor very correct as a writer, may be inferred from his ſtatement, that Zeghers *diſcovered* the *ſecret* of printing in colours upon *canvas:* where, for diſcovered the ſecret, we ſhould read, had recourſe to the expedient; and for canvas, according to the baron Heinneken, we ſhould read paper.

The concluding anecdotes related of this artiſt are probably more worthy of credit and of regret. Hercules made a laſt, and, according to Deſchamps, a ſtupendous effort, ſparing neither time nor pains, nor any kind of exertion of which he was capable, and produced an admirable landſcape, of which he offered the engraved plate for ſale to a print-dealer. The dealer adviſed him to convert his plate into ſnuff-boxes; and the artiſt heard with indignation that he would purchaſe it at no higher rate than the value of the copper. Zeghers took back his landſcape, and, vowing that each impreſſion ſhould ſell for as much as the dealer had offered for the plate, deſtroyed his engraving in a paroxyſm of diſappointment. The artiſt thus verified his vow, and the dealer loſt his bargain; but two proofs had been taken from the plate, and they were purchaſed at the price of ſixteen ducats each.

Nothing certain, however, can be inferred from this anecdote, without ſeeing one of the two impreſſions from the plate, or hearing ſome more faithful report of its merits than Deſchamps appears to have been qualified to give; ſince we know not who were the purchaſers: and the ignorant part of the tribe of collectors, will often freely give thoſe ſums for rarity, which they withhold from meritorious exertion.

Unable longer to endure the ſcorn and the neglect with which he was treated by the dealers and the public, this unfortunate artiſt addicted himſelf to drinking; and, one day returning to his houſe in a ſtate of intoxication, fell down ſtairs, and ſo materially injured himſelf that he died in a few hours.

It is almoſt ſuperfluous to add, that the works of Zeghers are very ſcarce. In the public hall at Dreſden are fifteen of his pictures; and another is mentioned by Houbracken, vol. ii. p. 136.

Gerard Valck, the ſervant, and afterwards the brother-in-law, of Bloteling, was born at Amſterdam in the year 1626. But both theſe artiſts migrated to England; and the reader will find an account of them, and their works, in our account of the *Origin and Progreſs of* ENGLISH *Engraving*.

Cornelius van Dalen the younger was born at Antwerp in the year 1626. He was the ſon of a print-ſeller of the ſame baptiſmal name, and, out of diſtinction, always added the word junior to his name. He is ſaid to have learned engraving of Cornelius Viſſcher; but his ſtyle varied from time to time, reſembling, as occaſion appeared to him to require, thoſe of Lucas Vorſterman, P. Pontius, S. Bolſwert, and other maſters. A ſet of antique ſtatues, engraved by him, are in a bold, free ſtyle, as if founded upon that of Goltzius: others, again, ſeem imitations of that of F. de Poilly. In all theſe different manners he has ſucceeded; and they manifeſt the extraordinary verſatility of his powers, and great command he had of the graver: for he worked with that inſtrument only.

He engraved a great variety of portraits, ſome of which are very valuable, and form the beſt, as well as the larger part of his works. He did not ſucceed ſo well in drawing the naked parts of the human figure: his outlines are heavy, and frequently incorrect; and the extremities, the feet eſpecially, are ſeldom well marked. The following are ſelected from his beſt engravings:

Portraits.—Queen Catherine of Medicis, ſeated, a very fine engraving, in large folio; Francis Deleboe Sylvius, a phyſician, C. V. Dalen del.; John Ruppert van Groenendyck, the burgomaſter of Leyden; Jacob Baudes Heertoot Waſſenaer, lieutenant and admiral; the old, old, very old man, Thomas Parr, aged one hundred and fifty-two, all of large folio ſize; Eſaias Dupré, the theologian, from D. Baudrigeen; Anna Maria Schierman, with ſix Latin verſes, after Van Ceulen; Andrea Rivetus, profeſſor of theology; Frederic Spanheim, from Van Negre, profeſſor of theology, all in folio; James, duke of York and Albany, from Sim.

Luttichuys; Charles II. of England, companion to the preceding, from the ſame painter; John Maurice, prince of Naſſau, after Gov. Hinck; Maarte Harpertſz Tromp, the Dutch admiral, after Livens; four very fine portraits, after Titian, from the cabinet of Reynſt, *viz.* Peter Aretine, John Boccace, George Barberelli, and Sebaſtian del Piombo, all of large folio dimenſions.

Hiſtorical, &c.—"The Adoration of the Shepherds;" "The Virgin and Infant Chriſt," both in 4to.; an allegorical engraving, repreſenting a ſatyr leading an aſs, and a woman and child lying near a cock, in 4to.; "The four Fathers of the Church," after Rubens, in folio, executed in the ſtyle of P. Pontius; "The Graces embelliſhing a Statue of Nature," after the ſame painter, a large upright print on two plates. In the execution of this print, he ſeems to have had an eye to the neater works of S. Bolſwert. "A Shepherd crowning a Shepherdeſs with Flowers," after Caſtelyn, in 4to.; "The Holy Virgin preſenting the Breaſt to the Infant Chriſt," after Hinck; "Venus and Cupid;" and a head of a negreſs, both from the ſame painter, all in folio; "The four Elements," repreſented by children, in ovals of quarto ſize; a concert of four perſons; "Giorgione," in large folio, from the cabinet of Reynſt; and "The Monument of Admiral Van Tromp," after a marble group by Verhulſt, a very rare print, in large folio.

Nicholas van Hoie, or Van Hoy, was born at Antwerp in the year 1626. He was but an indifferent engraver; but, at the death of Francis Leux, was entitled cabinet painter to the emperor of Germany. In conjunction with Steen, Offenback, and other artiſts equally indifferent with himſelf, he engraved the collection of pictures, which D. Teniers the younger made for Leopold, archduke of Auſtria. This collection was publiſhed at Antwerp in the year 1660, in folio, conſiſting of two hundred and forty-three prints, and is uſually known by the name of the Gallery of Teniers. The following engravings are likewiſe by him: "The Virgin and Holy Infant, with St. Jerome," after Baroccio, in 4to.; "Chriſt and the Woman of Samaria," after Raphael; "The dead Body of Chriſt extended on the Earth, and the Virgin proſtrate before it," from D. Fetti; and "Apollo and the Muſes on Mount Parnaſſus," after Tintoretto, all of folio ſize.

Richard Collin was born at Luxembourg in the year 1626. He went to Rome to ſtudy under Sandrart, from whoſe drawings he engraved ſeveral plates. He afterwards returned to Antwerp; from whence removing to Bruſſels, he was honoured with the title of engraver to the king of Spain. But in his engravings he ſeldom exceeded mediocrity. There is a portrait of this artiſt, with a long inſcription in bad French. The following are ſome of his beſt engravings:

Portraits of Artus Quellinus, a ſtatuary of Amſterdam; John Philip van Thielen, a flower-painter, both from E. Quellinus, in 4to.; Joachim Sandrart; Cornelius Hazart, a controvertiſt, both in folio; Bartholomew Murillo, the celebrated painter of Spain; Chriſtian Albert, biſhop of Lubeck, both in large folio; Anna Adelhildis, uxor principis de la Tour et Taxis; Claude Francis de la Viefville, abbé of Louvaine, in large folio; Arnold John Philip de Raet van Voont, knight of the order of Chriſt; and the thirty portraits of the ſaints of mount Carmel, all in large folio.

Hiſtorical, &c.—"Eſther before King Ahaſuerus," in large folio, from Rubens; "Chriſt carrying the Croſs," after Van Diepenbeck, in folio; "St. Arnold," after the ſame painter; and "The Sepulchral Monument of Peter Paſqual," both in 4to.

Francis van Neve, or de Neve, was born at Antwerp, A.D. 1627. He ſtudied the works of Rubens and Vandyke, and afterwards travelled to Italy. He became a landſcape-painter of conſiderable merit, and ſucceeded remarkably well in introducing ſmall figures into his pictures.

On his return to his native city, Van Neve etched a conſiderable number of landſcapes, into which he introduced hiſtorical figures with much judgment. They are executed in a ſlight, but intelligent ſtyle; the effects are very agreeable, and they are all from his own compoſitions, proving at once the excellency of his taſte, and the fertility of his genius. The following are ſelected from his works, as being the moſt meritorious.

A pair of mountainous landſcapes with buildings, and figures in the coſtume of the Grecians; a pair of landſcapes of the ſame character, with an angler and two other figures in one, the other has a large tree and a river in the fore-ground, and a man tending ſheep at a diſtance; a pair of paſtoral landſcapes, with figures in the dreſs of Arcadian ſhepherds; a pair of landſcapes, into one of which is introduced Diana and Endymion, and in the other Venus and Cupid; and another is Venus repoſing on the banks of a river, and Cupid ſwimming in it; a pair of hiſtorical landſcapes, in one of which is Narciſſus admiring himſelf; and the other is a paſtoral ſcene, with a ſhepherd playing the tabor, accompanied with his flock; all of folio dimenſions.

Henry Verſchuring was born at Gorcum in the year 1627. He learned the rudiments of art under Theodore Govertz, whoſe ſchool he quitted to ſtudy under John Both. From Utrecht, where Both reſided, he went to Rome, where he frequented the public academy, and travelled ſucceſſively to Florence and to Venice. In 1655 he returned to his native country, where he painted battles, ſkirmiſhes, and ſubjects of that kind, with great ſucceſs; he always imitated nature with much truth, and his compoſitions abound with wild variety and characteriſtic ſpirit.

Verſchuring executed a conſiderable number of ſlight etchings of ſkirmiſhes, military ſurpriſes and purſuits, from his own compoſitions, of which the preſent writer is unable to ſay more than that they are very ſcarce.

This artiſt was drowned in a tempeſt at ſea, on the twenty-ſixth of April, 1690.

John or Joſhua Offenbeck was born at Rotterdam in the year 1627, and became a landſcape and cattle-painter, whoſe merits will be treated under the article Ossenbeck.

He travelled ſucceſſively, either for patronage or improvement, to Frankfort, Mayence, Ratiſbon, and Vienna, and in the courſe of his profeſſional career, executed a conſiderable number of etchings in a free and painter-like ſtyle. Huber thinks they are the production of his leiſure, but it may fairly be preſumed that at leaſt thoſe which he executed for the gallery of Teniers were done as much for profit as for pleaſure.

Among theſe are "The Death of the Children of Niobe," after Palma; "The Children of Iſrael gathering Manna in the Deſart," after Tintoret; "Orpheus charming the Brutes," and "The Four Seaſons," all after Baſſan, and of folio ſize. Offenbeck is thought to ſucceed better in etching after the pictures of Baſſan, than thoſe of any other maſter, and the laſt-mentioned are among his very beſt prints.

For other publications he produced two ſets, of twelve quarto plates each, from his own compoſitions, of which one ſet conſiſts chiefly of animals; "A View of the Campo Vaccino," at Rome, and "The Caſarella, near the Gate of St. Sebaſtian," in the ſame city; "A Boar-hunt," after Bamboccio, and the chateau of M. de Wenzelbourg, drawn preſumptively by himſelf, all of folio dimenſions.

A ſet of ſix large upright folio etchings, entitled "The Gallery of Wenzelbourg," and after Salvator Roſa, Peter de Laer, and St. Vlieger, are of great variety; and "The Repreſentation of a grand Feſtival given at Vienna," after a picture by Alex. Lartucci, in large folio, is alſo among the fineſt and rareſt engravings of this maſter.

Adrian vander Kabel, or Cabel, was born at Ryſwick, near the Hague, A.D. 1631. He was the diſciple of John van Goyen, but appears to have formed his ſtyle partly from ſtudying the works of Salvator Roſa. He painted and etched landſcapes, which were ſometimes of paſtoral, and at others of marine character, all of which he ſtudied from nature, and imitated her with great accuracy.

The Rev. Mr. Gilpin juſtly remarks of his etchings, that, "in thoſe which he has ſtudied, and carefully executed, there is great beauty. His manner (ſtyle) is looſe and maſterly. His prints want effect, but abound in freedom. His trees are often particularly well managed: and his ſmall pieces in general are the beſt of his works."

Among theſe may be diſtinguiſhed a ſet of ſix quarto landſcapes, ornamented with figures and ruined edifices; another ſet of thirty of mountainous character, with rocks, caſtles, and cataracts; another ſet of four, alſo of romantic character, adorned with figures and ruined fabrics, in folio; a pair of landſcapes of the ſame general character, alſo in folio; and, in larger folio, another pair of "St. Jerome in the Deſart," and "St. Bruno," or, according to Strutt, "St. Anthony," alſo in a wild and ſavage landſcape. It is remarkable, that in the latter plate the figure of the ſaint is *engraved*, without any croſs-hatchings, in the ſtyle of Mellan, and if Strutt's conjecture be right, is inſerted by ſome other artiſt. The two latter prints are probably the rareſt, though not the beſt, of the prints of Vander Kabel, who died at Lyons in the year 1695.

Jeremiah Falck, or Falk, was born at Dantzic ſome time about the year 1630. In his youth he travelled to Paris, and ſtudied under Chaveau, but ſettled afterwards in Holland, where he etched and engraved ſeveral plates for the cabinet of Reynſt, in conſequence of which he is generally claſſed with the engravers of the Low Countries. He worked both with the etching-needle and the graver, and engraved hiſtory and portrait with conſiderable ſucceſs. In the courſe of his life he viſited the courts of Denmark and Sweden, but finally eſtabliſhed himſelf at his native city of Dantzic, where he died at an advanced age.

The number of his plates that are ſubſcribed with his name, with the addition of "Van Stockholmia," ſhew that he muſt have remained in Sweden for ſome years, and have given riſe to the ſuſpicion of Strutt, that he was a native of that country. His ſtyle of engraving is vigorous and free, and his drawing tolerably correct, but his chiaroſcuro is defective in harmony.

The Abbe Marolles was in poſſeſſion of ninety-three engravings from the hand of Jeremiah Falck, from which the following may be ſelected, as affording the beſt ſpecimens of his abilities; *viz.* the *Portraits* of Tycho Brahé, inſcribed "Non habere ſed eſſe;" William Blaeu, the diſciple of Tycho Brahe, a celebrated geographer, both in folio, and from drawings by himſelf; Conſtantine Ferbor, of Hamburgh, after Ad. Boy; Andrea de Leſzno Leſczynſki, biſhop of Kaminiec, inſcribed J. Falk, Polonius ſc.; queen Chriſtina of Sweden; Peter Gembici, biſhop of Cracovie, all after his own drawings; Hans Schack, a Daniſh general, after C. van Mander; Louis de Geor, after David Beck; Leonard, count of Torſtenſohn; Axel, count of Oxenſtiern; Axel Lilio, a ſenator of Sweden; Adolphus Johan, prince palatine; Charles Guſtavus, prince of Sweden, all after D. Beck, and in folio; and Adrian Spiegelius, for the folio edition of his works, which was publiſhed at Amſterdam, A.D. 1645.

Hiſtorical, &c.—A ſet of "The four Evangeliſts," half-length figures, in quarto; "A Concert of Muſic," conſiſting of four performers, after Guercino, engraved for the cabinet of Reynſt, in large folio; "The Virgin and infant Chriſt, accompanied by St. John," after J. Stella, in folio; "The Cyclops at the Forge," after Michael Angelo; "Eſau diſpoſing of his Birthright to Jacob," after Tintoretto; "A Man and Woman ſinging," from a picture attributed to John Lys, in folio; "The old Coquet at her Toilette," from the ſame painter; and "St. John preaching in the Deſart," after Bloemart, a very capital engraving, both in large folio. The laſt five engravings were for the cabinet of Reynſt.

John Hackaert, the landſcape-painter of Amſterdam, of whom we have treated in our vol. xvii. etched a few plates, about this period, with much ability, and in a ſtyle reſembling that of Waterloo.

Of theſe the chief are a ſet of ſix quarto plates of ſimple rural ſcenes, apparently views from nature. They are etched with taſte, and No. 4 is particularly beautiful.

Daniel Stoppendael of Holland was born in the year 1630 In his ſtyle of engraving he was a follower of Cornelius Viſſcher, but, like other *followers*, was always behind.

His principal engravings are, a portrait of Eraſmus reading, on a pedeſtal, in large folio; a ſet of twelve of figures and animals, in quarto, dated 1651; a collection of ſixty views, entitled "Les delices dic Diemen Meer," engraved from his own drawings, and another ſet of thirty-four views in Holland, all of quarto dimenſions.

B. Stoppendael, or Stoependaal, was the countryman and contemporary of Daniel. Whether they were related is uncertain. He migrated to England with William III. and his principal works, which are now become ſcarce, record the events of the revolution, which placed William and Mary on the throne of theſe kingdoms.

"An Attack of a Convoy of Proviſions;" the robbery of a coach, commonly known by the title of "The Piſtol Shot," and "The Lime-kiln," were engraved by Stoppendaal, after Viſſcher's prints from Bamboccio, and are at preſent more ſought after than the originals. "The Departure of William III.;" "The Arrival of that Prince in England;" "His Coronation;" and "His Opening of the Parliament," are of folio ſize, and from deſigns by the engraver himſelf.

Frederic Henry van Hohe was born at Haerlem, A.D. 1630, but migrated to England, and reſided chiefly in London, where he was employed by the bookſellers, and chiefly by John Dunton. His abilities were not conſiderable, but at a period when few engravings appeared that were ſuperior to his, it is not to be wondered at that thoſe of Van Hove ſhould have been held in ſome degree of eſtimation.

His prints are dated from 1648 to 1692, in which laſt year he executed the portrait of king William on horſeback, which was prefixed to "The Epitome of War." His beſt engraving, according to Strutt, is the portrait of Jacob Cornelis, a middling-ſized upright plate arched at the top, from C. Viſſcher, whoſe ſtyle of engraving he has imitated with ſome little ſucceſs. The productions of his graver were chiefly portraits, among which are thoſe of ſir Edmundbury Godfrey, in folio; and ſir Matthew Hale, in quarto. He engraved this laſt portrait twice, but the ſmalleſt is the moſt eſteemed. Several frontiſpieces and book ornaments, and many of the plates for Quarles's Emblems, are alſo among the prints of Van Hove.

The Bouttats were a numerous family of painters and engravers,

engravers. Frederic was born at Antwerp A.D. 1630, and had twenty-four children, of whom twelve were educated to different branches of fine art. Frederic publiſhed the works of other engravers as well as his own, and may deſerve more credit in the annals of commerce (if ſuch there be) than can be allowed him in thoſe of art. He worked with the graver only, in a neat but dry ſtyle; his works are numerous, and conſiſt chiefly of portraits, but their merits are ſmall. From among them the following may be ſelected with advantage.

The *Portraits* of J. Baptiſt van Heil, a portrait-painter of Bruſſels; Daniel van Heil, a landſcape-painter; and Leo van Heil, an architect, from pictures by J. Baptiſt van Heil; David Ryckaert, from a picture by himſelf; Charles Emanuel, duke of Savoy; Charles Gaſpar, elector of Treves; Chriſtina, queen of Sweden; Oliver Cromwell; Frederic-William, elector of Brandenburg; John George, elector of Saxony, all in quarto.

Of his *Hiſtorical* engravings—"The Holy Virgin, with St. John and the Infant Saviour;" and "A Card Party," from a deſign by himſelf, are alone worthy of notice.

Gaſper Bouttats was a younger brother of Frederic, who worked chiefly for the Dutch bookſellers. His prints conſiſt chiefly of etching, which he performed without taſte, in a tame and rapid ſtyle.

Beſide his book-plates, which we ſhall not enumerate, he engraved a few of larger dimenſions, among which are, "The Maſſacre of the Huguenots;" "The Aſſaſſination of Henry IV. of France;" and "The Decollation of the Counts Nadaſti and Cerini, and the Marquis Franciſſani," all of large folio ſize, which, as they are without painters' names, are perhaps deſigned by himſelf; and "A Proviſion Tent," after Wouvermans, alſo in folio.

Gerard Bouttats was of the ſame family, and was born A.D. 1634, at Antwerp. He travelled during his youth to Vienna, where he became engraver to the univerſity. His works riſe not above mediocrity, and conſiſt principally of portraits from his own drawings: among them are Adamus Munds; Antonio d'Aument; Charles Joſeph, archduke of Auſtria; and Don Peter, king of Portugal, all of quarto ſize.

His beſt *Hiſtorical* prints are, "The Name of Jeſus;" and "The Reſurrection of our Saviour," both in quarto.

Philibert Bouttats was likewiſe a native of Antwerp, and one of the ſons of Frederic. His engravings are moſtly portraits, but are deſtitute of merit. Among them is pope Innocent XI. in large folio; the dauphin, ſon of Louis XIV.; and its companion, Mary-Ann Victoria of Bavaria, both in folio ovals; Elizabeth Charlotte, ducheſs of Orleans; William-Henry, prince of Orange; Chriſtian V. king of Denmark; Herman Werner, biſhop of Paderborn, in a circle; Alexander Sidney, ambaſſador; John Sobieſki, king of Poland, all in folio; and a Theſis, with the portrait of the biſhop of Munſter, in large folio. We paſs over Peter Balthaſar, and the remainder of this family, as too inconſiderable to be worthy of the reader's attention.

Adrian Lomelin was born at Amiens in the year 1636. He ſtudied the art of engraving at Antwerp, and always reſided there. He worked with the graver only, and handled it very indifferently, but, unfortunately, ſeveral of the capital pictures of Rubens fell into the hands of this engraver, and his works are here ſpecified chiefly on account of the merits of the originals.

However, ſome of his portraits after Vandyke are not wholly deſtitute of merit, and from theſe the following may, with advantage, be ſelected.

Charles I. king of England; Ferdinand of Auſtria, governor of the Low Countries; Jacob le Roi, lord of Herbaix; John Charles de la Faille, a Jeſuit of Antwerp; Alexander de la Faille, an Antwerp ſenator; Zegher van Houtſum, of Antwerp; Adrian Stevens, an eccleſiaſtic; John Malderus, biſhop of Antwerp; John de Wael; and John Baptiſta de Biſthoven, an Antwerp Jeſuit. This laſt is reckoned the very beſt of the portraits of Lomelin: all are after Vandyke, and of folio dimenſions.

Hiſtorical, &c.—"Abigail appeaſing David;" "The Adoration of the Eaſtern Kings;" "The Circumciſion;" "The Baptiſm of Chriſt;" "Mary waſhing the Feet of Chriſt;" "Chriſt appearing to Mary Magdalen;" "The Trinity;" "The Triumph of Charity;" "Time unveiling Truth and conquering Hereſy;" "The Aſſumption;" "The Virgin and Infant Saviour," attended by St. Dominic, and various others, all of large folio ſize; "St. Cecilia," in folio; "The Judgment of Paris," in large folio, all after Rubens; "Chriſt taken in the Garden," from Vandyke; and "The Holy Virgin," with the youthful Saviour preſenting a crown to four fathers of the church, in folio, after Diepenbeck.

Nicholas Pitau, or Pithau, was born at Antwerp in the year 1633. He was the ſon and pupil of James Pitau. He travelled to Paris A.D. 1660. Baſſan erroneouſly informs us that he was born in 1664 at Antwerp; and Watelet ſays at Paris in 1633; Huber and Martini correct theſe miſtakes, and from other authorities it appears certain that he was at Paris the time we have mentioned above, and died there ſome time about the year 1676. His ſtyle of engraving nearly reſembles that of Francis de Poilly, though his ſtrokes are more vigorous. His drawing is in general tolerably correct, but, at times, is rather heavy, eſpecially in the extremities of his figures. He worked with the graver only, and appears to have handled that inſtrument with much facility; but from the ſameneſs of manner with which he has treated his figures, draperies, and back-grounds, the effect of his prints is cold and ſilvery. Watelet, who generally writes with more taſte and feeling than almoſt any other of the foreign critics on engraving, praiſes him ſomewhat too highly, when he aſſerts that "Pitau's engraving of the Holy Family, after Raphael, is a chef-d'œuvre, both for the beauty of the execution, the purity of the drawing, and the ſtrength and juſtneſs of the effect. The character of Raphael has, perhaps, never been ſo faithfully tranſlated as in this print, which, by amateurs, has been preferred to the famous engraving of the Saint, by Edelinck," which is after the ſame celebrated maſter.

This artiſt engraved both portraits and hiſtorical ſubjects, and the following are ſelected from his beſt.

Portraits.—St. Francis of Sales, biſhop and prince of Geneva; Louis Henry, duke of Bourbon; Oliver Cromwell, after Vander Werf, all in folio; Alexander VII., after P. Mignard, in large folio; Vincent de Paule, founder of the congregation of the Miſſion of St. Lazarus, after Sim. François, in folio; James Fabier du Bulay, maſter of the court of Requeſts; and Henry Louis Hubert de Montmort, of the French Academy, both in ovals of folio ſize; Theodore Bignou, maſter of the court of Requeſts, all after Ph. de Champagne; Peter Seguier, chancellor of France, from N. de Platte Montagne, in large folio; Prioli, author of the French Hiſtory; Alexander Paul Pitau, counſellor, both in folio; Gaſper de Fieubet, chancellor; Nicholas Colbert, in large folio, all after C. le Febure; Louis XIV. of France and Navarre; the dauphin, ſon of Louis XIV. both from le Febure; and an anonymous portrait of a man, half-length, after John Daret, all of large folio ſize.

Hiſtorical, &c.—"The Holy Family," after Raphael, in folio; "The Entombing of Chriſt," after L. Caracci, in large folio; "The Virgin with the Infant Saviour reading," in an oval, after Guerchino; "A dead Chriſt, with Angels weeping over him," from the ſame painter; a half-figure of "The Virgin with the Infant Chriſt," in folio; "Jeſus Chriſt in the Clouds, with St. John and the Virgin interceding for St. Bruno," in large folio; "Chriſt and the Woman of Samaria;" "The penitent Magdalen;" "The Council of St. Sulpitius;" and "The Holy Family," all after Ph. de Champagne, and of folio ſize. Another "Holy Family," wherein an angel is preſenting the infant Saviour with a baſket of flowers, after Villequin; and a large Theſis, after Seb. Bourdon.

Charles or Karel du Jardin was born at Amſterdam in the year 1635, and died at Venice in 1678. He was the diſciple of Paul Potter, or, as ſome authors affirm, of Berghem; and after ſtudying for ſome years in his native country, made a voyage to Italy, under the pretext of accompanying a friend to Livourna.

Here he was ſo well pleaſed, either with the climate and landſcape ſcenery, or the patronage which Italy afforded him, that he continued there for the remainder of his life. As a painter, we have already treated of the merits of Du Jardin. Both as painter and engraver, he added ſparkling force to the taſte and touch of Berghem. He underſtood the anatomy of domeſtic animals, perhaps better than Potter or Berghem. He drew with the utmoſt freedom, though his drawing is ſtrictly correct. He copied nature ſimply and exactly, though not ſervilely; and has given us not only the form, but the characteriſtic peculiarities alſo, of each animal. He never indeed, like Hondius, animates his creation with the violence of ſavage fury: his genius takes a milder turn. In his prints, all is quietneſs and repoſe. His dogs, after their exerciſe, lie ſtretched at their eaſe; and the languor of a meridian ſun commonly prevails through the piece. His compoſition is beautiful; and his execution, though neat, is ſpirited.

Some of his prints are of quarto, and others of folio, dimenſions; but they are generally met with, bound together in a folio volume, which is highly and juſtly valued by all perſons of taſte, and conſiſts of fifty leaves. His ſubjects are generally landſcapes, or paſtoral converſations, in which cattle are often the principal objects. Of that which is placed the fifth in the volume, the Rev. Mr. Gilpin has written: "The deſign, though humble, is beautiful. The two dogs repoſing at noon, after the labour of the morning, the implements of fowling, the fictitious hedge, and the loop-holes through it, all correſpond, and agreeably tell the little hiſtory of the day. The compoſition alſo is good. The nets and fowling-pieces are judiciouſly added, and make an agreeable ſhape with the dogs. The hedge adds another pyramidal form. The light is well diſtributed. The drawing and expreſſion are pure nature, and the execution elegant and maſterly."

RUYSDAEL, (for an account of the character of whoſe merits as a painter, ſee that article,) executed, about this period, ſome very maſterly etchings: they are ſlight, but very pictureſque, and may be conſidered as beautiful ſketches from nature. The following are a ſelection of the beſt: a very ſcarce, woody landſcape, of very delicate execution, in ſmall 4to.; a ſea-view, with veſſels, and a mountain towards the left, crowned with trees and buildings, in 4to.; a cottage emboſomed in trees, with a wooden bridge, and a peaſant and dog, in folio, executed in a broader ſtyle; a foreſt ſcene, in folio; and a landſcape of wild character, with a hovel on the deſcent of a hill, in folio.

John le Ducq was a native of the Hague, and born in the year 1636. He learned the rudiments of painting of Paul Potter, whoſe ſtyle he imitated with much ſucceſs. In 1671 Le Ducq was made director of the academy of painting at the Hague, and enjoyed the reputation of a good artiſt; but after ſome years he quitted the arts, and entered the military ſervice. Le Ducq executed ſeveral etchings from his own deſigns, with much intelligence and preciſion; among which is a ſet of eight quarto plates, of dogs, dated 1654.

Romyn or Romain de Hooghe was born at the Hague in the year 1638; and being a man of genius, and of great fertility of invention, ſoon diſtinguiſhed himſelf both as a deſigner and engraver. His ſtyle of art was ſingular and extravagant; but the ſurpriſe which his deſigns excited, and the impreſſion which their novelty made on the public mind, occaſioned his compoſitions to be much ſought after; and he compoſed and engraved many of the frontiſpieces to the books which were at that time printed in Holland.

The Rev. Mr. Gilpin ſays of him: "Romain de Hooghe is inimitable in execution. Perhaps no maſter etches in a freer and more ſpirited manner: there is a richneſs in it, likewiſe, which we ſeldom meet with. His figures, too, are often good; but his compoſition is generally faulty: it is crowded and confuſed. He knows little of the effect of light. There is a flutter in him, too, which hurts an eye accuſtomed to, and pleaſed with, ſimplicity."

His prints are generally either hiſtorical or allegoric; and among them, "The Deluge at Coeverden" (which, as Mr. Gilpin ſays, is finely deſcribed) has excited much notice.

This Deluge at Coeverden is a ſmall folio print, and is properly an *hiſtorical landſcape.* De Hooghe had here a *country* to deſcribe, and a *ſtory* to tell. The country is the environs of Coeverden, a Dutch town, with an immenſe bank thrown up againſt the ſea; the ſtory is the ruin of that bank, which was broken through in three places by the violence of a ſtorm. The ſubject was great and difficult, and the artiſt has acquitted himſelf in a maſterly manner. The town of Coeverden fills the diſtant view: the country is overſpread with a deluge, the ſky with a tempeſt, and the breaches in the bank appear in all their horror. The compoſition, in the diſtant and middle parts, is as pleaſing as ſuch an extenſive ſubject can well be. An elevated horizon was neceſſary to give a diſtinct view of the whole. The light is thrown over the landſcape in good maſſes; and the degree of flutter, which Mr. Gilpin ſeems to cenſure above, was here congenial to the ſubject. The expreſſion of the figures, of the horſes eſpecially, is very ſtrong: thoſe which the driver is turning, to avoid the horrid chaſm before him, are impreſſed with the wildeſt character of terror; and indeed the whole ſcene of diſtreſs, and the horrible confuſion in every part of it, are admirably deſcribed.

The execution, though good, is inferior to that of ſome others of the works of De Hooghe; and, with the foreground, a popular critic finds the following fault: The ſpirit, he ſays, which the artiſt has maintained through the reſt of the piece, ſeems here to flag: whereas here he ſhould have cloſed the whole with ſome noble confuſion, which would have ſet off the diſtant parts, and ſtruck the ſpectator with the ſtrongeſt images of horror. Inſtead of this, we are preſented with a few pigs and calves floundering in the water. The thought ſeems borrowed from Ovid. In the midſt of a world in ruins,

——"Nat lupus inter oves."

Among the numerous productions of this artiſt, the following are the moſt diſtinguiſhed: Servatus Gallæus, Roterodamenſis Batavus, in folio; admiral Michael Adriaenſz de Ruyter, a very fine portrait, in large folio; “The Army of William III. at the Battle of the Boyne,” and a medallion of himſelf and queen Mary, in large folio; “William Henry, prince of Orange, on Horſeback, accompanied by the young Princes, entering the City of Amſterdam;” an allegorical ſubject, relating to prince William Henry; another allegory, in compliment to Leopold II.; “The Marriage of William, Prince of Orange, with the Princeſs Mary;” “The Entry of the Prince of Orange into London;” “The Coronation of William III. in Weſtminſter Abbey;” “The Flight of James II. into France;” “Louis XIV. receiving James at St. Germains;” “The Siege of Vienna by the Turks;” “The Return of John III. king of Poland, after defeating the Turks;”; “The Siege of Rocheſter,” and “Taking of the Fort of Sheerneſs,” both ſubjects on one plate; “The Exceſſes committed by the French Soldiers at Bodegrave, and other Places in Holland;” “The Defeat of the French at Hochſtädt in 1704,” with the medallions of prince Eugene and the duke of Marlborough, all of large folio ſize; “The taking of Conſtantinople by the Turks,” in folio; “The Jews' Synagogue at Amſterdam;” “The taking of Nerva by Charles XII. in the Year 1700;” “The City of Gran, aſſaulted by the Imperialiſts,” both in large folio; “The Battle of St. Denis,” on two large plates; “The Prince of Orange declared Stadtholder of Holland;” “The Arrival of the Prince of Orange at London in 1688,” in large folio; twelve plates, illuſtrative of the faſhions of the ſeventeenth century, invented by De Hooghe, in 4to.; “The Deluge at Coeverden,” in folio, (the plate on which we have commented at ſome length); “The Entry of Louis XIV. into Dunkirk,” a large print, lengthways, on two plates, from Vander Meulen; “Charles II. king of Spain, deſcending from his Carriage to pay Homage to the Hoſt,” in folio, from De Hooghe's own compoſition; “The Maſſacre of the two De Witts,” in folio; an emblematical print, expoſing the vices of the monks and other eccleſiaſtics of the Romiſh church, a middling-ſized plate, lengthways, with the name of Loggan affixed to it, though it is evidently the work of De Hooghe, who, fearful perhaps of affixing his own name, fathered this engraving upon a foreign artiſt; and “The Fair at Arnheim,” in large folio.

Abraham Genoels, ſurnamed *Archimedes*, was born at Antwerp in the year 1638. He learned the rudiments of art of Jacques Backreel, and afterwards travelled to Paris for improvement, where he was employed by Le Brun and De Seve, and where a royal penſion and apartments in the Gobelins were aſſigned him. From the French metropolis, Genoels travelled to Italy, the common theatre of improvement, and after ſtudying there awhile returned to Paris, with the reputation of an excellent artiſt. In 1682 he viſited his native city, where he died at an advanced age. Genoels executed a conſiderable number of etchings of landſcapes in a free maſterly ſtyle, ornamented with very good figures and animals; a conſiderable number of them are from his own deſigns, and the large ones are particularly excellent. His compoſition is in general good, though perhaps, in ſome inſtances, a little too much crowded with objects. His prints ſhould be viewed as engraved *ſketches*, not as tranſlations of finiſhed pictures. This is the limit of their pretenſion, and thus regarded they are beautiful productions. The monogram of this artiſt will be found in *Plate* IV. of thoſe uſed by the artiſts of the Netherlands.

The following are a ſelection of the works of Genoels. A pair of mountainous landſcapes, with figures and monuments in the antique taſte, in 4to; three pair of landſcapes of the ſame character, and alſo in 4to; a ſet of four mountainous landſcapes, with water and buildings; four garden views with figures and ſtatues, in 4to; a pair of very fine Italian views, ornamented with figures and ſtatues; an Italian garden, with fountains and figures; a large landſcape with a waterfall; and a rocky ſcene with water, all of large folio dimenſions, are generally reckoned to be his very beſt productions.

James Neefs was born at Antwerp, A. D. 1630, and was probably related to Peter Neefs, the celebrated painter of architecture. He worked principally with the graver, and handled it with great facility. He drew the human figure with ſome degree of correctneſs, but in a mannered ſtyle. The characters which he has given to the heads of his figures, eſpecially when they required alſo an animated expreſſion, is often exaggerated.

He engraved both portrait and hiſtory, and his beſt works, though faulty in the above reſpects, have much merit on the whole. The following are ſelected as being moſt worthy the attention of the collector.

Portraits.—Joſeph Bergaigne, a Roman prelate, from Th. van Thulden; Gaſpar Nemius, biſhop of Antwerp, from G. Seghers; John Tollenario, a Flemiſh Jeſuit, from P. Fruytiers; Francis Snyders, the painter, the plate of which was etched by Vandyke, and finiſhed with the graver by Neefs; Anthony de Taſſis, from Vandyke; the marchioneſs of Barlemont, and counteſs of Egmont; Joſhua de Hertoghe, a miniſter of his Catholic majeſty at Ratiſbon; Martin Ryckaert, landſcape painter at Antwerp, all from Vandyke; Jaan Dolenaris, Jeſuit and author of the Speculum Vanitatis, after Ph. Fruytiers, all of folio ſize.

Hiſtorical, &c.—“The Fall of the Damned;” “Melchizedeck preſenting Bread and Wine to Abraham;” “Chriſt on the Croſs,” all in large folio; “St. Auguſtin,” in folio; “The Martyrdom of St. Thomas;” “The Judgment of Paris;” “The Triumph of Galatea,” very rare, all in large folio; “Philippus Prudens, Antwerpia,” repreſenting the king of Spain crowned by two genii, in folio; “The Cardinal Infanta of Spain,” in folio, all after Rubens; a woman with milk pails, and another with a baſket on her head; “Jeſus Chriſt and the ſix Penitents,” after Seghers, in large folio; “Job mal-treated by his Wife,” in folio; “The Martyrdom of St. Lievens;” “Jeſus Chriſt appearing to Mary Magdalen,” in large folio, after Seghers; “Chriſt before Pilate,” after Jordaens; “The Satyr, or the Gueſt who blew Hot and Cold,” in large folio; “A Shepherd and Shepherdeſs at rural Diverſion,” both after the ſame painter, in folio; and “St. Roch interceding for thoſe afflicted with the Plague,” after Eraſmus Quellinus, in folio.

Anthony Francis Baudins, or Baudouins, was born at Dixmude in the year 1640, and died at Paris in 1700. He was the diſciple of Vander Meulen, and con-diſciple of Van Hugtenbourg. He etched in a bold, free ſtyle, not unlike that afterwards adopted by Chatelain. Baudins executed a great number of plates, moſt of them from Vander Meulen; the beſt of which are as follows: a ſet of ſix landſcapes, in ſmall folio; a ſet of ſix, with buildings and figures, dedicated to Ph. de Champagne, in large folio; a ſet of eight, of buildings and figures; a hunt of hinds, dedicated to the marquis of Louvois; a ſtag hunt, a very rich compoſition; a large landſcape, into which is introduced the march of the king to Vincennes, dedicated to Le Brun; a landſcape, with the march of the queen to Verſailles, dedicated to the duke de Noailles; a view of Beſançon, on two plates; view of the city of Ardres, in Picardy; view of the city of Gray in Franche Compte; the city of Bethune in Artois, on two plates; a view of St. Lawrence de la

Roche, in Franche Compte; the caſtle of Jeux, on the frontiers of Franche Compte; the caſtle of Verſailles, as it was formerly; another view of the ſame caſtle as it is at preſent; the caſtle of Vincennes on the park ſide; the caſtle of Fontainbleau, on two plates; and two fine Italian garden views, after Genoels, all of them of very large folio dimenſions.

Michael Mouzin, or Moſyn, was born at Amſterdam in the year 1636. In the execution of his plates he united the point and the graver, but not ſucceſsfully, for his ſtyle is heavy and laboured, and his drawing incorrect. The following are extracted from his works as being moſt worthy of notice. Admiral van Waſſenaer, of Holland, in 4to. oval; admiral Ruyter, after H. van Alde, in folio; Cornelius de Witt, after the ſame painter, in large folio; John van Galen; a Dutch admiral, from Livens, in large folio; a couchant Venus, after Jac. Ad. Backer; the four elements under the empire of Venus, from Holſtein, in large folio; a group of children dancing to the muſic of a tambourin and triangle, played by a woman and ſatyr; another group of three children dancing; and a ſatyr preſenting a bunch of grapes to a female and child, all after Holſtein, in folio.

Jacob van Meurs was born at Amſterdam, A. D. 1640, but is rather an obſcure artiſt. He chiefly engraved book plates and ornaments, and ſome few portraits in a neat ſtiff ſtyle, among which are portraits of Nicholas Copernicus, the aſtronomer; Sibrandus Franciſcus Eydelſchemicus, from T. Faber, both in 4to.; profeſſor George Calixtus, in folio; Henry van Dieſt, doctor of theology, from Glauwe, in a quarto oval, and Charles II. of England, in folio, from Ant. Vandyke.

Levinus Cruylius, or Lewin Cruyl, was born at Ghent in the year 1640, but embraced the eccleſiaſtical life, and reſided at Rome. He drew and etched a conſiderable number of views in Rome, enriched with figures and buildings in a very intelligent pleaſing ſtyle. Many of his drawings were engraved by Julius Teſta, and we have alſo ſome very fine etchings by himſelf, that are marked with a monogram which will be found in *Plate* IV. of thoſe uſed by the engravers of the Low Countries. Of thoſe the chief are a ſet of twenty-three views of Rome, ancient and modern, in large folio; and another very large ſet of Roman views, with buildings and figures.

Peter Philippe, an artiſt of ſmall account, was a native of Holland, born ſome time about the year 1640. He engraved portraits, among which the following, though without poſſeſſing much merit, are probably the beſt.

A half-length of Louis Henry, prince of Naſſau, in folio; prince Henry Charles de la Tremouille, after Vander Bane; the aſſembly of the States General of Holland, after J. Toornfleet; and a Dutch banquet, after the ſame painter, all of large folio ſize.

Peter van Schuppen was born at Antwerp in the year 1623. Of whom he learned the earlier rudiments of art is not known, but he completed his ſtudies at Paris, whither he was invited at the ſame time with Edelinck, by the miniſter Colbert. His juvenile talents muſt therefore have been of high promiſe.

At Paris, he very judiciouſly placed himſelf under the inſtruction of Nanteuil; here he became juſtly celebrated both for the number and merit of his engravings, and here he died at an advanced age, A. D. 1702.

He engraved a conſiderable number of portraits, chiefly from his own drawings, and in a ſtyle which proves him to have been a man of conſiderable talent. The following are a ſelection of his beſt portraits, ſome of which are very fine. Claudius de Lingendes, in 4to.; Joannes Veriuſius, doctor of theology, after Loir; Samuel Bochart; Gilles Ménage, from de Pilles; and Nicholas le Camus, all in folio; Renaud, cardinal of Eſte, and biſhop of Reggio, in large folio; Anne de Courtenay, conſort of Maximilian, duke of Sully; Francis Pithou, juris conſulte, and Peter Pithou, his brother, all in folio; Anthony Chaſſe, prior of the monaſtery of St. Vedaſt; Peter Mercier, a general, all in folio; Francis Villani, biſhop of Tournay, from L. François; Anne Adolphine, baroneſs of Pauterſen, from the ſame painter, both in large folio; Claude Bazin of Beſon, from le Febure, in folio; Louiſa Mary Armand de Simianes, counteſs of Lyons; Louis le Pelletier, a parliamentary miniſter, from Nicholas de Largilliere; Francis van Meulen, the painter; and the prince of Wales, both from the ſame painter; Julius, cardinal Mazarine, from Nic. Mignard; Louis XIV. in a laurel border of oval form, from le Brun; the chancellor Seguier, from le Brun; Maximilian Henry, elector of Cologne, from Bartholet Flamael; Bernard de Foix, duke of Valette, from P. Mignard; Philip Deſpont, doctor of theology, from his own painting, all of large folio dimenſions.

Hiſtorical, &c.—"The Holy Virgin ſeated, with the Infant Chriſt," in an oval border of olive leaves, after Raphael, dated 1661, in folio; "The Holy Family, with St. John, who holds a Dove," from Seb. Bourdon. The earlieſt impreſſions are before the nudity of the infant was covered with drapery. "The Holy Family," after Gaſpar de Crayer; another "Holy Family," the ſame, except that the figure of St. Joſeph is eraſed; "St. Sebaſtian, with an Angel drawing an Arrow from his Body;" after Vandyke, all in large folio: and "King David," after Ph. Champagne, in folio.

The reader has probably already perceived that we are now arrived at a period, when the natural operation of commerce had tamed down engraving to the trading level, and an engraver rarely appeared in the Low Countries worthy of particular notice, though *workmen* of that profeſſion ſwarmed both in Holland and in Flanders.

The principle of the rapid acquiſition of pecuniary profit, which is the main ſpring of trade, ſeems to be eſſentially at variance with all the nobler purſuits of art and ſcience. An extraordinary artiſt—a phenomenon—may indeed now and then appear under ſuch circumſtances; as Mr. Bird, in our own times, has ſtepped majeſtically forth—the painter of pathetic ſentiment—from the tea-board manufactories of Birmingham; but the general principles of trade are not to be the leſs regarded as deſtructive, or at leaſt deeply injurious in their tendency, to all lofty intellectual effort, and all philoſophical enquiry into thoſe principles, on which improvement in art and ſcience may be perpetuated. To be exerciſed with honour and advantage to a nation, fine art has ever required a nobler impulſe and more foſtering care, than the ſhort-ſightedneſs of commerce has been inclined or prompted to beſtow. The golden eggs of art are never laid faſt enough for the cupidity of dealers. And the Cyclopædia might bluſh to detail the records of ſome engravers, who found a degree of favour and protection with the printſellers, which the word patronage was ſometimes proſtituted to expreſs, merely becauſe they *worked cheap*, and worked *ſubmiſſively*.

Among theſe obſequious tools, the engraver who would be content to afford the merchant the largeſt ſhare of profit, it became his intereſt to hold forth to the public, or to that part of the ſenſeleſs herd on whom Fortune ſhowers her favours in her moments of caprice, as the beſt artiſt. Diſheartened by preferences ſo unprincipled, the engraver of modeſt merit would retire in ſilence, and either change his profeſſion, or, if he were unable to do this, would look round for refuge where he might.

Several of thoſe of the Low Countries, who lived at this period, ſought an aſylum in England. Bouyed up by hope, perhaps attracted by falſe repreſentations of our national taſte or proſperity, they ſailed hither over a ſea of Diſappointment. They imagined an Heſperian garden, and found a ſterile waſte. They eſcaped from the rapacity of one ſet of dealers, to drudge under taſk-maſters that were more taſteleſs, and probably not leſs inexorable; and that fine ethereal mental eſſence, which is the ſpirit of art, was evaporated, partly by the ardours of trade, and partly by the agitations of political revolution.

We, therefore, ſhall paſs ſlightly over the dregs of Dutch engraving, with ſome regret on account of the nature of chronologic annals, and reſerve the remains of our particular attention for Houbraken, Audenaerd, Punt, and a few other artiſts of deſerved celebrity, with which muſt be cloſed our account of the ſchool of the Low Countries.

Conrad Waumans was born at Antwerp in the year 1630, and became the diſciple of Peter Bailliu. He unfortunately imitated his maſter, when much better models might have been found, and his drawing is not leſs incorrect, and his ſtyle of handling his graver ſcarcely a whit more principled. Yet he is the engraver of a conſiderable number of plates, which collectors have thought worthy of ſome attention. The chief of theſe are the

Portraits of John Both, (the landſcape painter and engraver,) after Willars; Herman Saftleeven; David Baille of Leyden, and Cornelius Janſen, both from pictures by that diſtinguiſhed artiſt, and all of 4to. dimenſions. In folio he engraved the marquis of Mirabelle; Emily, princeſs of Orange; Frederic Henry, prince of Orange, clad in armour; and Maria Clara, princeſs de Croye; all after Vandyke.

Hiſtorical, &c.—"The Deſcent from the Croſs," in large folio; "The Aſſumption of the Virgin," in 4to.; "The Holy Virgin and Infant Saviour," in folio; "The Holy Family with the abbé Alexander Scaglia receiving the Benediction of St. John;" and "Venus and Mars," in large folio; all after Rubens.

The family of Danckert, or Dankerts of Antwerp, though they maintained their ſtation as dealers in that commercial city for upwards of a century, were as artiſts, and ſpeaking of them in the aggregate, ſcarcely of ſuperior pretenſions to thoſe of Waumans.

Cornelius was born at Amſterdam in the year 1561, and eſtabliſhed himſelf as a printſeller at Antwerp ſome time about the middle period of his life. In his youth he produced a few meritorious prints, but (either by choice or neceſſity) his talents as an artiſt were gradually abſorbed by the craft and ſolicitudes of trade.

The *Portraits* of Guſtavus Adolphus, king of Sweden; Jacob Waſſenaer, earl of Obſdam; Cornelius de Wit; John Caſimir, count of Naſſau; John Calvin; and Peter Molinæus, all of folio dimenſions, are among the beſt of his engravings; to which the collector may add the following few *Hiſtorical* plates.

Equeſtrian figures of "Ninus," "Cyrus," "Alexander," and "Cæſar," with emblematical accompaniments, in large folio. A ſet of "The Seven Planets;" another of "The Seven Wonders of the World;" another of "The Twelve Sybils," in large quarto, all from his own deſigns; and "Meleager preſenting the Boar's Head to Atalanta," from Picou.

Danckert Dankerts was the ſon of Cornelius, and was born at Antwerp ſome time about the commencement of the ſeventeenth century. He was educated to engraving, but he was educated alſo to commerce, and ſucceeded his father as a printſeller.

He engraved portrait and landſcape, mingling in his technical practice the work of the etching needle with that of the graver. In his ſtyle of treating landſcapes, paſtorals, and cattle, he imitated Berghem and Viſſcher, but preſented us with little more than the *caput mortuum* of their abilities. He gradually fell into a dry and heavy habit of croſſing his firſt courſes of lines with ſquare ſecond courſes, and the taſte and intimate knowledge of forms by which thoſe great maſters are diſtinguiſhed, were in Dankerts utterly extinct.

He engraved chiefly after Berghem, and his beſt productions are "The Hartengaſt," or Stag-hunt; "Het Vinkebaantze," or, the Bird Catcher, both in large folio. A ſet of four large landſcapes of paſtoral ſubjects, of which one has the effect of moon light. Another ſet of four, with cattle and figures, of ſomewhat ſmall dimenſions. Another ſet of ſix, of ſimilar ſubjects, and a ſet of four, in folio, of which the title-page bears the inſcription "Danckert Danckerts fec. et exc." cut on a ſtone, all from the pictures of Berghem.

Of his *Hiſtorical* prints we need only mention "The Departure of Charles II. for England;" "Venus, Cupid, and Satyr," and a fountain with fiſhermen. There is alſo a print, which bears his name, of a curious cryſtal vaſe, which was found in the treaſury at Vienna; and his moſt eſteemed portraits are thoſe of Charles II. of England, and Bernard, earl of Martenitz.

John Danckerts was of Amſterdam, and of the ſame family with the preceding artiſt; the year of his birth has not been recorded, but ſoon after the middle of the ſeventeenth century he emigrated to England, where he engraved ſeveral plates after Titian and other maſters, and where he is ſaid to have produced the deſigns for the Engliſh tranſlation of Juvenal, which were engraven by Hollar.

Juſtin Danckerts was of the ſame family, and was alſo a printſeller of Amſterdam. He engraved the portraits of William, prince of Orange, and Caſimir, king of Poland; a Venus and ſleeping Cupid, and a ſet of the ſeven gates of Antwerp; more than which it would be needleſs to ſpecify of works ſo utterly worthleſs as productions of art.

Henry Danckerts was brother to John, and was likewiſe educated an engraver, but quitted that profeſſion to take up the pallet and pencils. He excelled in painting landſcape, and travelled to Italy for improvement, where he reſided during ſome time; from thence he came into England, and was patronized by Charles II. who employed him to paint views of the royal palaces, and the ſea-ports of England and Wales. Theſe works are dated 1678 and 1679. At the diſcovery of the Popiſh plot, being a Roman Catholic, and probably a ſuſpected character, he returned to Amſterdam, where he ſoon afterwards died.

The following are the moſt important of his engravings: *Portraits* of king Charles II.; Ewald Screvelius; and Chriſtian Rompf, (both phyſicians to the prince of Orange,) in large folio; a ſet of the ſea-ports and palaces of England, and a large view, engraved on three plates, of the Y at Amſterdam.

Simon Vlieger was born at Amſterdam in the year 1612. He ſtudied painting under Vander Velde the younger, and excelled in repreſenting landſcapes and ſea-views. This artiſt likewiſe etched ſeveral paſtoral ſubjects, ornamented with figures and animals, in a ſtyle which combined that of

Rembrandt with the ſpirit of Van Uden. The mark which he frequently affixed to his engravings will be found in our *Plate* IV. of thoſe uſed by the artiſts of the Netherlands: and the following is a ſelection of his beſt works.

A landſcape, with a barge unlading on the banks of a river; a pair of landſcapes, with trees, water, and figures, in quarto, executed in a very delicate ſtyle; a fiſh-market, with figures; a Dutch inn; a landſcape, with water and ruins; and another landſcape, with a number of turkies on the foreground, all of folio ſize.

Valentine le Febre, or Le Febure, was born at Bruſſels in the year 1642. In his youth he went to Venice to ſtudy the works of Titian and Veroneſe, and acquired ſome reputation as a painter. But his engravings, in general, are feeble, and want harmony; and the naked parts of his figures are heavy and mannered. He, however, handled the point with great facility, and produced good effects of chiaroſcuro.

In the year 1680, a ſet of fifty engravings, by this artiſt, appeared at Vienna, entitled "Opera ſelectiora, quæ Titianus Vecellius Cadabrienſis, et Paulus Calliari Veronenſis invenerunt et pinxerunt; quæque Valentinus le Febre Bruxellenſis delineavit et ſculpſit." In 1682, another edition was publiſhed, and in 1749 a third, with the plates retouched by John Adam Schweighart, of Nuremberg.

John Francis Milet, ſurnamed *Franciſco*, was born at Antwerp in the year 1644. He was of French extraction, and becoming the diſciple of Lorenzo Frank, was inſtructed to imitate the learned and admirable ſtyle of Pouſſin.

He became a painter and engraver of epic and heroic landſcape; travelled to Paris, and from thence to England, where he left ſome teſtimonials of his merit as an artiſt. On his return to Paris he was elected a profeſſor in the French academy, and ended his days in that metropolis, in the year 1680, leaving behind him ſeveral children, of whom two became painters.

The engravings of Franciſco are juſtly regarded with ſome intereſt by connoiſſeurs. D'Argenville mentions the ſubjects of only three, but the following are all after his compoſitions, and have every appearance of being the productions of the ſame hand.

An heroic landſcape, with Egyptian edifices, "The Nile, and Moſes floating in the Ark of Bulruſhes." Another, with the ſtory of Cephalus and Procris; a mountainous ſcene, with buildings and figures in the taſte of Pouſſin; another with paſtoral figures; another with figures bathing; another, in which is introduced the ſtory of the woman of Canaan; an Italian garden ſcene with a bridge and figures, and a pair of upright landſcapes, with ruined buildings and figures in the coſtume of antiquity, all of large folio dimenſions.

Cornelius Vermeulen was born at Antwerp in the year 1644. He travelled to Paris for profeſſional improvement, and reſided there for ſome years, but at length returned to his native country, and died there in 1702.

He handled the graver with judgment, his chiaroſcuro is tolerably good, and his ſtyle of manual execution poſſeſſes conſiderable neatneſs and clearneſs; but he did not underſtand the human figure correctly enough to excel in hiſtorical ſubjects, and his *portraits* are therefore his beſt works.

From theſe the collector may with advantage ſelect thoſe of queen Elizabeth; Anne Boleyn; Catherine Howard; and Oliver Cromwell, all after Vander Werf; John Baptiſta Boyer d'Aquilles; Louis de Clermont, biſhop of Leon; Henry Meyercron, envoy to the court of Denmark from France, all in folio; Maria Louiſa d'Orleans, ducheſs of Montpenſier, in an oval; Louis de Luxembourg, marſhal of France; Peter Vincent Bertim; Bardo Bardi Magalotti, a Florentine gentleman; Joſeph Roettiers, a medal engraver, all from H. Rigaud; Philip V. of France; Maximilian Emanuel, elector of Bavaria; Nicholas de Latinat, marſhal of France; Agnes Frances Lelouchier, counteſs of Arco, all after J. Vivier, in large folio; Louis Urban le Fevre de Caumartin, maſter of the Requeſts, from F. de Troy, in folio; Francis Brunet, preſident of the grand council, and Mezetin Angelo Conſtantine, both after the ſame painter; Maria Louiſa de Taſſis and Nicholas vander Borcht, both after Vandyke.

Theſe are his principal portraits, which are all of folio dimenſions. His few *hiſtorical* engravings that are worthy of notice, are "Erigone, with Bacchus under the Form of a Bunch of Grapes," in folio, after Guido. One of Rubens's Luxembourg gallery, from the Life of Queen Mary de Medicis, and a courtly allegory of "Louis XIV. conquering Hereſy," from a marble group, by Le Conte, both of folio ſize.

Adam van Zylvelt was born at Amſterdam, A.D. 1645; under what maſter he ſtudied is not known, but he evidently imitated the ſtyle of John Viſſcher. His principal works conſiſt of portraits, in the execution of which he rarely went beyond mediocrity, and of theſe the chief are Coornhaert the engraver, in 4to.; Stephen le Moine, a theologian of Leyden; Chriſtopher Wittichus, profeſſor of the Leyden academy, and Herman Witſius, a theologian; all from J. Heyman, and all of folio ſize.

Albert Meyeringh was a painter and engraver of landſcape and ornament. He was born at Amſterdam in the year 1635, and died in that city in 1714.

Albert learned the rudiments of art of his father Frederic Meyeringh, but owed the degree of excellence to which he attained rather to his own genius, and his friendſhip with Polydore, who was his fellow ſtudent. In his youth he travelled through France, and from thence to Italy for improvement. Here he firſt became acquainted with Polydore, and here for ten years the two friends purſued their ſtudies together.

Meyeringh now returned to Holland, and was much employed in painting the ceilings and other decorative parts of various public edifices. He alſo painted landſcape, and etched ſeveral folio plates, all from his own compoſitions, in a free and painter-like ſtyle. Their ſubjects conſiſt chiefly, like thoſe of the etchings of his friend Polydore, of rocky mountains, cataracts, and other romantic landſcape ſcenery, adorned with cattle, figures, and ruined edifices.

Of the ſuperior merits and general biography of John Glauber, the reader will find an account under the article Polydore. The etchings of this maſter are performed in a ſlight ſtyle, and their chiaroſcuro is but feeble. Yet are they valuable, on account of the claſſic or paſtoral beauties of his compoſition.

He in general etched after his own pictures, but he produced one claſſic landſcape with rocks and waterfalls after Pouſſin, and his allegorical ſet of the revolutions of the four great nations of antiquity, which is intitled "Statum Aſſyriorum, Perſarum, Græcorum, et Romanorum," is after Gerard Lairesse, as is alſo "Abiſhag before David." All the prints of Polydore are of folio dimenſions.

John Biſſchop, or Epiſcopius, was born at the Hague in the year 1646, and died at Amſterdam in 1686. He owed his excellence as an artiſt entirely to his own genius, having never ſtudied under any maſter. He made deſigns in diſtemper with great taſte, and which are beautifully finiſhed; and his etchings are very much eſteemed by connoiſſeurs, they are harmoniſed with the graver, and though ſlight, are free, intelligent, and pleaſing. He imparts richneſs to his tones, and roundneſs to his figures, far beyond what is uſually done with the point, ſo little aſſiſted as it is in the prints of Biſſchop by the graver. His figures in general are drawn with ability, yet in a mannered rather than a correct ſtyle. The extremities, indeed, are not always well marked, nor his heads equally expreſſive or beautiful.

His moſt conſiderable work is intitled "Paradigmata graphices variorum artiphicum tabulis Æneis," Hague 1672, in folio. Two editions of this work were publiſhed in the ſame year, one by the artiſt, conſiſting of one hundred and two plates; the other contains one hundred and thirteen, and was publiſhed by Nic. Viſſcher. As they differ eſſentially, the curious are generally deſirous of poſſeſſing both.

The mark uſed by this artiſt was a J and E, becauſe he latiniſed his name, ſubſtituting Epiſcopius for Biſſchop: this monogram will be found in *Plate* IV. of thoſe uſed by the artiſts of the Netherlands.

The remainder of the engravings by Biſſchop, are "Chriſt and the Woman of Samaria," in large folio, after Annibale Caracci; "Joſeph diſtributing Corn to the Egyptians," in large folio, from Bartholomew Brunberge; "The Martyrdom of St. Lawrence," its companion, from the ſame painter. A large book from the drawings of the great maſters; and a book of ſtatues.

John van Hugtenburg, or Huchtenbourg, was born at Haerlem, A.D. 1646, and died at Amſterdam in 1733. He ſtudied painting under John Wyck, and afterwards went to Italy for improvement, and reſided a conſiderable time at Rome. On his return he viſited Paris, and often painted on the ſame canvas with Van der Meulen, though his ſtyle bears reſemblance to that of Wouvermans. Hugtenburg excelled in painting battles, encampments, ſieges, &c.; and was employed by prince Eugene to paint and engrave the battles and ſieges he ſo fortunately conducted. This artiſt not only characteriſed the different nations he repreſented by the coſtume, but by the general phyſiognomy of his figures.

He likewiſe etched a conſiderable number of plates in a ſlight, ſpirited ſtyle, with great freedom, and in a way which manifeſts the hand of a maſter. The figures, horſes, and other principal objects, are executed with peculiar feeling and ability.

The work which he executed from the pictures which he painted for prince Eugene is uſually bound up in a large folio volume, with hiſtorical explanations by M. J. Dumont. They were publiſhed at the Hague in 1725, on the frontiſpiece is inſcribed "Déſſeintes et gravées en taille douce, par le Sieur Jean Huchtenbourg." This work is curious and conſiderable, but is not conſidered as containing his beſt engravings; he likewiſe ſcraped mezzotinto a good deal, but his performances in that art are not ſo good as his etchings; and it is very difficult to find good impreſſions.

When this artiſt did not ſign his name at length, he ſubſtituted his initials, in the manner expreſſed in *Plate* IV. of thoſe uſed by the engravers of the Netherlands. The following are conſidered as ſome of his beſt engravings.

"Travellers halting before a Forge," in folio; "William III. reviewing his Army near Arnheim," in large folio; a ſet of eight oval prints, in 4to., repreſenting marches, encampments, battles, &c.; a ſet of four mountainous landſcapes with figures; "Hunters reſting," in a woody landſcape, in large folio; all from his own pictures. "A combat of Cavalry," in large folio, after Van der Meulen; another "Combat of Cavalry," dedicated to duke Charles Albert of Chevreuſe, in large folio; "The City of Liſle, inveſted by the French Army," on two large folio plates; "The taking of Dole," in large folio, on two plates; "The March of Louis XIV. and his Retinue, over the Pont-neuf to the Palace," in large folio; all after Van der Meulen. "The Battle between the French and Germans in Italy," in large folio, after D. Hoogſtraten; and "The grand Proceſſion of Horſes in Holland," dedicated to Frederic William, ſon of the king of Pruſſia, in large folio. Theſe two laſt are etched, and then harmoniſed with the graver, and are very capital performances.

Mezzotintos from his own Deſigns.—"Two Cavaliers marauding;" "Two Horſe Soldiers diſmounting before a Victualling Tent," both in folio; "A Halt before an Inn;" "Departure for Hunting;" "A Combat of Horſe Soldiers;" another "Combat of Cavalry;" and "The Imperial Cavalry fighting againſt the Turks," all in large folio.

Peter Schenck was one of thoſe who regarded engraving as a trade, or means of obtaining money, merely; and on whom it is fruitleſs to dwell. He was born at Elberfeld, A.D. 1645; became a printſeller of Amſterdam, and died at Leipſic in 1711.

While he continued to engrave, he was a mere workingman of induſtry. Sometimes he ſcraped mezzotinto portraits, and ſometimes he etched views; but both were very indifferently performed. Thoſe of his productions which are beſt entitled to notice, are the

Mezzotintos of Petrus Schenck, after J. P. Feuerling, in folio; another portrait of Peter Schenck, ſeated at table with his wife, in large folio; Martin Luther; Gottifried Keck, after D. Richter; Gerard Laireſſe; Philip Jacob Spener, theologiſt; John Oleraris; Peter de Witt, a divine, after Muris; Simon Schynvoet, an architect of Amſterdam; William Henry, prince of Orange; Charles XI. and Charles XII. kings of Sweden; buſt of the Virgin; "A Criminal confeſſing to a Monk;" "A young Woman confeſſing to a Monk;" "Death playing the Violin, and preſenting himſelf to a Man," inſcribed "Mortis ingrata Muſica," all of folio ſize.

John vander Bruggen was another who merged the artiſt in the tradeſman. He was born at Bruſſels, A.D. 1649; and worked for ſome time in his native country, but afterwards went to Paris, where he eſtabliſhed himſelf as a printſeller. In 1698 he publiſhed the works of La Fage, with the portrait of that artiſt engraved by himſelf in mezzotinto, after Largilliere.

There is a great number of mezzotintos by Vander Bruggen, which, though not entirely deſtitute of merit, are ſuch as do him no great honour as an artiſt. The mark which he frequently uſed will be found in our *Plate* IV. of thoſe uſed by the engravers of the Low Countries.

The following are the moſt important of his engravings. The portrait of himſelf after Largilliere; Antony Vandyke; and the portrait of Louis le Grand, all in folio. "The Gold weigher," after Rembrandt; "An old Woman weighing Gold;" "A Man ſeated, with a Goblet in his Hand;" A Man leaning againſt a Table, and a Woman behind him ſcolding;" "A Man ſeated under a Tree lighting his Pipe;" "A Man ſleeping, and another ſtanding near him;" "Cupid and Pſyche ſleeping;" a large ſkull, inſcribed "Memento mori;" "An old Man in a Public-houſe, with a Girl playing the Flute;" "A Party of Peaſants in a Public-houſe, ſmoking and drinking;" both the latter are after Teniers; and all are of quarto dimenſions.

Suſanna vander Bruggen was doubtleſs related to this artiſt, and engraved ſome few plates of no great merit, after Vandyke and Rubens.

John Luycken, or Luyken, was born at Amſterdam ſome time about the middle of the ſeventeenth century, and died in that city in the year 1712. He ſtudied the arts under Martin Zaagmoelen. Baſſan ſays of his prints, “we remark in them a fertility of genius, joined with great ſpirit, judgment, and facility of execution, he is the Callot, the Della Bella, and the Le Clerc of Holland.” But this is ſaying a great deal too much. He neither drew ſo correctly, nor etched in ſo clear and determined a ſtyle as either of thoſe diſtinguiſhed engravers. It is true there are few of his prints, into which he has not introduced a great number of figures, but the groups are ſeldom artfully managed; the lights, for want of harmony, and being too much ſcattered, confuſe the ſubject, and fatigue the eye. This is ſpeaking of them, however, only comparatively; conſidering them by themſelves they poſſeſs great merit.

He chiefly engraved after his own deſigns, and the moſt conſiderable of his works is the large bible, which was publiſhed by Montier in two folio volumes, and the following.

A ſet of “The Ten Commandments,” in 8vo.; a ſet of ſeventeen, of “The Hiſtory of Lapland and Finland,” in 4to.; a ſet of ſeventeen views, &c. which accompany the Eaſtern Travels of M. Thevenot, in 4to. The hiſtory of William III. king of England, in 8vo.; “The Republic of the Hebrews,” in twenty-eight plates, in 8vo. and 4to. “The Theatre of Martyrs,” from the time of Jeſus Chriſt, to modern times, in a ſet of one hundred and five plates, in 4to.; “The Prophet Jonas, preaching to the Ninevites,” in large folio; “The Aſſaſſination of Henry IV. of France,” in folio; “The Flight of the Reformers at the Revocation of the Edict of Nantes,” in large folio; “The Maſſacre of St. Bartholomew, or the Death of admiral Coligny,” a very capital print, engraved on two large folio plates.

Gaſpar, or Caſpar Luycken, was the ſon of John Luyken, mentioned in the preceding article, and was born at Amſterdam in the year 1660. He learned engraving from his father, and deſigned and engraved a conſiderable number of plates; but his works are neither ſo numerous nor ſo meritorious as thoſe of his father, whoſe ſtyle he imitated. Among them the following will probably be found moſt worthy of ſelection. “St. Francis Xavier preaching before the Emperor of Japan;” “The Jeſuit Miſſionaries obtaining Audience of the Emperor of China;” “The Emperor Joſeph I. receiving the Holy Sacrament;” “The Miracle of the Five Loaves,” all of large folio ſize; “The Twelve Months of the Year;” “The Four Seaſons;” and “The Grand Roman Cabinet;” all in folio.

Paul van Somer was born in Holland, A.D. 1649. He reſided during ſome time at Paris, and afterwards came to London. He etched, engraved, and ſcraped in mezzotinto, but his works in either art do him no great credit; among them the following are moſt worthy of attention.

“Tobit burying the Dead,” in large folio, from Sebaſtian Bourdon; “Moſes found in the Ark of Bulruſhes,” after Pouſſin; “The Baptiſm of our Saviour,” after the ſame painter, both in folio; “Nil placet, &c.” or the fable of the old man and his aſs, after Griffier, on a ſet of ſix folio plates.

From his own Compoſitions.—“The Holy Family;” “The Adoration of the Shepherds,” both in folio; “A Ruſtic Converſation of Four Peaſants,” in large folio. The four parts of the day, on 4to. plates, *viz.* “The Morning,” (Cephalus at the chace;) “Noon Day,” (Arethuſa bathing in the river Alpheus;) “The Afternoon,” (Diana and Acteon;) and “The Evening,” (Pyramus and Thiſbe.)

The two following are in *mezzotinto.* “The Counteſs of Meath,” after Mignard; and “An Officer and Girl in converſation,” both in folio.

John van Somer was born in Holland in the year 1640, and was probably related to Matthias van Somer, who, according to profeſſor Chriſt, engraved a ſet of landſcapes. John engraved in mezzotinto, and with the graver, but did not much exceed mediocrity. The following are ſome of his beſt productions. Antony Gregatus, profeſſor of theology at Heidelberg; Daniel Sachſe, theologiſt, both in 4to.; Charles Louis, elector of Bavaria; Michael Adriantſz, admiral of the United Provinces, a fine portrait, in large folio, from Du Jardin; “Three Peaſants drinking in an Alehouſe,” from J. Both; “Dutch Smokers,” after Oſtade; “A Dutch Concert,” from Teniers; “A Man filling his Pipe, and a Girl drinking,” from Gerard Terburgh, all in folio; “The Angels appearing to Abraham,” in large folio, from Laſtman; and “A Party of Pleaſure,” from his own deſign.

S. A. Van Lamſweerde was a native of Utrecht, born ſome time about the year 1650; but he appears to have been an artiſt of no great merit. He engraved portraits ſomewhat in the ſtyle of Suyderhoef, among which the following are moſt worthy of notice.

Francis Gomarius, a theologian of Bruges, in folio; Henry Alting d'Embden, a theologian of Heidelberg, in 4to.; Anna Maria Schurman, in folio; Cyprian Regnier, a juris conſulte, at Utrecht, after Gerard Duffeit; and Charles de Maets, profeſſor of theology at Utrecht, after Hendrick Bloemaert; both in large folio.

John Lamſvelt was born at Utrecht in the year 1660. He was probably a diſciple of Romain de Hooghe, whoſe ſtyle he has tried to imitate. His principal works are portraits, part of which he engraved for the hiſtory of Louis XIII., by Michael le Vaſſor, among which the following are the moſt important. A Head of Oliver Cromwell, in an oval of quarto ſize; John de Wit; Cornelius Pieterſzoon Hooft; George Caſſander; Hubert Duiſhuis, of Rotterdam; all rare and much ſought after by connoiſſeurs; and a large folio engraving of “The Siege of Tournay, by the duke of Marlborough and prince Eugene.”

John Verkolie was born at Amſterdam in the year 1650, and died at Delft in 1693. He became an artiſt owing to an accident he met with in his youth, which obliged him to keep his bed for three years, during which time he amuſed himſelf with copying pictures and drawings: he acquired the rudiments of perſpective from books, and he ſoon tried to paint in oil, without any other inſtructions. He afterwards became the diſciple of John Lievens, and ſtudied with aſſiduity the pictures of Van Zyle. Verkolie reſided at Delft, where he was obliged to employ great part of his time in painting portraits, but he likewiſe ſucceeded in hiſtorical and converſational ſubjects. He amuſed himſelf with ſcraping in mezzotinto, which was then but recently diſcovered; and the prints which he executed are much ſuperior to what might have been expected at ſo early a period. The following *Portraits* are ſome of his beſt productions in that art.

Himſelf, after De Leeuw, in 8vo.; Steffan Wolters, from P. Kneller, in quarto; Joſias van de Kapelle, a clergyman of Leyden; Cornelius van Acken, a clergyman of Delft; William Henry, prince of Orange; and Hortenſia de Mancini, ducheſs of Mazarin, after Lely, all in folio.

Various Hiſtorical Subjects, &c.—“Jupiter and Caliſto,” from G. Netſcher, (the companion to “A Shepherd and Shepherdeſs,” by G. Valck, from the ſame painter); “Venus and Adonis," from his own compoſition, companion to "Cephalus and Procris," engraved by Broedelet, after Gerard Hoet; "Venus and Cupid;" "Pan and Flora;" "A young Man and Girl converſing," from Ochtenvelt, all of folio ſize.

Nicholas Verkolie was born at Delft in 1673, and was the ſon of the preceding artiſt. He became the pupil of his father, and ſucceeded in painting hiſtorical ſubjects and portraits. He was alſo celebrated for his Indian ink drawings, which he finiſhed with great delicacy. Nicholas learned the art of mezzotinto ſcraping from his father, and practiſed it with ſtill more ſucceſs. The following are ſome of his beſt engravings.

Portraits.—Nicholas Verkolie, from a picture by himſelf; the painter drawing from a model; the amateur Moëlards with a folio, all in quarto; John Peter Zomer, a connoiſſeur, holding a print in his hand, from A. Booner. Some few impreſſions were taken from this plate, without the print, which is held by Van Zomer; but theſe are exceedingly rare; Martin van Bockelin, from his own picture; and Bernard Picart, after Nattier, all in folio.

Various, from his own Deſigns, and after other Maſters.—"The Holy Family," after A. vander Werff; "Diana and Endymion;" and its companion, "Bacchus and Ariadne," both in folio; "A Shepherd careſſing a Shepherdeſs," in large folio, all after G. Netſcher; "An Entertainment in a Garden," in folio, after J. B. Weninx; "Two Men drinking and ſmoking," after A. Matham, in large folio; "A Youth aſleep on a Girl's Lap," from his own deſign; "A young Girl and her Lover having their Fortunes told." "An old Man ſeated in a Garden, with a Girl, who holds a Miniature in her Hand," both in folio. Heads of a man and woman laughing; a lap-dog playing on a chair; and two dogs at play, all in quarto, very delicate engravings.

Solomon Savery was born at Amſterdam ſoon after the middle of the 17th century, and by ſome writers is ſaid, with great probability, to have reſided during part of his life in England. Under what maſter he ſtudied, if under any, is not known; but he handled his graver with a degree of vigour, feeling, and characteriſtic touch which proclaims original powers. The mechanical exactneſs and regularity of his hatchings, he, with great addreſs, rendered ſubſervient to his art of expreſſing the ſeveral ſurfaces which ſo beautifully diverſify the ample face of nature: his chiaroſcuro is ſufficiently powerful; and if the graver was not the ſole inſtrument of his art, he very rarely employed the point.

He produced a few hiſtorical ſubjects; but his chief excellence lay in portrait engraving, and he ſeems to have been partial to ſuch heads as were covered with hats, either becauſe he engraved the high-crowned hat, which was then in faſhion, with conſiderable ability, or becauſe he believed that ſo broad a maſs of darkneſs which theſe hats afforded, gave effect to his faces.

His principal *Portraits* are thoſe of doctor Camphuyſen, ſurrounded by an olive wreath, and three allegorical figures, after C. Caſleyn; Simon Epiſcopius, and Andrea Calvius, after Cuyp; Iſaac Saaly of Ziriczee; John Speed, the Engliſh chronicler, with his hat on, a very excellent plate; king Charles I. with a high-crowned hat, the face of which portrait is believed to have been taken from a picture by Vandyke, and the hat and the other accompaniments added by Savery himſelf; and Thomas, lord Fairfax, alſo with a hat on, all of folio ſize.

Hiſtorical Subjects, &c.—"Chriſt expelling the Money-lenders from the Temple," in large folio. A man's head with muſtachios and ſhort curly hair, both after Rembrandt. A grand entertainment given on the water, in honour of Mary of Medicis, after S. Vlieger, (which belongs to a ſet of engravings that were publiſhed at Amſterdam in the year 1638, and entitled "Medicea Hoſpes.") A grand proceſſion, in large folio, after M. de Jonghe; and a ſet of ſeventeen etchings, of which the ſubjects are taken from Ovid's Metamorphoſes, after F. Cleyn.

Thomas Wyck, Theodore Maes, Julius François, (ſurnamed *Horizonti*), Louis Deyſter, Charles de Moor, and Richard and John van Orley, were Dutch and Flemiſh painters, who lived at this period, ſome of whom performed a few etchings, and others of whom ſcraped a few mezzotintos.

The etchings of Wyck are ſmall, but free and delicate. Fourteen of them, which were in the poſſeſſion of Mariette, and were ſold at his auction for three hundred and ſix livres and ſix ſous, are probably all that Wyck ever produced. They conſiſt of paſtoral and military ſubjects, and are all from his own compoſitions.

In thoſe of Maes, much of painter-like intelligence may be diſcerned. "The Holy Virgin and Infant Chriſt, attended by two Angels;" and a ſet of ſmall plates, of cavalry ſkirmiſhing, &c. are all that we know of from the needle of this artiſt.

The etchings of Horizonti, like thoſe beautiful water-colour pictures with far diſtant and ſweetly-painted horizons, from which he obtained his cognomen, are landſcapes in which Tivoli and the Campania of Italy are frequent features.

Deyſter filled up ſome of his hours of ſecluſion with etching and mezzotinto ſcraping; and his productions in theſe arts partake of the character of his genius as a painter, of which we have already treated. Among them is a ſet of four landſcapes, in rather a grand ſtyle, of quarto ſize, which are rare and much eſteemed.

The excellence of De Moor lay in portraiture. He etched, in a ſpirited manner, the heads of his maſter, Gerard Douw, Van Goyen, and Mieris, and he alſo, according to Baſſan, ſcraped a few plates in mezzotinto, of which we know not the ſubjects.

Richard van Orley was born at Bruſſels, A.D. 1652, and died in the ſame city in 1732. He learned the elements of art of his father, who was a landſcape painter of no great eminence. He began by painting miniatures; but feeling a deſire to gain a more elevated ſtation in art, he ſtudied in the ſchools of deſign with great aſſiduity, and became an hiſtorical painter of no mean talent.

He likewiſe executed a conſiderable number of etchings in a ſlight coarſe ſtyle, and which, in ſome inſtances at leaſt, are defective in point of drawing; among them, the following are the moſt meritorious.

"The Marriage of Joſeph and the Virgin," after Lucas Giordano, in folio; "The Fall of the rebel Angels," a large folio print, from Rubens; "A drunken Bacchus, ſupported by Satyrs," from the ſame painter; and "Vertumnus and Pomona," all in folio. A ſet of twelve, in octavo, from Guarini's "Paſtor Fido." A ſet of twenty-eight folio plates, lengthways, taken from the New Teſtament, from drawings by John van Orley.

John van Orley was the brother of Richard, and did not diſtinguiſh himſelf leſs as an artiſt; he frequently made drawings from pictures for the latter to engrave after; and likewiſe aſſiſted in engraving the ſet from the New Teſtament, after his own deſigns.

John Gole was born at Amſterdam about the year 1660. He worked with the graver in ſtrokes, and ſcraped ſeveral mezzotintos. His works are numerous, but not very eſtimable. On the whole, thoſe appear to be the beſt which are executed with the graver. A few of the beſt of his engravings, in each manner, are ſpecified below.

Line Engraving.—Charles XI., king of Sweden; the ducheſs de la Valliere; the unfortunate Grand Vizier; Kara Muſtapha; Mahomet IV., emperor of the Turks; Abraham Hellenbrock, a clergyman; the head of a man of letters, in an oval; Nicolas Colvius, a clergyman of Amſterdam, after B. Vaillant, all of folio ſize.

Mezzotinto Engravings.—Bernard Somer; John Oyers; and Jacob Gole (juris conſulte), the latter after D. Plaes; George Auguſtus, prince royal and elector of Brunſwick, after Hirſman; Charles III. king of Spain; admiral Van Tromp; Charles, landgrave of Heſſe-Caſſel; Balthaſar Becker, author of the Enchanted World; "Peaſants ſmoking round a Fire," after Oſtade. "A Group of three Peaſants in an Ale-houſe, one of whom plays the Violin," after Brouwer; "The Tooth-drawer," after Teniers, all in folio; "The School-maſter," after Hemſkerck; and "Heraclitus deploring the Miſery of human Nature," after C. Duſart, both in quarto.

John Groenſvelt, or Groenvelt, was born at the Hague in the year 1650. He etched a conſiderable number of plates, after Berghem, Van Goyen, Lingelbach, and other maſters, which are much eſteemed; and a few portraits, in which the faces are almoſt entirely ſtippled. His general ſtyle of manual execution is neat, but ſomewhat ſtiff: and the following are ſpecified as being ſome of the beſt of his engravings.

"Dorothea, counteſs of Sunderland," after Vandyke, in folio; "A Girl with a Cat," after Bloemaert, in quarto; "The Adoration of the Eaſtern Kings," after P. Veroneſe; "Chriſt before Pontius Pilate," after Andrea Schiavone; and, "A Man aſleep on a Tub," all of folio ſize; a ſet of ſix landſcapes, after Berghem; and another ſet of four, after the ſame maſter, of quarto ſize, the ſubjects of which are various paſtoral incidents.

Arnold Houbraken was born at Dordrecht in the year 1660, and died at Amſterdam in 1719. He ſtudied under various maſters, and laſtly under Samuel de Hoogſtraeten; he painted portraits and hiſtorical ſubjects; and is the author of a work in the Dutch language, entitled "The Great Theatre of the Dutch and Flemiſh Painters, by Arnold Houbraken, with their portraits, engraved by himſelf." According to our countryman Strutt, Houbraken came into England, and made drawings from the pictures of Vandyke, which were afterwards engraven by Peter van Gunſt, and he received one hundred guilders for every drawing. He executed ſeveral ſlight etchings, with great intelligence, from his own deſigns; which are much ſought after by amateurs. His heads of the painters are engraven, with much taſte, in ornamental borders, with ſeveral on one plate; and the following are likewiſe by him: A ſet of etchings of boys and vaſes; "Vertumnus and Pomona;" an emblematical ſubject, repreſenting three women looking at a child in a ſort of baſket, or cradle, encircled by a ſerpent; and "The Diſciples at Emmaus," in the ſtyle of Rembrandt; all in quarto, and from his own compoſitions.

James, or Jacob Houbraken, was an engraver of admirable talent, to whom England is largely indebted for perpetuating, and diffuſing through Europe, the portraits of ſeveral of her moſt illuſtrious poets, ſtateſmen, and warriors. He was born at Dordrecht in the year 1698, and was the ſon of Arnold, of whom we have treated in the preceding article. He dated many of his productions from Amſterdam, which ſeems to afford evidence of his long reſidence there, but he died in his native city in the year 1780.

Houbraken had no other maſter than his father, but his genius, and the ſtudy which he beſtowed on the beſt portraits of Nanteuil and Edelinck, ſuperſeded inſtruction, or rendered it ſuperfluous. Strutt thinks, and with much of the appearance of reaſon, that he formed his ſtyle of engraving more particularly, by an attentive ſtudy of that portrait of Le Brun, which is engraved by Edelinck, and prefixed to his battles of Alexander. However this may have been, his very high rank, as an engraver of portraits, was ſoon acknowledged through Europe, and has called forth the juſt encomiums of Watelet, of Gilpin, of Martini, and of Strutt. In the collection of portraits of illuſtrious men, which was publiſhed in London by J. and P. Knapton, which perhaps, on the whole, may be eſteemed the principal work of Houbraken; the ſurrounding accompaniments are ſaid to have been deſigned and engraven by Gravelot. Theſe accompaniments are etched with conſiderable taſte and energy, and form an harmonious and very agreeable contraſt, to the rich and deep-toned ſoftneſs and more elaborate execution of the portraits themſelves, to which they are kept in due ſubordination. In ſome of his foreign productions, however, Houbraken has himſelf oppoſed, in a ſimilar manner, though not perhaps with quite equal ſucceſs, the pictureſque wildneſs and roughneſs of etching, to the more poliſhed ſweetneſs and mellowneſs of his dry needle and graver, and even in the laced ruffs and other ornamental parts of the dreſſes of his Engliſh portraits, he has contrived to mingle a ſmall portion of etching with enviable ſucceſs. But his chief ſtrength lay in the truth and taſte of his drawing, and the vigour and delicacy with which, as occaſion required, he handled his graver. Sometimes, in the ſame production, may be beheld the boldeſt courſes of mellow lines,—as in the armour of his portrait of the marquis of Montroſe, after Vandyke,—blended and harmonized, with admirable addreſs, with the utmoſt ſweetneſs and delicacy of execution in the face and hair.

The monarch, or parliament, who could prevent engravers from affixing their names to any other than their own productions, would probably perform a moſt eſſential ſervice to engraving *as an art.* The demands of commerce will have the matter otherwiſe. The cupidity of gain, in all trading places, ſullies the purity of an honourable love of fame, and damps the ardour of diſintereſted exertion. In the age and country in which it was the fortune of Houbraken to be placed, he was almoſt of neceſſity ſubject to this baneful influence: and his name accordingly appears to ſome engravings that are certainly in parts, if not altogether, the productions of inferior men. He who would meaſure the true ſtandard of the merits of this diſtinguiſhed artiſt, or form a juſt eſtimate of his attainments, ſhould look at early impreſſions, (not ſuch as are now common in the London ſhops, and taken from the retouched plates,) of the portraits of ſir Thomas More, Hambden, Schomberg, the earls of Arlington and Bedford, the duke of Richmond, and ſome others in the ſame valuable volume.

Strutt is more critically obſervant in commenting on the works of Houbraken, than in moſt other parts of his biographical dictionary. He details the intereſt with which he regarded theſe portraits, with feeling; and exemplifies the compariſon which he made between Houbraken and thoſe admired portrait engravers who ſtand foremoſt in the ſchool of France, by an elegant analogy.

After admiring the ſoftneſs and delicacy of execution, good drawing, and fine taſte, which are diſplayed in the works of Houbraken, he ſays, "If his beſt performances have ever been ſurpaſſed, it is in the maſterly determination of the features, which we find in the works of Nanteuil, Edelinck, and Drevet: this gives an animation to the countenance, more eaſily to be felt than deſcribed. From his ſolicitude to avoid the appearance of an outline, he ſeems frequently to have neglected the little ſharpneſſes of light and ſhadow, which not only appear in Nature, but, like the accidental ſemitones in muſic, raiſe a pleaſing ſenſation in the mind, in proportion as the variation is judiciouſly managed. For want of attention to this eſſential beauty, many of his celebrated productions have a miſty appearance, and do not ſtrike the eye with the force we might expect when we conſider the excellence of the engraving."

The biographer here certainly touches his inſtrument with a finger of exquiſite feeling: yet, as the wild muſic which ſhould accompany and aid the varying ſentiment of mental emotion, is of a diſtinct character from that Lydian meaſure and thoſe dulcet tones, that

———" Sooth the ſoul to pleaſure;"

ſo Strutt muſt not be ſuppoſed to mean that one particular ſtyle of engraving is ſuited, in preference to all others, to portraits of every kind, and engraved after whatever painter. The preſent writer entertains little doubt but that the ſemi-demi diſtinctions which he perceives between the ſtyles of different engravers, analogous to thoſe which are noted in muſic, will one day be ſo generally felt and underſtood by profeſſors, and finally by the public at large, as to become the ſubject of critical admeaſurement and animadverſion; and when that day of pleaſure ſhall arrive, the ſoftneſs and ſweetneſs, and delicate indefinity which addreſſes the fancy rather than the ſenſe, which confers that exquiſite melting roundneſs to which female and infantile beauty is ſo much indebted; which may be traced in the ſtyle of Houbraken, and which, in our own times, has played among the zephyrs, the loves, and the graces of Cipriani and Bartolozzi, will be as much admired, when properly introduced, as the more energetic touches of manly character and expreſſion, or "little ſharpneſſes" which our Engliſh critic has deſcribed with a feeling ſo technically juſt.

Compariſons might, doubtleſs, be ſeverally inſtituted with advantage to our critical knowledge of portrait engraving, between the Dutch artiſt and thoſe great ornaments of the French ſchool whom Strutt has named, but it would perhaps lead us into too wide a field for the preſent occaſion. To compare him with Drevet alone: his works, though leſs elaborate, are ſcarcely leſs highly finiſhed, and are more mellow and free. Drevet ſeemed always approximating toward an ideal ſtandard of perfection in which exactitude ſhould blend with truth and the graces, and the peculiar taſte, and even the redundant ornaments of Rigaud, the portrait painter of a ſhowy and luxurious, rather than a taſteful age, are ſeduouſly rendered: Houbraken, diſguiſing every appearance of ſolicitude, is always maſterly and free, and always like the painter after whom he works, whether it be Holbein, Vandyke, or Lely. Drevet tranſcended all his predeceſſors, and left poſterity to wonder at his powers of execution, and deſpair of attaining them: Houbraken is more practically meritorious; when we ſee one of his portraits, we believe, as we admire it, that the ſame hand and mind might have accompliſhed many, whereas, when we behold the St. Bernard, or archbiſhop of Paris, of Drevet, we think that ſcarcely leſs than a life could have been beſtowed on them, and that he who has engraved theſe plates has done enough for one man, if he has done no more. If Drevet appears to defy competition, he does ſo with a ſtretch of careful attention, and a ſhare of manual and viſual power, which we cannot but admire, whereas Houbraken is always eaſy, and always ſucceſsful, when he does not allow a ſubſtitute to handle his graver. He appears, in his works, to have lived to be eminently and extenſively uſeful; the ſpectator cannot regard one of his portraits, without ſuppoſing that he muſt, or knowing that he might, have done many; becauſe he perceives that the artiſt knew the point where an high degree of excellence might, with practical advantage, ſtop ſhort of the elaborate preciſion, and recondite beauty of executive detail, which is diſplayed in the portraits of Drevet.

The following liſt contains the whole of the works of Houbraken with which we are acquainted.

Portraits in Folio.—A half-length of himſelf, after Quinkhard, dated 1749; Arnold Houbraken, the father of Jacob; William VIII. landgrave of Heſſe Caſſel; Jacob van Hoorn, who married, for the fourth time, at the age of ninety-ſeven, a young woman of twenty-three; and its companion, his laſt wife, Jacoba van Selſted; Albert Seba, of Erzeel, in Ooſtfriſe, member of the Academy of Natural Curioſities at Amſterdam; John Burmann, doctor of medicine; Francis Burmann, of Utrecht, theologian; Guſtavus William, baron of Imhof; Peter Muſchenbroeck, profeſſor of medicine at Leyden, all after Quinkhard; George, lord Anſon, after J. Wanderlaar; Ferdinand van Collen, a burgomaſter of Amſterdam; Gerard Arnoult, a burgomaſter; Herman Alexander Roell, theologian, both from the ſame painter; Peter Burman, profeſſor at Utrecht, after Herman vander My, or Myn; Jerome Gaubius, a phyſician; John Conrad Rucker, a juris conſulte, both from the ſame painter; George I. king of England; Thurlow, ſecretary to Oliver Cromwell; and Thomas, lord Fairfax, both after Cooper; Catherine Howard, queen of Henry VIII.; ſir Thomas More, the chancellor, both from Holbein, the latter a very celebrated engraving; William James Sgraveſande, a mathematician, after Vandyke; William Ruſſell, duke of Bedford, from the ſame painter; George Villiers, duke of Buckingham, after C. Johnſon; Sigbert Havercamp, profeſſor at Leyden, after F. Mieris; Mary Stuart, conſort of William III. prince of Orange, after G. Netſcher; John de Witt, grand penſionary of Holland, from C. Netſcher; John Rodolphus Faeſch, of Baſle, from J. R. Huber; lieutenant-general Talmaſh, after ſir Godfrey Kneller; Anthony, duke of Shafteſbury, after ſir Peter Lely; Mary Louiſa, of Heſſe Caſſel, from B. Accama; Henrietta Wolters, from a picture by herſelf; Cornelius Frooſt, the painter of Amſterdam; Jacob Compo Weyerman, from C. Frooſt; Nicholas Verkolie, from a picture by himſelf; Herman Schyn, ſchoolmaſter, from Henrietta Wolters, called Van Peene, all in quarto; Chriſtian Gottlieb Glafey, after P. Salice; John Mannekemolen, after Schouman; the czar, Peter the Great; William VIII. landgrave of Heſſe Caſſel; and William, prince of Orange, all of folio dimenſions.

Hiſtorical, &c. after C. Frooſt.—"The Grandmother," from the cabinet of Pinto, at Amſterdam, in large folio; "Avarice deceived," from the cabinet of Vander Mark, of Leyden, in folio; "The Feſtival of St. Nicholas," from the cabinet of Muilman, at Amſterdam; "The Cymbal Player," a grand compoſition, from the cabinet of Verſchuring; "The Fair at Amſterdam," from the cabinet of Neyman; "Tartuffe, the Impoſtor," from the cabinet of Braamcamps, all in large folio. And the two following for the Dreſden gallery; "Daniel Barbaro," a Venetian nobleman, after P. Veroneſe, in folio; and "The Sacrifice of Manoah," in large folio, after Rembrandt.

John van Vianen, of Amſterdam, was alſo a portrait engraver, but of talents very inferior to thoſe of Houbraken. He was born in the year 1660. He drew portraits from the life in a manner which has the reputation of accuracy, but his ſtyle of engraving, though neat, is taſteleſs.

Among his portraits are thoſe of John Turretin, of Geneva; Auguſtus Pfeiffer, of Lubec; and Simon de Vries, from drawings by Vianen himſelf; and Frederic William I. king of Pruſſia, in cameo, with ornamental accompaniments, after J. Goerée, all of folio dimenſions.

Vianen alſo engraved and publiſhed ſeveral views of his native city of Amſterdam.

Wilhelm, or William Swidde, was born in the province of Holland, A.D. 1660. He probably ſtudied under one of the Viſſchers. Soon after his pupillage he travelled to Sweden, where he obtained patronage, and where he probably paſſed the remainder of his life.

He both drew and engraved landſcape in a very pleaſing ſtyle, in which delicacy is united with ſpirit, and his name and works have the honour of deſcending to poſterity with thoſe of Puffendorf, for the firſt edition of whoſe life of Charles Guſtavus, of Sweden, Swidde produced the engravings, and alſo for "Suecia Antiqua et Hodierna."

The reſt of his prints are generally found in ſets, of which there is one, of twelve views of towns and cities in the province of Frieſland; another ſet of ſix beautiful engravings, entitled "Verſcheyde landſchapjes ſeer aardig getekent door D. Dalens, geetſt door W. Swidde, et uytgegeven door N. Viſſcher;" and another ſet of ſix mountainous landſcapes, with ruined edifices, cattle, and figures, in ſmall folio, alſo after Dalens.

John de Leeuw, the portrait-engraver, is worthy of ſmall notice. He was born at the Hague ſoon after 1660, and was probably deſcended from William de Leeuw, of whom we have already treated.

In conjunction with John Lamſvelt, he engraved the portraits for "The Hiſtory of Louis XIII." by Michael le Vaſſor. He alſo engraved the portrait of John, duke of Marlborough, which is inſcribed with the motto "Veni, Vidi, Vici," in folio; a very neat portrait of Karolus Niellius, in quarto; Joſeph Juſtus Scaliger; and Cowley, the poet.

Robert van Audenaerd, or Oudenord, was born at Ghent, A.D. 1663. The name is provincial, and means literally *of Oudenord*, of which place the father of our artiſt is believed to have been a native.

Robert applied himſelf to the ſtudy of art at a very early period of life, under the direction of Van Cleef, and other Flemiſh maſters. He afterwards travelled to Rome for improvement, and was received into the Academy of Carlo Maratti.

At this period he is ſpoken of with praiſe as a painter; but we ſhall here conſider him only as an engraver. His early progreſs in the latter art, was interrupted by an act of profeſſional indiſcretion, which is thus related by Strutt.

"He frequently uſed to amuſe himſelf at his leiſure with the point; and being pleaſed, as it ſhould ſeem, with a ſketch of his maſter, repreſenting the marriage of the Virgin, he etched a plate from it, of which Carlo Maratti knew nothing, until the impreſſions being circulated about, he accidently ſaw one of them in a print-ſhop, and by enquiry, ſoon diſcovered its author. Audenaerd felt ſeverely the effects of his reſentment, which he carried to ſuch an height, that he forbade him to approach his ſchool, declaring he would never ſee his face again." Maratti, however, though warm in his reſentment, was not implacable, and the preſent writer would willingly aſcribe the reconciliation which afterward took place between the maſter and diſciple, to the interceſſion of Giacomo Frey.

Frey (as we have related in our biography of that very diſtinguiſhed artiſt), was the liberal friend and fellow ſtudent of Audenaerd, and with the energy and indiſcretion, poſſeſſed the generoſity, of genius; every principle of ſympathy muſt, therefore, have operated with him in obtaining the forgiveneſs of his maſter, and the return of his friend.

It ſeems not improbable that the aſſiduity of Audenaerd was quickened by this occurrence, for he ſoon made ſo great progreſs in engraving, that Maratti was extremely pleaſed, poured forth his inward feelings reſpecting his art, ere they were mellowed into principle, in the preſence of his two favourite pupils; and many of his beſt pictures were, at his own inſtance, put into the hands of Audenaerd to engrave. In particular, it was by his recommendation, which has ſince been perceived to have its foundation in the ſoundeſt theory, that the two fellow-ſtudents learned to incorporate ſo large a portion of etching as we behold in their hiſtorical prints, with the work of the graver.

On this point, Strutt judiciouſly ſays, "the plates which were done by this artiſt entirely with the graver, are not equal, in my opinion, to thoſe where he alſo uſed the point: they are cold and deſtitute of effect, and often, from his great ſolicitude to avoid an outline, his draperies appear heavy, and want ſharpneſs in the folds. The ſame heavineſs appears alſo in his heads and other extremities, and all the naked parts of the figure in general, as I think, will readily be allowed on examination of that, which repreſents "The Aſſumption of the Virgin," from Carlo Maratti, a middling-ſized upright plate, with this inſcription, "Quaſi aurora conſurgens;" which, if compared with the ſlight etching of "Hagar and Iſhmael," from the ſame maſter, I think the ſpirit of the latter will well repay the want of that neatneſs which is found in the former. Audenaerd certainly poſſeſſed great knowledge of the human figure, and his drawing is ſeldom incorrect."

During his ſtay in Italy, cardinal Barbarigo, with becoming regard for the fame of his anceſtry, engaged our artiſt to engrave the portraits of the diſtinguiſhed men of that family, with emblematical accompaniments.

The work conſiſts of one hundred and ſixty-five plates, and for ſome years remained imperfect on account of the death of the cardinal, but at length the five plates which were wanting to its completion, were engraved at the expence of one of his deſcendants, and the work appeared at Padua, in large folio, accompanied by certain Latin poetry, in the year 1762; ſince which period it has been ſold at the Barbarigo palace, at the price of twelve ſequins.

After reſiding ſeventeen years in Italy, Audenaerd returned to his native city, where he died in 1743, being fourſcore years of age. We ſubjoin a liſt of his beſt engravings.

Portraits.—Cardinal Sacriſſanti; cardinal Turuſi; and cardinal Ottoboni, all from J. B. Gauli; cardinal Francis Barbarini, after Carlo Maratti; cardinal Henry de la Grange d'Arquien, after Deſpontes; cardinal Joſeph d'Archinto; cardinal Andrea di Santa Croce, both from Joſeph Paſſeri; and father Francis Caraccioli, worſhipping the ſacrament, after And. Procaccini, all of folio ſize.

Hiſtorical, &c. after Carlo Maratti.—"Hagar in the Deſart;" "Abraham offering his Son Iſaac;" "Abraham's Servant meeting Rebecca;" "David with Goliah's Head;" "The Celebration of the Victory of David;" "Bathſheba at the Bath;" "The Annunciation;" "The Adoration of the Magi," an etching; "The Flight into Egypt;" "A Repoſe during the Flight into Egypt," all in folio; "Chriſt on the Mount of Olives," in large folio; "Chriſt on the Croſs;" "The Body of Chriſt on the Knees of his Mother," accompanied by St. John and the holy women; "The Death of the Virgin;" "The Aſſumption of the Virgin," after a picture in the cathedral of Urbino, all in large folio; "The Death of St. Joſeph," an etching in folio; "The Virgin diſtributing the Roſary to the Nuns," commonly called "Our Lady of the Roſary;" "The penitent Magdalen;" "The Martyrdom of St. Blaiſe;" "St. Anthony of Padua kiſſing the Foot of the Infant Saviour;" "St. Philip of Neri;" "James I. king of Italy, received among the Gods;" "The finding of Romulus and Remus," all in large folio; "Daphne purſued by Apollo," after a picture in the cabinet of the king of France, on two large plates.

Hiſtorical, &c after various Italian Maſters.—"The Nativity of our Saviour," after P. da Cortona, in large folio; a ſet of five etchings from "The Life of St. Bibiene," the fourth and fifth are from ſtatues by Bernini, the remainder from P. da Cortona; a group of "Atalanta and Hippomene," after Bernini; "The Rape of the Sabines," from John de Bologna; "St. de Facunda," after Hiac. Brandi, all in folio; "The Birth of the Virgin," from Annib. Caracci; "The Flagellation," and "Supplication of St. Andrew," both in large folio; and "St. Andrew tranſported to Heaven," in folio, all from Dominichino; "The Holy Family, with St. Luke painting the Portrait of the Virgin Mary," after M. A. Franceſchini of Bologna; "The Anger of Achilles," a large engraving on three plates, dedicated to pope Innocent XII., and after J. B. Gauli; and a very rare and large engraving of an allegorical theſis, in which the ſame pope appears ſeated on a throne, or in the chair of St. Peter, overcoming hereſy, &c.: it alludes alſo to the converſion of Frederic Auguſtus, and contains medallions of that prince and queen Chriſtina of Sweden.

Arnold van Weſterhout was born at Antwerp in the year 1666. After learning the rudiments of engraving of his father, he journeyed to Italy, and remained for ſome time at Florence, ſtudying his art under the patronage of the archduke Ferdinand, from whence he removed to Rome, in which metropolis he remained till the year 1730, which was that of his death. His plates are executed with the graver only, in a neat, clear ſtyle; but his chiaroſcuro is feeble, and the outlines of his figures are not always correct. He engraved a conſiderable number of plates from his own compoſitions, and ſome few after other maſters, among which the following are moſt worthy of attention.

Portraits.—Michael Angelo Zamburinus, ſuperior of the Jeſuits, after Odati; Julius de Arrighettis, ſuperior of the order of the Servites, after Dio. Godin, both in 4to.; cardinal James Antony Meriga, after L. David; and prince Roſpoli, in an oval, from the ſame painter, both in folio.

Hiſtorical, &c. after various Maſters.—"St. Peter Nolaſque borne through the Clouds by two Angels," and "Victory," both from his own compoſitions; a female, with a unicorn, in a landſcape back-ground, after Caracci, in 4to.; "The Deſcent from the Croſs," after Daniel de Volterra, in large folio; "The Virgin and Child," after Carlo Maratti; "St. Paul preaching at Athens," after J. B. Lenardi; "The Muſes protecting the Monuments of fine Art from the Ravages of Time," all in folio, from the ſame painter; "The Elevation of Virtue, and Depreſſion of Vice," dedicated to Lazari Pallavicini, in large folio; "A Woman kneeling, crowning an Eagle, accompanied by Pegaſus," perhaps the muſe of Pindar, after S. David, in folio.

Peter van Gunſt was born at Amſterdam in the year 1667. This artiſt poſſeſſed infinitely more patience than good taſte. He worked with the graver only, in a ſtyle which ſeems evidently formed upon the works of the Drevets. His firſt and ſecond courſes of lines are equally neat, and equally powerful, which gives them a cold, ſilvery effect. The folds of his draperies, though not ill drawn, are marked too harſhly, eſpecially upon the outlines of the lighter parts of them. His fleſh is generally extremely neat, and finiſhed with ſmall dots; but the lights are too much covered, which makes them appear heavy and laboured; and he drew but incorrectly. His portraits are by far the beſt, as well as the moſt numerous of his works; but they are, in a great meaſure, liable to the ſame objections as his hiſtorical ſubjects. The following are ſelected from his works, as being of the moſt importance:

Portraits.—Urbain Cherreau, from John Petitot. This is believed to be the only print engraved after that maſter, who was a celebrated enamel painter. Cornelius de Witt; Charles de St. Evremond, after Parmentier, all in 4to.; Balthaſar Bekker of Amſterdam, author of the Enchanted World, after Webber; Jahacob Saporteu, a famous rabbi of Amſterdam; Francis Valentine of Dordrecht, an eccleſiaſtic, after A. Houbraken; Frederic Dekker, doctor of medicine at Leyden, after C. de Moor, all of folio dimenſions; Salomon van Til, theologian, from the ſame painter, in large folio; Hero Siberſma, a clergyman of Amſterdam, from Boelaud; John William Triſo, prince of Naſſau, after B. Vaillant; Boris, prince of Kurakin, miniſter of the Ruſſian ſtates, after Kneller; Didier Eraſmus of Rotterdam, after Holbein; Mary, queen of England, after Vander Werff; Mary Stuart, queen of Scotland; Frederic, palatine, king of Bohemia; Elizabeth, his queen; James I. of Great Britain; Hugh Latimer, biſhop of Worceſter; Francis Junius, painter and author, all after Vander Werff; head of William III. of England, after J. Brandon, all of folio ſize; Charles II. of England, after F. Stampart, in large folio; John Churchill, duke of Marlborough, after Vander Werff; a ſet of ten portraits, of Charles I., his queen, and the Engliſh nobility of both ſexes of his court, whole length figures from Vandyke; and a ſet of nine, of "the Loves of the Gods," after Titian, all in large folio. The ſame ſet was engraved in mezzotinto by J. Smith.

Bonaventura Overbeck, ſurnamed *Romulus*, was born at Amſterdam in the year 1667, and died in the ſame city in 1706. He was the diſciple of G. Laireſſe, and publiſhed three folio volumes, (entitled "Reliquiæ antiquæ Urbis Romæ,") of the antiquities of Rome; to which city he travelled three times, to make the neceſſary ſtudies from nature, after which his plates were etched: and hence he obtained the cognomen of Romulus. His engravings are much admired for their firmneſs of ſtyle, and judicious diſtribution of light and ſhade, and were publiſhed at Rome in the year 1709; but preſumptively there was an earlier edition.

Iſaac Moucheron was likewiſe a native of Amſterdam, and born in the year 1670. He was the ſon of Frederic Moucheron, an admirable landſcape painter, of whom he learned the rudimental principles of art; but at the age of twenty-four, travelled to Rome for improvement, where he made a great many drawings of Tivoli, and other places in and about Rome. After his return to Amſterdam, he ſoon became known by his excellent landſcapes, enriched with figures and animals, which are held in the higheſt eſtimation. This artiſt executed a conſiderable number of etchings, in a very delicate ſtyle; the moſt important of which are a ſet of twenty-ſix folio plates, entitled "Views of

Heemſted, in the Province of Utrecht, drawn and engraved by J. Moucheron, and publiſhed by the Widow of Nicholas Viſſcher, with the Permiſſion of the States General." They are accompanied with French and German letter-preſs. Four garden views, with ruins and figures in the antique ſtyle; another ſet of four, of the ſame character, in large folio, from his own drawings; four landſcapes, with buildings and figures, entitled "Einigé Landſchapen, geſchildert door G. Pouſſin in Romen, in t'Koper gebracht door J. Moucheron in Amſterdam," in folio; and a landſcape, mentioned by Baſſan, of which we know neither the title nor deſcription.

Matthew Pool was born at Amſterdam in the year 1670, but ſtudied engraving at Paris, where he reſided for ſome years. He afterwards returned to his native country, where he married the daughter of Barent Graat, and engraved a conſiderable number of plates after various maſters, in a ſtyle reſembling that of Bernard Picart. The moſt important of his engravings are as follows: Petrus Hogenbetius, phyſician and poet; Barent Graat, the father-in-law of our artiſt; "Jupiter ſuckled by the Goat Amalthea," after B. Graat, all in folio; "Cupid caught in a Net by Time," after Guerchino, in an oval; a bacchanalian ſubject, after Pouſſin; a ſet of twelve, after Rembrandt, all in 4to.; a ſet of one hundred and three, entitled "The Cabinet of the Art of Sculpture, by Van Boſſuet, engraven by M. Pool, from the Drawings of B. Graat," in folio; and the three large burleſque repreſentations of the ceremonies practiſed by the Dutch painters at Rome, on the reception of a member into the ſociety, called "Schilderbent," from drawings by Barent Graat, after the original pictures by Dominique van Wynen, all in large folio.

James Coelmans was born at Antwerp in the year 1670, and died at Aix, in Provence, in 1735. He was the diſciple of Cornelius Vermeulen, and was invited to Aix by M. de Boyer d'Aguilles, to engrave his collection of pictures, in conjunction with Sebaſtian Barras. This ſet of engravings was finiſhed A.D. 1709, but was not publiſhed till 1744. It is the moſt conſiderable, and the beſt of the works of Coelmans, though the plates are executed chiefly with the graver, in a dark heavy ſtyle, deſtitute of harmony.

The drawing of the naked parts of the human figure is defective, and the expreſſion of the heads is likewiſe but poor. The ſet of engravings above mentioned, conſiſt of one hundred and eighteen, from which the following are ſelected as being the moſt important.

Portraits.—Donna Olympia Maldachini; the niece of pope Innocent X. from a picture by Joſephin; the miſtreſs of Alexander Varotari, ſurnamed Veroneſe, from a picture by that painter, both in quarto; a head of Paul Veroneſe, painted by himſelf, in folio; Conradus Ruten, from Bronkhorſt, in quarto; Francis de Malherbe, after Finſonius Belga; Vincent Boyer, comte d'Aguilles, &c. from a picture by le Grand; and John Batiſta Boyer, comte d'Aguilles, &c. after Hyacinthus Rigaud, all of folio dimenſions.

Hiſtorical, &c.—"The Holy Family," with a landſcape back-ground, from F. Maſſoli Parmenſis, in large folio; "St. Dominique paſſing the Holy Writings through the Fire, without damaging them," after Fr. Vanni; "The firſt Interview of Rachael and Jacob," after Michael Angelo; and its companion "Laban recompenſing Jacob with Rachael," from the ſame painter; "Jacob quitting Laban," a fine compoſition, after Caſtiglione; a very rich compoſition of muſicians, dancers, drinkers, &c. ſurrounded with whatever can add to the luxury and ſupport of mankind, inſcribed "Omnia vanitas," from the ſame painter; "Diana and Actæon," from Ottovænius, all of large folio ſize; "Lot and his Daughters flying from Sodom," after Rubens, in folio; the interior of a Gothic church, with figures, after Steenwyck, in quarto; "A Satyr drinking from a Vaſe, which is ſupported by a Cupid," accompanied by a nymph, who ſeems to ſay, that is enough! and is probably intended for Temperance, after Pouſſin; "The Martyrdom of St. Bartholomew," after Seb. Bourdon; "Mount Parnaſſus," a rich compoſition, from Euſtace le Sueur, all in large folio; "The Flight into Egypt," after P. Puget; "The Murder of the Innocents," from Claude Spierre, both in folio; and a head of "The Holy Virgin," after Seb. Barras, in large quarto.

Albert Haelwegh was a native of the Netherlands, and born about the year 1670. In 1690, he reſided at Copenhagen; but was afterwards invited to Denmark, where he engraved a conſiderable number of portraits, in a ſtiff, dark ſtyle, but which, for ſome reaſon with which we are not acquainted, are collected with ſome degree of avidity by the foreign connoiſſeurs. Of the works of Haelwegh, the following are moſt worthy of notice; Louis, landgrave of Heſſe Caſſel, from S. Duarte; Joachim de Gerſdorf, of Synbyholm; Otten Krag de Woldberg; Gundee Roſenkrantz de Winding; Frederick Ratz de Tygeſtrup; Peter de Reetz de Tygeſtrup; and Magnus Kaas de Stofring, all Daniſh ſenators, from Albert Wachters, in folio; Sophia Amelia, queen of Denmark and Norway, in large folio; Chriſtian, count de Rantzou, earl of Brandenbourg, a fine portrait, in large folio, both from the ſame painter; the frontiſpiece to the "Flora Danica" of Simonis Pauli, with a portrait of the author, after Carl van Mander, in quarto; and "The Four Seaſons," from the ſame painter, alſo in quarto.

Francis Pilſen was born at Ghent in the year 1676, and became the pupil of Robert van Audenaerd. There are very few prints by the hand of this artiſt, and the following are all we can ſpecify. "The Holy Virgin ſuckling the Infant Chriſt," after Rubens, in octavo; "The Converſion of St. Bavon," a grand compoſition, arched at the top, after Rubens, in large folio; "The Judgment of Midas," after the ſame painter; and "The Martyrdom of St. Blaize," from Gaſpar de Crayer, both in folio.

Abraham Rademacker was born at Amſterdam, A.D. 1675, and died at Haerlem in 1735. He became an excellent landſcape painter and engraver, without any inſtructions, having never ſtudied under any maſter.

Rademacker drew in Indian ink, and painted in diſtemper, many views in Holland, which he embelliſhed with figures and animals; he alſo etched a collection of views in the United Provinces, in a very maſterly ſtyle; it contains three hundred prints, and was publiſhed at Amſterdam in 1731, in two quarto volumes.

Francis Harrewin was born at Bruſſels in the year 1681. He was the diſciple of Romyn le Hooghe, and engraved a conſiderable number of plates from his own compoſitions, and thoſe of other maſters. Among his works is a ſet of the caſtles and villas, for le Roy's account of the Brabant family, which was publiſhed in 1699; and alſo the following portraits of Henry de Lorraine, duke of Guiſe; Margarite de Valois, both in octavo; Albert, archduke of Auſtria, a whole length figure at prayer with St. James; its companion Iſabella, infanta of Spain, alſo kneeling, while St. Margaret is preſenting her with a wreath of flowers, both very rare prints in large folio, and after Rubens. Two folio views of the houſe of ſir P. P. Rubens, at Antwerp, after Van Croes, may alſo be reckoned among the beſt productions of Harrewin.

Francis de Wilde was a native of Holland, born ſome time about the year 1680; according to Huber, but probably at a ſomewhat earlier period, ſince the etchings of his daughter were publiſhed in 1703. He reſided at Amſterdam, where he etched and publiſhed “The Angels appearing to Abraham;” “The Birth,” or “Triumph of Venus;” views, of a ſea-port, and the city of Chalons, a landſcape with reapers, and ſome few other ſubjects, both hiſtorical and landſcape, which are believed to be all from his own compoſitions. His etchings are performed in a pleaſing and ſpirited ſtyle, and the above were publiſhed early in the eighteenth century.

De Wilde alſo acquired ſome celebrity by his collection of antique gems, which were etched by his daughter Mary, on fifty quarto plates, and publiſhed at Amſterdam, in the year which is mentioned above.

John Admiral, or l'Admiral, was born at Leyden, A.D. 1680. Under whom he ſtudied is not known, but his ingenuity was very conſiderable, and he employed much of his time in engraving natural hiſtory and anatomy. The anatomical plates which he engraved for the work of the celebrated Ruyſch are held in great eſtimation, and his other moſt important work is engraved from his own cabinet of inſects, to collect and arrange which occupied thirty years of his life, excepting that portion of his time which was neceſſarily ſpent in his profeſſional purſuits as an engraver. This collection was engraved on twenty-four plates, and publiſhed by l'Admiral himſelf in 1746.

A. van der Laan was born at Utrecht in the year 1690. He travelled to France, and remained there ſome years, during which time he was chiefly employed by the Pariſian bookſellers.

The moſt conſiderable work we have by this artiſt, is a ſet of landſcapes, many of which are of the heroic and claſſical ſubjects which were painted and drawn in Germany and Italy, by Polydore. They are etched in a very delicate ſtyle, but on cloſer examination they appear to want preciſion.

This artiſt alſo engraved a good number of plates after Van der Meulen, among which are the frontiſpiece for Ryer's Alcoran, in quarto; the portraits of Lawrence Coſter of Haerlem, in folio; a burleſque hunt of dwarfs, in large folio; and two large folio plates of “The Whale Fiſhery.”

Peter Bout was a native of Bruſſels, and was born in the year 1690. He painted converſational ſubjects, and always introduced the figures in the landſcapes of Bodewyns. There are ſome ſlight etchings by the hand of this artiſt, from his own compoſitions; among which the following are the moſt important. A ſet of four landſcapes, two of which are winter ſcenes with ſkaiters, the third a poſt chaiſe ſtopping at the door of an inn, and the fourth is a marine ſubject, in folio.

A. F. Bargas was the countryman and contemporary of Bout. He executed ſome few etchings of landſcapes in a free and ſpirited ſtyle, both from his own compoſitions and thoſe of P. Bout; which he uſually marked with the letters A. F. combined in a cypher, and placed before his name. Among theſe are a ſet of ſix views of towns, villages, &c. embelliſhed with figures from his own deſigns; and a ſet of four after P. Bout, *viz.* “A Fiſh Market;” “The Bride conducted to Church;” “A Country Wedding;” and “A Village Fair,” all of folio dimenſions. This laſt ſet was publiſhed, both with and without the names of the artiſts.

John Wanderlaar, or Wandelaar, was born at Amſterdam in the year 1692. He ſtudied the principles of drawing and engraving under Folkema and William van Gauwen; and was ſo much intereſted in the general proſperity of the fine arts of his native country, that he became one of the moſt diſtinguiſhed and ſtrenuous advocates in Amſterdam for the erection of a public drawing academy in that city.

Wandelaar paid great attention to the ſtudy of anatomy, and was acquainted with the three greateſt anatomical profeſſors of the age, namely Ruyſch, Kant, and Albinus, for the great work of the latter of whom he engraved the large anatomical figures, ſo much and ſo juſtly admired. They were drawn from the ſubjects themſelves by Wandelaar under the inſpection of Albinus, who appears to have directed him, though, copying from dead and flayed ſubjects, to ſwell out the muſcles to the natural plumpneſs of living and ſtrong men. The plates are engraved in a clear ſtyle, well adapted to the occaſion, and were firſt publiſhed in the year 1747. The work appeared under the title of “Tabulæ ſceleti et muſculorum corporis humani,” and was ſoon tranſlated into Engliſh, and the plates copied by Grignion, Ravenet, Scotin, and others. Wandelaar likewiſe painted portraits on paſteboard; and drew with great ability in red and black chalks, frequently copying the pictures of the old maſters. The following engravings alſo are by him. A ſet of twelve quarto plates, of “The Birth, Life, and Death of Our Saviour;” the portrait of Herman Boerhaave, profeſſor of medicine at the Leyden academy, in folio; and two octavo plates of “The Grand Emir and his Wife; or King and Queen of the wandering Arabs.”

Jacob Folkema was born at Dockum, in Frieſland, in the year 1692, and eſtabliſhed himſelf at Amſterdam, where he died A.D. 1767. He ſtudied engraving under his father, and produced a great number of plates, of which ſome are after Picart, and others from his own compoſitions. They conſiſt chiefly in ſmall portraits, and vignettes for books. This artiſt had a ſiſter Anne, who painted miniatures with ſome ſucceſs; and likewiſe made ſome few etchings.

The moſt eſteemed of the engravings of Folkema are, an emblematical ſubject on the death of the prince of Orange, William IV.; “Time unveiling a Buſt of Francis Rabelais,” ſurrounded with allegorical figures, in quarto, an odd compoſition: A lion and dog ſleeping; and its companion, a lion and cat ſleeping, in folio. The portraits of Michael Cervantes de Saavedra, from G. Kort; John Ens, profeſſor of theology at Utrecht, after Colla; Petrus de Maſtricht, profeſſor of theology at Frankfort, from the ſame painter; Humphry Prideaux, dean of Norwich, after E. Seeman jun. all in quarto.; Snethlagius, an eccleſiaſtic of Amſterdam, from Anne Folkema, in folio; and “The Martyrdom of St. Peter and St. Paul,” in large folio, after Nicolo del Abbate, for the Dreſden collection.

Jacob de Wit was born at Amſterdam in the year 1695, and died in the ſame city in 1754. He was ſucceſſively the diſciple of Albert Spires, a portrait painter, and Jacob van Halen, an hiſtorical painter, but he greatly conduced to his own improvement, by ſtudying the pictures of Vandyke and Rubens. De Wit painted hiſtory, and excelled in painting in imitation of bronze and marble baſſo-relievo. In the year 1712, which muſt have been while he was yet a youth of ſeventeen, he made drawings from the ceilings in the Jeſuits' church at Antwerp, by Rubens, ſome of which he engraved, or aſſiſted Punt in engraving. He likewiſe etched a few other plates in a free intelligent ſtyle, among which are “The Holy Virgin and Infant Saviour,” in ſmall quarto; and a ſet of four of groups of cupids and genii, variouſly engaged, in large quarto; the latter ſet are probably his very beſt productions in this art.

John Punt was born at Amſterdam in the year 1711. He ſtudied engraving under Van der Laan, and the art of painting in imitation of baſſo relievo, under Jacob de Wit. He alſo painted hiſtory in a ſtyle which bears ſtrong reſemblance to that of Terveſtin, and after the age of fifty-five executed ſeveral ceilings; but we have here to treat of him only as an engraver.

In his folio prints from the compartments of the cielings of the Jeſuits' college at Antwerp, Punt diſcovers admirable taſte and ſkill. Perhaps in the works of no engraver whatever, may be ſeen better examples of the bold fore-ſhortening of Rubens, whoſe knowledge of the perſpective of objects, when ſeen from beneath, and eſpecially that of the human figure, is admirably diſplayed in theſe ceilings, and is not leſs admirably rendered in the engravings, through the medium however of drawings, which we have already mentioned, and which muſt in all probability have been excellent, by J. de Wit.

Punt is one of thoſe artiſts whoſe general reputation in the world has been by no means in proportion to their merits. Strutt, as the preſent writer conceives, could not have ſeen his productions, or could only have ſeen thoſe few plates which, though they bear his name, are evidently the work of ſome inferior artiſt, for he calls him, with a tone of acquieſcence in the deficiency of his fame, "a Dutch engraver of no great note;" and Huber and Martini have fallen into another error reſpecting him, (as will be noticed below,) which has alſo tended to deprive him of ſome portion of his juſt meed of reputation.

Regarding his "Moſes on the Summit of Piſgah;" his "Queen of Sheba in the Preſence of Solomon;" his "Nativity of Chriſt," or any other of the beſt of this ſeries of engravings from the ceiling of the Jeſuits' college, we ſcarcely know where to look for an hiſtorical engraver who accompliſhed more ſucceſsfully, what he evidently aimed at; or who has imparted to his works more of the appearance of finiſh with the reality of ſlightneſs. Other men may proceed in the production of more operoſe works by careful obſervation and patient induſtry; a well-practiſed hand, guided by the vivid and ſpontaneous feeling of a taſteful mind, is alone adequate to the production of ſuch prints as theſe. The art of leaving broad maſſes of white paper, without the leaſt appearance of baldneſs, crudeneſs, or chalkineſs, Punt poſſeſſed in an exemplary degree; and notwithſtanding his ſlightneſs, his tones, when required to be ſo, are ſweet, hazy, and aerial, in the *upper* parts, and it ſhould be remembered that, in theſe celebrated ceilings, the perſpective points, of ſight and diſtance, are not in the horizon but in the heavens, while, in the lower part, his engraving is rich, mellow, and vigorous. In "The Adoration of the Magi," and "St. Michael expelling the rebellious Angels," theſe qualities are more eſpecially obſervable. In the latter the rolling clouds, and ſmouldering ſmoke, and bickering flame, as well as the nudities, wings, ſhield, and drapery of the figures, are treated in a very ſuperior ſtyle. His metal vaſes, armour, and other ſuch objects, have alſo, though done with ſmall labour, a peculiarly poliſhed and glittering character, and all the various objects that enter into theſe ſeveral compoſitions are harmonized with artful ſimplicity, and in each are ſo thoroughly incorporated, that all evidently appears to be the production of the ſame hand and mind; and that mind, at no time languid; but always animated, rapid, in full poſſeſſion of itſelf, and carrying the ſpectator of taſte along with it.

The chiaroſcuro of Punt is broad, bold, and harmonious; his lights are bright; his ſhadows and reflexes cleared and enriched by vigorous touches of the graver, and his moſt delicate tints are firm. His ſtyle of manual execution, generally ſpeaking, conſiſts of maſterly courſes of lines firmly etched, or freely engraven: ſo freely, that the dextrous incorporation of theſe two modes of art are in his works much to be praiſed. Sometimes he throws a ſecond, and ſometimes a third courſe of engraved lines acroſs his etching with the utmoſt freedom, as may be ſeen in the draperies, clouds, ground, and other paſſages of his works; and upon other occaſions, as in metallic and other ſhining or poliſhed ſubſtances, he employs an interline, always adapting his hatching, ſo as to characterize, in proportion to their relative degrees of importance in the compoſition, the ſeveral textures of the ſurfaces to be expreſſed.

Huber and Martini ſtate that of the ſet of engravings from the compartments of the ceiling of the collegiate church of the Jeſuits, ten were etched by Jacob de Wit, namely, "The Fall of the rebel Angels;" "The Aſcenſion of Elias;" "Eſther before Ahaſuerus;" "The Nativity;" "The Triumph of St. Joſeph;" "The Temptation," "Reſurrection," and "Aſcenſion of Chriſt," and "The Aſſumption" and "Coronation of the Holy Virgin."

Now, theſe ten engravings exhibit two ſuch diſtinct and almoſt oppoſite ſtyles of etching, that they cannot all be the production of the ſame artiſt. It is further obſervable, that the whole ſet of thirty-ſix bear the name of De Wit as the draughtſman who, in the firſt inſtance, made thoſe copies from the ceilings of Rubens, from which the plates were engraven,—one only of thoſe ten mentioned by Huber and Martini bears the addition of "aquaforti" to the words "J. de Wit delineavit," and that one is "The Temptation of Chriſt in the Deſart," which is etched in a ſtyle very inferior to "The Fall of the rebel Angels," and thoſe other ſubjects which are enumerated above; another, which is inſcribed "De Wit aquaforti," is "Abraham offering up Iſaac," which is not mentioned by thoſe authors as being the production of his etching-needle. On the whole, we are therefore led to claim all the moſt meritorious of theſe engravings for John Punt, and to conclude that Huber and Martini muſt, in this inſtance at leaſt, have written at random.

The works of this artiſt, with which we are acquainted, are the portraits of Joanna Koerten Block, as a medallion with attendant genii, and Jacques de Roure of Antwerp, from a picture by himſelf, both in quarto. A ſet of forty ſmall folio plates, of which the ſubjects are taken from La Fontaine's fables, after the deſigns of d'Oudry, publiſhed in 1758 and 1759; a ſet of thirty-ſix folio plates from Rubens' ceilings of the collegiate church of the Jeſuits at Antwerp, prefaced by an hiſtorical portrait of this great painter, with allegorical accompaniments deſigned by De Wit. "The Aſcenſion of Our Saviour," engraved after Sebaſtian Rica, for the work which is entitled "The Dreſden Gallery;" "The Engliſh Coach," after G. van der Myn, both in large folio; "The Guard-Houſe of the Dutch Officers," after C. Trooſt; engraved for the cabinet of M. Braamcamp at Amſterdam, by Punt and Tanje, and, by the ſame engravers in conjunction, "The Declaration of Love," and "The Propoſal of Marriage," both after Trooſt, and of folio dimenſions.

John Louis Krafft was born at Bruſſels, A. D. 1710. In 1733, he publiſhed a book, intitled "Trèſor de Fables choiſies des plus excellens Mythologiſtes," containing one hundred and fifty of his engravings. And afterwards the portraits for the hiſtory of the houſe of Auſtria, which was publiſhed in three folio volumes at Bruſſels, in 1744. This artiſt likewiſe etched five ſubjects after Rubens, which are ſpecified in the catalogue of the works of that maſter, all of which are very rare; and alſo, "Job ſurrounded by his Friends and his Wife;" "Chriſt giving the Keys to St.

Peter;" "Chriſt with Nicodemus," (half figures,) all from Rubens; "Jupiter and Danae," from a drawing by Rubens, after Titian, all in 4to.; "Venus and Cupid," from a drawing by Rubens, after Giorgione; "St. Martin dividing his Cloak with the Beggar," after Vandyke, in large folio; "The Village Goatherd," and "Country Converſation," both in folio; and a ſtormy ſea view, in large folio, all from Teniers.

Krafft heightened ſome of the impreſſions from his engravings with white chalk, which, from the difficulty of preſerving ſuch works, are now become rare and valuable.

Cornelius Trooſt was born at Amſterdam in the year 1697, and died in the ſame city in 1750. He was the pupil of Arnold Boonen, and beſides engraving both in lines and mezzotinto, he painted portraits, fancy ſubjects, and hiſtory, and was ſurnamed the Watteau of Holland, from the ſparkling delicacy of his touch, and purity, and beauty of his colouring. The etchings of this maſter are much ſought after for their truth and brilliancy; he likewiſe ſcraped ſeveral ſubjects in mezzotinto, among which are, a buſt of an old man with a long beard, and a girl drawing, both in 4to; the portrait of Pietro Locatelli da Bergamo, and that of Vlaming, the poet, with two Dutch verſes beneath, both in large folio, and all from his own drawings and paintings.

Philip Endlick, or Endelick, was born at Amſterdam A.D. 1700. He was the diſciple of Bernard Picart, and always reſided in the place of his nativity. The following portraits are engraven by him, from his own drawings, and are executed in a firm ſtyle. John Taylor, the celebrated oculiſt, of London; Henry, count of Moens; John Philip d'Almérie, governor of the iſle of St. Martin; John Goſewyn Eberhard Alſtien, John Noordbeck, Peter Hollebeck, and Leonard Beels, all clergymen of Amſterdam, of folio ſize.

Peter Tanjé was a native of Amſterdam. He was born in the year 1700, and died in the ſame city in 1760. Tanjé was a laborious artiſt, and engraved a great number of portraits, vignettes, &c. But his moſt conſiderable work is five plates, from the famous windows of St. John's church at Gouda, and he likewiſe worked for the Dreſden gallery. The following are ſelected from his engravings, as being moſt worthy the attention of the connoiſſeur.

Portraits.—Peter Tanjé, from J. M. Quickhard; John Maria Quickhard, both in folio; Martin Luther, from Lucas Cranach, in 4to.; Benjamin de Briſſac, an eccleſiaſtic of Amſterdam, from L. F. du Bourg; Charles Linnæus, profeſſor of botany at Upſal; John Oſterdyck Scheht, doctor of medicine at the Utrecht academy, after Quickhard; Albert Vogct, theologian; John Beukelman de Honn, an eccleſiaſtic, from P. M. Braſſer; John van Marle, an eccleſiaſtic of Rotterdam, after Curland; Thomas Philip de Boſſu, cardinal and archbiſhop of Mechlin, from Snyers, all in folio; Lawrence Heiſter, ſurgeon; and Henry Ulhonn, phyſician; two medallions on the ſame plate, from Quickhard in 4to.; William van Haren, regent of Frieſland, from Akema, in an oval; William, prince of Orange, from F. de la Croix; George II. of England, from Faber; Charles VII. of Germany; Chriſtina, queen of Sweden, from Seb. Bourdon; Guſtavus Reinbeck, doctor of theology, from Peſne; and M. Fagel, after G. J. Xavery, all in folio.

For the Gallery of Dreſden.—A man with a book, from Correggio, known by the name of "The Phyſician of Correggio," in large folio; a woman in a bonnet, after Rubens, in folio; "A dead Chriſt," from F. Salviati; "Children dancing before the Altar of Love," from Albano, both in large folio; "Card Players," after Michael Angelo; "Tarquin and Lucretia," from Lucas Jordaens, both in folio; "Joſeph and the Wife of Potiphar," half figures, from Carlo Cignani; and a portrait of a man, after Rembrandt, half length, both of folio ſize.

Hiſtorical, &c.—"The Temptation of Job," after Trooſt, in 4to.; "The Court of Law, of the Peaſants of Puiterveen," for the cabinet of M. Ploos van Amſtel; and its companion, "The wicked Tavern-keeper at Puiterveen;" "Falſe Virtue or ſham Sorrow;" and its companion, "The Tutor deceived," all in folio; "The Philoſophers, or the runaway Girl;" "The ſick Chamber of the Dutch;" and "The Marriage of Chlorus and Roſetta," all in large folio, after Trooſt.

Peter van Bleeck the younger was born in the year 1703, ſomewhere in Flanders, but for the greater part of his life reſided in England, and died in London A.D. 1764. He was a mezzotinto ſcraper, and the ſon of Richard van Bleeck, a portrait painter; he always added the word junior to his name or cypher, for which ſee *Plate* IV. of thoſe uſed by the artiſts of the Netherlands.

Moſt of his works are portraits, and are executed in a ſtyle not inferior to that of John Smith. The following are ſome of the moſt important. Richard van Bleeck, from a picture by himſelf; Franceſco du Queſnoy, from A. Vandyke; Paul Rembrandt van Ryn, from a picture by himſelf; Eleanor Gwin, from ſir Peter Lely; Mrs. Cibber in the character of Cordelia; Mrs. Clive, in the character of Phillida; the comedians, Griffin and Johnſon, in the characters of Tribulation and Ananias, all from his own drawings; and "The Virgin with the Infant Saviour," after Vander Werff. The four laſt are in large folio, the reſt ſomewhat ſmaller.

Arthus Schouman was born at Dordrecht in the year 1710, and ſtudied the principles of art under Adrian vander Burg. He became a painter of ſome repute, and in 1748, he eſtabliſhed himſelf at the Hague, where he continued to exerciſe his various talents in crayon and water colour, painting; etching; mezzotinto ſcraping; and engraving on cryſtal, till toward the cloſe of the century.

Among his beſt prints are a ſmall etching of St. Francis; a man's head with muſtachios, in 4to; and a lady at her toilette, in 4to.; Saartze Jans, after Trooſt, with ſix Dutch verſes; a mezzotinto engraving in folio, and a party of amateurs at the houſe of a painter, alſo after Trooſt, and of 4to. ſize.

Simon Fokke was born A.D. 1712 at Amſterdam, and ſtudied engraving under John Caſpar Philips. He was a man of patient induſtry and unremitting application, but of little taſte, and no genius. The greater part of his works conſiſts of ſmall portraits and vignettes, which he executed for the Dutch bookſellers with conſiderable neatneſs. In the large hiſtorical works which he attempted he was far leſs ſucceſsful.

Among his beſt productions are the portraits for a work, intitled "Portraits hiſtoriques des Hommes illuſtres du Dannemarc;" it was publiſhed in 1746, in 4to.: and alſo the prints for another work, intitled "Arrivement et Sejour de L. A. S. S. et R. Monſeigneur le Prince Stadholder Héréditaire des Pays Bas, et de Madame ſon éſpouſe, á Amſterdam le 30 de Mai et jours ſuivans, en 1768." Of his ſingle prints upon a larger ſcale, the following are to be preferred. A portrait of himſelf, in 4to.; a view of the Y before Amſterdam, in folio; "The Statue of the Prince of Naſſau Weibourg," from Haag; "Jacob keeping the Sheep of Laban," from the Dreſden gallery, after Eſpagnoletto;

"Women bathing," after Trooſt ; a burleſque on the death of Dido, in the Dutch ſtyle, after the ſame painter ; a landſcape, with the effect of winter, after P. Breughel ; a view of the port of Livourna, after Vernet ; and its companion, a view in the neighbourhood of Narni in Lombardi, from the ſame painter, all in folio.

Jurian Cootwick, or Kootwyck, was originally a goldſmith, and born at Amſterdam in the year 1714. He excelled in drawing with Indian ink and crayons, and engraved after many of the old maſters, with ſome ability. An old woman ſeated, with a paper in her hand, in imitation of a drawing in black and white chalks ; another of the ſame ſubject, a man ſeated, with his hat on his knees ; a ſhepherd playing the flute, accompanied by a ſhepherdeſs ; a landſcape ; the ſame landſcape with alterations ; a pair of landſcapes ; a pair of ruſtic ſubjects, with cows ; and a loaded aſs, are all believed to be after his own drawings.

He alſo engraved a ſea view, after Lud. Backhuyſen, which is very rare ; a very highly finiſhed engraving of the ſame ſubject ; a paſtoral ſubject, with a ſhepherd and his flock, after Berghem ; and a ſet of three of cows and an aſs, after P. van Bloemen.

Jacob vander Schley was likewiſe a native of Amſterdam, and born in the year 1715. He was one of the beſt of the pupils of Bernard Picart, under whom he ſtudied till the death of that artiſt, and afterward finiſhed moſt of the plates which were left imperfect by him.

The greateſt part of the engravings of Schley are vignettes, portraits, and other book ornaments, which he executed in the ſtyle of his maſter : the following are ſome of the beſt of them.

"An Emblem of Divine Juſtice;" John Baptiſta Boyer, marquis d'Argens, from Th. van Pee ; Antonio Bernard Prévot, almoner to the prince of Conti, both in 4to. ; Bernard Picart, ſurrounded with allegorical figures, deſigned by Schley himſelf in folio ; Henry de la Tour, viſcount Turenne ; and "The Combat between Jarnac and Chataigneraye," both ſmall plates, and from drawings by the engraver himſelf.

Peter Spruyt was born at Antwerp in the year 1720. He was a man of ſome talent, and etched ſeveral plates, amongſt which are the following, all after Rubens.

"Suſannah ſurpriſed by the Elders ;" "The Rape of Orythia ;" "The Continence of Scipio ;" and a group of children with wreaths of flowers, all of folio ſize.

C. Exſhau was a native of Holland, whom Brandes miſtakenly ſuppoſes to have been an Engliſhman. He was born in the year 1730, and became one of the moſt ſucceſsful of the numerous imitators of Rembrandt, after whoſe pictures and prints he chiefly engraved.

Among his beſt works are, the head of an old man with a beard and large round hat, executed by means of mezzotinto combined with etching ; head of an old man with a beard and ſhort hair, both ſmall ; "Joſeph accuſed by the Wife of Potiphar," a large folio print, with a ſtriking chiaroſcuro ; "The Storm and Ship," wherein are the apoſtles, alſo diſtinguiſhed by its very grand effect, all after Rembrandt ; a girl with a baſket of cherries, accompanied by two boys, is after Rubens.

Chriſtina Chalon was born at Amſterdam in the year 1749. She was diſtinguiſhed, from a very early period of life, by her talents and love for the fine arts, and was inſtructed in that of engraving by Van Amſtel, and Sarah Trooſt. The final period of her life has not been recorded, and ſhe may perhaps be ſtill living.

Chriſtina is believed to be of the ſame family with the two diſtinguiſhed painters of the ſame name, who are now practiſing their art with ſo much credit to themſelves, and benefit to the public, in this metropolis. There are prints from her hand which were produced at the very early age of ten years ; in particular one, containing three figures, a promiſing and honeſt earneſt of her future attainments. She engraved both in lines and in imitation of crayons. In the latter mode of art, her print of a ſcullion in converſation with two children, is ſtippled with ſufficient neatneſs. Among her beſt works in lines are two pair of heads in ſmall circles ; "The Entrance to School ;" "The Interior of a Village School," and ſome other plates, of which the ſubjects are various incidents of domeſtic converſation, and Dutch ruſticity.

We are now arrived at the time which gave birth to an engraver of the Low Countries, who is ſtill living, following his profeſſional purſuits in England, and known to the preſent writer. Ever regardful of the public, he ſtops ſhort with a diſtruſt of his own feelings, which may not be thought unbecoming, at the name of Mr. Anthony Cardon.

LOWCOOTY, in *Geography*, a town of Hindooſtan, in Bahar ; eight miles W. of Mongir.

LOWDEBA, a town of Hindooſtan, in Allahabad ; 24 miles S.S.W. of Allahabad.

LOWE, PETER, in *Biography*, a ſurgeon of the ſixteenth century, was born in Scotland. In a work, entitled "A Diſcourſe on the whole Art of Chirurgery," publiſhed at Glaſgow in 1612, he acquaints his readers, that he had practiſed twenty-two years in France and Flanders ; that he had been two years ſurgeon-major to the Spaniſh regiment at Paris ; and had then followed his maſter, the king of France (Henry IV.) ſix years in his wars. In the title page of his book, he calls himſelf doctor in the faculty of ſurgery at Paris, and ordinary ſurgeon to the king of France and Navarre. It does not appear how long he had reſided at Glaſgow ; but he mentions that, fourteen years before the publication of his book, he had complained of the ignorant perſons who intruded into the practice of ſurgery, and that in conſequence the king (of Scotland) granted him a privilege, under his privy ſeal, of examining all practitioners in ſurgery in the weſtern parts of Scotland. He refers to a former work of his own, entitled "The Poor Man's Guide," and ſpeaks of an intended publication concerning the diſeaſes of women. His epitaph in the cathedral church-yard of Glaſgow (ſee Pennant's Tour to the Hebrides, p. 134.) is, however, dated 1612, in December of which year the work juſt mentioned was publiſhed ; ſo that he was probably prevented by death from fulfilling his intention. The "Diſcourſe on Chirurgery" appears to have been in eſteem ; for the fourth edition of it was printed in London in 1654. It is, indeed, copious, plain, and methodical ; full of references to ancient and modern authors ; and, in fact, like the majority of books of thoſe times, is more founded on authority than obſervation. Ames mentions another work of his with the following title, "An eaſy, certain, and perfect Method to cure and prevent the Spaniſh ſickneſs ; by Peter Lowe, doctor in the Faculty of Chirurgerie at Paris, Chirurgeon to Henry IV." London 1596, 4to. Aikin's Biog. Mem. of Med.

LÖWEN, in *Geography*, a royal town of Sileſia, in the county of Glatz, the inhabitants of which are chiefly employed in turning; 13 miles W. of Glatz. N. lat. 50° 13′. E. long. 16° 3′.

Löwen, *Löhen*, or *Lewin*, a town of Sileſia, in the principality of Brieg, on the Neiſſe; nine miles S.E. of Brieg. N. lat. 50° 40′. E. long. 17° 33′.

LÖWENBERG, or Lemberg, a town of Sileſia, in the principality of Jauer, near the Bober; 25 miles W. of Jauer. N. lat. 51° 5′. E. long. 15° 42′.

LOWENDAHL, Ulric-Frederic, Woldemar, *Count of*, in *Biography*, a celebrated general, was born at Hamburgh in the year 1700. His father, grand marſhal and miniſter of the king of Poland, elector of Saxony, inured him to arms when he was only thirteen years old. He roſe gradually in the army, and ſerved in ſeveral campaigns, expoſed to the dangers and fatigues of warfare, proving himſelf, on all occaſions, worthy of the rank he held, by his valour and prudence. In 1721 the king of Poland gave him the command of his horſe-guards and a regiment of infantry; his leiſure time he employed in the profound ſtudy of gunnery and fortification, and in 1728 he was made field-marſhal and inſpector-general of the Saxon infantry. After the death of the king he diſtinguiſhed himſelf in the defence of Cracow; in the following campaigns he commanded the Saxon auxiliaries on the Rhine under prince Eugene, and he had a chief command at the ſtorming of Otchakof. In 1743 he entered the ſervice of the king of France, and was for ſome years actively employed in the war in which that monarch was engaged. In 1747 he attained the ſummit of his glory as a beſieging general, by making a ſweep of ſeveral towns of Flanders, concluding with that of Bergen-op-Zoom, which had been deemed impregnable. Immediately after the capture of this laſt place Lowendahl was declared a marſhal of France. He now retired from the active ſcenes of war, and diſtinguiſhed himſelf as a worthy eſtimable character in private life, equally agreeable and inſtructive in converſation, and furniſhed with a variety of knowledge. He was converſant with many languages, and devoted a large portion of his time to reading. He died at the age of fifty-five. His name had been ſome time enrolled among the honorary members of the Academy of Sciences. Moreri.

LOWENDOLLAR, or Lyondollar, a Dutch ſilver coin, valued at 42 ſtivers, or a little more. This coin is ⅔ of the ducatoon, weighs 17 dwts. 14 grs., and is valued at 43.07*d*. in ſir I. Newton's Table of Aſſays, &c.

LÖWENSTEIN, in *Geography*, a town and capital of a county, which is a ſief annexed to Wurtemberg; nine miles E.S.E. of Heilbron. N. lat. 49° 6′. E. long. 9° 28′.

LOWER, Richard, in *Biography*, an eminent phyſician and anatomiſt, was born at Tremere, in Cornwall, about the year 1631. He was deſcended from a good family, and received a liberal education, being admitted as king's ſcholar at Weſtminſter ſchool, and thence elected to Chriſt-church college, in Oxford, in 1649. After the uſual courſe of univerſity ſtudies, he took the degree of M.A. in 1655, and then turned his attention to medicine. He became acquainted with the celebrated Dr. Willis, who employed him as a coadjutor in his diſſections, and found him ſo able an aſſiſtant, that he afterwards became his ſteady friend and patron, and introduced him into practice. In 1665, Lower took the degree of M.D.; and in the ſame year publiſhed a defence of Dr. Willis's work on fevers, entitled "Diatribæ Thomæ Williſii M.D. et Prof. Oxon. de Febribus Vindicatio adverſus Edm. de Meara Ormondienſem Hibern. M.D." 8vo., a work of conſiderable learning and force of argument, but not without ſome fallacies, as he afterwards himſelf admitted. But his moſt important work was, his "Tractatus de Corde, item de motu et calore Sanguinis, et Chyli in eum tranſitu," which was firſt printed in London in 1669. In this work the ſtructure of the heart, the origin and courſe of its fibres, and the nature of its action, were pointed out with much accuracy and ingenuity. He likewiſe demonſtrated the dependance of its motions upon the nervous influence, referred the red colour of the arterial blood to the action of the air upon it in the lungs, and calculated the force of the circulation, and the quantity and velocity of the blood paſſing through it. In a word, this treatiſe was one of the moſt important contributions of the time to anatomical and phyſiological improvement. The work excited particular notice, in conſequence of the chapter on the transfuſion of blood from the veſſels of one living animal to thoſe of another, which the author had firſt performed experimentally at Oxford, in February 1665, of which ſome account had been laid before the Royal Society, and printed in the Philoſ. Tranſactions 1666, through the requeſt of the Hon. Robert Boyle. He ſubſequently practiſed the transfuſion upon an inſane perſon before the Royal Society. Lower claims the merit of originality in this matter; but the experiment had certainly been ſuggeſted long before by *Libavius* (which ſee), and it is a matter of diſpute with whom the thought firſt originated. It is allowed, however, that the French firſt tried the experiment upon the human ſubject. But it were uſeleſs to enter into the queſtion; ſince experience ſoon decided, that the operation was attended with pernicious conſequences, and it was therefore exploded. Lower had removed to London ſoon after the commencement of theſe experiments, and in 1667 had been a fellow of the Royal Society, and of the College of Phyſicians. The reputation acquired by his publications brought him into extenſive practice; and after the death of Dr. Willis, he was conſidered as one of the ableſt phyſicians in London. But his attachment to the Whig party, at the time of the Popiſh plot, brought him into diſcredit at court, ſo that his practice declined conſiderably before his death, which occurred in January 1690-91. He was buried at St. Tudy, near his native place, in Cornwall, where he had purchaſed an eſtate. In addition to the writings above-mentioned, he communicated ſome papers containing accounts of anatomical experiments to the Royal Society; a ſmall tract on catarrh, which was added, as a new chapter, to the edition of the treatiſe de Corde of 1680; and a Letter on the ſtate of medicine in England. Gen. Biog. Eloy Dict. Hiſt. de la Med.

Lower, *To*, in *Sea Language*, is to eaſe down gradually, expreſſed of ſome weighty body, which is ſuſpended by tackles or other ropes, which being ſlackened, ſuffer the body to deſcend as ſlowly or expeditiouſly as the occaſion requires. Hence lower *handſomely*, and lower *cheerly*, are oppoſed to one another; the former being the order to lower gradually, and the latter to lower expeditiouſly.

Lower *Alloway's Creek*, in *Geography*, a townſhip of America, in Salem county, New Jerſey.

Lower *Creek*, a river of America, in the weſtern territory, which runs into the Ohio. N. lat. 40° 9′. W. long. 80° 43′.

Lower *Dublin*, a townſhip of America, in Philadelphia county, Pennſylvania, containing 1495 inhabitants.

Lower *Landing*, or *Eaſt Landing*, lies on Niagara river, Upper Canada, oppoſite to Queenſtown on the Niagara-fort ſide.

Lower *Marlborough*, a poſt-town of America, in Maryland, 30 miles from Annapolis, and 12 from Calvert court-houſe.

Lower *Milford*, a townſhip of America, in Burk's county, Pennſylvania.

Lower *Penn's Neck*, a townſhip of America, in Salem county, New Jerſey.

Lower *Weau Towns*, lie in the territory N.W. of the Ohio, 20 miles below Rippacanoe creek, at its mouth in Wabaſh river.

Lower, in *Rural Economy*, a term provincially applied to a lever in ſome places.

LOWERING, in the *Diſtillery*, a term uſed to expreſs the debaſing of the ſtrength of any ſpirituous liquor by mixing water with it. The ſtandard and marketable price of theſe liquors are fixed, in regard to a certain ſtrength in them called *proof*; this is that ſtrength, which makes them, when ſhook in a phial, or poured from on high into a glaſs, retain a froth or crown of bubbles for ſome time. In this ſtate ſpirits conſiſt of about half pure or totally inflammable ſpirit, and half water; and if any foreign or home ſpirit is to be expoſed to ſale, and is found to have that proof wanting, ſcarce any one will buy it, till it has been diſtilled again and brought to that ſtrength; and if it is above that ſtrength, the proprietor uſually adds water to it to bring it down to that ſtandard. This addition of water, to debaſe the ſtrength, is what is called lowering it. People well acquainted with the goods will indeed buy ſpirits at any ſtrength, only lowering a ſample to the proof ſtrength, and by that judging of the ſtrength of the whole; but the generality of buyers will not enter into this, but have it all lowered for them.

There is another kind of lowering in practice among the retailers of ſpirituous liquors to the vulgar: this is the reducing it under the ſtandard of proof. They buy it proof, and afterwards increaſe their profit upon it, by lowering it with water one-eighth part. The quantity of ſpirit is what they generally allow themſelves for the addition of water; and whoever has the art of doing this, without deſtroying the bubble proof, as this is eaſily done by means of ſome addition that gives a greater tenacity to the parts of the ſpirit, will deceive all that judge by this proof alone; that is, very nearly all who are concerned in the ſpirit trade. Such an additional quantity of water as one-eighth makes the ſpirit taſte ſofter and cooler, and will make many prefer it to the ſtronger ſpirit, which is hotter and more fiery; but unleſs the ſpirit, thus lowered, were tolerably clean, or the proof be ſome other way preſerved, the addition of the water lets looſe ſome of the coarſe oil, which makes the liquor milky, and leaves a very nauſeous taſte in the mouth. Shaw's Eſſay on Diſtillery.

The way to judge of ſpirits not being thus lowered or debaſed in ſtrength, is to examine them by the eye and tongue; and in buying a quantity of proof goods, ſuch ſhould always be choſen as are clean, thin, and light, and have a good crown of froth, which goes off in large bubbles, ſuch as taſte ſoft and uniform, and are not high flavoured, of an alkaline guſt, nor acrid and fiery, but ſoon quit the tongue.

Lowering *the Flag*. See Flag.

LOWES Water, in *Geography*, a lake of England, in the county of Cumberland, about ſix miles in circumference; 10 miles S. of Cockermouth.

LOWEST Region. See Region.

LOWESTOFF, in *Geography*, a market-town and pariſh in the hundred of Mutford and Lothingland, on the coaſt of Suffolk, England. For a conſiderable period it was denominated Lothnwiſtoft, as ſome think, from Lothbroch, a noble Dane, who landed in this neighbourhood about the year 864, and *wiſta*, a half hide of land. This derivation of its name is extremely doubtful. The town, however, is certainly of much earlier origin. Mr. Gillingwater, in his "Hiſtory of Loweſtoft," ſays it can be traced back to a period anterior to the fourth century. This town has ſuffered much from the plague at different periods, particularly in the years 1348 and 1547. It has likewiſe ſuſtained frequent plundering and depredations, on account of the attachment of its inhabitants to the cauſe of royalty.

The ſituation of this town is lofty, and exhibits a fine and commanding appearance. It extends about a mile in length, and conſiſts chiefly of one principal ſtreet, running in a gradual deſcent from north to ſouth, which is interſected by ſeveral ſmaller ſtreets or lanes from the weſt. The whole is, in general, well paved, and many of the houſes, having been lately rebuilt in the modern ſtyle, give the town an appearance of great neatneſs. From its ſituation and expoſure to the northern ocean, over which it commands an extenſive proſpect, it enjoys a moſt ſalubrious air, keen, but bracing. On the declivity of the cliff a number of hanging gardens are formed, which are interſperſed with alcoves and ſummer-houſes. At the foot of theſe gardens is a long arrangement of fiſhing-houſes, extending the whole length of the town. Between theſe and the beach ſtand the boats employed in the herring-fiſhery, which is the chief ſupport of the town, 70,000 barrels being exported from hence every ſeaſon. Here are alſo two light-houſes, conveniencies for boat-building, and accommodations for bathing. A conſiderable number of families reſort here for the benefit of the ſalt-water. Beſides theſe ſources of wealth to the inhabitants, there is a tolerable mackarel fiſhery, which commences in May and continues till the latter end of June, and ſupplies the adjacent markets, as well as the metropolis. A ſmall china manufactory, and a ropery, alſo belong to the town.

The church, ſituated about half a mile weſt from the town, is a very fine building, in the pointed ſtyle of architecture, and conſiſts of a nave with two ſide aiſles. The principal entrance is by a ſtately porch, on the ſouth ſide of which are three niches, the centre one intended for the reception of a ſtatue of St. Margaret, the ſaint to whom the church is dedicated. The chancel is particularly neat and elegant. The font, which is very ancient, is aſcended by three ſtone ſteps, the upper one bearing an inſcription, but ſo much corroded as to be almoſt unintelligible. It is ſurrounded by three rows of ſaints, each row containing twelve figures, and is otherwiſe finely adorned by carved work. Mr. Whiſton, the friend of ſir Iſaac Newton, and ſome time profeſſor of mathematics in the univerſity of Cambridge, from which he was expelled for his Arian principles, was long vicar of this church. This town had likewiſe formerly three chapels of eaſe, but only one of them now continues to be uſed. There are diſſenting meeting-houſes here for Methodiſts and Preſbyterians. A theatre was erected in 1790.

Loweſtoff is protected by ſtrong batteries on the ſea-ſide. From its extenſive fiſhery, it is a good nurſery for ſeamen, and has given birth to ſeveral eminent naval officers. A great ſea-fight took place off this town on the 3d of June, 1665, between the Britiſh fleet under the duke of York, and the Dutch fleet, which was commanded by admirals Opdam and Van Tromp, in which the latter were defeated with the loſs of eighteen ſhips taken and fourteen ſunk. In this action, admiral ſir Thomas Allen, a native of this town, particularly diſtinguiſhed himſelf. In the vicinity of Loweſtoff formerly ſtood the village of Newton, which has been entirely ſwallowed up by the ſea.

Loweſtoff, according to the parliamentary returns of 1800, contained 572 houſes, and 2332 inhabitants. The market is held on Wedneſday, and the fairs on the 12th of May and 19th of October. A very full hiſtory of this town has been publiſhed under the following title, "An hiſtorical Account of the ancient Town of Loweſtoff, with curſory Remarks on the adjoining Pariſhes, and a general Account of the Iſland, by Edm. Gillingwater, 4to. 1790."

LOWHILL, a townſhip of America, in Northampton county, Pennſylvania, containing 545 inhabitants.

LOWITZ, George Moritz, in *Biography*, profeſſor at Gottingen, and member of the Imperial Academy of Sciences at Peterſburgh, was born, in 1722, at Fürth, near Nuremberg. He was put apprentice to the trade of a goldſmith, and by his expertneſs in the buſineſs, he was enabled afterwards to conſtruct and improve mathematical inſtruments, with the uſe of which he was well acquainted. He now turned his attention to ſcience, and made a very uncommon progreſs in mathematics and natural philoſophy. In 1748, he diſtinguiſhed himſelf by conſtructing two charts of the ſolar eclipſe, which was to take place in the following July. He afterwards obſerved the eclipſe with great accuracy, by a new method of his own invention. Next year he publiſhed a chart repreſenting the ſolar eclipſe announced for the 8th of January, 1750, as it would appear to the inhabitants of Peterſburg, Rome, Berlin, Nuremberg, Liſbon, &c. During theſe years he had been employed in the education of young perſons, and in 1751 he was appointed profeſſor of mathematics and natural philoſophy in the Egidian ſeminary at Nuremberg, and was entruſted with the care of the obſervatory. On his entrance into this new office he pronounced an oration on the advantages which might be derived from the ſtudy of the higher branches of mathematics, which was printed in 1752. He publiſhed in the ſame year an account of various experiments on the properties of the air, which he employed as a guide in his lectures. About this time he removed to Gottingen, and was made profeſſor of practical mathematics, with a ſalary of four hundred dollars. Having little to do as profeſſor, he filled up his vacant hours in writing papers on various uſeful ſubjects; the greater part of theſe were read before the Royal Society of Gottingen, and they added, in a conſiderable degree, to his reputation. He was at the ſame time employed by the Coſmological Society in conſtructing globes; but, after a time, conceiving his ſervices had not been ſufficiently remunerated, he quitted the ſociety with diſguſt. After this he was appointed, by the Hanoverian government, director of the obſervatory, an office which he reſigned in 1764, together with the profeſſorſhip; and he now reſided at Gottingen as a private individual. He ſoon found that his means were inſufficient for his ſupport: his affairs became embarraſſed, and his ſituation would probably have been forlorn, had not the Academy of Sciences at Peterſburg invited him into Ruſſia for the purpoſe of obſerving the tranſit of Venus, which was to take place in the year 1769. In a ſhort time after this he was appointed a member of the Academy of Sciences in the aſtronomical department, and he was ordered to repair to Surjef, a ſmall town on the river Ural, a few miles from the Caſpian ſea, the place deſtined for obſerving this curious phenomenon. This miſſion he accompliſhed in the completeſt manner, and publiſhed an account of it in the year 1770. He then proceeded, in the month of September, by the Caſpian ſea, to Aſtrachan, and having determined the geographical poſition of that city, he repaired to ſome other places for the like purpoſes. He was next engaged in ſurveys for a new canal, which he continued, at different periods, till the month of Auguſt, 1774, when the whole undertaking was unfortunately ſtopped by a ſudden and unexpected irruption of ſome rebel troops. Lowitz, and his friend and aſſiſtant, betook themſelves to places which they hoped would afford them ſhelter and ſecurity. The latter, after burying his books, inſtruments, and other property, ſought for ſafety in the fortreſs of Dmetrieſſk, from whence he proceeded to Aſtrachan. Lowitz, with his family, ſet out for the German colony of Dobrinka, but unfortunately fell into the hands of the rebel chief, who put him to death in the moſt barbarous manner. His wife and ſon were ſuffered to eſcape after they had been plundered of the beſt part of their property: but Lowitz's books, papers, and inſtruments, having been depoſited in an unoccupied houſe, were, by good fortune, preſerved. Gen. Biog.

LOWK, in *Agriculture*, a provincial term, ſignifying to weed corn, or other crops ſown broad-caſt.

LOWKOW, in *Geography*, a town of Poland, in the palatinate of Volhynia; 10 miles E. of Zytomiers.

LOWLANDS, a denomination applied to the ſouthern diſtricts of Scotland, in contradiſtinction to the *Highlands;* which ſee. The inhabitants of theſe different diſtricts differ from each other in language, manners, and dreſs; but the difference has been gradually decreaſing. The language, manners, habits, and dreſs of the gentlemen in the Low Countries reſemble thoſe of their Engliſh neighbours, with whom they have frequent intercourſe. The peaſantry and middle claſs are ſober, induſtrious, and good economiſts; hoſpitable and diſcreet, intelligent, brave, ſteady, humane, and benevolent. Their fidelity to one another is a ſtriking feature in their character. In their mode of living and dreſs there are ſome peculiarities, but theſe are gradually wearing out. Within theſe few years the uſe of pottage, and bread of oatmeal, is almoſt diſuſed among the commonalty, and tea, wheaten bread, and animal food, are as common on the north as on the ſouth of the Tweed. See Scotland.

LOWMAN, Moses, in *Biography*, was born in London in the year 1679. He was originally intended for the profeſſion of the law, was educated accordingly, and entered a ſtudent in the Middle Temple. When he attained to years of manhood, he abandoned the law, and determined to qualify himſelf for the office of miniſter among the Proteſtant diſſenters. With this view he proceeded to Holland, and purſued his ſtudies at Utrecht and Leyden, and on his return in 1710 he was choſen aſſiſtant preacher to a diſſenting congregation at Clapham, of which he was afterwards elected paſtor. In this connection he continued during the remainder of his life, diſcharging the duties of his ſtation with conſtancy and regularity, eſteemed and beloved by his flock, and highly reſpected by thoſe who knew him. As an author, his firſt publication was in 1740, and intitled "A Diſſertation on the Civil Government of the Hebrews, in which the true Deſign and Nature of their Government are explained, and the Juſtice, Wiſdom, and Goodneſs of the Moſaical Conſtitutions vindicated, &c." In 1745, he publiſhed "A Paraphraſe and Notes upon the Revelation of St. John," which is held in high eſtimation by the moſt judicious critics. The next work of Mr. Lowman was upon Jewiſh antiquities, intitled "A Rational of the Ritual of Hebrew Worſhip, &c." Beſides theſe, he printed a ſmall tract concerning "The Demonſtration of a God, from the Argument à priori," and a ſermon on Popery. He died in 1752, in the 73d year of his age. As he was a firm believer in the Chriſtian revelation, ſo he had imbibed the ſpirit which it recommends; and thoſe virtues and duties which he inculcated upon others he carefully practiſed himſelf. Biog. Brit.

LOWOSITZ, in *Geography*, a town of Bohemia, in the circle of Leitmeritz; four miles W.S.W. of Leitmeritz. N. lat. 50° 30'. E. long. 14° 9'.

LOWOWECH, or NEUSTAT, a town of the duchy of Warſaw; 33 miles W. of Poſen.

LOWREY, a town of Hindooſtan, in the circar of Gohud; 36 miles E.S.E. of Raat.

LOWTAIAH, a town of Algiers; 27 miles S. of Tubnah.

LOWTH, WILLIAM, in *Biography*, a learned Engliſh divine and commentator of the ſcriptures, ſon of an apothecary, was born in the pariſh of St. Martin's, Ludgate, in the city of London, in the year 1661: he was inſtructed in the claſſics at Merchant Taylors' ſchool, and made ſuch progreſs in them that he was deemed fully qualified for the univerſity before he was quite fourteen years of age, and was accordingly elected from thence into St. John's college, Oxford, in 1675. He took his degree of M.A. in 1683, and proceeded bachelor of divinity in 1688. His firſt publication was "A Vindication of the divine Authority and Inſpiration of the Old and New Teſtament," in anſwer to Le Clerc's famous five letters on this ſubject. This work attracted public notice, and he was appointed chaplain to Dr. Mew, biſhop of Wincheſter, and ſhortly promoted to a prebend in the cathedral church of that ſee, and to a rectory in Hampſhire. Mr. Lowth next publiſhed a ſmall piece, which has been very frequently reprinted, entitled "Directions for the profitable reading of the Holy Scriptures," &c. In 1714 he publiſhed two ſermons, and alſo "A Commentary on the Prophet Iſaiah," in quarto, which was followed, in 1718, by "A Commentary on the Prophet Jeremiah." In 1723 he gave the world his "Commentary on the Prophet Ezekiel," and ſoon after one on Daniel, and the minor prophets. Theſe illuſtrations of the prophecies were afterwards collected in a folio volume, as a continuation of biſhop Patrick's Commentary on the other parts of the Old Teſtament, in which form they have been frequently reprinted. Mr. Lowth, though an able ſcripture expoſitor, was a good general ſcholar, and furniſhed Dr. Potter, afterwards archbiſhop of Canterbury, with notes on Clemens Alexandrinus, which were publiſhed, with the author's name to each, in the doctor's edition of that father. He communicated to Dr. Hudſon remarks on Joſephus, of which that editor availed himſelf, and acknowledged his obligations in the preface to his edition of the Jewiſh hiſtorian. To the labours of Mr. Lowth many other learned men and valuable writers have been indebted, beſides thoſe above referred to. He died in 1732, being in the ſeventy-third year of his age. He was diſtinguiſhed for unaffected piety, a moſt exemplary zeal in the diſcharge of the paſtoral functions, and for an unremitting deſire of being uſeful to his pariſhioners. Biog. Brit.

LOWTH, ROBERT, ſon of the preceding, was born at Wincheſter in the year 1710. Here he was educated in grammar learning at the ſchool founded by William of Wykeham, in which he acquired an accurate knowledge of the Greek and Roman claſſics, and made conſiderable progreſs in oriental literature. Even at ſchool he diſcovered a poetical genius, and among other pieces which he wrote at that period, was a beautiful poem on "The Genealogy of Chriſt," as it is repreſented on the eaſt window of Wincheſter college chapel; and another, which appeared in the twenty-third volume of the Gentleman's Magazine, entitled "Catherine's Hill," the place where the Wincheſter ſcholars are allowed to play on holidays. In 1728, he was ſent to New college, Oxford, of which inſtitution he was elected a fellow in 1734: took his degree as M.A. in 1737, and was, in 1741, elected profeſſor of poetry in the univerſity of Oxford. In the diſcharge of the duties of this office he delivered his "Prælectiones" on Hebrew poetry, which will be noticed more at large hereafter. His firſt preferment in the church was the rectory of Ovingdon, in Hampſhire, to which he was preſented by biſhop Hoadly. In 1748, Mr. Lowth accompanied Mr. Legge, afterwards chancellor of the exchequer, to Berlin, who went to that court in a public character, and with whom, from his earlieſt years, he lived on terms of the moſt uninterrupted friendſhip. In the following year he undertook the charge of the ſons of the duke of Devonſhire, as travelling tutor on the continent. The duke was ſo thoroughly ſatisfied with the conduct of Mr. Lowth in this office, that he afterwards proved his ſteady friend and patron. In 1750 he was appointed archdeacon of Wincheſter, and three years after he was preſented to the rectory of Eaſt Woodhay, in the county of Southampton. In 1753 he publiſhed his work already mentioned, entitled "De ſacra Poeſi Hebræorum Prælectiones Academicæ;" of which he gave the public an enlarged edition in 1763, in two volumes 8vo. The ſecond volume conſiſts of additions made to the work by the celebrated Michaelis. This work, though entitled only "Lectures on Hebrew Poetry," will be found "An excellent compendium of all the beſt rules of taſte, and of all the principles of compoſition, illuſtrated by the boldeſt and moſt exalted ſpecimens of genius, which antiquity has tranſmitted to us, and which have ſeldom fallen under the inſpection of rational criticiſm. But theſe lectures teach us not only taſte, but virtue; not only to admire and revere the ſcriptures, but to profit by their precepts. The author has penetrated into the very ſanctuaries of Hebrew literature; he has inveſtigated, with a degree of preciſion which few critics have attained, the very nature and character of their compoſition; by accurately examining, and cautiouſly comparing every part of the ſacred writings; by a force of genius, which could enter into the very deſign of the authors; and by a comprehenſiveneſs of mind, which could embrace, at a ſingle view, a vaſt ſeries of correſponding paſſages, he has diſcovered the manner, the ſpirit, the idiom of the original, and has laid down ſuch axioms as cannot fail to facilitate our knowledge and underſtanding of the ſcriptures." Such is the opinion of this work given by the tranſlator of it, the late Dr. George Gregory. Subjoined to the "Prælectiones" is "A ſhort Confutation of Biſhop Hare's Syſtem of Hebrew Metre." In the year 1754, the univerſity of Oxford honoured the author with the degree of doctor of divinity, and in the following year he was nominated firſt chaplain to the marquis of Hartington, lord lieutenant of Ireland. Thither he accompanied that nobleman, and was, in a ſhort time, offered the biſhopric of Limerick, which however he exchanged for ſome preferment in the county of Durham, in his own country. In 1758, Dr. Lowth preached a ſermon at Durham, on Free Enquiry in Matters of Religion, which has been frequently reprinted. In the ſame year he publiſhed his "Life of Wykeham, Biſhop of Wincheſter," and founder of the colleges in which he had received his education. His next piece has been exceedingly popular in our ſchools, though now generally ſuperſeded by a work of the ſame kind by Mr. Lindley Murray, *viz.* "An Introduction to Engliſh Grammar." Paſſing over a controverſy between Dr. Lowth and Dr. Warburton, which did not reflect much credit on the angry tempers of the diſputants; we may obſerve that Dr. Lowth was elected a fellow of the Royal Society at Gottingen in the year 1765, and in the following year he was promoted to the ſee of St. David's, and almoſt immediately tranſlated to the biſhopric of Oxford. In this high office he remained till the year 1777, when he ſucceeded Dr. Terrick in the ſee of London. In 1778 he publiſhed the laſt of his literary labours, entitled "Iſaiah: A new Tranſlation, with a preliminary Diſſertation, and Notes, critical, philological, and explanatory." His deſign, in this work, was not only to give an exact and faithful repreſentation of the words and ſenſe of the prophet, by adhering cloſely to the letter of the text, and treading, as nearly as may be, in his footſteps; but, moreover, to imitate the air and manner of the author, to expreſs the form and faſhion of the compoſition, and to give the Engliſh reader ſome notion of the peculiar turn and caſt of the original. This verſion, excellent in itſelf, was not entirely faultleſs, and the miſtakes were pointed out by Michael Dodſon, eſq. (See Dodson.) In 1779 the biſhop was called on to preach a ſermon before the king at the Chapel-royal, on Aſh-Wedneſday, in which he attacked the opponents to the miniſterial ſyſtem of government, among whom was the celebrated Dr. Richard Price, who defended himſelf with energy and ſpirit. In 1781 biſhop Lowth was engaged in a law ſuit with Lewis Diſney Ffytche, eſq., concerning the legality of general bonds of reſignation, which, if Dr. Towers's ſtatement of the caſe be at all accurate, was highly diſcreditable to his lordſhip: ſuffice it to ſay, that in this caſe the deciſions of the courts of law, almoſt unanimouſly pronounced, were unexpectedly reverſed by the houſe of lords, by a ſmall majority of *one*, and of the numbers who voted on this occaſion fourteen were biſhops, and as ſuch parties in their own cauſe. (See Dr. Towers's Obſervations on the Cauſe between the Biſhop of London, and L. D. Ffytche, eſq.) In 1783 the biſhop was fixed on to ſucceed archbiſhop Cornwallis, but on account of his advanced age he thought proper to decline the high honour of the archbiſhopric of Canterbury. In the latter years of his life he endured a great degree of ſuffering from that dreadful diſorder, the ſtone, which he bore with fortitude and reſignation to the divine will. He experienced alſo ſome of the moſt painful ſtrokes of calamities which a father can experience, in the loſs of affectionate children. In 1768 his eldeſt daughter died at the age of thirteen, of whom he was paſſionately fond, and whoſe death he deplored in the following exquiſitely beautiful epitaph, which is inſcribed on her tomb:

Cara, vale, ingenio præſtans, pietate, pudore,
Et pluſquam natæ nomine cara, vale.
Cara Maria, vale. At veniet felicius ævum
Quando iterum tecum, ſim modo dignus, ero.
Cara, redi, læta tum dicam voce paternas,
Eja, age in amplexus, cara Maria, redi.

In 1783, his ſecond daughter, as ſhe was preſiding at the tea-table, ſuddenly expired. His eldeſt ſon alſo, of whom he was led to form the higheſt expectations, was hurried to the grave in the bloom of youth. His lordſhip died at Fulham in 1787, having nearly completed the 77th year of his age. Of biſhop Lowth's extenſive learning, fine taſte, and peculiar qualifications for the ſtation which he filled, he has left abundant proofs. While his amiable manners rendered him an ornament to the high rank in which he moved, and endeared him to all with whom he converſed, his zeal for the eſtabliſhed religion of the country made him anxious to promote to places of truſt and dignity ſuch clergymen as he knew were beſt qualified to fill them. He united, in an eminent degree, the qualities of the gentleman with thoſe of the ſcholar: he converſed with elegance, as he wrote with accuracy. His heart was tender and ſympathetic. He poſſeſſed a mind which felt its own ſtrength, and decided on whatever came before it with promptitude. In thoſe trials where affliction was to be ſuffered or ſubdued he behaved as a man and a Chriſtian. His piety had no tincture of moroſeneſs; his charity no leaven of oſtentation. The biſhop was author of ſome ſermons, preached on particular occaſions, and of many poetical pieces, ſome of which have been frequently reprinted; the titles of which will be found in the General Biography.

LOWVILLE, in *Geography*, a poſt-town of America, in Oneida county, New York; 550 miles from Waſhington.

LOWYA, a town of Hindooſtan, in Bahar; 15 miles S.S.E. of Bettiah. N. lat. 26° 35′. E. long. 84° 43′.

LOXA, or Loja, called by Abulfeda *Luſchah*, an irregularly built town of Spain, in the province of Grenada, ſituated partly on the declivity and partly at the foot of a hill near the Xenil, about five leagues W. of Grenada, and taken from the Moors in 1486. It contains three pariſhes, four convents, four hoſpitals, a bridge, and the ruins of a caſtle; together with a ſalt-work and a copper forge. It is the chief town of a corregidorad; the country about it is pleaſing, fertile, and full of olive trees, gardens, orchards, fine fruit trees, and flowers. In the vicinity are immenſe numbers of hares and rabbits. Near the town, towards Grenada, are a ſmall plain and a valley, both ſown with corn, flax, and hemp, and producing alſo a great quantity of vegetables. N. lat. 37° 18′. W. long. 4° 18′. It contains about 8000 inhabitants.

Loxa, or *Loja*, a town of South America, the capital of a juriſdiction of the ſame name, in the province of Quito, founded in the year 1546, by captain Alonſo de Mercadillo, and reſembling in extent, form, and buildings, the city of Cuença; but the temperature of the air is conſiderably hotter. Beſides two churches, Loja has ſeveral convents, a nunnery, a college of Jeſuits, and an hoſpital. In its diſtrict are 14 villages, and within the territory of its juriſdiction is produced the famous ſpecific for intermitting fevers, well known by the name of Caſcarilla de Loja, or Quinquina. (See Cascarilla and Cinchona.) The juriſdiction of Loja derives alſo great advantage from breeding the *Cochineal*; which ſee. The inhabitants of Loja, known over the whole province by the name of Lojanos, do not exceed 10,000 ſouls; though formerly, when the city was in its greateſt proſperity, they were much more numerous. Their character is much better than that of the inhabitants of Cuença; and beſides their affinity in cuſtoms and diſpoſition to thoſe of the other villages, they cannot be reproached with the character of being ſlothful. In this juriſdiction ſuch numerous droves of horned cattle and mules are bred, that it ſupplies the others of this province, and that of Piura in Valles. The carpets alſo manufactured here are of ſuch remarkable fineneſs, that they find a ready ſale wherever they are ſent. The corregidor of Loja is governor of Yaguarſongo, and principal alcalde of the mines of Zaruma; but the poſt of governor of Yaguarſongo is at preſent a mere title without any juriſdiction; part of the villages which formed it being loſt by the revolt of the Indians, and the others added to the government of Jaen; ſo that the corregidor of Loja enjoys only thoſe honours intended to preſerve the remembrance of that government. The town of Zaruma, in the juriſdiction of which are mines of gold, has preſented the corregidor of Loja with the title of its alcalde major. It was one of the firſt towns founded in this province, and at the ſame time one of the moſt opulent; but it is at preſent in a mean condition, owing chiefly to the decay of its mines, on which account moſt of the Spaniſh families have retired, ſome to Cuença, and others to Loja; ſo that at preſent its inhabitants are ſaid not to exceed 6000. The declenſion of theſe mines, which is owing to the negligence of thoſe that are concerned in working them, more than to a ſcarcity of the metal, has been diſadvantageous to the whole department of Loja; and conſequently diminiſhed the number of its inhabitants. S. lat. 4°. W. long. 79° 14′.

Loxa, a town of Sweden, in the province of Savolax; 108 miles N. of Nyſlot.

LOXARTHRUS, (from λοξος, *oblique*, and αρθρον, *a joint*,) in *Surgery*, deformity of a joint.

LOXIA, in *Natural Hiſtory*, a genus of birds of the order paſſeres, of which, according to Latham, there are eighty-five ſpecies; but in the laſt edition of Gmelin, there are an hundred ſpecies enumerated and deſcribed. This latter arrangement we ſhall follow in the preſent article. The eſſential character is as follows: the bill is ſtrong, thick, convex, rounded at the baſe; the lower mandible is bent in at the edge; the noſtrils are ſmall, and round at the baſe of the bill; the tongue is truncate. The familiar name of this genus is *groſbeak*.

In the loxia, emberiza, and fringilla genera, both mandibles are moveable, by which means they are able to ſhell and break in pieces the ſeeds they feed upon. Of this numerons tribe there are but five ſpecies that are Britiſh, which will be noticed by aſteriſks prefixed to the ſpecific names.

Species.

* Curviroſtra; Common croſs-bill. Mandibles croſſing each other; body varying in colour; wings and forked tail brown. Linn. *Le bec-croiſe*, Briſſ. *Sheld-apple*, or *croſs-bill*, Willoughby. This is the moſt remarkable bird of the whole genus. Both mandibles are hooked, and turned different ways, ſo that they do not meet in a point. The bill, however, is not uniformly in the ſame direction: in ſome individuals the under mandible is twiſted to the right, in others to the left ſide; a circumſtance that has been noticed, to prove that the variation in the bill is rather owing to certain uſes to which it is applied by the bird, than to any fixed appointment in nature. This ſpecies is found ſometimes in Britain, though it is not by any means a conſtant viſitor in theſe iſlands. It inhabits more generally the northern countries of Europe, eſpecially ſome parts of Germany, Switzerland, Ruſſia, Sweden, &c. where it is permanent the whole year. Birds of this ſpecies migrate, from unknown cauſes, into other countries, not regularly, but in the courſe of ſeveral years. They inhabit the pine foreſts, and feed upon the cones; for the ſcaling of which their bills are admirably formed. This bird is obſerved to hold the cone in one claw, like the parrot; and to have all the actions of that bird, when kept in a cage. It is ſaid to make its neſt in the very higheſt parts of the fir trees, faſtening it to the branch with the reſinous matter which exudes from the trees. Mr. Latham ſays, "I have never heard of its breeding in England, but know one inſtance of its being ſhot at large in the middle of ſummer. I have been told that they have done great damage in orchards, by tearing the apples to pieces for the ſake of the ſeeds, the only part they delight in. Many are taken with a bird-call and bird-lime, and others by a horſe-hair nooſe fixed to a long fiſhing-rod: for ſo intent are they on picking out the ſeeds of the cone, that they will ſuffer themſelves to be taken by the nooſe being put over the head.

There are two varieties: the one reddiſh, head ſcarlet; the other larger, bill thicker and ſhorter. The male is red, varied with brown and green, and is ſaid to change its colours thrice a year; the female is olive-green, mixed with brown.

Leucoptera; White-winged groſbeak. Mandibles croſſing each other; feathers whitiſh, edged with red; rump pale red; vent whitiſh; tail and wings black, the latter with two white bands. It inhabits North America; is about ſix inches long. The bill is of a horn colour; legs are brown. Latham received ſpecimens both from Hudſon's Bay and New York.

Psittacea; Parrot-billed groſbeak. Olive colour; quill and even tail-feathers edged with yellowiſh; lower mandible much ſhorter. The plumage in the female is not unlike that of the male, except the head, which is the ſame as the other parts of the body, with a mixture of yellowiſh-grey about the ſides of the head. It inhabits the Sandwich iſlands.

* Coccothrauſtes; Hawfinch. This is *le gros-bec* of Briſſon, and is rather larger than the foregoing ſpecies. It is of a cheſnut-aſh colour; wings with a white line, having the middle quill-feathers rhombic at the tips; tail-feathers black at the baſe of the thinner web. The female is leſs bright in colour; the part between the bill and the eye is grey, inſtead of black. This may ſerve as a general deſcription, but the colours vary very much. This ſpecies, though ranked among the Britiſh birds, viſits theſe kingdoms occaſionally, and for the moſt part in winter, and has never been known to breed here. It is more plentiful in France, where it may be ſeen in abundance about the beginning of April; and ſoon after makes its neſt between the fork of the branches of trees, about ten or twelve feet from the ground. It is compoſed of ſmall dry fibres, intermixed with liverwort, and lined with finer materials. The eggs are of a roundiſh ſhape, of a blueiſh-green, ſpotted with olive-brown, with a few irregular black markings interſperſed. It is alſo common in Italy, Germany, Sweden, and the weſtern parts of Ruſſia, where the wild fruits grow: in the reſt of the empire they are exceedingly ſcarce, except beyond lake Baikal, where they arrive from the ſouth in great plenty, to feed on the berries of a tree peculiar to that country. From the ſtrength of the bill, it cracks the ſtones of the fruit, of the haws, cherries, &c. with the greateſt eaſe.

* Ennucleator; Pine groſbeak. *Gros-bec de Canada*, Briſſon. *Le dur-bec*, Buffon. *Greateſt bullfinch*, Edwards. Wings with a double white line; tail-feathers all black; head, neck, breaſt, and rump, in the young bird red, in the old bird yellow; female olive, or greeniſh-brown, with here and there a reddiſh or yellowiſh tinge, but chiefly at the top of the head. It frequents the moſt northern parts of this kingdom, being only met with in Scotland, and eſpecially the Highlands, where it breeds, and inhabits the pine-foreſts, feeding on the ſeeds like the croſs-bill. It is found in all the pine-foreſts of Siberia, Lapland, and the northern parts of Ruſſia; common about St. Peterſburgh in the autumn, and is caught in great plenty at that time for the uſe of the table, returning north in the ſpring. Theſe birds are likewiſe common in the northern parts of America, and appear at Hudſon's Bay about the month of May, to which place they are ſaid to come from the ſouth, and are obſerved to feed on the buds of the willow.

Macroura; Long-tailed groſbeak. Black; band on the wings and back reddiſh-yellow; tail long, wedged. Inhabits

habits Africa, near the Senegal. It is about ſeven inches long; the bill and legs are black.

AUREA; Gold-backed groſbeak. Black; back golden; wing-coverts pale brown, ſpotted with black; legs blueiſh. It inhabits Benguelo.

RUBICILLA; Caucaſian groſbeak, ſo called from the Caucaſian mountains which it inhabits. It is about eight inches long. Scarlet, ſpotted with white; belly and vent roſy; greater wing-coverts brown; tail black; feathers of the body cinereous at the baſe, giving the plumage a waved appearance.

* PYRRHULA; Bullfinch. *Le Bouvreuil*, Briſſon. The bill of this bird is of a dark horn colour, the upper mandible hooked, and projects over the lower, which is roundiſh, like a parrot's; top of the head, feathers round the eye, and a ſpot under the beak, of a dark blue gloſſy black; the hind part of the neck and the back are grey; the throat and breaſt are of a beautiful fleſh-coloured red; belly and vent white, as is the rump; quill-feathers and tail black; wing-coverts blue-black, the leſs ones tipped with white; legs very ſhort and black. The female is black on the head, flight-feathers, and tail; breaſt and under parts of a reddiſh-brown; the rump whitiſh. There are three other varieties: 1. Entirely black. 2. White, back with a few black ſpots. 3. White; head, neck, breaſt, and belly roſy.

Theſe birds are very troubleſome viſitors to the orchards and gardens, in the ſpring of the year; feeding on the buds of cherries, plums, and other fruit-trees. They retire to woods and cloſe cover, to build their neſts in May. They have no ſong in the ſtate of nature, but are readily taught fine notes of muſic, and even to ſpeak. Females are made as perfect as males in muſical tunes. They form a ſlight neſt of twigs laid croſſways, and lay four eggs.

CARDINALIS; Cardinal groſbeak; Virginian nightingale. *Le gros-bec de Virginie*, Briſſon. Creſted, red; frontlet black; bill and legs blood-red; bill and legs pale roſy; creſt, when erect, pointed. The female differs from the male, being moſtly of a reddiſh-brown. This ſpecies is met with in ſeveral parts of North America, and has obtained the name of nightingale, on account of its fine ſong. In the ſpring, and moſt part of the ſummer, it ſits on the tops of the higheſt trees, ſinging early in the morning, ſo loud as to pierce the ears; frequently kept in cages, in which it ſings through the year: ſometimes it is quite mute for a time, and again reſtleſs, hopping from perch to perch, and ſinging alternately. It inhabits North America; feeds on grain and Indian corn, which it hoards up.

CARLFONI. Red; chin black; rump, tail, wings, and legs brown. Inhabits the iſlands of the Indian ſea; it reſembles the cardinalis, but is not creſted.

BOETONENSIS; Indian groſbeak. Creſted, red; frontlet red; bill and legs yellow; the toes are long; claws ſharp, pointed; wing-coverts black. It inhabits India, and is about eight inches long.

MADAGASCARIENSIS; Madagaſcar groſbeak. Red, ocular band black, back ſpotted with blackiſh; the bill alſo is black; wings and tail brown edged with olive. It is about five inches and a half long, and inhabits Madagaſcar. The young birds at firſt are olive, and do not arrive at the red colour but by degrees.

MEXICANA; Mexican groſbeak. Red; wings and tail black. It inhabits New Spain, and is about ſix inches and a half long.

BRASILIANA; Braſilian groſbeak. Brown; beneath reddiſh, with ſpots annulate with black; head and middle of the belly red; creſcent on the nape and tip of the tail white; the bill is of a fleſh colour; wings and tail black; wing-coverts and ſecondary quill-feathers reddiſh at the tips. It is found in Brazil.

DOMINICANA; *Le gros-bec du Breſil*, Briſſon; *American bullfinch*, Willoughby. Black; head and chin ſcarlet; breaſt, belly, and edge of the quill-feathers white; the neck is blackiſh above; back, rump, and wing-coverts grey a little ſpotted with black; vent and ſides of the neck whitiſh; wings and tail black; legs cinereous. It inhabits Brazil. There is a variety; cinereous, beneath ſnowy; fore part of the head and throat red; tail-feathers black edged with cinereous, the outmoſt white on the outer edge. It is about the ſize of a lark.

CUCULLATA; Creſted Dominican groſbeak. Cinereous; creſted; head and chin ſcarlet; breaſt and belly white; tail long, the lateral feathers blackiſh. This, which by Latham is reckoned a variety of the Dominicana, and which is about the ſame ſize, inhabits Brazil.

SIBIRICA; Siberian groſbeak. Size of a linnet, but fuller of feathers. Bill ſomewhat longer than that of a bullfinch; round the baſe of it the feathers are of a deep purple; head and back in ſome birds of a deep vermilion; in others of a roſe-colour marked with brown, as in the linnet; the under parts paler, and not ſpotted. The female and young birds are of the colour of a linnet, with a tinge of red on the belly and rump.

This is a moſt beautiful ſpecies, and inhabits the buſhy ſhrubs about the rivers and torrents of the ſouthern mountains of Siberia, and particularly about lake Baikal; fond of the ſeeds of the blueiſh and other mugworts; it is a reſtleſs bird, and in winter unites into ſmall flocks, and keeps in warmer ſituations among the ſhrubs.

VIRGINICA; Yellow-bellied groſbeak. Head, neck, middle tail-feathers, and body beneath red; belly yellow; nape, lower part of the back, wings, and lateral tail-feathers olive. The bill is yellow, and the bird is found in Virginia.

CRISTATA; Creſted groſbeak. Whitiſh, front is creſted; the rump and legs are red; middle tail-feathers very long. It inhabits Ethiopia, and is one of the largeſt of its tribe. Creſt and breaſt in the male red, female white.

ERYTHROCEPHALA; Paradiſe groſbeak. *Le cardinal d'Angola*, Briſſon; *Sparrow of Paradiſe*, Edwards. Pale aſh; head purpliſh; breaſt ſpotted with white; bill and legs fleſh colour; chin red; body beneath; a double oblique band on the wings white. It inhabits Angola.

MAJA; White-headed groſbeak. Brown; head white. It inhabits Malacca and China, and is about four inches long. The head and neck are whitiſh, and ſo alſo are the ſecond and fourth quill-feathers.

FLAVICANS; Yellow groſbeak. Back greeniſh; head tawny; the wings and tail are of a greeniſh-yellow. It is the ſize of a canary bird, and is an inhabitant of Aſia.

BONARIENSIS; Marigold groſbeak. Head and neck blue; body above blackiſh, beneath yellow; belly and vent ſulphur; wings and tail blackiſh, edged with blue. It inhabits Buenos Ayres, where it is rarely ſeen till September; it frequents cultivated places and gardens; ſeen in pairs, and apparently very much attached to each other; feeds on graſs and on ſeeds. The bill is blackiſh; the legs are reddiſh; claws ſharp, curved, grooved, the hind-one very large.

ORYZIVORA; Java groſbeak. *Le gros-bec cendre de la Chine*, Briſſon; *Padda*, or *Rice bird*, Edwards. Cinereous; temples white; bill red. It inhabits China, Java, and Africa, is five inches long, and very deſtructive to rice plantations. The female has the bill and eye-lids very pale red, and wants the white on the cheeks; but the edge of the wing is white as well as the under tail-coverts. It is thought to be a Chineſe bird, by its being often met with on the paper hangings of that country. Latham thinks this the more likely, as he has ſeen it among ſome Chineſe paintings, in which it bore the name of "Hung-tzoy."

Flabellifera; Fan-tailed groſbeak. This ſpecies is the ſize of a ſparrow; length about five inches. Bill ſtout and duſky; the upper parts of the body are reddiſh-brown, paleſt on the rump; the under the ſame, but ſomewhat paler, and more inclined to red; quills, tail, and legs duſky. One of theſe birds had a grey breaſt and belly. They inhabit Virginia, where they are called fan-tails, and continually carry the tail ſpread in an horizontal direction.

Panicivora; White-winged groſbeak. Black; ſpurious wings black; bill fleſh-colour. It inhabits Africa, and is ſeven inches and a half long.

Malacca; Malacca groſbeak. Bay; head and belly black; bill blue; the breaſt and flanks are white; and the legs are brown. It inhabits Java and China, and is rather more than four inches long. There is a variety that is ferruginous, head and lower part of the neck black.

Molucca; Molucca groſbeak. Browniſh; head, throat, and tail-feathers black; the bill is black; hind-head brown; rump waved white and black; wings and legs brown. It inhabits the Molucca iſles.

Punctularia; Cowry groſbeak. Bay; belly black, ſpotted with white; the bill and legs black; hind-head and back reddiſh-brown; breaſt and flanks black, with hearted white ſpots, middle of the belly and vent white. It inhabits Java.

Undulata; Eaſtern groſbeak. Brown-red, beneath waved with brown; the tail is a pale red-aſh. It inhabits Aſia; is ſix inches long. The bill is ſhort and ſtrong.

Hordeacea; Yellow-rumped groſbeak. Tawny; temples white; tail and breaſt black. Inhabits India.

Sanguinirostris; Red-billed groſbeak. Grey, beneath white; bill and legs red; the front and face are black; breaſt and belly pale ochre; the feathers are ſometimes blackiſh in the middle; wings and tail brown. It inhabits ſome parts of Africa and Aſia.

Astrild; Waxed-bill groſbeak. Brown waved with blackiſh; bill, orbit, and breaſt ſcarlet. It inhabits the Canaries, America, and Africa; is about four inches long; hides itſelf under graſs and herbs, and feeds on ſeeds. There are two other varieties, *viz.* 1. Rump and vent ſcarlet. 2. Beneath roſy-white; crown, neck, and back blue; a ſcarlet band acroſs the eyes.

Leucura; White-tailed groſbeak. Bill and legs red; head and wing-coverts cinereous; back yellow; breaſt and belly yellowiſh; tail white, the outmoſt feathers black. It inhabits Brazil, and is three inches long.

Cyanea; Angola blue groſbeak. Blue; wings and tail black; the bill is of a lead-colour, irides hazel, legs black. It inhabits Angola.

Virens. Greeniſh; ſhoulders blue; wings and tail black, edged with green. It inhabits Surinam.

Angolensis; Angola groſbeak. Black-blue; belly ferruginous; wings with a white ſpot; the bill is black; wings edged with white; legs purpliſh-fleſh-colour. Found in and near Angola.

Ferruginea; Brown-headed groſbeak. Head and chin brown; body above black, beneath ferruginous; even tail and quill-feathers black, edged with yellow; the bill is of a horn colour, and the legs are pale; its length is about ſix inches.

Melanura; Grey-necked groſbeak. Head and tail black; neck above brown; throat and vent grey; belly reddiſh; vent white; quill-feathers black, the primaries near the tip, and the ſecondaries on the inner edge, are white. It inhabits China, and is the ſize of the hawfinch. The head of the female is grey.

Aurantia; Orange groſbeak. Orange; crown black; quill and tail-feathers black, edged with orange. The female has the whole head, and fore-part of the neck, black; the under part of the body white; the reſt of the body orange but leſs bright; and the quills edged with grey. It inhabits the iſle of Bourbon, but ſome ſpecimens have been ſent from the Cape.

Torrida; White-billed groſbeak. Black; breaſt and belly bay; middle tail-feathers very long. It inhabits South America.

Lineola; Lineated groſbeak. Black; the frontal line and temples are white. The body above is black-blue, and beneath it is white; bill black, with a white ſpot above the upper mandible; tail is forked; quill-feathers black, the primary white at the anterior baſe. It is found in many parts of Aſia and Africa.

Hamburgia; Hamburgh groſbeak. Head and neck cheſnut above; chin, band in the middle of the white throat, and rounded tail, brown; back, breaſt, and rump yellowiſh-brown, ſpotted with black; belly, vent, and two bands on the wing-coverts, white. It is about ſix inches long; inhabits Hamburgh and its neighbourhood; feeds on inſects, and climbs trees like a creeper.

Mexicana; Yellow-headed groſbeak. Spotted with brown; front, chin, rump, and eye-brows pale yellow. It inhabits New Spain, and is nearly ſix inches long.

* Chloris; Greenfinch. This is a well-known bird; the colour is a yellowiſh-green, paleſt on the rump and breaſt, and inclining to white on the belly: the quills are edged with yellow, and the four outer tail-feathers are yellow from the middle to the baſe; the bill is pale brown and ſtout; and the legs are fleſh-colour. The female inclines more to brown.

The greenfinch is common in Great Britain, and makes its neſt in ſome low buſh, hedge, &c. compoſed of dry graſs, lined with hair and wool; the female lays five or ſix eggs, marked at the larger end with red-brown: ſhe is ſo anxious and careful of her charge during incubation, that ſhe is often taken on the neſt. The male takes his turn in ſitting on the eggs. The greenfinch ſoon becomes tame; even old birds are familiar almoſt as ſoon as they are caught. It is apt to grow blind, like the chaffinch, if much expoſed to the ſun; it flies in troops in winter, and lives five or ſix years.

It is common in many parts of Europe, but in Ruſſia it is rarely ſeen, and never in Siberia, hence it is imagined that it ſhifts its quarters according to the ſeaſon. It is common in the northern parts of England and in many parts of Scotland.

Sinensis; Chineſe groſbeak. Head and neck greeniſh-grey; back pale brown; primary quill-feathers, the firſt half yellow, lower part black; ſecondaries within black, without grey, vent yellow. It inhabits China.

Butyracea; Yellow-fronted groſbeak. Greeniſh; head and back ſpotted with black, beneath yellow; bill, tail, quill-feathers, and legs black. The front, eye-brows, and temples are yellow; ſpots on the female brown and the tail tipt with white. It is found in India and at the Cape.

Dominensis; St. Domingo groſbeak. Green-brown, beneath pale rufous, ſpotted with brown; vent and area of the eyes white; wings black; tail and legs brown. It inhabits St. Domingo.

AFRICANA; African groſbeak. Varied with greeniſh-brown and grey, beneath white; breaſt varied with brown; primary quill and lateral tail-feathers edged with reddiſh-white, the outmoſt with a white ſpot. Inhabits the Cape of Good Hope.

HYPOXANTHA; Sumatra groſbeak. Yellowiſh; front and eye-brows pale yellow, quill and tail-feathers black, edged with yellowiſh. Inhabits Sumatra.

CANADENSIS; Canada groſbeak. *Le gros-bec de Cayenne*, Briſſon. Size of a houſe-ſparrow; bill aſh-colour, and the edges of it ſomewhat projecting in the middle; the upper parts of the plumage olive-green; the under paler, and inclining to yellow; the feathers round the baſe of the bill, and the chin, black; the legs are grey. It inhabits Cayenne and Canada, as its different names ſignify.

SULPHURATA; Brimſtone groſbeak. Olive-brown; throat and belly pale yellow; eye-brows yellow; it is about ſix inches in length, and inhabits in flocks near the Cape of Good Hope, frequents the banks of rivers, and builds a pendulous neſt, with a long neck beneath, in trees and ſhrubs.

FLAVINENTRIS; Yellow-bellied groſbeak. Olive ſpotted with brown, beneath yellow; quill and tail-feathers brown, edged with olive; above the eyes a yellow ſtripe; the rump is olive coloured; tail forked; legs grey. Inhabits the Cape of Good Hope. There is a variety; hind-head, cheeks, and chin cinereous.

COLLARIA; Nun groſbeak. Yellowiſh; breaſt and collar yellow; temples black. There is a variety with a broader collar. Inhabits India and Angola.

GRISEA; Grey groſbeak. Blue-grey, neck and front white; bill and claws brown, legs reddiſh.

BENGALENSIS; *Le moineau de Bengale*, Briſſon. *Yellow-headed Indian ſparrow*, Edwards. *Bengal groſbeak*, Linn. Grey; crown yellow, temples whitiſh; belly whitiſh; ſpotted with brown. "This bird," ſays ſir William Jones, "is exceedingly common in Hindooſtan; he is aſtoniſhingly ſenſible, faithful, and docile; never voluntarily deſerting the place where his young are hatched, but not averſe, like moſt other birds, to the ſociety of mankind; and eaſily taught to perch on the hand of his maſter. In a ſtate of nature he generally builds his neſt on the higheſt tree he can find; eſpecially on the Palmyra, or on the Indian fig-tree, and he prefers that which happens to overhang a well or a rivulet: he makes it of graſs, which he weaves like cloth, and ſhapes like a bottle, ſuſpending it firmly on the branches; but ſo as to rock with the wind, and placing it with its entrance downward, to ſecure it from the birds of prey. Its neſt uſually conſiſts of two or three chambers; and it is popularly believed that he lights them with fire-flies, which he is ſaid to catch alive at night, and confine with moiſt clay or with cow-dung. That ſuch flies are often found in his neſt, where pieces of cow-dung are alſo ſtuck, is indubitable; but as their light could be of little uſe to him, it ſeems probable that he only feeds on them. He may be taught with eaſe to fetch a piece of paper, or any ſmall thing that his maſter points out to him. It is an atteſted fact, that if a ring be dropped into a deep well, and a ſignal be given to him, he will fly down with amazing celerity, catch the ring before it touches the water, and bring it up to his maſter with apparent exultation; and it is confidently aſſerted, that if a houſe, or any other place, be ſhewn to him once or twice, he will carry a note thither immediately on a proper ſignal being made. The young Hindoo women at Benares, and in other places, wear very thin plates of gold called *ticas*, ſlightly fixed, by way of ornament, between their eye-brows; and when they paſs through the ſtreets, it is not uncommon for the youthful libertines who amuſe themſelves with training theſe birds, to give them a ſignal which they underſtand, and ſend them to pluck the pieces of gold from the foreheads of their miſtreſſes, which they bring in triumph to their lovers.

MALABARICA; Malabar groſbeak. Cinereous; quill and tail-feathers black; chin and vent white; the bill is black. It inhabits India.

AFRA; Black-bellied groſbeak. Beneath black; head, flanks, and tail-coverts yellow; wings and tail browniſh. It is found in Africa.

CAFFRA. Black, quill-feathers brown; ſhoulders red; plumage ſilky; bill brown-aſh; quill-feathers at the edges and coverts white; tail longer than the body; legs grey. It is of the ſize of a bull-finch, and inhabits the Cape of Good Hope.

TOTTA. Quill and tail-feathers all black, the very tips white; the body is of a browniſh colour, but beneath is a pale orange; front greeniſh-brown; it has ſix primary quill-feathers; eight ſecondary; ten tail-feathers beneath ſooty; ſhanks yellowiſh; legs black.

INDICA; Aſh-headed groſbeak. Blackiſh, beneath whitiſh; head and neck cinereous; tail tipt with white. Inhabits India; is very ſmall; and has blue legs and bill.

ASIATICA; Aſiatic groſbeak. Reddiſh-aſh, beneath cinereous; belly pale red; head, greater wing-coverts, quill-feathers, and tip of the tail black. It inhabits China, and is the ſize of a bull-finch. There is a variety; blueiſh-aſh; head, wings, and tail black; quill and two middle tail-feathers and tip of the tail black.

CANORA; Brown-cheeked groſbeak. Dirty greeniſh, beneath cinereous; cheeks brown, ſurrounded with a yellow fringe. It inhabits Mexico, and ſings charmingly.

LINEATA; Radiated groſbeak. Black, beneath white; ſides of the body, and baſe of the primary quill-feathers, tranſverſely ſtreaked with white and black.

PERLATA; Pearled groſbeak. Black, beneath brown; near the tail varied with white and black. It inhabits Africa.

FASCIATA; Faſciated groſbeak. Browniſh, with black creſcents; quill-feathers, tail, and cheeks brown, under the chin a broad red band; the bill is blueiſh-grey, and the legs are of a fleſh-colour. It inhabits Africa.

CANTANS; Warbling groſbeak. Brown, tranſverſely lined with blackiſh, beneath white; tail brown, wedged. It inhabits Africa, and is about four inches long. A variety of this ſpecies has a yellowiſh belly; chin and ſides waved white and blackiſh, and is named the Gambia groſbeak.

MELANOCEPHALA; Black-headed groſbeak. Pale yellow; head black; bill cinereous; throat and irides black; legs blue-aſh. It is about ſix inches long, and inhabits Gambia.

ERYTHROMEAS. Red; head and chin black; the bill is black, white at the baſe; tail rounded. Female above greeniſh-orange, mixed with red, beneath orange; quill-feathers olive, the outer edge rufous.

CORONATA; Black-creſted groſbeak. Scarlet, beneath blue; creſt on the head and ſpot in the middle of the throat black. It inhabits America.

CANA; Cinereous groſbeak. Hoary; quill and tail-feathers brown, legs red; bill cinereous; greater quill-feathers white at the baſe, blackiſh at the tips; tail blackiſh, edged with pale aſh; legs fleſh colour.

PHILIPPINA; Philippine groſbeak. Brown, beneath yellowiſh-white ; crown and breaſt pale yellow ; chin brown. The female has the upper parts brown, margined with rufous ; rump of this laſt colour ; legs yellowiſh. Theſe inhabit the Philippine iſlands, and are noted for making a moſt curious neſt, in form of a long cylinder, ſwelling out into a globoſe form in the middle. This is compoſed of the fine fibres of leaves, and faſtened by the upper part to the extreme branch of a tree. The entrance is from beneath ; and after aſcending the cylinder as far as the globular cavity, the true neſt is placed on one ſide of it, where, ſays Latham, this little architect lays her eggs, and hatches her brood in perfect ſecurity. There are three diviſions in the neſt of this bird ; the firſt is occupied by the male, the ſecond by the female, and the third contains the young ; in the firſt apartment, where the male keeps watch, while the female is hatching, a little tough clay is placed on one ſide, and on the top of this clay a glow-worm, which is ſaid to afford it inhabitants light in the night-time.

There is a variety of this ſpecies. Tail and quill-feathers greeniſh-brown, edged with yellow. Inhabits Abyſſinia. This makes a neſt ſomewhat like the former, of a ſpiral ſhape, not unlike that of a nautilus. It ſuſpends it, like the other, on the extreme twig of ſome tree, chiefly one that hangs over ſome ſtill water ; and always turns the opening towards that quarter from whence leaſt rain may be expected.

Abyssinica ; Abyſſinian groſbeak. Yellowiſh ; crown, temples, throat, and breaſt black ; ſhoulders blackiſh ; quill and tail-feathers brown, edged with yellow. It inhabits Abyſſinia ; ſize of the hawfinch ; makes a pyramidal pendent neſt, the opening of which is on one ſide, facing the eaſt ; it is divided in the middle by a partition, and the neſt is within this cavity on one ſide ; by this means it is ſecure from the intruſion of ſnakes, ſquirrels, monkies, and other miſchievous animals, and defended from the weſterly rains, which laſt for ſeveral months almoſt unceaſingly.

Pensilis ; Penſile groſbeak. Green ; head and throat yellow ; ocular band green ; belly grey ; vent rufous-red ; bill, legs, tail and quill-feathers black, the laſt edged with green. This ſpecies inhabits Madagaſcar ; is the ſize of a houſe-ſparrow ; conſtructs its penſile neſt of ſtraw and reeds, ſhaped like a bag, with an opening beneath, on one ſide of which is the true neſt. The bird does not chooſe a new ſituation every year, but faſtens a new neſt to the end of the laſt ; ſometimes as far as five, one hanging from another ; builds in large ſocieties, and brings three young ones at each hatch.

A bird ſimilar to this is mentioned in Kæmpfer's Hiſtory of Japan, which makes the neſt near Siam, on a tree, with narrow leaves and ſpreading branches, the ſize of an apple-tree ; the neſt in the ſhape of a purſe, with a long neck, made of dry graſs and other materials, and ſuſpended at the end of the branches ; the opening always to the north-weſt. The hiſtorian ſays he counted fifty on one tree only ; and deſcribes the bird itſelf as being like a canary-bird in colour, but as chirping like a ſparrow.

Socia ; Sociable groſbeak. Rufous brown, beneath yellowiſh ; frontlet black ; tail ſhort. This ſpecies inhabits the interior parts of the Cape of Good Hope : they live together in vaſt tribes under one common roof, containing ſeveral neſts, which are built on a large ſpecies of mimoſa ; this, from its ſize, its ample head, and ſtrong wide ſpreading branches, is well calculated to admit and ſupport their dwellings. The tallneſs and ſmoothneſs of its trunk are alſo a perfect defence againſt the invaſions of the ſerpent and the monkey tribes ; in one tree deſcribed by a very intelligent traveller, Mr. Paterſon, there were ſeveral hundred neſts under one general roof. It is deſcribed as a roof, becauſe it reſembles that of a thatched houſe, and projects over the entrance of the neſt below in a ſingular manner. "The induſtry of theſe birds," ſays this author, "ſeems almoſt equal to that of the bee. Throughout the day they ſeem to be buſily employed in carrying a fine ſpecies of graſs, which is the principal material they uſe for the purpoſe of erecting this extraordinary work, as well as for additions and repairs. Though my ſhort ſtay in the country was not ſufficient to ſatisfy me by ocular proof that they added to their neſt as they annually increaſed in numbers ; ſtill, from the many trees which I have ſeen borne down by the weight, and others which I have obſerved with their boughs completely covered over, it would appear that this is really the caſe. When the tree, which is the ſupport of this aerial city, is obliged to give way to the increaſe of weight, it is obvious that they are no longer protected, and are under the neceſſity of building in other trees. One of theſe deſerted neſts I had the curioſity to break down, to inform myſelf of the internal ſtructure of it ; and found it equally ingenious with that of the external. There are many entrances, each of which forms a regular ſtreet, with neſts on both ſides, at about two inches diſtance from each other. The graſs with which they build is called the Boſhman's graſs, and I believe the ſeed of it to be their principal food ; though, on examining their neſts, I found the wings and legs of different inſects. From every appearance the neſt which I diſſected had been inhabited for many years, and ſome parts of it were much more complete than others. This, therefore, I conceive to amount nearly to a proof that the animals added to it at different times, as they found neceſſary from the increaſe of the family, or rather of the nation or community."

Striata ; Striated groſbeak. Brown, ſtreaked with ferruginous, beneath white ; throat black. About the ſize of a wren. It inhabits Bourbon.

Zeylonica ; Ceylon groſbeak. Ferruginous brown, beneath purple, waved with black ; front and rump blueiſh. Inhabits Ceylon.

Ludoviciana ; Louiſiana groſbeak. Black ; breaſt, belly, band on the wings, and baſe of the quill-feathers white. Inhabits North America, and is about ſix inches long. There is another variety with a roſy breaſt.

Maculata ; Spotted groſbeak. Feathers of the upper part of the body black, ſpotted with white towards the tip, of the lower part whitiſh, ſtreaked with black ; quill and tail-feathers whitiſh on the outſide. It inhabits America.

Obscura ; Duſky groſbeak. Middle of the throat, and double band on the wing-coverts white ; quill-feathers green, flanks white, ſpotted with brown ; feathers of the head, neck, and back edged with brown. Inhabits in the neighbourhood of New York.

Hudsonica ; Hudſon's Bay groſbeak. Brown ; belly white, ſides ſpotted with brown ; wing-coverts with two red bands. It inhabits Hudſon's Bay, from whence it derives its name. It has ſtrong bill and legs ; feathers of the back and rump, ſecondary quills and tail-feathers edged with pale rufous ; tail a little forked.

Capensis ; Cape groſbeak. Blackiſh-brown ; rump and wing-coverts pale yellow. There is a variety with feathers above browniſh, in the middle ſpotted with black, beneath whitiſh, ſpotted with black. The bill and legs black ; feathers of the head ſhort, and in breeding time ſilky ; wings cheſnut, edged with grey ; greater quill-feathers edged with yellow, back ſometimes pale yellow. Inhabits

Coromandel and the Cape; is found chiefly in thickets near rivers; eggs cinereous, ſpotted with black.

Nigra; Black groſbeak. *Le bouvreuil noir du Mexique*, Briſſon and Buffon. *Little black bullfinch*, Cateſby, Albin. &c. This ſpecies is of the ſize of a bullfinch; the bill is black, ſtout, and deeply notched in the middle of the upper mandible; plumage black, except a little white on the fore-part of the wing, and baſe of the two firſt quills; legs black. Inhabits Mexico.

Crassirostris; Thick-billed groſbeak. Black; baſe of the quill-feathers, and middle tail-feathers in the middle white; legs whitiſh; the bill is thick and yellowiſh.

Regulus; Crimſon-creſted groſbeak. Bill very thick and ſtrong. There was a fine ſpecimen of this bird in the Leverian muſeum.

Americana; Black-breaſted groſbeak. Black; beneath white; pectoral band black; wings with a double white band; tail rounded; legs brown. It inhabits America.

Cærulea; Blue groſbeak. *Le bouvreuil bleu de la Caroline*, Briſſon. This ſpecies is the ſize of the bullfinch: bill half an inch, ſtout, and brown; the baſe of it ſurrounded with black feathers, which reach on each ſide as far as the eye; the whole plumage beſides is of a deep blue, except the quills and tail, which are brown with a mixture of green, and acroſs the wing-coverts a band of red; the legs are duſky. The female is brown with a little mixture of blue.

"I ſuſpect," ſays Latham, "this to be Bancroft's bird, which he ſays is ſky-blue, with the outer edges of the quills and tail crimſon; and the more ſo, as I have lately met with one from Cayenne, which had the chin, as well as round the bill, black, and both the ſhoulders, ſome of the wing-coverts, and the edges of the ſecondaries, marked with reddiſh."

Urix; Grenadier groſbeak. Grey; bill, front, and belly black; neck and rump tawny; ſometimes the wings are white, and the tail is brown. It is the ſize of a ſparrow; inhabits Africa, and is found chiefly in marſhy grounds and among the reeds. The neſt is formed with ſmall twigs, ſo cloſely interwoven with cotton, as not to be penetrated in any weather. It is divided into two compartments, of which the upper is for the male, and the lower for the female and the young.

Flamingo. White; head, neck and breaſt, and belly roſy. Inhabits Upſal; reſembles the bullfinch; bill and legs reddiſh; feathers of the frontlet blackiſh at the tips; third and fourth quill-feathers and ſpot on the rump black; tranſverſe line on the wings and upper ſurface of the tail ſooty.

Violacea; Purple groſbeak. *Le bouvreuil violet de Bahama*, Briſſon. *Black ſparrow*, Raii Syn. This is the ſize of the ſparrow; bill is black; plumage violet black, except the irides, a ſtreak over the eye, the chin, and the vent, which are red; legs duſky grey. Where the male is black, the female is brown, and the red is not ſo bright; it inhabits the Bahama iſlands, Jamaica, and the warmer parts of America

Grossa; White-throated groſbeak. Blueiſh hoary; throat and tail-feathers blackiſh; chin white; bill red. Inhabits America.

Minima; Dwarf groſbeak. Brown; beneath teſtaceous; primary quill-feathers at the baſe and ſecondaries on the hind-part white. This ſpecies is very ſmall; it inhabits Surinam.

Fusca; Brown groſbeak. *Le petit bouvreuil noir d'Afrique*, Briſſon. Size of a canary bird; bill ſhort and thick, and of a lead colour; the head and upper parts of the body brown; the under of a pale aſh-colour; vent pure white; the quills duſky black; the baſe of eight of the middle quills white; tail the colour of the quills, with paliſh ends; legs pale. It is an inhabitant of Africa, and is met with at Bengal.

Guttata. Brown; breaſt black; bill and rump red; ſides of the body black ſpotted with white. It inhabits New Holland.

Septentrionalis; Northern groſbeak. Black; wings with a white ſpot. Inhabits Scandinavia; reſembles the bullfinch.

Minuta; Minute groſbeak. Grey; rump and belly beneath ferruginous; ſome quill-feathers on each ſide white at the baſe; tail entire. It inhabits Surinam and Cayenne; is very ſmall, active, and bold; frequents inhabited places, and feeds on ſeeds and fruit. Bill and legs brown; cries like a ſparrow; makes a roundiſh neſt, compoſed of a reddiſh herb, and placed on the trees which it frequents.

Bicolor; Orange-bellied groſbeak. Brown; beneath red: another variety; browniſh, beneath white; chin ſomewhat ferruginous. Inhabits India; the bill is whitiſh and legs are brown.

Prassina; Red-rumped groſbeak. Olive-green, beneath yellowiſh hoary, rump pale red; legs yellow. This is the deſcription of the male; the female of a variety is olive brown, beneath yellowiſh hoary; rump pale red; legs yellowiſh.

Tridactyla; Three-toed groſbeak. *Le Guifso Balito*, Buffon. Bill toothed on the edges; the head, throat, and fore-part of the neck of a beautiful red, which is prolonged in a narrow band quite to the vent; the upper part of the neck, back, and tail black; the wing-coverts brown, edged with white; quills brown, with greeniſh edges; legs dull red; the wings reach half way on the tail; the toes three only, two before and one behind.

This inhabits Abyſſinia; frequents woods, and is a ſolitary ſpecies; feeds on kernels and ſeeds, which it breaks with the greateſt eaſe with its bill. Latham, Lewin, Gmelin's Linnæus, &c. &c.

LOXOCARYA, in *Botany*, from λοξος, *oblique*, and καρυον, *a nut.* Brown Prodr. Nov. Holl. v. 1. 249. This genus is ſeparated from *Reſtio*, ſolely on account of its having an undivided ſtyle, and a fruit of one cell, which is as it were a third part, or one lobe, of that of *Reſtio.* We preſume to think this diſtinction ſcarcely ſufficient. One ſpecies only is mentioned.

L. *cinerea*; found by Mr. Brown in the ſouth part of New Holland.

LOXODROMIC Table. See Table.

Loxodromics, the art or method of oblique ſailing, by the loxodromy, or rhumb.

LOXODROMY, Loxodromia, formed of λοξος, *oblique*, and δρομος, *courſe*, the line which a ſhip deſcribes in ſailing on the ſame collateral rhumb.

The loxodromy, called alſo the *loxodromic line*, cuts all the meridians in the ſame angle, called the *loxodromic angle.* This line is a ſpecies of the logarithmic ſpiral, deſcribed on the ſurface of the ſphere, having the meridians for its radii.

LOYAL, in the *Manege*. A horſe is ſaid to be loyal, that freely bends all his force in obeying and performing any manege he is put to; and does not defend himſelf, or reſiſt, notwithſtanding his being ill treated.

A loyal mouth is an excellent mouth, of the nature of ſuch as we call mouths with a full reſt upon the hand.

LOYALSOCK Creek, in *Geography*, a river of America,

rica, in Northumberland county, Pennſylvania, which runs into the W. ſide of the branch of Suſquehannah river, from the N.E.; 26 miles from Sunbury. It is navigable 20 or 30 miles up for batteaux of 10 tons. N. lat. 41° 15′. W. long. 77° 1′.

LOYHA, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 65° 6′. E. long. 25°.

LOYOLA, Ignatius de, in *Biography*, celebrated as the founder of the order of Jeſuits, was deſcended from a noble Spaniſh family, and born in 1491, at the caſtle of Loyola, in the province of Guipuſcoa, whence he derived his ſurname. At an early age he was appointed page at the court of Ferdinand and Iſabella, and was ſhewn diſtinguiſhed marks of favour. But the indolence and ſameneſs of a courtier's life did not accord with young Loyola's active diſpoſition; he panted for fame, and to attain to a conſpicuous ſituation, he determined to enter into the army. He was taken under the patronage of the duke de Nájara, a grandee of Spain, a ſoldier of high reputation, and under his auſpices, he paſſed through different degrees of military rank, and diſcovered on all occaſions great courage, and a ſtrong attachment to the ſervice. His morals, which had been corrupted at court, were not reformed in the army, where, following the example of thoſe about him, he addicted himſelf to the licentiouſneſs too prevalent in the military life; he was, however, poſſeſſed of a high ſenſe of honour, was frank, diſintereſted, and generous, and much beloved by thoſe who ſerved under him. In 1521, he had the command of the citadel of Pampeluna, then beſieged by the French, and after diſplaying the utmoſt valour in repulſing the enemy, he was in a moment diſabled by a ſevere wound in the left leg, and by a cannon ſhot which broke his right. The garriſon having thus loſt the example of their leader, ſurrendered at diſcretion. The French paid every attention to Loyola, and as ſoon as he was in a ſtate fit to be moved, they ſent him in a litter to his native place. It was a conſiderable time before a cure was effected, and during that period he happened to have no other ſource of amuſement than what he found in reading the lives of the ſaints, the effect of which on his mind, was to inſpire him with a deſire of emulating the glory of the moſt celebrated among them. From this time he reſolved to renounce the vanities of the world, to viſit the Holy Land, and to devote himſelf to an auſtere religious life. Hence he undertook a pilgrimage to our lady of Montſerrat, to hang up his arms near her altar. His zeal at this time was without all bounds; he attempted to take away the life of a perſon who ſuggeſted a doubt whether the Virgin Mary had remained pure and immaculate after her delivery. Having arrived at Montſerrat, he adopted a new method of conſecrating himſelf to the ſervice of the Virgin; he ſtripped off his clothes, which he gave to a poor man, put on a coarſe garment of ſackcloth, girded himſelf with a cord, from which was ſuſpended a gourd for carrying water, put a matted ſhoe on one foot, which had not yet recovered the injury produced by his wounds, leaving the other naked and his head expoſed to the violence of the weather, and ſubſtituting in the place of his lance a plain crab-tree ſtaff. Thus equipped, he preſented himſelf before the altar of the Holy Virgin, hung his military weapons on a pillar near the altar, and watched all night, ſometimes kneeling and ſometimes ſtanding, devoting himſelf as a champion. Early in the following morning Loyola departed on foot for Manreſa, three leagues from Montſerrat, intending to go through a courſe of penance, by way of preparation for his expedition to the Holy Land. He underwent, for the ſpace of twelve months, the moſt rigorous mortifications of every kind, after which he commenced his labours of ſpiritual exhortation, both in private families and in public places, and in a very ſhort time he publiſhed his book entitled "Spiritual Exerciſes." Loyola, intent upon viſiting the Holy Land, embarked for Italy, and proceeded to Rome to obtain the pope's bleſſing, which he obtained from Adrian VI. with leave to purſue his pilgrimage to Jeruſalem. After viſiting the ſcenes of our Saviour's principal tranſactions in that city, and the ſurrounding country, and going through the exerciſes uſually performed by pilgrims, Loyola formed the deſign of remaining in Paleſtine, for the purpoſe of devoting himſelf to the converſion of the inhabitants of the Eaſt. This deſign he communicated to the father guardian of the Franciſcans, by whom he was referred to the father-provincial, who, aware of the danger of the enterpriſe, refuſed his conſent, and ſent Loyola back to Europe. At Barcelona he commenced a courſe of ſchool learning, which he completed in two years, and then went to the univerſity of Alcala de Henares, where he ſuffered himſelf to be diverted to other objects beſides literature, and of courſe made but a mean progreſs in his ſtudies. He had taken as his model the works of Thomas à Kempis, which he was perpetually reading. He ſpent a conſiderable portion of his time in the ſervice of the ſick, in begging excurſions, and in inſtructing and exhorting the people. Loyola had now aſſociated himſelf with four companions who imitated his plans of life, and looked up to him as a maſter and leader. Their different dreſs, and extraordinary manner of living, induced multitudes to become their followers: this awakened the jealouſy of the inquiſitors, who inſtituted enquiries relative to Loyola's doctrine and behaviour, and having found that he was a believer in the ſound faith, he was diſmiſſed. After this he was ſome time impriſoned on the ſuſpicion of having perſuaded a lady of rank and her daughter to undertake a long pilgrimage barefoot. Being liberated, he went to Salamanca, and was a ſecond time impriſoned through the interference of the Dominican monks, who were jealous of his popular exertions in a religious courſe. He was now determined to abandon his native country, where he was ſubject to ſo many hindrances in what he conceived the way of his duty: he accordingly went to Paris in 1528, where he re-commenced the ſtudy of the Latin language at Montague college; went through a courſe of philoſophy in the college of St. Barbara, and ſtudied divinity under the Dominicans. His zeal in inſtructing others expoſed him to trouble in Paris, as it had done in the Spaniſh univerſities, and he narrowly eſcaped whipping in St. Barbara's college-hall. No ſuffering had the effect of cooling his zeal; he formed an aſſociation among the ſcholars of that college, the members of which took a vow to conform to a ſtrict religious diſcipline, and to engage in a new undertaking for promoting the intereſts of the Catholic faith. They agreed to preach in public places, and in every place where they could obtain permiſſion, recommending the beauty and rewards of virtue, and pointing out the deformity and puniſhments of vice, and this in a ſimple evangelical manner, without the vain ornaments of eloquence; that they ſhould inſtruct children in the Chriſtian doctrine, and the principles of right conduct, and that they ſhould receive no money for exerciſing their functions, but be governed in all their proceedings by a view to the glory of God. The ſociety thus formed was to be denominated "The Company of Jeſus." Loyola was now anxious to obtain the approbation of the pope, in order that a new inſtitution might be formed under his ſanction. His holineſs, Paul III. referred the petition of Loyola to the committee of cardinals, who violently oppoſed the eſtabliſhment of ſuch an order, repreſenting it not only as unneceſſary but extremely dangerous. He again threw himſelf at the feet of the pope, and propoſed that beſides the three vows of poverty, chaſtity, and monaſtic obedience, which are common to all the orders of regulars, the members of his ſociety ſhould take a fourth vow, of obedience to the pope, binding themſelves to go whitherſoever he ſhould command for the ſervice of religion, and without requiring any thing from the holy ſee for their ſupport. This was a propoſal which the pope could not reject; he confirmed the inſtitution of the Jeſuits by a bull, granted the moſt ample privileges to the members of the ſociety, and appointed Loyola to be the firſt general of the order. (See our article JESUITS.) In 1550, he was deſirous of reſigning his office of general, but the ſociety would not conſent to the meaſure, and he retained it till his death in 1556, when he was in the ſixty-ſixth year of his age. Before that event, he had ſeen his order ſpread over the greateſt part of the old and new worlds, and he had eſtabliſhed, in the ſhort ſpace of ſixteen years, twelve large provinces, containing at leaſt an hundred colleges. He was beatified by pope Paul V., and in 1622 he was canonized by Gregory XV. Bayle. Moreri. Robertſon, and art. Jeſuits.

LOYOLA, in *Geography*, a village of Spain, in the province of Guipuſcoa, formerly belonging to the family of Ignatius, founder of the order of Jeſuits. See JESUITS.—Alſo, a town of South America, in the audience of Quito; 50 miles S. of Loxa.

LOZE, a river of Congo, in Africa, which runs into the Atlantic, navigable for boats, but having no harbour at its mouth. S. lat. 7° 55′.

LOZENGE, or LOZANGE, in *Geometry*, a kind of parallelogram, or quadrilateral figure, conſiſting of four equal and parallel lines or ſides, whoſe angles are not right, but whereof two oppoſite ones are acute, and the other two obtuſe; the diſtance between the two obtuſe ones being always equal to the length of one ſide.

Scaliger derives the word lozenge from *laurengia;* this figure reſembling, in ſome reſpects, that of a laurel leaf. In geometry, it is ordinarily called *rhombus;* and, when the ſides are unequal, *rhomboides*.

LOZENGE, in *Heraldry*, is a rhombus, or figure of equal ſides, but unequal angles; reſembling a quarry of glaſs in our old windows; placed erect, point-ways. It is in this figure that all unmarried gentlewomen and widows bear their coats of arms; becauſe, as ſome ſay, it was the figure of the Amazonian ſhield; or, as others, becauſe it is the ancient figure of the ſpindle.

The lozenge differs from the *fuſil*, in that the latter is narrower in the middle, and not ſo ſharp at the ends.

LOZENGES, among *Jewellers*, are common to brilliant and roſe diamonds. In the former they are formed by the meeting of the ſkill and ſtar-facets on the bezil; in the latter, by the meeting of the facets in the horizontal ribs of the crown.

LOZENGE is alſo a ſort of medicine, made into ſmall pieces, to be held or chewed in the mouth till they are melted there; the ſame with what are otherwiſe called *trochiſci, troches*.

LOZERE, in *Geography*, one of the nine departments of the ſouthern region of France, compoſed of Gevaudan and part of the Cevennes, N. lat. 44° 30′, S.E. of Cantal, and S. of the Upper Loire, 18 French leagues long, and 15 broad, contains 5390 kiliometres, or 269 ſquare leagues, and 155,927 inhabitants. It is divided into three diſtricts, 24 cantons, and 193 communes. The diſtricts are Marvejols, including 60,750 inhabitants; Mende, 52,813; and Florac, 42,364. Its capital is Mende. Its contributions amount to 892,776 fr. and its expences to 179,687 fr. The northern diſtricts conſiſt partly of granite mountains; towards the middle of the department the hills are calcareous; and in the ſouthern part the Cevennes are compoſed of ſchiſtus. A conſiderable proportion of this territory is not ſuſceptible of culture. The chief products are barley, flax, hemp, fruits, and paſtures for ſheep. Here are mines of iron, copper, lead, and antimony, with mineral ſprings.

LOZICZE, a town of Poland, in the palatinate of Bielſk; 56 miles S.W. of Bielſk.

LOZZI, a town of the iſland of Corſica; 11 miles N.W. of Corte.

LOZZO, a town of Italy, in the Paduan; 8 miles S.S.W. of Padua.

LU, a town of France, in the department of Marengo; 8 miles W. of Alexandria.

LU, in *Chineſe Muſic*, implies a key. Dividing the octave into 12 ſemitones, they give the name of *lu* to each, numerically. See CHINESE MUSIC.

LUA, in *Geography*, a river of the iſland of Cuba, which runs into the ſea; 25 miles N.E. of Cape Cruz.—Alſo, a town of Arabia, in the province of Oman, on the coaſt; 10 miles N. of Sohar.

LUA, in *Mythology*, a Roman divinity mentioned by Livy, lib. viii. and invoked in war. The name is ſuppoſed to be derived from *luere, to expiate*.

LUABO, in *Geography*, a river on the W. coaſt of Africa, a branch of the great river Zambezi, which ſeparates from it at the diſtance of 30 leagues from the ſea.—Alſo, an iſland ſituated between the Luabo and Zambezi. See MOCARANGA.

LUANA POINT, a cape on the S. coaſt of Jamaica. N. lat. 18° 2′. W. long. 77° 50′.

LUANCO, a town of Spain, in Aſturia, near the W. coaſt; 20 miles N. of Oviedo.

LUANZA, a town of Africa, in the country of Mocaranga. S. lat. 17° 15′. E. long. 32° 30′.

LUARCA, a ſea-port town of Spain, on the N. coaſt, in the province of Aſturias; 30 miles N.W. of Oviedo.

LUBAD, a town of Aſiatic Turkey, in Natolia, on a lake of the ſame name, 21 miles long, and four broad; 7 miles S. of Burſa.

LUBAN, a town of Lithuania, in the palatinate of Novogrodek; 20 miles S.E. of Sluck.

LUBAN, or *Louban*, one of the Philippine iſlands, about 12 miles in circumference.

LUBARTOW, a town of Poland, in Volhynia; 36 miles W. of Berdiczow.

LUBASZYN, a town of Lithuania, in the palatinate of Minſk; 52 miles E. of Minſk.

LUBAT, a town of Aſiatic Turkey, in Natolia; 28 miles W. of Burſa.

LUBATCHOW, a town of Auſtrian Poland, in Galicia; 16 miles N. of Lemberg.

LUBBECKE, or LUTHICKE, a town of Weſtphalia, in the county of Minden, conſiſting of about 258 dwelling-houſes, which obtained the privileges of ſaints in 1270, and was ſurrounded with ramparts, ditches, and walls. This town enjoys ſeveral immunities, and particularly a territorial juriſdiction over a conſiderable diſtrict. Its chief trade conſiſts in yarn and linen, breeding of cattle, and brewing of beer. It has ſuſtained, at ſeveral times, great damage by fire; 14 miles W. of Minden.

LUBBEN, or LUBIO, a town of Lower Luſatia, ſituated on the Spree, in a circle to which it gives name;

56 miles S. of Berlin. N. lat. 51° 37′. E. long. 13° 45′.

LUBBERT, Sibrand, in *Biography*, a theological profeſſor and divine, was born at Langoworde, in Frieſland, about the year 1556. He ſtudied in the colleges of Bremen and Wittemberg. He afterwards went to Geneva, and diligently attended the lectures of Beza, Caſaubon, and Francis Portus. From Geneva he went to Newſtadt, and attended the lectures of the learned Zachary Urſinus, who, after a time, recommended him as his own ſucceſſor as profeſſor of logic, an honour which he declined, and accepted ſoon after an invitation to become paſtor of a congregation at Embden. The duties of this office he diſcharged with ſingular fidelity and zeal. In 1584, he removed to Frieſland, and was appointed preacher to the governor and deputies of the ſtates of that province; alſo profeſſor of divinity in the new univerſity of Franeker. He went to Heidelberg, where he was admitted to the degree of doctor of divinity, and then returned to his profeſſorſhip, which he occupied with reputation nearly forty years. During this period he was often employed in very important affairs. He died at Franeker in 1625, at the age of ſixty-nine. He was author of many learned pieces againſt Bellarmin: he publiſhed a work againſt Socinus, and he wrote againſt Arminius, Vorſtius, Grotius, and the other defenders of the cauſe of the Remonſtrants. His laſt work was a commentary on the Catechiſm of Heidelberg. Bayle. Moreri.

LUBCZ, in *Geography*, a town of Ruſſian Lithuania; 25 miles N. of Novogrodek.

LUBECK, a city of Germany, one of the three cities of the Hanſeatic league, acknowledged as ſuch, together with Hamburgh and Bremen, in the definitive treaty of indemnities, 25th of February 1803, with the guarantee of their juriſdiction and perpetual neutrality. It is alſo one of the college of imperial and free cities. It is ſituated within the limits of Holſtein, on the navigable river Trave, communicating by ſeveral ſtreams with the Baltic and German ocean. The town ſtands on the two declivities of a long hill, moderately high, the eaſtern part extending towards the navigable river Wackenitz, and the weſtern towards the Trave. Beſides walls and towers, it is alſo ſurrounded by ſtrong ramparts, and wide moats. The ſtreets are for the moſt part ſteep, and the houſes built of ſtone, and old faſhioned, the doors being ſo large as to admit carriages into the hall, which ſerves frequently for a coach-houſe. The eſtabliſhed religion, ever ſince the year 1530, has been Lutheraniſm. It has four parochial churches, as well as the cathedral of an ancient ſee. The archbiſhopric of Lubeck lies in that part of the duchy of Holſtein, which was anciently called "Wagria." Its ſee was firſt erected by the emperor Otho I. at Oldenburg, in 951, for the converſion of the Wends, or Veneti, who inhabited this country, and transferred to Lubeck in the year 1164. The reformation of the dioceſe was begun under biſhop Henry of Bocholt, and being promoted by his ſucceſſors, was accompliſhed in 1561. The biſhop of Lubeck, though a prince of the empire, yet in the college of princes ſat neither on the ſpiritual nor temporal bench, but on a particular bench placed croſs-ways, and laid there for him and the biſhop of Oſnabruck, when a Lutheran. He had alſo a vote among the princes of the circle of Lower Saxony. The cathedral ſtands in the imperial city of Lubeck: but is inveſted with no authority. The chapter conſiſts of thirty perſons, who, with the exception of four Roman Catholics, are all Lutherans. When the indemnities were ſettled at Ratiſbon in 1802, it was decreed that the biſhopric with its chapter ſhould be ſeculariſed in favour of the duke of Oldenburg: reſerving only the property within the city, which was to be added to the domain of the city. Lubeck was once the chief city of the *Hanſeatic league*, which ſee; but this honour now belongs to Hamburgh. On the ſpot where it now ſtands was formerly a town named "Bucu;" but when this was demoliſhed, about the year 1144, Adolphus II., count of Holſtein and Schauenburg laid the foundation of this city, which, in proceſs of time, became ſo famous. In 1156 the town, which had ſuffered much from fire, was given by count Adolphus to duke Henry, which, being rebuilt, he erected into a free port, and conferred upon it a municipal right of great importance. This was confirmed in 1188, by the emperor Frederick I., and afterwards by ſucceeding emperors. In 1276, the whole city, five houſes excepted, was deſtroyed by fire. Lubeck has various manufactures, and its trade is very conſiderable, partly owing to the commodiouſneſs of its ſituation. The quay of Lubeck is on the river Trave, which falls into the ſea at the diſtance of 14 miles, and admits veſſels from 150 to 200 tons burden, and ſometimes, but rarely, 300. Mr. Coxe obſerved about 120 merchant ſhips deſtined to Ruſſia, Sweden, and Denmark. The trade, however, is chiefly a trade of commiſſion, drawing from Ruſſia, Sweden, and Denmark their raw commodities, and ſupplying them with wines, ſilks, cloth, and ſteel ware. The exports, partly by Lubeck, and partly by Hamburgh, are grain, flax, hemp, hops, wax, honey, cattle, butter, cheeſe, fruits, feathers, dried geeſe, tallow, linſeed, wool, and timber. Lubeck, according to Hoeck, contains 30,000 inhabitants. It was taken by the French in 1806. N. lat. 53° 52′. E. long. 10° 40′.

Lubeck, or *Luboi*, an iſland in the Eaſt Indian ſea, near Madura. Its diſtance W. of Tonikaky is about 112 leagues; and W. from the iſlands of Salembo 31 leagues. S. lat. 5° 43′. E. long. 112° 44′.

LUBEN, a ſmall town of Sileſia, with large ſuburbs, in the principality of Lignitz: here is a Lutheran college; 12 miles N. of Lignitz. N. lat. 51° 22′. E. long. 16° 15′.

LUBENAU, or Lubnow, a town of Lower Luſatia, in the circle of Calau, on a ſmall river which runs into the Spree, the chief place of a barony with a chateau; 15 miles S.S.E. of Lubben. N. lat. 51° 53′. E. long. 13° 52′.

LUBERSAC, a town of France, in the department of the Correze, and chief place of a canton, in the diſtrict of Brives; 8 miles W. of Uzerche. The place contains 3087, and the canton 10,351 inhabitants, on a territory of 247½ kiliometres, in 12 communes.

LUBIEN, a town of the duchy of Warſaw; 26 miles S.S.W. of Poſen.

LUBIENIETZKI, Stanilaus, in *Biography*, a celebrated Unitarian miniſter in the 17th century, was born at Racow in the year 1623. He was educated with great care, and his father introduced him, in due time, to perſons of reſpectability and conſequence in the ſtate. About the year 1648 he was admitted into the miniſtry by the ſynod of Czarcow, and appointed paſtor of a church of that name. This ſituation he was obliged to quit in 1655, upon the irruption of the Swedes into that neighbourhood, and in the following year he retired with his family to Cracow. Here he employed much of his time with the other miniſters, in frequent faſting, prayer, and preaching; and for the benefit of the Hungarian Unitarians, who came thither with prince Ragotſki, he frequently preached in the Latin language. While he continued at Cracow he was much noticed by the king of Sweden, who did him the honour of admitting him to his table. After that city fell again into the hands of the Poles, in 1657, he followed the Swediſh garriſon, with two other Unitarians, to ſupplicate that they and friends of the ſame religious perſuaſion, who had placed themſelves under his protection, might be comprehended in the amneſty to be granted at the concluſion of the peace with Poland. This was not granted, and finding that there was no hope of remaining in ſafety in his native country, he went to Copenhagen, in 1660, to ſeek an aſylum from the king of Denmark for his perſecuted brethren who had been baniſhed from Poland. He received kind treatment from his majeſty, who could do nothing more than promiſe to connive at their ſettlement at Altena. Thus circumſtanced, he thought it adviſable to return to Pomerania, and arrived at Stettin in 1661. Perſecution followed him to this place, and he was obliged to remove to Hamburgh, where he directed his family to join him in the year 1662: from this city he was driven by the ſame fiend in 1667, and took refuge again at Copenhagen. He now hoped there was a proſpect of a peaceful ſettlement, becauſe the magiſtrates of Frederickſburg conſented that the Unitarians ſhould reſide in their town, and enjoy, without moleſtation, the private exerciſe of their religion. He therefore removed to that city, and invited his baniſhed brethren to join him, ſparing no pains nor coſt, that he might ſettle and provide for them there. Scarcely, however, had they taken quiet poſſeſſion of their new abodes, when they were baniſhed from the city, and even the dominions of the prince to whom the city belonged. Lubienietzki was ill at the time when he received the order, but promiſed to obey it as ſpeedily as poſſible. Before, however, he could be removed, poiſon was adminiſtered to him in his food, to which two of his daughters, as well as himſelf, fell ſacrifices, while his wife, who had eaten very ſparingly, narrowly eſcaped the ſame fate. He died in 1675, about the age of fifty-two. He wrote many books, the greater number of which was not printed. The principal publiſhed work was entitled "Theatrum Cometicum," in two vols. folio, which contains a minute hiſtorical account of every ſingle comet which had been ſeen or recorded from the deluge to the year 1665. At the time of his death he was engaged in writing "A Hiſtory of the Reformation in Poland," which was printed in Holland in 1685, in 8vo, with an account of the author's life.

LUBIN, AUGUSTINE, an able geographer in the ſeventeenth century, was born at Paris in the year 1624. He entered, at an early age, among the religious of the reformed order of St. Auguſtine, and was diſtinguiſhed by his proficiency in literary purſuits, particularly in ancient and modern geography, and in ſacred and profane hiſtory. He paſſed through all the offices of his order, and his ſcientific ſkill was rewarded with the poſt of geographer to the king. He died at Paris in 1695. His principal works are "Martyrologium Romanum, cum Tabulis Geographicis et notis Hiſtoricis;" "Tabulæ Sacræ Geographicæ, ſive Notitia Antiqua, medii Temporis, et nova, Nominum utriuſque Teſtamenti ad Geographiam pertinentium;" being a kind of dictionary to all the places mentioned in the bible; "Geographical Tables;" "The Hiſtory of Lapland," tranſlated from Scheffer; "The Geographical Mercury," &c.

LUBIN, EILHARD, was born at Weſterſtede, in the county of Oldenburg, of which place his father was miniſter. He ſtudied at ſeveral German univerſities, and acquired an exact knowledge of the Greek language, with the branches of ſcience uſually taught in thoſe ſeminaries. He was appointed profeſſor of poetry in the univerſity of Roſtock in 1595, and ten years afterwards, was promoted to the profeſſorſhip of divinity. He wrote notes on Anacreon, Juvenal, Perſius, &c. His principal work was entitled "Phoſphorus de Cauſa prima et Natura Mali," printed at Roſtock in 1596. He died in 1621. Bayle.

LUBINIA, in *Botany*, was named by Commerſon, the French botaniſt, in honour of his friend the chevalier de St. Lubin, who diſtinguiſhed himſelf formerly at the ſiege of Madras, and was, it ſeems, in the confidence of Hyder Ally. What pretenſions the chevalier had to commemoration, as a votary of ſcience, does not appear, nor was Commerſon very ſelect in the diſtribution of ſuch honours. Juſſieu, who muſt have ſeen ſpecimens, paſſed over the plant and the name in ſilence. Lamarck referred it to *Lyſimachia*. Venten. Jard. de Celſ. 96.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Lyſimachiæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, in five deep, ovate, rather unequal ſegments, with membranous edges, permanent. *Cor.* of one petal, nearly ſalver-ſhaped, ſlightly irregular; tube funnel-ſhaped, the length of the calyx; limb in five deep obtuſe ſegments, the two lowermoſt rather the ſmalleſt. *Stam.* Filaments five, awl-ſhaped, inſerted into the lower part of the corolla, equal, the length of the tube; anthers erect, oval, two-lobed. *Piſt.* Germen ſuperior, almoſt globular, ſmooth; ſtyle cylindrical, the length of the ſtamens, permanent; ſtigma ſimple, obtuſe. *Peric.* Capſule roundiſh-oval, crowned by the ſtyle, with five notches at the top, of one cell, not burſting. *Seeds* numerous, roundiſh, compreſſed, rough. *Receptacle* central, ovate, ſomewhat compreſſed, unconnected with the capſule except at the baſe, from which it ſeparates as the ſeeds ripen.

Eſſ. Ch. Corolla ſalver-ſhaped, irregular. Capſule ovate, not burſting, crowned with the ſtyle, of one cell. Seeds numerous, attached to a central receeptacle.

1. L. *ſpatulata*. Vent. Jard. de Celſ. t. 96. (Lyſimachia mauritiana; Lamarck Dict. v. 3. 372. Illuſtr. n. 1980.)—The only known ſpecies. Native of the iſle de Bourbon. M. Cels appears to have had it in cultivation. The *root* is ſaid by Ventenat to be biennial, and the *flowers* to be produced in the beginning of ſummer. This *plant* has ſomething of the aſpect of *Convolvulus tricolor*, but is firmer, and quite ſmooth. The woody *ſtem* produces a few ſimple branches, a ſpan long, clothed with numerous, ſcattered, ſpatulate, obtuſe, entire, rather fleſhy *leaves*, above an inch long, tapering down into a bordered footſtalk. *Flowers* axillary, ſolitary, on ſimple ſtalks, half as long as the leaves. *Calyx* dark brown, dotted with black, white at the edge. *Corolla* yellow, nearly as broad as that of *Lyſimachia nemorum*.—Capſule when preſſed burſting irregularly, ſometimes at the ſides, ſometimes, according to Ventenat, into two or four apparent valves. Lamarck ſays it has five valves, but he perhaps judged from the notches at the top. The *fruit* therefore, and the irregular corolla, mark this genus as ſufficiently diſtinct from *Lyſimachia*; to which may be added, on the ſcore of habit, its alternate, not oppoſite or whorled, leaves.

LUBISCHAW, in *Geography*, a town of Pruſſia, in the province of Pomerelia; 18 miles S. of Dantzic.

LUBISCHMAT, a town of Pruſſia, in the palatinate of Culm; 5 miles E. of Thorn.

LUBLENIETZ, or LUBENSKY, a town of Sileſia, in the principality of Oppeln; 29 miles E. of Oppeln. N. lat. 50° 39′. E. long. 18° 42′.

LUBLIN, a city of Poland, and capital of a palatinate of the ſame name; part of which is annexed to the new country of Galicia. It is ſurrounded with a wall and ditch, and though not very large, its caſtle, which is built on a high rock, is ſeated on the river Byſtzrna, in a pleaſant and fertile country. This town contains many churches and convents; and in its ſuburbs are many Jews, who are accommodated with a ſpacious ſynagogue. It has three fairs in the year, one of which laſts a month; and they are frequented by German, Greek, Armenian, Arabian, Ruſſian, Turkiſh, and other traders and merchants. The chief tribunal for Little Poland was formerly held here, together with a provincial diet and a court of judicature. Lublin is diſtant 85 miles S.E. of Warſaw. N. lat. 51° 6′. E. long. 22° 45′.

LUBNEKI, a town of Samogitia; 10 miles N. of Miedniki.

LUBNI, a town of Ruſſia, in the government of Kiev, on the Sula; 8 miles E.S.E. of Kiev. N. lat. 50°. E. long. 32° 54′.

LUBOK, commonly called the *Baviaan*, or *Baboon*, an iſland in the Eaſt Indian ſea, not far from the coaſt of Java, not large, but extremely populous. Seventy or eighty veſſels are continually paſſing to and fro between this iſland and the coaſts of Java and Borneo.

LUBOLO, a province of Angola, in Africa, on the banks of the Coanza.

LUBOMLA, a town of Auſtrian Poland, in Galicia; 32 miles E. of Chelm.

LUBOZ, a town of Lithuania, in the palatinate of Novogrodek; 16 miles N.E. of Novogrodek.

LUBRONG, or Teshoo-Loomboo, a town of Thibet, and reſidence of Teſhoo Lama, capital of that part of the country which is immediately ſubject to his authority, is ſituated in N. lat. 29° 4′ 20″, and E. long 89° 7′. This is a large monaſtery, conſiſting of three or four hundred houſes, the habitations of the Gylongs, beſides temples, mauſoleums, and the palace of the ſovereign pontiff; in which are comprehended alſo the reſidence of the regent, and the dwellings of all the ſubordinate officers, both eccleſiaſtical and civil, belonging to the court. It is included within the hollow face of a high rock, and has a ſouthern aſpect. Its buildings are all of ſtone, none leſs than two ſtories high, flat-roofed, and covered with a parapet, riſing conſiderably above the roof, compoſed of heath and bruſhwood, inſerted between frames of timber, which form a ledge below, and are faſhioned above into a cornice, capped with maſonry. All the houſes have windows; that in the centre projecting beyond the walls, and forming a balcony: they are not cloſed with ſhutters, but black mohair curtains. The principal apartment in the upper ſtory has an opening over it, covered with a moveable ſhed, which ſerves the purpoſe of ſometimes admitting light and air, and in the winter ſeaſon, occaſionally, the grateful warmth of the ſun. Turner's Tibet.

LUBUNGAN, a town on the north coaſt of the iſland of Mindanao.

LUBWACH, a town of Germany, in the biſhopric of Bamberg; 8 miles N.E. of Bamberg.

LUBZ, or Lubitz, a town of the duchy of Mecklenberg; 23 miles S.S.W. of Guſtrow. N. lat. 53° 30′. E. long. 12 .

LUC en Diois, a town of France, in the department of the Drôme, and chief place of a canton, in the diſtrict of Die, ſeated on the Drôme; 9 miles S. of Die.

LUCALA, a town of Africa, in Angola, on a river of the ſame name, which runs into the Coanza; 30 miles N.E. of Maſſangano.

LUCAN, in *Biography*, a celebrated Roman poet, was born at Corduba, in Spain, about the year 39 before the Chriſtian era. His father, Annæus Mela, a Roman knight, was the youngeſt brother of Seneca the philoſopher; and his mother, Acilia, was daughter of Acilius Lucanus, an eminent orator. Lucan was brought to Rome during the firſt months of his infancy, and was committed, at a very early age, to the care of the ableſt maſters in grammar and rhetoric. He ſtudied philoſophy under the ſtoic Cornutus, from whom he derived the lofty and free ſtrain of ſentiment by which he is ſo much diſtinguiſhed. It is ſaid he completed his education at Athens. Seneca, then tutor to the emperor Nero, obtained for him the office of queſtor: he was ſoon after admitted to the college of augurs, and conſidered to be in the full career of honour and opulence. He gave proofs of poetical talents at a very early age, and acquired reputation by ſeveral compoſitions; a circumſtance that excited the jealouſy of the emperor, who valued himſelf on his powers as a poet and muſician. Lucan even ventured to recite one of his own pieces, in competition with Nero; and, to the ſurpriſe of every one, the judges decided in favour of Lucan. From this period Nero regarded the poet with all the malignity of a vanquiſhed rival, and made uſe of his power in forbidding him again to repeat any of his verſes in public. In the conſpiracy againſt the tyrannical emperor, Lucan took a part: the plot was diſcovered, and he was apprehended among the other conſpirators. Tacitus and other authors have accuſed him of the puſillanimity of endeavouring to free himſelf from puniſhment, by accuſing his own mother, and involving her in the crime of which he was guilty. Mr. Hayley has endeavoured to reſcue his name from ſo terrible a charge, by obſerving and commenting on the fact, that the mother of Lucan was paſſed over without puniſhment: hence he inferred, that no evidence exiſted of her having been charged by her ſon, but popular rumour; becauſe it is well known that no other perſon, however diſtantly implicated in the conſpiracy, eſcaped without ſome kind of penalty. At any rate, his confeſſions were of no avail, and his mind recovered its firmneſs for the concluding ſcene. No favour was granted him but the choice of the death he would die; and he choſe the ſame which had terminated the life of his uncle Seneca. His veins were accordingly opened; and when he found himſelf growing cold and faint through loſs of blood, he repeated ſome of his own lines, deſcribing a wounded ſoldier ſinking in a ſimilar manner: theſe were the laſt words which he uttered. He died in the year 65, and in the 27th year of his age. Of the various poems of Lucan, none but his Pharſalia remain, which is an account of the civil wars between Cæſar and Pompey, but is come down to us in an unfiniſhed ſtate. Its title to the name of an epic poem has been diſputed by thoſe critics, who, from the examples of Homer and Virgil, have maintained that machinery, or the intervention of ſupernatural agency, is eſſential to that ſpecies of compoſition. As to the merits of the poetry itſelf there are various opinions. Lucan certainly poſſeſſes neither the fire of Homer, nor the melodious numbers of Virgil. If he had lived to a maturer age, his judgment as well as his genius would have been improved, and he might have claimed a more exalted rank among the poets of the Auguſtan age. His expreſſions, however, are bold and animated; his poetry entertaining; and it has been aſſerted that he was never peruſed without the warmeſt emotions, by any whoſe minds were in uniſon with his own. The beſt edition of the Pharſalia is the Variorum, Leyd. B. 8vo., 1669. The editions by Oudendorp, 1728; by Burman, 1740; by Bentley, 1760; and by Barbou, 1767, are in good eſteem. The Pharſalia has been tranſlated into Engliſh verſe by Mr. Nicholas Rowe. There was no Delphin edition of this poem, devoted to the intereſts of liberty; but it was one of the firſt pieces of ancient literature that was publiſhed during the French republic, by Didot, in a ſplendid folio.

Lucan, in *Geography*, a village of the county of Dublin, Ireland, pleaſantly ſituated on the banks of the Liffey. It is remarkable for a ſulphureous medicinal ſpring, which is much frequented. It is 6½ miles W. from Dublin.

Lucan, *Al*, a town of Aſiatic Turkey, in Aladulia; 15 miles E. of Maraſch.

LUCANAS, a juriſdiction of the dioceſe of Guamanga, in the viceroyalty of Peru, commencing about 25 or 30 leagues S.W. of Guamanga. Its temperature is cool and moderate. The parts of the former breed large droves of all ſorts of cattle; and thoſe of the latter are fertile in grain, herbs, and fruits. It alſo abounds in valuable ſilver mines, in which the riches of Peru chiefly conſiſt; and by theſe means it becomes the centre of a very extenſive commerce; great numbers of merchants reſorting hither with their goods, and others for purchaſing ſuch proviſions as their own reſpective countries do not afford, for which they give in exchange ingots and pinnas of ſilver.

LUCANIA, in *Ancient Geography*, a province of Italy, bounded on the north by Campania and Apulia, on the eaſt by Sinus Tarentinus, on the ſouth by Brutium, and on the weſt by the Tuſcan ſea. A ridge of the Apennines, running from north to ſouth, divides this province into two parts.

LUCANUS, in *Natural Hiſtory*, a genus of inſects of the order coleoptera: antennæ clavate, the club compreſſed and divided into ſhort pectinate leaves; jaws projecting beyond the head, ſo as to reſemble horns, toothed; two palpigerous tufts under the lip.

This genus differs chiefly from the Scarabæus, (to which the reader is referred,) in having the jaws conſiderably elongated, ſo as to give the appearance of a pair of denticulated horns; while the antennæ terminate in a laterally flattened tip, divided on the interior ſide into ſeveral lamellæ. There are twenty-ſix ſpecies, of which four are Britiſh, which will be noticed by aſteriſks.

Species.

Alces. Jaws exſerted, four-toothed at the tip. It inhabits ſeveral parts of Aſia. The head is large, depreſſed, black, ſinuate on each ſide; jaws longer than the head, compreſſed at the tip, and armed with a ſtrong tooth in the middle within.

Giraffa. Jaws exſerted, depreſſed, with many different ſized teeth; lip rounded. Inhabits Aſia. The jaws are likewiſe very long; the teeth at both ends larger; thorax with an unequal margin; body black.

* Cervus; Stag-beetle, or ſtag-chaffer. Jaws exſerted, forked at the tip; a ſmall branch near the middle within. It is the largeſt of all the European coleopterous inſects, ſometimes meaſuring nearly two inches and a half in length, from the tip of the jaws to the end of the body. Its general colour is a deep cheſnut, with the thorax and head, which is of a ſquariſh form, of a blacker caſt; and the jaws are often of a brighter or redder cheſnut colour than the wing-ſhells; the legs and under-parts are coal-black; and the wings which, except during flight, are concealed under the ſhells, are large, and of a fine pale yellowiſh-brown. This remarkable inſect is chiefly found in the neighbourhood of oak-trees, delighting in the ſweet exſudation, or honey-dew, ſo frequently obſerved on the leaves. Its larva, which perfectly reſembles that of the genuine beetles, is alſo found in the hollows of oak-trees; reſiding in the fine vegetable mould uſually ſeen in ſuch cavities, and feeding on the ſofter parts of the decayed wood. It is of a very conſiderable ſize, of a pale yellowiſh or whitiſh-brown colour; and when ſtretched out at full length, meaſures nearly four inches. It has been ſuppoſed by Roeſel, that theſe *larvæ* were the *coſſi* of the ancient Romans, which, according to Pliny, were in high eſteem as an article of luxury. What renders this ſuppoſition the more probable is, that the larvæ of a ſpecies of cerambyx, as well as of a curculio, are well known to be greatly admired by the inhabitants of the Weſt Indian iſlands, and are frequently collected at a great expence, as a highly delicate diſh, being broiled or fried for that purpoſe. When arrived at its full ſize, which, according to ſome, is hardly ſooner than the fifth or ſixth year, it forms, by frequently turning itſelf, and moiſtening it with its glutinous ſaliva, a ſmooth oval hollow in the earth, in which it lies; and afterwards remaining perfectly ſtill for the ſpace of nearly a month, diveſts itſelf of its ſkin, and commences pupa or chryſalis. It is now of a ſhorter form than before, of a rather deeper colour, and exhibits, in a ſtriking manner, the rudiments of the large extended jaws and broad head, ſo conſpicuous in the perfect inſect: the legs are alſo proportionably larger and longer than in the larva ſtate. The ball of earth, in which this chryſalis is contained, is conſiderably larger than a hen's egg, and of a rough exterior ſurface, but perfectly ſmooth and poliſhed within. The chryſalis lies about three months before it gives birth to the complete inſect, which uſually emerges in the months of July and Auguſt. The time, however, of this inſect's growth and appearance in all its ſtates varies much, according to the difference of ſeaſons. It is not very uncommon in many parts of England.

The commonly ſuppoſed female differs ſo much in appearance from the male, that it has by ſome authors been conſidered as a diſtinct ſpecies. It is not only ſmaller than the former, but totally deſtitute of the long and large ramified jaws; inſtead of which it has a pair of very ſhort curved ones, ſlightly denticulated on their inner ſide: the head is alſo of conſiderably ſmaller diameter than the thorax. In point of colour it reſembles the former. Among thoſe who conſider it as a diſtinct ſpecies may be numbered the ingenious Mr. Marſham, F.L.S., who, in his "Entomologia Britannica," aſſures us that the real female inſect extremely reſembles the male, but is ſmaller, and wants the larger denticulation on the inner ſide of each horn. The generally ſuppoſed female he diſtinguiſhes by the title of "Lucanus inermis."

Saiga. Jaws exſerted, many-toothed; lip abbreviated, emarginate. Inhabits America. Body depreſſed, ſmooth, black; jaws hardly forked at the end.

Elaphus. Jaws exſerted, one-toothed, forked at the tip; lip deflected, conic; hind margin of the head much elevated, emarginate. Female leſs; the jaws not exſerted. Inhabits Virginia.

Capreolus. Jaws exſerted, the middle denticles differently ſhaped, forked at the tip. Inhabits Germany. It is about half the ſize of the cervus above deſcribed; jaws with two thick approximate lobed denticles in the middle; body black.

Dama. Jaws exſerted, two-toothed within, as long as the head. Inhabits Virginia. A variety has jaws entire at the end; thighs ferruginous.

Femoratus. Jaws exſerted, three-toothed; body black; thighs ferruginous. It inhabits Cayenne. The head is plain, almoſt without lip; thorax more duſky; the fore margin fulvous, ciliate; the hind margin two-toothed each ſide; ſcutel fulvous, ſilky.

Bison. Jaws exſerted, many-toothed; thorax and ſhells edged with red. Inhabits America. Edge of the thorax rufous, with a black line.

Gazella. Jaws two-toothed within; body black; ſhells edged with teſtaceous. Inhabits Siam. The jaws are ſhort; head with a ſmall plate before the eyes; hind edge of the thorax notched on each ſide; ſhanks angular, grooved.

Lama. Jaws exſerted, three-toothed, ſhorter than the head; thorax angular. Inhabits India.

Suturalis. Jaws exſerted, three-toothed at the baſe within; body teſtaceous, with a dorſal black line; the head is teſtaceous, with a black margin and dorſal line, which is bifid at the tip; thorax teſtaceous, with a black dorſal line and ſpot each ſide at the baſe.

Carinatus. Depreſſed; thorax unarmed, ſhorter than the head, the hinder angles excavated; abdomen very ſhort; breaſt ending behind in an acute angle. Inhabits India.

* Parallellepipedus. Jaws with a lateral elevated tooth within; body depreſſed. It inhabits Europe. Body black, very ſmall: female with a double prominent dot on the head.

Tenebroides. Jaws lunate, one-toothed; body black; thorax margined; ſhells ſubſtriate. Inhabits Ruſſia. Abdomen pitchy.

Cacuroides. Jaws incurved, with a thick differently ſhaped tooth within; ſhells punctured, ſlightly downy; thorax a little grooved; ſhanks ſerrate. It inhabits Van Diemen's land.

* Caraboides. Blueiſh; jaws lunate; thorax margined: varies in being greeniſh, with reddiſh legs and abdomen. Inhabits Europe.

Piceus. Black, ſmooth, ſtriate; antennæ, abdomen, and legs pitchy. Inhabits Sweden.

Capensis. Exſcutellate, black; body depreſſed; thorax ſtriate. Found in Chili, South America.

Pilmus. Exſcutellate, black; ſhells with punctured grooves. Inhabits the Cape.

Tarandus. Scutellate, black, very ſmooth; jaws exſerted, three-toothed at the tip, two-toothed on the inner ſide. Inhabits Africa.

Antilope. Jaws exſerted, edged on the inner ſide, the upper margin two-toothed, but the lower five-toothed; body brown, nearly ſmooth. Found in different parts of Africa.

Bubalus. Black; jaws bifid; one part projecting, ſublunate, three-toothed within; the other larger, deflected, arched entire. Inhabits Georgia.

Interruptus. Antennæ arched; body black, with a recumbent ſpine on the crown; thorax and abdomen remote; thorax and ſhells ciliate, with rufous. Inhabits America and the Weſt India iſlands, under rotten ſugar-canes. This is the paſſalus interruptus of Fabricius.

Dentatus. Antennæ arched; head many-toothed; thorax punctured at the ſides; thorax and abdomen remote. Found in the iſland of Guadaloupe. This is the paſſalus dentatus of Fabricius.

Minutus. Antennæ arched; thorax and abdomen remote, ferruginous; ſhells teſtaceous. This is the paſſalus minutus of Fabricius, and is found in the South American iſlands. The body is much depreſſed, hardly larger than a louſe; jaws exſerted, ſhort, unarmed, pointed; ſhells hardly ſtriate.

Dr. Shaw mentions a highly elegant ſpecies, that has lately been diſcovered in New Holland, which differs from the reſt in being entirely of a beautiful golden green colour, with ſhort, ſharp-pointed, denticulated jaws of a brilliant copper colour. The whole length of the inſect is rather more than an inch. Gmelin's Linn. Shaw's Zoology. Donovan.

LUCAR, among the Romans, an appellation given to the money expended upon plays and public ſhows.

Lucar *de Barrameda, St.*, in *Geography*, a decayed ſea-port town of Spain, in the province of Seville, at the mouth of the Guadalquivir, the key of Seville, with a good harbour, but difficult of acceſs on account of a rock in the water. A whole fleet may lie ſecurely in the road. The chief article of its trade is ſalt; 13 miles N. of Cadiz. N. lat. 36° 45′. W. long. 6° 27′.

Lucar *de Guadiana, St.*, a town of Spain, in the province of Seville, ſituated on the Guadiana, on the confines of Portugal, and defended by towers and baſtions. The tide flows up to the town, ſo as to bring ſmall veſſels into its harbour; 64 miles W. of Seville. N. lat. 37° 30′. W. long. 7° 25′.

Lucar *le Mayor, St.*, a town of Spain, in the province of Seville, on the Guadiamur; 10 miles W. of Seville.

LUCARIA, an ancient feaſt celebrated by the Romans. Sext. Pompeius obſerves, that the lucaria were ſolemnized in the woods, where the Romans, defeated and purſued by the Gauls, retired, and concealed themſelves. The word, according to Feſtus and Sext. Pompeius, comes from *lucus*, *a grove* or *wood*. Varro derives it from *luce*, the ablative of the word *lux*, *light* and *liberty*. But the former etymology ſeems the more natural.

It was held in the month of July, in memory of the aſylum they found in the wood, which was between the Tyber and the road called Via Salaria.

LUCAS, Tudensis, in *Biography*, a Spaniſh writer and prelate, who flouriſhed in the thirteenth century, was firſt a deacon in the church, and afterwards biſhop of Tuy, a city of Gallicia, whence he has his ſurname. He travelled into ſeveral parts of the eaſt and other countries, for the purpoſe of obtaining information concerning the religion and ceremonies of different nations; and was raiſed to his biſhopric by pope Gregory IX. His principal work was "A Treatiſe againſt the Albigenſes." He was author, likewiſe, of "The Life of St. Iſidore of Seville;" and he made conſiderable additions to "The Chronicle of St. Iſidore." Gen. Biog.

Lucas, Francis, a learned divine, who flouriſhed in the ſeventeenth century, was a native of Bruges, was educated at Louvain, attained to the degree of doctor, and was made dean of the church of St. Omer's. He died in 1619. He was profoundly ſkilled in the Greek, and in all the oriental languages; and was an expert judicious critic. He was the author of "Notationes in ſacra Biblia, quibus variantia diſcrepantibus Loca, Exemplaribus ſummo Studio diſcutiuntur," 4to., 1580; "Commentaria in Evangel." in 5 vols., folio; "Notæ ad varias Lectiones in Evangel.;" "Concordantiæ Latinorum Bibliorum Vulgatæ Editionis," and of many other learned works.

Lucas, Paul, a celebrated traveller, was born at Rouen in 1664. He felt an early inclination to travel into foreign countries, which he gratified by ſeveral tours through the Levant, Egypt, Turkey, and other parts. He brought back a rich treaſure of medals and other curioſities for the king's cabinet, who ordered him to draw up an account of his travels, and who, in 1714, nominated him one of his antiquaries. He was afterwards employed by the ducheſs of Burgundy. In 1723 he took another voyage to the Levant, by order of Lewis XV., and collected many curious and valuable manuſcripts and medals. From this period to 1736 he lived a life of repoſe; but in the laſt named year he viſited Spain, a country which he had never before ſeen, and was well received by the king, who engaged him to arrange his cabinet of medals: but during this employment he was taken ill, and died in 1737, at the age of ſeventy-two. He was author of a work, entitled, "Travels of Paul Lucas," in ſeven volumes. In four of them is an account of his voyage to the Levant, to Greece, Aſia Minor, Macedonia, and Africa. His travels in Turkey, Aſia, Syria, Paleſtine, and Egypt, were publiſhed at Rouen, in three volumes.

Lucas, Richard, a native of Wales, was born at Preſteigne, in Radnorſhire, in the year 1648; and when he had laid a good foundation in grammar learning, he was ſent to the univerſity of Oxford, and entered a ſtudent at Jeſus college in 1664. He took his degree of arts in 1668, and in 1672; and was ſome time maſter of the free-ſchool at Abergavenny, in Monmouthſhire. From this place he removed to London, and obtained the vicarage of St. Stephen's, Coleman-ſtreet, and became lecturer of St. Olaves, Southwark, in 1683. In 1691 he took his degree of doctor of divinity, and was inſtalled prebendary of Weſtminſter in 1696. Soon after this, an infirmity which he had experienced in his eyes, from his youth, deprived him totally of his ſight. He died in 1715, at the age of ſixty-ſeven, and was buried in Weſtminſter Abbey. He was highly valued by his contemporaries for his piety and learning; and his writings have tranſmitted his name with honour to poſterity. Of theſe the moſt important is his "Inquiry after Happineſs," in two volumes, 8vo., which has gone through many editions. It is remarkable that it was compoſed by the author, after he had loſt his ſight, and was rendered incapable of public ſervices. His other works are "Practical Chriſtianity," and "The Morality of the Goſpel;" "A Guide to Heaven;" "Five Volumes of Sermons," and ſome ſmaller pieces. He tranſlated into the Latin language "The whole Duty of Man," which was printed in 1680. Biog. Brit.

Lucas, *St.*, in *Geography*, a town of Mexico, in the province of Guatimala; 12 miles E. of Guatimala.—Alſo, a ſmall iſland near the coaſt of Mexico, in Salinas bay. N. lat. 10° 15'. W. long. 85° 22'.

LUCAU, or Lucca, in *Geography*, a town of Saxony, in the principality of Altenburg; 8 miles N.N.W. of Altenburg. N. lat. 51° 6'. E. long. 12° 18.—Alſo, a town of the duchy of Carinthia, near the Geil; 32 miles E. of Brixen.

LUCAYA Islands. See Bahama.

LUCAYO, one of the Bahama iſlands; 20 miles long, and five broad. N. lat. 27° 25°. W. long. 78°.

LUCAYONEQUE, one of the Bahama iſlands; 75 miles long, and five or ſix broad, but of an irregular form. N. lat. 27°. W. long 77° 30'.

LUCCA, a ſmall republic of Italy, on the coaſt of the Tuſcan ſea, in N. lat. 43° 50'. It is bounded N. by the late duchy of Modena; on the S.W. by the Mediterranean; and every where elſe by Etruria. It is computed to be upwards of 35 miles in length, and from 15 to 20 in breadth, and to contain 288 ſquare miles, and within its extent one city, 150 villages, and 120,000 inhabitants, of whom, it is ſaid, that from 20,000 to 30,000 are able, on occaſion, to bear arms. The Luccaneſe are the moſt induſtrious people of Italy, and no ſpot of ground is left uncultivated; the hills being covered with vines, olives, cheſnut, and mulberry trees, while the meadows near the coaſt nouriſh numerous cattle; but the country does not produce corn ſufficient for the conſumption of its inhabitants. Oil and ſilk are the chief exports of Lucca, and their motto is Libertas, a goddeſs, rarely found more amiable than here. Lucca was anciently a Roman colony; when the Lombards overran Italy, it became tributary to them; afterwards it was annexed to the dominion of the Franks, and from them the emperors of Germany claimed its ſovereignty. In the reign of Charles IV. it became an independent ſtate, and has, during three centuries, maintained its liberty, under the protection of ſome foreign power. In the recent revolutions of Italy, this ſtate adopted a conſtitution ſimilar to the French; and it is now a principality, with the addition of Maſſa Carrara, and Garfagnana.

Lucca, the capital of the fore-mentioned principality, and the reſidence of the government, is delightfully ſituated in a plain, terminated by eminences, and diverſified with villages, ſeats, ſummer-houſes, vineyards, meadows, and cornfields. This city is regularly fortified with eleven baſtions; its circuit is about a league; it is well-built, and the ſtreets, though irregular, are broad and well paved. Situated near the river Serchio, 12 miles N.E. of Piſa, it contains a ſtate-palace, within which is a large arſenal, a Gothic cathedral, with a richly furniſhed chapel, 25 churches, 40 convents, and about 40,000 inhabitants; among whom are many artiſts and manufacturers, eſpecially in ſilk and gold, and ſilver ſtuffs. The biſhop holds immediately of the pope, and is entitled to the pallium, or crucifix, as an archbiſhop. In the cathedral is a volo ſanto, or wooden crucifix, to which a peculiar veneration is paid. In the year 1799, the French entered this city, and impoſed upon it a contribution of 2,000,000 livres. They ſeem to have taken it under their protection, and to allow it its freedom. N. lat. 43° 54'. E. long. 10° 34'.

Lucca, a river of Aſia, which riſes in Perſia, and runs into the Indus, about 18 miles above the conflux with the Chunaub.

LUCCHESI, Andrea, in *Biography*, a native of Venice, and maeſtro di cappella, in 1772, to the elector of Cologne. A pleaſing compoſer, whoſe motets were frequently ſung by Manſoli, and other great ſingers in the churches of Italy, and whoſe ſymphonies were much eſteemed, even in Germany, where they have been brought to the greateſt perfection. In 1767, he compoſed a cantata for a grand feſtival given to the duke of Wirtemburg at Venice.

LUCCI, in *Geography*, a town of Naples, in Calabria Citra; 3 miles S. of Biſignano.

LUCCOS, a river of Morocco, anciently called *Lixos*, which runs into the Atlantic at Laracha.

LUCE, St., a cluſter of ſmall iſlands in the Indian ſea, near the eaſt coaſt of Madagaſcar. S. lat. 24° 30'. E. long. 47° 40'.

Luce, *Eau de.* See Eau *de Luce.*

LUCEA, in *Geography*, a bay or harbour, on the N. ſide of the iſland of Jamaica, into which run two rivers, called Eaſt and Weſt Lucea; 14 miles W. of Montego bay. N. lat 18° 28'. W. long. 78° 9'.

LUCENA, a town of Spain, in the province of Cordova, in which are ten convents; 29 miles S.S.E. of Cordova. N. lat. 37° 32'. W. long. 4° 29'.—Alſo, a town of Spain, in Valencia; 18 miles N.E. of Segorbe.

LUCENAY l'Eveque, a town of France, in the department of the Saône and Loire, and chief place of a canton, in the diſtrict of Autun; 7 miles N. of Autun. The place contains 804, and the canton 9168 inhabitants, on a territory of 250 kiliometres, in 12 communes. N. lat. 47° 5'. E. long. 4° 20'.

LUCERA, an ancient, inconſiderable, manufacturing town of Naples, capital of the province of Capitanata, and ſee of a biſhop, ſuffragan of Benevento; containing four churches and nine monaſteries, and pleaſantly ſituated on an eminence in a plain, near the middle of the province, about 75 miles N.E. of Naples. The juriſdiction of the province is held here, and the manufacture is cloth. N. lat. 41° 28'. E. long. 15° 16'.—Alſo, a town of Naples, in Calabria Citra; 7 miles S. of Coſenza.

LUCERIUS, in *Mythology*, a name given to Jupiter, as *Luceria* was given to Juno, as the deities which gave light to the world.

LUCERN, in *Geography*, a canton of Switzerland, bounded on the W. and N. by Bern, on the E. by Zurich and Schweitz, on the S. by Underwalden and Bern, lying in N. lat. 47° 10'; being from 30 to 50 miles from N. to S., and from 25 to 30 in breadth, and containing 100,000 inhabitants, who are chiefly employed in agriculture. The ſouthern parts of this canton are chiefly mountainous, and furniſh for exportation cattle, hides, cheeſe, and butter. The northern diſtrict is fruitful in corn, which, being more than ſufficient for the conſumption of the canton, allows of a conſtant exportation from the weekly market held in the town, to which the inhabitants of the ſmall canton reſort for the purchaſe of that and of other neceſſaries. This commerce, together with the paſſage of the merchandize for Italy, is the chief ſupport of the town, and might be much improved and augmented, conſidering its advantageous ſituation; for the Reuſs iſſues from the lake, paſſes through the town, and, having joined the Aar, falls into the Rhine.

Lucern, originally ſubject to the houſe of Auſtria, was expoſed to the inroads of Uri, Schweitz, and Underwalden, when theſe cantons had ſeized their independence. Her commerce to Italy was interrupted; her fairs unfrequented; and her citizens compelled to be continually under arms, in order to protect their territory from inceſſant depredations. Under theſe circumſtances, the Auſtrians loading the citizens with exorbitant taxes, Lucern made her peace with the confederate cantons; and, expelling the Auſtrian party, entered into a perpetual alliance with Uri, Schweitz, and Underwalden, and became a member of the Helvetic union. The acceſſion of Lucern gave additional credit and power to the confederacy, and enabled it to reſiſt all the efforts of a great and implacable enemy. In 1386, Leopold, duke of Auſtria, invaded the canton with a numerous army; when the combined troops gained a bloody victory at Sempach, in which Leopold loſt his life.

The government of Lucern was entirely ariſtocratical, or rather oligarchical. The ſovereign power reſided in the council of 100, compriſing the ſenate, or little council. The great council was the nominal ſovereign; but the whole power actually reſided in the ſenate, conſiſting of 36 members, who were formed into two diviſions, exerciſing the office by rotation. The adminiſtration of the current affairs, the care of the police, the management of the finances, and the whole executive power, reſided in the ſenate, which ſat conſtantly; whereas the ſovereign council was aſſembled only upon important occaſions. The ſenate had cognizance of criminal cauſes; but in caſe of capital condemnation the ſovereign council was convoked, in order to pronounce the ſentence. In civil cauſes, an appeal lay from the ſenate to the ſovereign council, which, in reality, was a matter of mere form, as it was an appeal from the ſenators in one court, to the ſame ſenators in another. The influence of the ſenate over the ſovereign council was abſolute; for they conſtituted above a third of that body, choſe their own members, conferred the principal charges of government, and nominated to the eccleſiaſtical benefices, which are conſiderable; nearly two-thirds of the revenue of the canton belonging to the clergy. From a view of this conſtitution, it appears, that when the ſpirit of the conſtitution is oligarchical, all laws enacted for the purpoſe of counteracting the power of the nobles are mere cyphers. However, in ſome inſtances, the authority of the nobles is controuled; for, in declaring war and peace, forming new alliances, or impoſing taxes, the citizens were to be aſſembled, and to give their conſent. Lucern, being the firſt in rank and power among the Catholic cantons, was the reſidence of the pope's nuncio, and all affairs relating to religion were diſcuſſed in the annual diet, which aſſembled in the town, and which was compoſed of the deputies of thoſe cantons.

Lucern, though an oligarchical ſtate, manifeſted, at the time of the French revolution, an averſion from all innovation. The people appeared to be ſatisfied with their government, and reſiſted all attempts to effect a change. During the progreſs of the revolution, Lucern acted with great ſpirit, and was inclined to join in defence of her own independence, as well as in ſupport of the Helvetic union. Even after the ſurrender of Bern and the deſertion of Zurich, a numerous body of peaſants demanded the re-eſtabliſhment of the ancient government, and joined the troops of the ſmall cantons to reſiſt the entrance of the French; and the whole canton did not acquieſce without much oppoſition and bloodſhed. At length a corps of French, after a ſhort inveſtment, entered the town of Lucern, and reduced the people to unconditional ſubmiſſion. Soon after this event, Lucern became the ſeat of the new Helvetic government. According to the conſtitution of the 29th of May, 1801, Lucern was one of the 17 departments, or cantons, into which Switzerland was divided: it retained its former extent and deputed five repreſentatives to the diet. Near the town of Lucern is mount "Pilate," formerly called Mons *Pileatus*, from the Latin word *pilea*, becauſe its top is generally covered with a cloud or cap. This word has been corrupted into "Pilatus," whence ſome have ridiculouſly contended that Pontius Pilate, after having condemned our Saviour to death, was ſeized with remorſe, made an excurſion into Switzerland, and drowned himſelf in a lake at the top of the mountain. At the elevation of 5000 feet, and in the moſt perpendicular part of this mountain, near the paſture of Brunlen, is obſerved, in the middle of a cavern hollowed in a black rock, a coloſſal ſtatue, which appears to be of white ſtone. It is the figure of a man in drapery, leaning one elbow on a pedeſtal, with one leg croſſed over the other, and ſo regularly formed, that it can ſcarcely be a luſus naturæ. This ſtatue is called "Dominic" by the peaſants, who frequently accoſt it from the only place in which it can be ſeen, and when their voices are re-echoed from the cavern, they ſay, in the ſimplicity of their hearts, "Dominic has anſwered us." It is difficult to imagine by whom, or in what manner, this ſtatue could be placed in a ſituation which has hitherto proved inacceſſible to all who have endeavoured to approach it. This is, perhaps, one of the higheſt mountains in Switzerland, if eſtimated from its baſe, and not from the level of the ſea; its elevation above the lake being more than 6000 feet. Soon after the French took poſſeſſion of Lucern, general Brune erected, with great ſolemnity, the ſtandard of liberty on the top of mount Pilate; thus, as Coxe ſays, conferring on the Swiſs the ſhadow, while he deprived them of the ſubſtance of freedom. Coxe's Switzerland, vol. i.

LUCERN, the capital of the above-deſcribed canton, a ſmall, tolerably built, walled, trading town, containing about 3300 inhabitants, and agreeably ſituated on a plain almoſt environed by hills, at the efflux of the Reuſs from the lake of Lucern, and at the N.W. extremity of the lake; 30 miles S.W. of Zurich, and 40 E. of Bern. The cathedral and Jeſuits' church are the only public buildings worthy of notice; but they are overloaded with rich ornaments, and diſgraced by bad paintings. In the cathedral is an organ of fine tone, and extraordinary ſize; the centre pipe is 40 feet long, near three in diameter, and weighs 1100 pounds. The bridges which ſkirt the town, round the edge of the lake, are the faſhionable walks of the place, and remarkable for their length; being covered at the top, and open at the ſides, they afford a conſtant view of the delightful and romantic country; they are decorated with coarſe paintings, repreſenting the hiſtories of the Old Teſtament, the battles of the Swiſs, and the dance of Death. In the Waſſerthurm tower, the treaſure of the republic is depoſited. The arſenal is well furniſhed with arms. This place is a thoroughfare from Italy by mount St. Gothard; but it has no manufactures of conſequence, and little commerce. Of late the principles of toleration have been better underſtood and more widely diffuſed than they were formerly, and a literary ſociety has been eſtabliſhed for the promotion of polite learning. The lake is bounded towards the town of Lucern by cultivated hills ſloping gradually to the water, contraſted on the oppoſite ſide by an enormous maſs of barren and craggy rocks. N. lat. 46° 56′. E. long. 8° 6′. See the preceding article.

Lucern, *Lake of*, called the Waldſtætter ſee, or lake of the four cantons, conſiſts of ſeveral branches and gulfs, diſtinguiſhed by particular names, and affording variety of fine ſcenery. See Lake.

Lucern, in *Botany*. See Medicago.

Lucern, in *Agriculture*, a plant of the artificial graſs kind, chiefly cultivated as a green food for cattle, and which affords a larger produce than moſt other ſorts in proportion to the extent of land. It is known among botaniſts by the name of *medicago ſativa*, and is the *alſaſa* of the Spaniards, and the *grand treſle* of the French. It has a perennial root, and an annual ſtalk, which riſes full three feet high in good land, and is furniſhed at each point with trifoliate leaves, the lobes of which are ſpear-ſhaped, about an inch and a half long, and half an inch broad, ſawed towards the ſtalks. The flowers grow in ſpikes, which are from two to near three inches in length, ſtanding upon naked footſtalks two inches long, riſing from the wings of the ſtalks: they are of the pea-bloom, or butterfly kind, of a fine purple colour, and are ſucceeded by compreſſed moon-ſhaped pods, which contain ſeveral kidney-ſhaped ſeeds. It flowers in June, and its ſeed ripens in September.

There are ſeveral varieties of lucern, as thoſe with violet-coloured flowers, with yellow flowers, with yellow and violet flowers mixed, and with variegated flowers: but the editor of Mr. Miller's Dictionary obſerves, that they are only variations of the ſame plant, ariſing accidentally from the ſeed. However, neither the yellow nor the variegated flowered lucern is ever ſo ſtrong as that with purple flowers; and cannot of courſe be ſo profitable to the cultivator.

It may be remarked, that Columella eſteemed this plant as the choiceſt of all fodder, becauſe it laſted many years, and bore being cut down four, five, or ſix times a year. In his opinion it enriched the land on which it grew, fattened the cattle fed with it, and was often a remedy for ſick cattle. About three-quarters of an acre of it is, it is ſuppoſed, abundantly ſufficient to feed three horſes during the whole year. But though it was ſo much eſteemed by the ancients, and has been long cultivated to advantage in France and Switzerland, it has yet found no great reception in this country, though it will ſucceed here as well as in either of the above countries, being extremely hardy, and capable of reſiſting the cold of our climate.

In the Synopſis of Huſbandry, it is noticed, that it is not till within theſe thirty years that this graſs has been much in repute with the farmer, though it was known in England long before that time: but the cultivation of it was chiefly confined to gentlemen who raiſed it on their own demeſnes; for the huſbandmen, being well convinced of the extraordinary care required to prepare the land for the growth of it, were deterred from embarking in a buſineſs which ſeemed to be attended with much expence, and contented themſelves with raiſing green fodder from their tares and clover, leaving the cultivation of this uſeful graſs to their landlords, who could better ſpare the money for that purpoſe. But now that its virtues are better known, and the method of raiſing it more perfectly underſtood, there are few farmers, who do not chooſe to ſow ſome acres of it, to ſupply their horſes with a wholeſome and laſting feed throughout the ſummer. The ſeed is of a paler caſt than that of clover, and rather larger in ſize. It is annually provided from Holland by the ſeedſmen, and ſold at different prices, from one to two ſhillings or more *per* pound, according to circumſtances.

Soil.—In reſpect to the ſoils that are moſt ſuitable to the culture of this plant, they are all thoſe of the more deep, rich, and dry kinds, as thoſe of the ſound, mellow, loamy, and ſandy deſcriptions; but on ſuch as are retentive of moiſture, it ſhould not be attempted, as the roots of the plants are liable to be greatly injured, if not wholly deſtroyed, by the ſtagnation of water about them. Weeping gravelly lands, and all ſuch as are not well drained, are of courſe improper for this ſort of culture. Mr. Young ſuggeſts, that "the ſoils that ſuit lucern, are all thoſe that are at once dry and rich. If they poſſeſs theſe two criteria, there is no fear but they will produce large crops of lucern. A friable deep ſandy loam or chalk, or white dry marly bottom, is excellent for it. Deep putrid ſands, warp on a dry baſis, good ſandy loam on chalk, dry marle or gravel, all do well: and, in a word, all ſoils that are good enough for wheat, and dry enough for turnips to be fed on the land, do well for lucern. If deficient in fertility, they may be made up by manuring, but he never yet met with any land too rich for it."

Preparation.—The author of the Syſtem of Agriculture remarks, that "in the preparation of the land, the ſoil ſhould be always brought into as fine a condition of mould as poſſible. This may be effected by repeated ploughing and harrowing, and the previous growth of ſuch ſorts of crops of the green kind as have a tendency to clean and render the land more fine and mellow." In this intention Mr. Young adviſes the taking of two crops of turnips, carrots, or cabbages, either in ſucceſſion, or alternating with each other, the turnips in the heavier loams being eaten off upon the land in the ſecond autumn before it is ploughed up. In either of theſe caſes, from the hoeing and conſtant culture which is neceſſary while the crops are upon the land, it will be left in a ſuitable ſtate of cleanneſs and friability. "Others recommend fallowing as a better practice, the root weeds of every kind being carefully picked out in the different ploughings and harrowings. From the great length of time the ground muſt remain unemployed in this mode of preparation, it is probably only capable of being practiſed with advantage where the lands are heavy and very full of weeds." But whatever mode is employed, the land muſt be rendered perfectly clean before this ſort of crop is ventured upon it.

And it is requiſite, that before the ſeed is put in, the mould ſhould be rendered perfectly fine by ploughing it over as frequently as may be neceſſary, and breaking it well down by occaſional harrowing. It will ſeldom be neceſſary to make uſe of manure; but where the land is found to ſtand in need of it, the application is beſt made with the firſt of the green crops. The object to be conſtantly kept in view in this buſineſs, is chiefly that of rendering the land perfectly clean from weeds, and at the ſame time highly mellow and friable.

Nature and Quantity of Seed.—As ſeedſmen are apt to keep their ſeeds from year to year, it may be neceſſary to appriſe the farmer, that that which is perfectly freſh, is the moſt proper for being ſown, as moſt ſmall ſeeds vegetate in the moſt perfect manner when new.

And with reſpect to the quantity of ſeed, Dr. Dickſon has ſtated that the proportion that is neceſſary, is variable according to the nature of the land, and the manner in which the crop is cultivated. In the broad-caſt method, from eighteen to twenty pounds may be proper, while in that of the drill, it will be conſiderably leſs, according to the diſtances at which the operation is performed. In two feet equidiſtant rows, the uſual allowance is about ſix pounds; in thoſe of eighteen inches about eight pounds; in thoſe of twelve inches, ten or twelve pounds; and in nine-inch rows, ſixteen or eighteen pounds may be neceſſary, though Mr. Young only recommends from twelve to fifteen pounds for the acre.

Time and Manner of Sowing.—In his ſyſtem of agriculture, the ſame writer ſtates, that “the moſt proper ſeaſon for putting this ſort of crop into the ground, is as early as can be done in the ſpring months, as in this way the plants may be fully eſtabliſhed before the ſeaſon becomes too hot. The latter end of March, for the more ſouthern diſtricts, may be the moſt proper period; and the beginning of the following month for thoſe of the north. When ſown late there is more danger of the plants being deſtroyed by the fly, as has been obſerved by Mr. Tull. If the plants be intended to be tranſplanted out in the garden method, it will alſo be the beſt practice to ſow the ſeed bed as early in the ſpring as the froſts will admit, in order that the plants may be ſtrong, and fit to ſet out about the beginning of Auguſt.”

In regard to the mode of ſowing or putting in the crop, this writer alſo ſuggeſts, that “it ſhould vary with the circumſtances of the ſoil, and the mode of after-management that can be adopted with the moſt convenience. Where much attention cannot be beſtowed on the buſineſs of hoeing and keeping the crop clean, the beſt method is that of ſowing the land broad-caſt; though in this method the crop may not laſt ſo long in the ground. But in caſes where the crops are capable of being kept in a ſufficiently clean condition by repeated hoe-culture, the drill may be more adviſable, particularly in narrow diſtances. The practice of tranſplanting can, perhaps, only be done in particular caſes, on ſmall pieces of deep land that are in great heart, and require the plants in conſequence to ſtand thin and regular upon the ground, as in theſe modes they become large and of vigorous growth. In ſoils that are inclined to moiſture at ſome depth below the ſurface, it may be a uſeful method of keeping the roots of the plants from being injured by their penetrating too deeply, as is more the caſe when the plants riſe from ſeed. The ſeed may be ſown either alone or with grain crops, in the ſame manner as clover; each method has its advocates, and it is probable that they may be uſeful under different circumſtances, as in the deeper and more fertile ſorts of land the firſt may be the moſt beneficial method, and in thoſe of the lighter and leſs deep kinds the latter; as in the deep ſorts of land there may be leſs loſs of time in procuring the green produce for horſes or other ſorts of ſtock, as well as a greater certainty of the crop ſucceeding. But in the lighter and more porous ſoils, by being ſown with corn, the plants may be better protected in their early growth, as well by the ſhade as the moiſture that will, in that way, be preſerved. Some indeed ſpeak of its ſuperior utility on the ground of long experience, in its being better preſerved from the fly. Wherever this mode is made uſe of, the grain ſhould, however, be ſown thinner than is uſually the caſe, in proportion as the ſoils are more rich. Oats are preferable to barley for the purpoſe, as being leſs liable to lodge, eſpecially when ſown thin. From five or ſix pecks to three buſhels, ſown as evenly as poſſible, may be the beſt proportions, the ſmaller quantity being neceſſary on the richeſt ſoils.” Mr. Young remarks, that “the greateſt ſucceſs by far that has been known is by the broad-caſt method, which is nearly univerſal among the beſt lucern farmers, even among men who admire and practiſe the drill huſbandry in many other articles. But as they moſtly (not all) depend on ſevere harrowing for keeping their crops clean, which is a troubleſome and expenſive operation, he ſtill ventures to recommend drilling, but very different drilling from that which has been almoſt univerſally practiſed, *viz.* at diſtances of eighteen inches or two feet. Objections to theſe wide intervals are numerous. If kept clean hoed, the lucern licks up ſo much dirt, being beaten to the earth by rain, &c. that it is unwholeſome, and the plants ſpread ſo into theſe ſpaces that it muſt be reaped, which is a great and uſeleſs expence. For theſe reaſons, as well as for ſuperiority of crop, he recommends drilling at nine inches, which, in point of produce, mowing, and freedom from dirt, is the ſame as broad-caſt; and another advantage is, that it admits a ſcarifying once a year, which is much more powerful and effective than any harrowing. Theſe facts are ſufficient to weigh ſo much with any reaſonable man, as to induce him to adopt this mode of drilling, as nearer to broad-caſt by far than it is to drills at eighteen or twenty-four inches, which open to a quite different ſyſtem, and a ſet of very different evils. Nine-inch rows might *practically*, but not literally, be conſidered as broad-caſt, but with the power of ſcarifying.” And in regard to “the material point, of with or without corn, two conſiderations preſent themſelves. One is, the extreme liability of lucern to be eaten by the fly, which does great miſchief to many crops, when very young, and againſt which the growing corn is ſome protection. The value of the barley or oats is another object, and not to be forgotten. It is alſo gained in the firſt year's growth of the lucern, which is very poorly productive, even if no corn be ſown, ſo that he muſt own himſelf clearly an advocate for drilling it among corn, either between the rows of nine-inch barley, or acroſs drilled barley at a foot; perhaps the latter is the beſt method, as there is leſs probability of the crop being laid, to damage the lucern. The quantity of ſeed-corn ſhould alſo be ſmall, proportioned to the richneſs of the land; from one buſhel to a buſhel and a half, according to the fertility of the ſoil; another ſecurity againſt the miſchief of *lodging*. If theſe precautions are taken, it would be preſumptuous to ſay that ſucceſs muſt follow, *that* being always, and in all things, in other hands than our's; ſeed may prove bad, the fly may eat, and drought prevent vegetation, but, barring ſuch circumſtances, the farmer may reſt ſatisfied that he has done what can be done; and if he does ſucceed, the advantage will be unqueſtionable.”

In the broad-caſt mode, in every caſe, as ſoon as poſſible after the grain has been ſown and harrowed properly in, the lucern ſeed ſhould be immediately put in in that mode, by a regular even caſt over the fine ſurface, covering it with a light ſeed-harrow, but it ſhould not be too deeply covered in, two inches being fully ſufficient. In the drill method, the ſame ſyſtem ſhould be followed, the lucern ſeed being drilled in immediately after the corn has been put into the ſoil.

It need hardly be noticed that the plats of ground ſown for the purpoſe of raiſing plants, to be ſet out in the garden method of culture, ſhould always be without grain, or other ſorts of crops, in order that they may admit of having the plants properly thinned out and kept clean, and in a vigorous ſtate of growth, for being ſet out with the moſt advantage and ſucceſs poſſible.

With regard to the proper diſtance of the rows, it may in addition be obſerved, where the drill mode of culture is practiſed, it ſhould probably depend upon the ſtate and circumſtances of the ſoils. Mr. Kent adviſes two feet as the beſt diſtance in all caſes; while others think equal diſtances of a foot in rich ſoils, ſuch as are worth from thirty to forty ſhillings the acre, and nine inches in thoſe that are of inferior fertility, as from fifteen to twenty ſhillings the acre, the beſt general diſtances. On ſoils of leſs value it is probable that this culture can ſeldom be had recourſe to with much benefit to the farmer. The laſt diſtance approaches much to the broad-caſt method, which is contended by ſome as the moſt appropriate in almoſt all caſes, and of courſe it may be preferable, as it admits of being plowed between by a ſuitable plough, in the room of the harrowed method, and the obſervations made above are decidedly in favour of the method.

In whatever method this ſort of ſeed may have been ſown, it is, when good, quick in its vegetation, beginning to ſprout in the courſe of a week, and ſoon ſpreading the plants over the ſurface of the land. And the ſooner it obtains its rough leaf the better, as it is then like turnip-plants, out of danger of being deſtroyed by the fly. But before theſe plants arrive at this ſtate of growth, they are liable, eſpecially in dry ſeaſons, to be much injured, if not wholly conſumed, by the ravages of the ſame ſort of inſect as that which is ſo detrimental to the turnip crops. "Where the greateſt part of the plants are injured in this way, the author of "Practical Agriculture" thinks it is probably the beſt method, when the crop has been put in alone, to plow up the land, and ſow it down again with freſh ſeed, as ſoon as poſſible." And this he ſuppoſes "is an advantage which the ſowing the crop alone has over that of putting it in with thoſe of other kinds."

After Culture.—It may be ſtated in regard to the after-management of this graſs, that, as the economy of the plant is ſuch as to render it incapable of being grown with much advantage, where other ſorts of plants, whether of the graſs or weed kind, are apt to annoy it; much care and attention ſhould of courſe be employed in keeping it clean and free from the intruſion of all ſuch vegetable productions. This, the ſame author thinks, "may be effected in different ways, according to the methods in which the crop has been raiſed. Where the broad-caſt plan has been purſued, little is neceſſary, where the land has been properly prepared after the grain crop has been removed, except keeping all ſorts of heavy ſtock from coming upon it. In a dry ſeaſon, if there be occaſion, the field may however be fed a little by calves, and other very light ſtock, but they ſhould never be kept long upon the plants at one time. When the ſecond cutting has been made in the following year, if any graſs ſhows itſelf the land ſhould be harrowed over in a moderate manner, by a harrow which is not too heavy nor too long in the tines, two or more times, as may be neceſſary in different directions, the graſſy matter being collected by a ſmall light implement of the ſame kind, and removed from the land. This buſineſs ſhould be executed as ſoon in the early part of the ſpring as the nature and ſtate of the ground will admit, as dry a period as poſſible being taken for performing the work. In the ſucceeding years two ſuch harrowings may be frequently required, one in the early part of the ſpring ſeaſon, and the other in the cloſe of ſummer. But in theſe caſes, eſpecially where there is much graſs appearing, a much heavier ſort of harrow ſhould be made uſe of." In the 25th vol. of the Annals of Agriculture, one is adviſed of ſuch a weight, as is ſufficient for four horſes, and which does not ſpread more than four or five feet; but in moſt caſes, eſpecially where the work is ſo frequently performed, one that requires leſs draught may be adequate to the purpoſe, as where ſuch large heavy harrows are employed, there is much danger in injuring the crowns of the plants, and thereby cauſing their deſtruction; whereas by the uſe of the lighter ones, they are moſtly much benefited from the mould being ſtirred about their roots. After theſe operations, as in the above caſe, the weeds ſhould be brought together, and removed from the ground. When the crops are thin and patchy, ſeed in proportion to the deficiencies ſhould be ſown over ſuch places before the harrowings commence each time. In every caſe the roller ſhould be applied immediately after the operation has been performed, not only for the purpoſe of compreſſing the mould about the roots of the plants, but to render the ſurface perfectly level and fit for the ſcythe. In this method of culture, "where the produce is not to ſome extent, it is probably better to feed the crop by light cattle-ſtock in the autumn than mow it."

In reſpect to the drill-ſown lucern, it is recommended, "where the rows are ſufficiently evident, in the autumn ſeaſon, after the grain has been ſecured, that a ſmall ſhim ſhould be paſſed between them, in order to extirpate all the weeds and graſſy materials, as well as to looſen the mould about the roots of the plants, and that they may be rendered more perfectly clean, the hand-hoeing of the plants in the rows: and that, in the ſucceeding year, ſtill more particular attention to the uſe of the ſhim and hoe will be requiſite. The buſineſs ſhould be begun as early as the ſtate of the ſoils will ſafely admit of its being executed: being continued occaſionally in ſuch a manner, as to induce the cultivator to leave it again for the production of this graſs. In ſituations where ſuch grounds could be conveniently flooded or covered with water occaſionally, they might therefore be very advantageouſly converted into good meadow or graſs-lands; a ſort of application that has long ſince been recommended by De Serres, a French writer of great reſpectability: when ſuch lands are perfectly broken up, they afford, in moſt caſes, admirable crops of the grain kind: oats, as being leaſt injured by a luxuriant growth, may, in general, be the moſt adviſable as the firſt crop."

It has been adviſed, "as a good rule in theſe caſes, to give good hoeings, either of the horſe or hand kinds, as ſoon as weeds appear every time after the crops are taken off. If the plants are perfectly ſtraight in the rows, which ſhould always be the caſe, a ſhim may be had recourſe to with the greateſt benefit, as it may be drawn ſo cloſely to the plants, as in a great meaſure to ſave the expence of hand-hoeing, as, in ſuch caſes, it will be only neceſſary to extirpate the weeds or natural graſs plants that may have eſtabliſhed themſelves among the lucern plants in the rows, which is capable of being effected in a very complete manner by the uſe of a pronged hand-hoe. And it is further recommended never, by any means, to ſuffer fields of this ſort to become weedy, under the ſuppoſition, that the produce may not cut well, or be free from duſt; as where it is of ſufficiently vigorous growth, and of a ſuitable diſtance in the rows, according to the nature of the land, there can be no reaſon for ſuch an injurious practice, as it is only where the planting is executed at larger diſtances than the condition of the ſoil will permit, that any inconvenience can be experienced in this way."

It may be ſtated, that "where hand-hoeing is the method chiefly depended on for keeping crops of lucern in a proper ſtate of culture, much of the buſineſs may be performed by women, or even children, and the expence be thus conſiderably leſſened."

Application of Manure.—In caſes where the ſoils on which this plant is grown are not of conſiderable fertility, the occaſional application of manure may be of great advantage, in thickening and increaſing the quantity of crop; for this uſe clean well rotted dung is probably by much the beſt manure, as where earthy compoſts, aſhes, or ſoot are employed, they are apt to promote the growth of, or bring up graſſes too much; the latter are, however, ſometimes ſown over the crop in the winter ſeaſon. The dung is adviſed, in the 25th vol. of the Annals of Agriculture, to be applied in the quantity of about twenty tons to the acre, every five or ſix years. Mr. Kent, however, thinks it a better practice to put a ſlight coat on annually in the ſpring ſeaſon. As much expence might be incurred in the culture, eſtabliſhment, and after management of this ſort of crop, in order to inſure a favourable produce, the farmer ſhould not too haſtily attempt it, till he has found how far it will ſuit his convenience and other circumſtances.

Expences of Cultivation.—The various expences attending it, as ſtated by different writers before the late riſe in the price of labour, are thus given, as well as the profit in ſoiling horſes. At preſent, however, a third more may be added, and, in ſome caſes, much more.

Expences.

	£.	s.	d.
Two ſpring ploughings extra	0	18	0
Harrowings	0	2	6
Eight pounds of ſeed	0	8	0
Driling	0	2	6
Horſe-hoeing in autumn	0	2	6
Hand-hoeing ditto	0	5	0
Firſt year	1	18	6

Annual Expences afterwards.

	£.	s.	d.
To rent, tithe, and rates	1	10	0
Four horſe-hoeings	0	10	0
Three hand-hoeings	0	12	0
Five mowings	0	12	6
Raking together	0	5	0

Profit in the Practice of Soiling Horſes.

	£.	s.	d.
By keeping five horſes, from beginning of May to middle of October, at 2*s.* 6*d.* *per* horſe, *per* week	14	7	6
	14	7	6

Nearly double this is ſometimes made by ſoiling clover.

Number of Cuttings and Manner of Cutting.—In a late practical work, it is ſtated that, "as this is one of the moſt forward of the artificial graſſes, it frequently attains a ſufficient growth for the ſcythe towards the end of April, or beginning of the following month; and in ſoils that are favourable for its culture, will be in a ſtate of readineſs for a ſecond cutting in the courſe of a month or ſix weeks longer, being capable of undergoing the ſame operation, at nearly ſimilar diſtances of time, during the whole of the ſummer ſeaſon. In this laſt ſort of ſoil, with proper management, in the drill method, it has been found to riſe to the height of a foot and a half in about thirty or forty days, affording five full cuttings in the ſummer. But in the broad-caſt crops, in the opinion of ſome, there are ſeldom ſo many cuttings afforded in the ſeaſon, three or four being more common, as the growth is ſuppoſed to be leſs rapid, than by either of the other modes:" this is, however, contradicted by other cultivators, who have beſtowed much care on the ſubject, as will be evident hereafter. And it is ſtated, that "in order to have new ſucceſſions of this graſs conſtantly becoming ready to be cut, it has been recommended, for the purpoſe of ſoiling, to have the broad-caſt plantations formed into ſo many diviſions, as that one of them may be cut daily, as about ſixty; and thoſe of the drilled, and tranſplanted kinds, into from thirty to forty, according to the nature of the land, conſuming them in the ſame manner. Theſe cuttings muſt, however, be varied in proportion to the differences in the growth of the crops, and the conſumption. The moſt economical mode of cutting the produce is, without doubt, by means of the ſcythe, though the reaping-hook has been made uſe of by ſome; after being cut, the food ſhould be conveyed, as ſoon as poſſible, to the animals: this may be done by a light cart, or large barrow, made for the purpoſe, according to the ſcale on which the buſineſs is conducted. One cutting in the day is only adviſed by ſome, but as there is a loſs as well as injury done to all ſorts of green-cut food by keeping, even for a few hours in hot ſeaſons, it may be a better practice to have two cuttings in the day, eſpecially when the weather is warm, and the lucern at no great diſtance; beſides, the food is eaten better when quite freſh."

Value and Application of.—It is ſtated, that "the produce of this ſort of crop, in converting it to the purpoſes of ſoiling cattle, will neceſſarily be different under different circumſtances, but an acre can ſeldom, when under proper culture and management, ſupport leſs than from three to five or ſix horſes, or other cattle, during the ſix ſummer months, the profit of which cannot be leſs than from ſeven to ten or twelve pounds." "And in letting it remain for hay, which is leſs advantageous, in three mowings, an acre, where the crop is good, will ſeldom afford leſs than from three to five tons of dry hay. In Mr. Arbuthnot's trials, as ſtated in Mr. Young's Tour, the produce was four loads, but in thoſe of others, on rich grounds, it was five. It is likewiſe remarked, that "in making this ſort of plant into hay, the ſame directions ſhould be attended to as for clover; the leſs the produce is ſhaken about the better, provided it be ſufficiently quickly dried, as the leaves will be more fully preſerved in the ſtems, and the hay, of courſe, more valuable. From its greater ſucculence, it will, in common, require rather more time than clover, or ſaintfoin, in making into hay. As this ſort of hay is held in leſs eſtimation than that of either of the above graſſes, it ſhould always be conſumed at home by the farm horſes, or other ſtock; and that of the other ſorts ſent for ſale."

But the principal and moſt advantageous practice, in the application of lucern, is that of ſoiling horſes, neat cattle, and hogs; yet as a dry fodder, it may alſo be capable of affording much aſſiſtance in many caſes; and as an early food for ewes and lambs, be of great value in particular caſes. "As this plant bears repeated cutting, better than moſt of thoſe of the artificial graſs kind, ſprings in a more quick and expeditious manner, and affords a healthy nutritious food, it muſt be of vaſt utility to the farmer, where horſes and cattle form a large part of his ſtock; with horſes in this way, it has been found by ſome, as ſtated in the fourth volume of Mr. Young's Eaſtern Tour, 'to anſwer better than any other ſort of green food that has been tried. The number of cuttings that it admits of, being on different ſoils, and under different modes of culture, from about three to five, affording a produce of green herbage adequate to the ſupport of from three to four or five horſes, for a period of nearly ſix months in the ſummer ſeaſon, as has been ſeen above;' and though much of this vaſt advantage, in the ſupport of theſe animals, may with propriety be aſcribed to the economy of the conſumption of the food, that unavoidably takes place in this excellent practice, the real produce in green food, is, without doubt, larger than in moſt other graſs crops. The broad-caſt crops, in the trials of ſome cultivators, appear to have been more profitable, in this mode of conſuming the produce, than thoſe of either the drilled or tranſplanted methods of culture; in the practice of Mr. Hall, the former ſupported from four to five horſes for twenty-ſix weeks, while the tranſplanted crop, in rows two feet aſunder, only afforded produce ſufficient for the keeping of three. And in thoſe of Mr. Clayton, in the broad-caſt method, without grain, five horſes were kept from the middle of May till Michaelmas, while that drilled in equidiſtant rows, at the diſtance of eighteen inches, only ſupported four." There are many other facts, that lead to the ſame concluſion. "On very rich ſoils, the drilled lucern will, without doubt, when the plants are kept perfectly clean, and the mould well ſtirred between the rows, and laid to their roots, afford an abundant produce, perhaps more ſo than in the broad-caſt; but to do this, great attention in the culture muſt be beſtowed." And in "its application, in the ſoiling of cows, and other ſorts of cattle, in the fold yards, and in the feeding and fattening of oxen, its importance is equally great. It is found that in ſoiling cows, the proportion of this ſort of food, conſumed in twenty-four hours, is from about ſixty or ſeventy, to upwards of a hundred pounds, in thoſe which are of the middling-ſized kinds; an acre maintaining in the proportion of about four for twenty weeks. In other trials, larger proportions of ſtock have been kept by this practice." In feeding cattle with this ſort of food, it is obſerved, that "in its green ſtate, care is neceſſary, however, not to give the animals too much at a time, eſpecially when it is moiſt, as they may be *hoven* or *blown* with it, in the ſame way as with clover." The trials, it is added, that have been made in fattening bullocks or other cattle with this green fodder, are not numerous, but they are ſufficiently ſo to prove its utility in ſuch application. In Mr. Young's trials, cattle have been found to increaſe faſt in fleſh by it, paying at the rate of four ſhillings and ſixpence a head *per* week, which is conſidered as a great proof of the value of the plant in this view. Its ſuperiority to tares is prodigious. It has alſo been conſidered of the greateſt value in this view, in Ireland, by Mr. Herbert, after much experience of it. The great power which it poſſeſſes in fattening is rendered indeed ſufficiently evident, by the ſudden effects which it produces in this way, in ſoiling horſes; in moſt inſtances they get into high condition, in a ſhort time becoming "fat, without oats or hay," in ſome caſes. And "ſheep have likewiſe been fattened on this green food with great ſucceſs, in Mr. Baldwin's trials." Alſo, "in ſoiling hogs in the fold yards, it has been attended with conſiderable ſucceſs—and it has been ſuggeſted that as theſe animals do not bite ſo cloſely as ſheep, they may be admitted upon the crop with ſafety."

And the advantage of this mode of application over that of making the crops into hay, and their expence, produce, and profit, are ſtated by Mr. Young in this way.

Average of Five Crops.

Soils.	Application.	Expences.			Product.			Profit.		
		£.	s.	d.	£.	s.	d.	£.	s.	d.
Light ſandy loam - - - -	Soiling -	1	14	6	13	0	0	11	5	6

Averages - - - - - -	- -	3	8	11	10	8	8	7	10	5

Further, the reſult of the comparative experiment made by Mr. Anderton with this crop, and thoſe of burnet and ſaintfoin, as ſtated by the ſame writer in his Eaſtern Tour, ſhews its ſuperiority over them clearly.

Lucern, at four cuttings, green, produced	159
Burnet - - - -	84
Saintfoin - - - -	82

And the advantages of making them into hay, are thus ſtated:

One cutting of each.

Lucern, in graſs,	57½ lb.	in hay,	22 lb.
Burnet, in ditto,	25½	——	7
Saintfoin, in ditto,	29½	——	9

Although lucern crops ſhould not be cloſely fed down with ſheep, it is not improbable but that "in particular caſes they may be applied as an early green feed for ewes and lambs with great utility and convenience, as they may be relied on for this ſort of feed much ſooner than any of the other kinds of artificial graſs crops, eſpecially in ſoils of the rich, dry, and warm deſcriptions, being often ready for this purpoſe ſoon after the middle of March, affording a good bite through the whole of the following month; the moſt difficult period for the providing of ſuitable ſupport for this kind of ſtock. The benefit in the healthy growth and improvement of the lambs in this mode, will much more than counterbalance any loſs ſuſtained in the firſt cut, for the ſoiling of horſes. The ſheep ſhould not, however, remain on longer than while the freſh ſhoots are eaten down." And it is concluded on the whole, that "though this plant is capable of being thus uſefully applied, conſidering the great expences which are neceſſary in raiſing and keeping lucern crops in a ſtate of production, and their affording but little produce, eſpecially when ſown without corn, for the two firſt years, notwithſtanding they appear to yield a great advantage in the practice of ſoiling animals; it is probable that much of the profit depends upon the method of conſuming them, and not on that of the particularly advantageous nature of the plant. Its ſuperiority to clover, when the differences in the expences of their culture, and other circumſtances, are fairly brought into view, will not perhaps appear ſo great as many, on a ſuperficial obſervation, may have ſuppoſed. The point in which it moſt materially excels that almoſt invaluable plant, is, the duration, or time, which it laſts in the ground, after being once introduced, continuing from ten to fifteen and even twenty years, according to the ſtate and nature of the ſoil and the attention that is beſtowed in the after management. This is a circumſtance of the firſt importance, in caſes where the cultivator wiſhes to avoid the trouble and expence of grain crops, as he can keep a ſuitable extent of land under this crop, for the purpoſe of ſoiling his ſtock without them, while with clover it is utterly impoſſible. Where the proportion of land is ſmall, and the quantity of cattle and horſe ſtock diſproportionately large, it is a plant admirably calculated for the cultivator's purpoſe, when grown convenient to the farm-yards, and kept in due order by proper cultivation. In has alſo been recommended on dairy farms, as of great utility in ſupporting the cows, and increaſing the quantity of milk. Where the ſoils are ſuitable, a few acres under this graſs, round the houſe, muſt in almoſt all caſes be valuable for the purpoſe of early green food."

The advantages of cultivating lucern are conſidered by Mr. Young ſo extremely great, that the "agriculturiſt ſhould, he thinks, determine at all events to have ſufficient at the leaſt, for the ſummer ſupport of all his teams, and other horſes; and if in addition to this quantity, he provides alſo for thus feeding much other ſtock in his farm-yard, he will find it a moſt profitable practice."

Breaking up old Lucern Grounds.—It has been already ſuggeſted, that "on attempting to break up lands that have been long under this ſort of crop, it has been ſometimes found, from the great ſtrength of the roots of the lucern plants, and the conſequent difficulty of deſtroying them, that they have been reſtored in ſuch a manner, as to induce the cultivator to leave them again for the production of this graſs." And that in ſituations where ſuch grounds could be conveniently flooded or covered with water occaſionally, they might be very advantageouſly converted into good meadow or graſs lands. A ſort of application, that has long ſince been recommended.

In cutting lucern crops, the author of the Farmer's Calendar ſuggeſts that it ſhould always be performed in a longitudinal direction of the drills, or rows, or of the field, in order that a ſcarifying may be given to the young growth before it is too far advanced. And the ſame writer remarks, that this ſort of crop requires much manure, for though on good land it may afford a good produce, without ſuch application; to carry its cultivation to the higheſt ſtate of perfection, "not only of *product* but alſo of *clear profit*," it ſhould have plenty.

But though this ſort of plant is ſeldom liable to be injured by the froſt, in the ſouthern diſtricts of the kingdom, where it is the moſt extenſively cultivated, a writer in an uſeful periodical work, complains that in an experiment of his, in which the lucern was drilled about a foot diſtant in the rows, it deſtroyed every plant. "A few indeed, (ſays he,) at diſtant intervals, recovered in the ſpring, and grew very decently, puſhing out long, ſtrong, and carrot roots; but their number was ſo inconſiderable, and the weeds ſo abundant and luxuriant, that it became neceſſary to plow all down." In this caſe the land does not ſeem to have been in a proper ſtate of either preparation or heart for the growth of this ſort of crop. And it is ſuggeſted, that in giving this ſort of food to cows, it is neceſſary to have the precaution of letting it be made uſe of the day after it is cut, and not the ſame day, as in this caſe the animal is liable to ſwell. In his trials it was found that a large cow conſumed about eighty-four pounds of this food in twenty-four hours, and that if more be given, the animal will probably waſte it. And it is added, that the butter made from milk produced from this ſort of food, is equal to any made from cows fed on the beſt meadows and paſtures.

LUCERNA, in *Geography*, a town of France, in the department of the Po, lately belonging to Piedmont, in the province of the Four Vallies, to one of which it gives name; five miles S.W. of Pinerolo.

LUCERNA, in *Ichthyology*, a ſpecies of *Trigla*; which ſee.

LUCERNARIA, in *Natural Hiſtory*, a genus of the Vermes Molluſca claſs and order. Body gelatinous, wrinkled, branched; mouth placed beneath. There are three ſpecies, which inhabit the Northern ſeas, and live among the "fuci" and "ulvæ," generally adhering firmly to their habitation, and rarely changing their abode; they feed on polypes, or oniſci; the body is commonly headleſs and eyeleſs, with granulated tubercles.

Species.

QUADRICORNIS. Body long coiled, with four forked arms tentaculate at the tip. Inhabits fuci, and feeds on polypes. The body is without head or eyes, brown, pellucid, quadrangular, each angle running into an arm, the branches of which are terminated by a faſciculus of thirty or forty tentacula; tail flexuous in the middle and diſpoſed in numerous plaits and folds, thickened at the baſe and tapering gradually, obtuſe at the tip, and extenſile, like the tentaculæ; mouth white with cinereous ſtriæ, and four-toothed.

PHRYGIA. Body long papillous, with numerous globeriferous arms deflected into an hemiſphere; fixed at the baſe by a byſſus or maſs of filaments. This is found in the Greenland ſeas at a conſiderable depth, and ſeldom changes its abode. Body varying in ſhape, about half an inch long, reddiſh with white globules and papillæ; neck erect, exſertile, and beſet with numerous exſertile papillæ; arms ſhort, ſlender, and entangled together.

AURICULA. Reſembling an oil-flaſk; neck round, the lower extremities dilated and ſurrounded with eight faſciculi of tentacula. This ſpecies is likewiſe found in the Greenland ſeas, adhering very firmly to the largeſt ulvæ, from which it rarely moves; feeds on oniſci, and is about an inch and a half long. Body black or reddiſh, rarely cheſnut-brown with a gold tinge, lubricoſe, glabrous, the margin ſurrounded with eight granulate tubercles, reſembling ſo many faſciculi of tentacula, containing about ſixty in each; theſe are black tipt with white; mouth white.

LUCERNATES, in the *Eccleſiaſtical Hiſtory*, a term uſed by the primitive Chriſtians for canticles, which they ſung in their nocturnal aſſemblies; probably from theſe rites being performed by lamp-light.

LUCHNOW Hills, in *Geography*, a range of mountains in Hindooſtan, between the circars of Ruttunpour and Goondwana; the paſſage over which is called "Luchnow Paſs," and is ſituated about eight miles W. of Kyragur.

LUCHO, a town of the principality of Pomerelia; 12 miles S.W. of Dantzic.—Alſo, a town of the principality of Luneburg, on the Jetze, in a moiſt ſoil, ſo that moſt of the houſes are erected on piles; 40 miles E.S.E. of Luneburg. N. lat. 52° 58′. E. long. 11° 17′.

LUCHOWICZE, a town of Lithuania, in the palatinate of Novogrodek; 40 miles S.S.E. of Novogrodek.

LUCIA, St., or, as it is called by the French, *St. Alouſie*, from its having been diſcovered on St. Lucia's day, one of the Charaibe or Caribbee iſlands in the Weſt Indies, about 27 miles in length from N. to S., and 12 broad. In this iſland are ſeveral hills, two of which are remarkably round and high, and ſaid to have been volcanoes. At the foot of theſe hills are fine vallies, well-watered, and having good ſoil, that produces trees, the timber of which ſerves the planters of Martinico and Barbadoes for building their houſes and windmills. The iſland alſo ſupplies plenty of cocoa and fuſtic. The air, fanned by the trade winds, which, by the arrangement of the hills, are admitted into the iſland, and thus moderating the heat, is reckoned ſalubrious. The iſland has ſeveral good harbours and bays, which afford commodious anchorage; particularly the "Little Careenage," which is accounted the beſt in all the Caribbees, and which induced the French to prefer it to the other neutral iſlands. This harbour poſſeſſes ſeveral advantages, ſuch as its depth, the excellent quality of its bottom, and its convenient careening places. Thirty ſhips of the line may lie here ſheltered from hurricanes, without the trouble of mooring them. As to the other harbours, the winds are always favourable for going out, and the largeſt ſquadron may be in the offing in leſs than an hour. In the iſland are nine pariſhes, eight to the leeward, and only one to the windward. A high road is made round the iſland, and two others which croſs it from E. to W., and thus afford an eaſy conveyance of the commodities of the plantations to the barcaderes, or landing places. In the year 1769, the free inhabitants of the iſland amounted to 2524; the ſlaves to 10,270. Of cattle it had 1819 horned beaſts, and 2378 ſheep, beſides 598 mules and horſes. Its plantations conſiſted of 1,279,680 plants of cocoa; 2,463,880 of coffee; 681 ſquares of cotton; and 254 of ſugar canes: 16 ſugar works were actually at work, and 18 nearly completed. Its produce yielded 112,000*l.*, which was capable of being improved to 500,000*l.* After the Engliſh had been ſettled for ſome time in this iſland, the Charaibes, inſtigated by the French in the year 1638, either killed or drove from the iſland the Engliſh ſettlers with their governor. When the civil wars broke out in England, a party of French arrived here, under a perſon named Rouſſelan, well provided with ſtores and ammunition. Rouſſelan recommended himſelf to the Charaibes, ſo that he and his colony carried on an advantageous trade; but upon his death in 1654, he was ſucceeded by La Riviere, who with his whole colony was maſſacred by the Charaibes. It is needleſs to recount the attempts made by the French, and alſo by the Engliſh in 1672, and at a later period in 1723, to obtain and preſerve a ſettlement in this iſland. At length, when the Engliſh were compelled to relinquiſh all hopes of obtaining this and other iſlands by force, St. Vincent, Dominica, Tobago, and St. Lucia were declared neutral by the treaty of Aix-la-Chapelle in 1748; and thoſe who remained of the ancient proprietors were left in unmoleſted poſſeſſion. The treaty of neutrality was no ſooner concluded, than both Engliſh and French appeared diſſatisfied with the arrangement they had made. The Engliſh, in particular, diſcovered, that by acceding to the compromiſe, they had given up St. Lucia, an iſland worth all the reſt, and to which, it muſt be owned, they had ſome colourable pretenſions, founded on a treaty entered into with the Charaibean inhabitants in 1664, 600 of whom attended an armament that was ſent thither by lord Willoughby, and actually put the Engliſh publicly and formally into poſſeſſion. By the peace of Paris, February 1763, the three iſlands of Dominica, St. Vincent, and Tobago were aſſigned to Great Britain; and St. Lucia to France in full and perpetual ſovereignty; the Charaibes not being once mentioned in the whole tranſaction, as if no ſuch people exiſted. The Engliſh took this iſland in the year 1779, but reſtored it at the peace in 1783; it was retaken by the Engliſh in 1794, reſtored in 1795, and retaken in 1796; reſtored and recaptured in 1803. N. lat. 13° 37′. W. long. 60° 30′.

Lucia, *St.*, a town of Sicily, in the valley of Demona; ſeven miles N. of Meſſina.—Alſo, a town of the iſland of Corſica; ſix miles N.E. of Corte.—Alſo, one of the ſmaller Cape Verd iſlands, about 24 miles in length, high and mountainous. On the E. ſide is a harbour, defended by two ſmall iſlands, which afford good ſhelter and anchorage. N. lat. 16° 46′. W. long. 24° 30′.—Alſo, a town of South America, in the government of Buenos Ayres, on the E. ſide of the river Plata; 140 miles N. of Santa Fé.—Alſo, a town of Brazil, in the government of Goyas, on the river Tocantins. S. lat. 12° 20′.—Alſo, a town of South America, in the government of Buenos Ayres, on the Parana; 110 miles S. of Corientes.—Alſo, a town of Peru, in the government of Arequipa; 50 miles S.E. of Arequipa.—Alſo, a town of South America, in the audience of Quito, on the Daûlé; 35 miles N.N.W. of Guayaquil.—Alſo, a town of Italy, in the Treviſan; 20 miles E.S.E. of Trevigio.—Alſo, a river of Africa, which runs into the Indian ſea; S. lat. 28 .—Alſo, a river of America, in Eaſt Florida, which runs S.E. along the E. ſide of the peninſula, and communicates inland with the Indian river.

Lucia *Bay*, *St.*, a bay on the E. coaſt of the iſland of Borneo. N. lat. 4° 16′. E. long. 117 18′.

LUCIAN, in *Biography*, a diſtinguiſhed Greek writer, a native of Samoſata, on the banks of the Euphrates, was born in the reign of Trajan, of mean parentage, and in his youth was placed with his uncle to learn the art of a ſtatuary. Having no genius for the profeſſion, and failing of ſucceſs in ſome of his firſt attempts, he withdrew from his maſter, and went to Antioch, where he engaged in literary ſtudies, and embraced the profeſſion of a pleader. He reported, that he was induced to this ſtep by a dream, in which Learning ſeemed to draw him to her, and to promiſe to his efforts fame and immortality. He was ſoon diſguſted with the contention of the bar, and confined himſelf to the practice of eloquence as a ſophiſt or rhetorician, in which capacity he viſited ſeveral foreign countries, particularly Greece, Italy, Spain, and Gaul. The emperor M. Aurelius was ſenſible of his great merit, and appointed him regiſter to the Roman governor of Egypt. He died about the year A.D. 180, when he had attained the great age of 90. The works of Lucian, which are numerous, and written in the Attic dialect, conſiſt chiefly of dialogues, in which he introduces different characters with much dramatic propriety. His ſtyle is eaſy, ſimple, elegant, and animated, and he has ſtored his compoſitions with many lively ſentiments, and much of the true Attic wit. His frequent obſcenities, and his vulgar manner of expoſing to ridicule almoſt every kind of religion, have drawn upon him the cenſure of moraliſts in all ages. The beſt editions of Lucian's works are thoſe of Bourdelot, Paris 1615; of Grævius, Amſt. 1687; of Reitzius, Amſt. 1743, and the Bipontine edition in 10 vols. 1789—93.

Lucian, (de elect. ſeu Cygnis,) is the only ancient writer who has dared to doubt of the muſical abilities of ſwans. He tells us, with his uſual pleaſantry, that he tried to aſcertain the fact, by making a voyage on the coaſts of Italy; and relates, that being arrived at the mouth of the Po, he and his friends had the curioſity to ſail up that river, in order to aſk the watermen and inhabitants concerning the tragical fate of Phaeton; and to examine the poplars, deſcendants of his ſiſters, whom they expected to ſhed amber inſtead of tears; as well as to ſee the ſwans repreſent the friends of this unfortunate prince, and hear them ſing lamentations and ſorrowful hymns, night and day, to his praiſe, as they uſed to do in the character of muſicians, and favourites of Apollo, before their change. However, theſe good people, who never had heard of any ſuch metamorphoſes, freely confeſſed, that they had indeed ſometimes ſeen ſwans in the marſhes near the river, and had heard them croak and ſcream in ſuch a diſagreeable manner, that crows and jays would be ſirens, compared with them, in a muſical capacity; but that they had never even dreamed of ſwans ſinging a ſingle note that was pleaſing, or fit to be heard.

LUCIAN, a Chriſtian martyr in the fourth century, is ſuppoſed to have been a native of Antioch, of which place he became a preſbyter. He was a pious and learned man, very eloquent, and well-ſkilled in the knowledge of the ſcriptures. He publiſhed an edition of the Septuagint, with corrections, ſuggeſted by a collation of ancient copies, which verſion was generally uſed in Jerome's time by the churches from Conſtantinople to Antioch. He publiſhed alſo an edition of the New Teſtament, the canon of which appears to have been much the ſame with that of other Chriſtians. Jerome does not commend theſe editions; he depreciates Lucian's Septuagint in compariſon with Origen's. It is certain that Lucian was in high eſteem with the Arians of the fourth century, and on that account it has been ſuppoſed that he adopted their principles; though he is claimed on the other ſide as the advocate of the doctrine of the Trinity; but Dr. Lardner, who has examined the queſtion with his uſual diligence, candour, and impartiality, obſerves, "Whether Lucian's opinion concerning the Trinity, particularly concerning the *Word*, was the ſame with that, which is now reckoned orthodox, or not, which is a point not eaſily determined; we have ſeen other accounts of him which are unqueſtioned; and all muſt be ſatisfied, that he was a pious, learned, and diligent man; that he believed Jeſus to be a divine teacher and the Chriſt." During the perſecution of the Chriſtians in the reign of Maximin, Lucian was apprehended, and conducted to Nicomedia, where the emperor then was. Here he was commanded, in the preſence of the monarch, to renounce the Chriſtian faith; this he not only refuſed, but delivered an able and very eloquent defence of it, of which the following is given in Lardner: "It is no ſecret, ſaid he, that the God whom we Chriſtians worſhip, is the one God declared to us by Chriſt, and by the Holy Ghoſt inſpired in our hearts. I own, that we alſo once truſted in gods of our own making, but Almighty God, commiſerating the errors of mankind, ſent his wiſdom into this world clothed in fleſh to teach us the knowledge of God, who made the heavens and the earth, who is eternal and inviſible. He, moreover, gave us a rule of life, and delivered to us the precepts of righteouſneſs; he taught us to practiſe ſobriety, to rejoice in poverty, to be very meek, to be willing to ſuffer, to preſerve the purity of our minds, to be patient at all times. He likewiſe foretold the things that have ſince happened to us; that we ſhould be brought before kings and rulers, and be ſlaughtered as victims; for which cauſe alſo, though he was immortal, as being the Word and Wiſdom of God, he yielded himſelf to death, that, whilſt he was in the body, he might ſet us an example of patience. Nor did he deceive us by dying, but on the third day roſe again, being innocent and unſpotted, and undergoing death only that he might overcome it by riſing again. Theſe things are well atteſted, and a large part of the world now acknowledge the truth of them." Upon this he was ſent to priſon, and ſpeedily put to death, but in what manner is not known. He was buried at Helenopolis. Lardner, vol. iii. edit. 1788.

LUCIANA, in *Geography*, a town of Spain, in the province of Seville; eight miles W.N.W. of Ecija.

LUCIANANO, a town of Etruria; 12 miles W. of Cortona.

LUCIANISTS, or LUCANISTS, a religious ſect, ſo called from Lucianus, or Lucanus, a heretic of the ſecond century, being a diſciple of Marcion, whoſe errors he followed, adding ſome new ones to them.

Epiphanius ſays, he abandoned Marcion; teaching, that people ought not to marry for fear of enriching the Creator: and yet other authors maintain, that he held this error in common with Marcion, and other Gnoſtics. He denied the immortality of the ſoul; aſſerting it to be material.

There was another ſect of Lucianiſts, who appeared ſome time after the Arians. They taught that the Father had been a Father always, and that he had the name even before he begot the Son; as having in him the power, or faculty of generation; and in this manner they accounted for the eternity of the Son.

LUCIANO, in *Geography*, a town of Spain, in New Caſtile; 19 miles W. of Civdad Reel.

LUCID INTERVALS, the fits of lunatics, or maniacs, wherein the phrenzy leaves them in poſſeſſion of their reaſon.

It is ſaid, lunatics are capable of making a will in their lucid intervals.

LUCIDA CORONÆ, in *Aſtronomy*, a fixed ſtar of the ſecond magnitude, in the northern crown. See CORONA *Borealis*.

LUCIDA *Hydræ*. See COR *Hydræ*.

LUCIDA *Lyræ*, a bright ſtar of the firſt magnitude, in the conſtellation *Lyra*.

LUCIDO, ST., in *Geography*, a town of Naples, in Calabria Citra; 11 miles W.N.W. of Coſenza.

LUCIDUM SEPTUM. See SEPTUM.

LUCIFER, in *Aſtronomy* and *Mythology*, a name given to the planet Venus, when ſhe appears in the morning before ſun-riſe.

LUCIFER, in *Biography*, a celebrated biſhop of Cagliari, the metropolitan city of the iſland of Sardinia, flouriſhed in the fourth century. He was one of the deputies ſent by pope Liberius to Milan, in the year 354, at the time when the emperor Conſtantius had ſummoned a council for the purpoſe of condemning Athanaſius. Lucifer, and Euſebius, biſhop of Verceil, adhered moſt ſtrenuouſly to the cauſe of Athanaſius, which ſo enraged the emperor that he baniſhed them into the Eaſt. Lucifer was ſent to a city in Syria, from whence he was removed to Eleutheropolis in Paleſtine. Here he wrote two books, in defence of Athanaſius and his ſupporters, with ſo much boldneſs, or perhaps violence, that St. Jerome ſays he muſt at the time have made up his mind to the ſuffering of martyrdom. Theſe books he not only made public, but ſent a copy of them to Conſtantius, in his own name. The emperor, amazed at his intrepidity, deſired them to be returned to the biſhop, in order that he might have an opportunity to acknowledge or to diſavow them. The prelate avowed himſelf the author, and knowing the probable conſequences, ſaid he was ready to ſuffer death in defence of what he had written and done. Athanaſius ſent him a letter of thanks for the ſervice which he had performed for the Catholic cauſe, and requeſting a copy of his works, which he either tranſlated himſelf, or cauſed to be tranſlated from the Latin into Greek. On the death of Conſtantius, Lucifer recovered his liberty and came to Antioch, where the Catholics were divided into two parties. Lucifer widened the breach already made, by joining with the opponents of the biſhop of Miletus, who, though a Catholic, was ordained by biſhops ſuſpected of Arianiſm, and had communicated with them, and ordained a Preſbyter among the mal-contents to the epiſcopal office. This ſtep was condemned by his friend, and formerly fellow ſufferer Euſebius, who had been ſent to Antioch by the ſynod of Alexandria, with the view of re-eſtabliſhing the peace of the church. But Lucifer determined to maintain what he had done, and withdrew from the communion of Euſebius, and he formed a party, called after himſelf Luciferians, who reſolved to avoid all commerce or fellowſhip with thoſe biſhops who had declared themſelves in favour of the Arians. With this reſolution he went into Sardinia, and thereby produced a ſchiſm in the church, which at firſt ſpread widely, but did not obtain numerous adherents, and does not appear to have out-lived the century. Lucifer died about the year 370. His works are written in a harſh and barbarous ſtyle. According to Lardner, they conſiſt very much of paſſages of the Old and New Teſtament, cited one after another, which he quotes with marks of the greateſt reſpect. He farther adds, that the works of this prelate have not yet been publiſhed with all the advantage that might be wiſhed. The titles of theſe works are "Ad Conſtantinum Imperatorem, lib. ii.;" "De Regibus Apoſtaticis;" "De non conveniendo cum Hereticis;" "De non parcendo Delinquentibus in Deum;" "Quod moriendum ſit pro Filio Dei;" and "Epiſtola brevis ad Florentium." They were collected together, and publiſhed at Paris by John Till, biſhop of Meaux, in 1568. Gen. Biog. Lardner, vol. iv. edit. 1788. Moreri.

LUCIFERA, in *Mythology*, a ſurname given to Diana, under which title ſhe was invoked by the Greeks in childbed. She was repreſented as covered with a large veil, interſperſed with ſtars, bearing a creſcent on her head, and holding in her hand a lighted flambeau.

LUCIFERIANS, a religious ſect, who adhered to the ſchiſm of Lucifer, biſhop of Cagliari, in the fourth century, who was baniſhed by the emperor Conſtantius, for having defended the Nicene doctrine concerning the three perſons in the Godhead.

St. Auguſtine ſeems to intimate, that they believed the ſoul, which they conſidered as of a carnal nature, to be tranſmitted to the children from their fathers. Theodoret ſays, that Lucifer was the author of a new error. The Luciferians increaſed mightily in Gaul, Spain, Egypt, &c. The occaſion of the ſchiſm was, that Lucifer would not allow any acts he had done to be aboliſhed. There were but two Luciferian biſhops, but a great number of prieſts and deacons. The Luciferians bore a peculiar averſion to the Arians.

LUCILIUS, Caius, in *Biography*, a Roman poet, was born at Sueſſa, in the country of the Aurunci, about the year 148 B.C. He was of a good family, and in the Numantine war bore arms under Scipio Africanus the younger, with whom, and his friend Lælius, he lived in terms of friendſhip. He is looked upon as the founder of ſatire, and as the firſt conſiderable writer of ſatires among the Romans. From Horace, who refers to them ſeveral times in his own ſatires, it appears that he imitated the old Greek comedians in marking out by his cenſure individuals notorious for their vices, even thoſe of the very higheſt rank. Though ſuperior to his poetical predeceſſors at Rome, and though he wrote with great roughneſs and inelegance, he gained many admirers. By Horace he is compared to a river which rolls upon its waters precious ſand, accompanied with mire and dirt. Of his thirty books of verſes only a few ſcattered fragments are come down to modern times. He died at Naples about the year B.C. 103. His fragments have been collected and publiſhed, with notes by Francis Douza, in quarto. They are alſo given in Mattaire's "Corpus Poetarum."

LUCINA, of *lux*, *light*, in *Mythology*, a deity who preſided over the labour of women and the birth of children. This title is ſometimes given to Diana, but moſt commonly to Juno.

LUCIO, St., in *Geography*, a town of Etruria; 14 miles E.S.E. of Leghorn.

LUCIOPERCA, in *Ichthyology*, a ſpecies of *Perca*; which ſee.

LUCIPARA, or Lusipara, in *Geography*, a ſmall barren iſland in the Eaſt Indian ſea, near the S. coaſt of the iſland of Banca. S. lat. 3° 14'. E. long. 106° 20'.

LUCITO, a town of Naples, in the county of Moliſe; 11 miles N.E. of Moliſe.

LUCIUS I., pope, in *Biography*, ſucceeded to the high dignity upon the death of Cornelius in the year 252, and after a ſhort pontificate he is ſuppoſed to have died in March 253. He was baniſhed Rome immediately after his ordination, under the reign of Gallus; but he ſoon returned to the great joy of his flock, who crowded to meet him. St. Cyprian wrote him a letter of congratulation, in which he obſerves, that he was perhaps recalled to be immolated in the ſight of his flock, that they might be encouraged and animated by his Chriſtian conſtancy and reſolution. Cyprian in another place calls him a martyr, nevertheleſs we have no account of the manner of his death, and hence it has been thought that the expreſſion made uſe of by this father is not to be underſtood ſtrictly and literally.

Lucius II. pope, raiſed to that dignity on the death of Celeſtine II. in 1144, was a native of Bologna, who embraced the eccleſiaſtical life among the canons of St. Auguſtine. In 1125 he was created a cardinal, and appointed librarian of the Roman church. After this he was nominated the chancellor, and twice was ſent papal legate into Germany. A ſhort time before the death of Innocent II. the Romans threw off the papal yoke in temporal matters, reſtoring the ſenate, and creating their own magiſtrates, to whom they would yield obedience. In this attempt to recover their ancient liberties, they perſiſted after the election of Lucius, whom they acknowledged for lawful pope, but would not own him for their ſovereign. They contended that it was inconſiſtent with the profeſſion of the clergy, that they ſhould poſſeſs lordſhips, eſtates, and temporal dominion, and that they ought to content themſelves with ſuch decent ſubſiſtence as they might derive from voluntary tythes and oblations. To Lucius, as their biſhop, they paid all due reſpect; but ſoon after his election, they veiled the patrician dignity in one of their own body, and ſubmitted to him as their prince. Lucius took every method to oppoſe their plans; he ſought aſſiſtance from Conrad, king of Germany, and when he was refuſed, he put himſelf at the head of his own troops, and marched againſt the Capitol, where the ſenate was ſitting. His forces were defeated and himſelf wounded with a ſtone, which terminated his life in a few days, after a pontificate of about eleven or twelve months. Some of his letters are extant in the 10th vol. of the Collect. Concil.; and two in the ſecond vol. of Baluze's Miſcel.

Lucius III., pope, a native of Lucca, was educated to the church, and after various degrees of preferment, he was created cardinal by Innocent II. By Adrian IV. he was ſent legate into Sicily; after this pope Alexander III. appointed him legate to the emperor Barbaroſſa, and on the death of Alexander in 1181, he was raiſed to the holy ſee. He was the firſt pope who was elected by the cardinals alone, to the excluſion of the people and clergy, who had hitherto taken a part in the choice of a new pope. Towards the cloſe of the year 1182, a quarrel took place between the pope and the Romans, owing to his refuſal to comply with ſome cuſtoms which had been obſerved by all his predeceſſors. The people broke out into inſurrection, and drove him out of the city, purſuing him from one ſtrong hold to another, till he retired for ſafety to Verona. At firſt he was ably ſupported by the emperor, who ordered Chriſtian, archbiſhop of Mentz, to march in his defence at the head of a powerful army. This prelate ſoon reduced all the ſtrong holds in the neighbourhood of Rome, and ſo haraſſed the Romans, that they were ready to receive the pope on his own terms, when the death of Chriſtian produced a ſudden alteration in the ſtate of affairs; and the Romans, feeling their power, became more determined than ever in their oppoſition. Lucius ſent nuncios to all Chriſtian princes and biſhops to gather contributions; large ſums were gained which he ſpent in bribing the leaders of the oppoſing parties, and then ventured to return to Rome. A ſecond inſurrection drove his holineſs to Anagni, whence he went into Lombardy, to implore the protection of the emperor, who was at that time on his march into Italy, for the purpoſe of holding a council at Verona. In 1184 the council was opened, and the pope preferred his complaints againſt the Romans, painting, in the ſtrongeſt colours, the enormities which they had perpetrated; and they were, without heſitation, declared enemies of the church. To this council is to be traced the origin of the inquiſition againſt heretics. For not only were the Albigenſes condemned and anathematiſed anew, under different names, but all who ſhould admit them into their houſes, ſuffer them in their territories, or afford them any ſort of relief. Under the ſame ſentence were included all thoſe who held or taught different doctrines from thoſe held and taught by the Roman church. Some grounds of diſpute aroſe between the emperor and the pope, as well with reſpect to the reinſtatement of certain biſhops who had been ſuſpended; as alſo on account of the pope's refuſal to crown the emperor's ſon Henry, and to give him the title of emperor. The pope, however, was not willing to proceed to a direct rupture with the emperor, and the buſineſs in diſpute was ſuſpended. In 1184, we find Lucius preſſing, with great earneſtneſs, the Chriſtian princes to ſend powerful ſuccours to the aſſiſtance of their friends and brethren in the Holy Land. While he was promoting, to the utmoſt of his power, a new cruſade, he died at Verona in November 1184, after a pontificate of little more than four years. He is commended for prudence, piety, and unblemiſhed manners. Two of the "Letters," and a "Decree" of this pope's, are to be found in the 10th vol. of the Collect. Concil. Mr. Gibbon, ſpeaking of the 2d and 3d Lucius, ſays, "I cannot forget the ſufferings of two pontiffs of the ſame age, the ſecond and third of the name of Lucius. The former, as he aſcended in battle array to aſſault the Capitol, was ſtruck on the temple by a ſtone, and expired in a few days. The latter was ſeverely wounded in the perſons of his ſervants. In a civil commotion ſeveral of his prieſts had been made priſoners, and the inhuman Romans, reſerving one as a guide for his brethren, put out their eyes, crowned them with ludicrous mitres, mounted them on aſſes with their faces to the tail, and extorted an oath, that in this wretched condition they ſhould offer themſelves as a leſſon to the head of the church." Bower. Moreri. Gibbon, vol. xii.

Lucius, in *Ichthyology*, a ſpecies of *Eſox*; which ſee.

Lucius *Marinus*, the *Sea-pike*, a name given by ſome authors to the fiſh more uſually called the *merlucius*, and in Engliſh the *hake*. See Gadus.

Lucius *Marinus* is alſo uſed by many authors for the *ſudis*, called alſo by ſome *ſphyræna*.

Lucius *Terreſtris*, the *Land-pike*, in *Zoology*, the name of a very ſingular ſpecies of American lizard, which has the ſhape, ſcales, &c. of the pike-fiſh; in the place of the fins of that fiſh it has four legs, but theſe are ſo weak and ſlender that it makes no uſe of them in walking, but crawls along upon the ground in the manner of a ſnake, and draws its legs after it; it grows to about fifteen inches long, with a proportionable thickneſs; it is all over covered with ſmall, ſtrong, and gloſſy ſcales, of a ſilver grey. In the night they retire into holes and caverns, and make a very diſagreeable and loud noiſe, much louder than the croaking of frogs. They ſeldom ſtir out of their holes, unleſs in the duſk of the evening; and if they are ever met with in the day-time, their ſtrange motion ſurpriſes all who ſee them.

LUCKAMPOUR, in *Geography*, a town of Bengal; 70 miles N.W. of Midnapour.

LUCKAU, or Lucca, a town of Lower Luſatia, in a circle of the ſame name, on the river Preſte, containing four churches, a Latin ſchool, and an hoſpital; 49 miles N. of Dreſden. N. lat. 51° 51′. E. long. 13° 40′.

LUCKENS, a town of Sweden, in the province of Drontheim; 25 miles S.S.W. of Drontheim.

LUCKENWALDE, a town and principal place of a circle, in the duchy of Magdeburg; 50 miles E. of Magdeburg. N. lat. 52° 6′. E. long. 13° 3′.

LUCKERCOOT, a town of Hindooſtan, in Guzerat; 30 miles E. of Godra.

LUCKIA, a town of Hindooſtan, in Oude; 40 miles N.E. of Gooracpour.

LUCKIDAUR, a town of Bootan; 40 miles N. of Beyhar, 46 geographical miles in horizontal diſtance from Taſſaſudon. N. lat. 26° 56′.

LUCKIGATCHY, a town of Bengal; 10 miles N.E. of Kiſhenagur.

LUCKINPOUR, a town of Hindooſtan, in the circar of Cicacole; 24 miles N. of Cicacole.—Alſo, a town of Hindooſtan, in Surgooja; 10 miles S.W. of Surgooja.

LUCKIPOUR, a town of Bengal; 40 miles S.E. of Calcutta.—Alſo, a town of Bootan; 55 miles S. of Taſſaſudon.—Alſo, a town of Hindooſtan, in Bengal; 35 miles S.S.W. of Comillah.—Alſo, an iſland in the mouth of the river Ganges, about nine miles long and two broad. N. lat. 22° 27′. E. long. 90° 48′.—Alſo, a town of Bengal, on an iſland of the ſame name; 50 miles S. of Dacca.

LUCKMIPOUR, a town of Hindooſtan, in Bahar; 30 miles E. of Bahar.—Alſo, a town of Bengal; 32 miles S.S.E. of Curruckpour.

LUCKNADANG, a town of Goondwana; 88 miles N. of Nagpour.

LUCKNORE, a town of Hindooſtan, in Bahar; 28 miles S. of Patna. N. lat. 25° 8′. E. long. 85° 16′.

LUCKNOUTI. See Gour.

LUCKNOW, a circar of Hindooſtan, in Oude, bounded on the N. by Kairabad, on the E. by Oude circar, on the S. by Manickpour, and on the W. by Canage; about 75 miles long, and 45 broad. The capital is Lucknow.

Lucknow, a large and populous, but irregular and inelegant, city of Bengal, capital of the fore-mentioned circar, and of the ſubah of Oude, ſituated on the Goomty, which runs on the N. ſide of the town, and is navigable for boats of a common ſize at all ſeaſons of the year; founded by Latſchman, or Lacman, and rebuilt by Bikarmadjit, king of Oude. The ſpot on which the founder reſided is preſerved in remembrance by a moſque, erected for this purpoſe by Aurungzebe. This is a very ancient city, and moderately extenſive; many of the houſes are of brick, but the greateſt part conſiſts of mud walls, covered with tiles, and built on ſcattered eminences, ſo that the aſcents and deſcents are numerous and fatiguing; and the ſtreets are narrow and filthy, no care being taken to preſerve them clean. Moſt of the old palaces were deſtroyed by Suja Dowla, and others erected. The magnificent edifices are few. The houſes of the merchants are conſtructed of brick, and are lofty and ſtrong. Lucknow is diſtant from Allahabad 127 miles; from Agimere 428; from Arcot 1147; from Bahar 388; from Cabul 1118; from Dacca 790; from Dowlatabad 728; from Golconda 794; from Gwalior 211; from Oude or Fyzabad 85; from Patna 316; from Seringapatam 1201; from Viſiapour 920. N. lat. 26° 52′. E. long. 81° 14′.

LUCKO, or Luzk, a city of Ruſſian Poland, capital of the palatinate of Volhynia, with a caſtle, where the biſhop of Volhynia reſided, and where the Jeſuits had a college; it is alſo the reſidence of a Ruſſian biſhop, and has a provincial diet, and court of judicature; 200 miles E.N.E. of Cracow. N. lat. 50° 40′. E. long. 25° 19′.

LUCKOUR, a town of Hindooſtan, in the circar of Sohajepour; 20 miles S. of Sohajepour.

LUCKUMRY, a town of Meckley; 35 miles W. of Munnypour.

LUCO, a town of Naples, in Abruzzo Ultra; nine miles S.S.W. of Celano.

LUÇON, a town of France, and ſee of a biſhop before the revolution, in the department of the Vendée, and chief place of a canton, in the diſtrict of Fontenoy le Comte; 15 miles from it. It is ſituated on a canal, about ſix miles in length, communicating with the ſea. The environs are marſhy, and the air is unwholeſome. The place contains 2630, and the canton 8572 inhabitants, on a territory of 332½ kiliometres, in 10 communes. N. lat. 46° 29′. W. long. 1° 4′.

Luçon, or Luzon, ſometimes called *Manilla*, from its capital, is the largeſt and moſt important of the Philippine iſles, being more than ſeven degrees, or near 500 Britiſh miles in length, and about 100 of medial breadth. This iſland is pervaded in its length by a high chain of mountains towards the eaſt, ſo that its interior parts are difficult of acceſs; and the examination of it is alſo reſtrained by the jealouſy of the Spaniards. It is alſo traverſed by the branches of a conſiderable river, on the banks of which the capital is ſeated; and its lakes are numerous, the largeſt of which is the ſource of the river Manilla. Several volcanoes occur in this iſland, nor are earthquakes uncommon. Its ſoil is uncommonly fertile, and its products are gold, copper, and iron. Such is the fertility of the ſoil, that rice, which in other countries requires much cultivation, grows every where with little or no attention, and even in the higheſt mountains, without being watered. Of rice they have different kinds, ſome of which requires four or five months between the ſowing and the harveſt, and ſome which is ſown and reaped within 40 days. Although they have no wheat but that which is imported, the ſoil is very capable of bearing it, as appeared by an experiment, in which one buſhel produced 130. The graſs grows, the trees bud, bloſſom, and bear fruit all the year, not only in the gardens but on the mountains. The richeſt fruits of the Weſt Indies, as well as of the Eaſt, are here abundant, and ſome that are found no where elſe. Here are 40 different ſorts of palms, the moſt excellent cocoas and caſſia, the ſugar-cane and cotton of peculiar beauty. In the mountains are found wild cinnamon, wild nutmegs, ebony, ſandal wood, together with excellent timber for building and ſhipping. Gold is found upon the mountains in every part of the iſland, waſhed out of the earth by the heavy rains; in the mould of their vallies, carried down by their rivulets; and in the ſand and mud of their lakes, brooks, and rivers. The Spaniards obtain about 1000 or 1500 pounds weight every year, as a tribute of the inhabitants. All kinds of cattle abound, ſo that a large fat ox does not coſt above four pieces of eight. Civet-cats are alſo very common, and their civet is highly valuable. Ambergris is alſo thrown on their coaſts in prodigious quantities. The natives, who are of a mild character, are called Tagals, like all thoſe of the Philippines, and ſeem to be of Malay origin. They are tall and well made, wearing only a kind of ſhirt, with looſe drawers; but the dreſs of the women is chiefly a large mantle, and their black and beautiful hair ſometimes reaches the ground; their complexion is a deep tawny. Their houſes are of bamboo covered with palm leaves, raiſed on pillars to the height of eight or ten feet. The chief food is rice, which is often eaten with ſalted fiſh. M. Sonnerat has given ſome account of the interior part of the country, as far as he was able to penetrate it. At the diſtance of about a day's journey from the capital, he found himſelf buried in woods, no habitation nor appearance of cultivation preſenting themſelves to his view. Some ſcattered Indians, having their ſhoulders covered with the ſkins of wild goats, the reſt of the body being naked, with a bow in their hands and arrows on their back, were diſcovered. Their looks were haggard, and their countenances very unprepoſſeſſing. They ſeemed to be timid and diſpoſed to flee from the face of man, and even from one another. They have no ſociety; they are ſolitary wanderers; ſtopping when night overtakes them, and ſleeping in the hollows of trees. They have no families, and they ſeem to be conſtrained merely by inſtinct to ſue the females whom chance has thrown in their way. After traverſing the wood above-mentioned, M. Sonnerat was led to a large lake, in the middle of which is an iſland, where ſome Indian families have taken refuge; here they live by fiſhing, and preſerve their liberty, ſuffering no one to land on the place, which ſerves them for an aſylum. On the E.S.E. the lake is bounded by high mountains; the ſoil is fertile, and there are many fruit trees; and hence Manilla is ſupplied with fruit. Theſe mountains are inhabited by a mild ſet of people, who employ themſelves in making mats, cloth, and different works with the abacca, a kind of banana which bears no fruit, and of which the filaments are very ſtrong. Theſe people have laws, and puniſh crimes, the chief, in their eſtimation, being adultery. On the other ſide of the mountains, which bound the lake on the E.S.E., are immenſe plains, traverſed by large and deep rivers, which diffuſe fertility. Here are a few ſcattered villages inhabited by men, without morals, without virtue, without equity;

who fear each other, and having no protection from laws, truſt to the force of arms alone for their ſafety. In a word, they live in perpetual diſtruſt and dread of one another. Nevertheleſs, ſays our traveller, the arts have reduced this ſavage nation, without ſoftening their ferocious manners. Columba was the name of one of the largeſt villages poſſeſſed by this ſavage tribe; and on the day of his arrival the people had a grand feſtival, which they celebrated with divers ſpectacles. Part of theſe ſpectacles was the exhibition of a tragedy, and this was preceded by a cock-fight, and by other games, at which large ſums were won and loſt. Two leagues from Columba, in a village of leſs extent, was a rivulet, whoſe water was hot and boiling; and yet on the banks of this rivulet were vigorous ſhrubs; one of theſe ſhrubs was an "agnus caſtus," and the two others "aſpalatus." The Spaniſh governor, conceiving that theſe waters poſſeſs ſome good qualities, has conſtructed near them ſeveral baths. Fiſh were found ſwimming in this water, the heat of which was ſo great, that our author could not touch it. In the interior of the country, he ſays, there are many nations, which the Spaniards have in vain endeavoured to ſubdue. No force is ſufficient to ſubjugate them; but they fly to a diſtant aſylum, and there it is ſaid they ſwear an implacable hatred againſt the oppreſſors of their country, meditating and preparing means of vengeance. From thence they iſſue in mean boats; but fortified by courage, and animated by hatred, they dare to approach the gates of the capital. Their incurſions are a ſucceſſion of pillages, murders, ravages, and rapes. On leaving the village, traverſed by the rivulet of hot water, our author took an eaſterly route, and after three hours' journey, found himſelf in an immenſe plain, which was watered and rendered fertile by a rivulet of clear, light, and wholeſome water, that deſcended from the top of a neighbouring mountain. Large meadows were enamelled with flowers, whoſe variety of colour and perfume delighted equally the ſight and the ſmell. The inhabitants were friendly and hoſpitable.

In ſome provinces of this iſland there are Pintadoes, that is, painted negroes, whoſe perſons are tall, ſtraight, ſtrong, and active, and diſpoſition excellent; and to the blacks, ſuch as we have deſcribed, who live in the mountains and thick-woods, the Spaniards have given the name of Negrilloes; they are a rude and barbarous people. In the mountains, near ſprings, and in caves pleaſantly ſituated, there is a nation called the Ilayas, or Tinghianos, who, as ſome ſuppoſe, are deſcended from the Japaneſe, as free as the Negrilloes, but differing from them in diſpoſition and character; for they are not only very brave, but very courteous and humane. This iſland is divided into provinces, moſt of which are under the juriſdiction of the Spaniards. The principal are the Balayan, in which are 2500 tributary Indians; in that of Camarinas is the city of New Caceres, the ſee of a biſhop. Paracale contains 7000 Indians, who pay tribute to Spain; this province abounds in mines of gold and other metals, and of valuable load-ſtones. In Cagayan are 9000 tributaries; but the richeſt and moſt populous province is ſaid to be that of Illocos, whoſe coaſt extends upwards of 90 miles. There are ſeveral others, ſuch as Pangaſian, Bahi, Balacan, &c. N. lat. 12° 48′ to 18° 48′. E. long. 120° 6′ to 124° 10′. See Manilla.

LUCOTTA, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of Sumatra. N. lat. 1° 43′. E. long. 97° 25′.

LUCRETIA, in *Biography*, a diſtinguiſhed Roman lady, was the wife of Collatinus, a relation of Tarquin, king of Rome. Her accompliſhments proved fatal to her; and the praiſes which a number of young nobles at Ardea, who were attached to the Roman army, among whom were Collatinus and the ſons of Tarquin, beſtowed upon the domeſtic virtues of their wives at home was, in truth, productive of a revolution in the ſtate. While each was warm with wine, it was agreed that they ſhould inſtantly take their horſes, and go to Rome to aſcertain the fact how the wife of each was employed. The ladies of the Tarquins were found paſſing the night with their friends and relatives at a banquet, but Lucretia was employed in the midſt of her female ſervants, and ſharing their domeſtic labours. The beauty and innocence of Lucretia, who received her huſband and the young princes with the moſt exquiſite female grace, made ſuch an impreſſion upon Sextus Tarquinius, that he reſolved, at whatever expence, to gratify the guilty and infamous paſſion which he had conceived. In a few days after, he left the camp in ſecrecy, and came to the houſe of Lucretia, who entertained and lodged him with a noble and unſuſpecting hoſpitality; but, in return for her kindneſs, in the dead of the night he introduced himſelf to the virtuous lady, who refuſed to his intreaties, what her fear and ſhame granted to his ſavage threats. She ſubmitted to the cruel wretch, whom he not only, with a drawn ſword, threatened to murder, but to blaſt alſo her reputation, by killing one of her ſlaves, and putting him in her bed, that an apparent criminal connection might ſeem to have met with its deſerved puniſhment. Tarquin left her in triumph, but his exultations were ſhort-lived; ſhe, who had loſt her honour, had nothing left in life of any value: ſhe aſſembled, in the morning, her huſband, her father, and neareſt relatives, revealed to them the indignities ſhe had ſuffered, entreating them to avenge her wrongs, at the ſame time declaring that ſhe was reſolved to expiate her own fault by a voluntary death. To their intreaties, their arguments, and remonſtrances, ſhe turned a deaf ear, and while they were inventing new reaſons why ſhe ought to live to bear teſtimony againſt the monſter, ſhe drew a dagger that ſhe had concealed for the purpoſe, and plunged it into her heart. Hiſtorians have given the accounts ſomewhat different; our account is that of Livy, but all agree that the melancholy cataſtrophe was the immediate cauſe of the expulſion of the Tarquins, and the change of the Roman form of government.

LUCRETIUS, Titus Carus, a celebrated Roman poet and philoſopher, born about the year 96 B.C., was ſent at an early age to Athens, where he is ſaid to have ſtudied under Zeno and Phædrus. Here he imbibed the philoſophical tenets of Epicurus and Empedocles, which, at that period, prevailed at the great ſeat of Greek learning: theſe and other doctrines, popular among the literati, he afterwards explained and elucidated in his celebrated work, entitled "De Rerum Natura;" it contains, in fact, the firſt complete and accurate ſtatement of the Epicurean philoſophy in the Latin language. In this poem the writer has controverted all the popular notions of heatheniſm, and even thoſe points which are fundamental in every ſyſtem of religious faith, the exiſtence of a firſt cauſe, by whoſe power all things were and are created, and by whoſe providence they are ſupported and governed. Nevertheleſs, the maſterly genius and unaffected elegance of the poet are every where conſpicuous; his language and verſification ſometimes partake of the rudeneſs of an early period of literature, and in the argumentative parts of his work, the poet is frequently difficult to be underſtood; but where the ſubject admits of elevated ſentiment and deſcriptive beauty, no Roman poet has taken a loftier flight, or exhibited more ſpirit and ſublimity; the ſame animated ſtrain is ſupported almoſt throughout

out entire books. Virgil ſtudied him, and has borrowed much of his diction. This poem was written and finiſhed while the poet laboured under a violent delirium, occaſioned by a philtre, which the jealouſy of his miſtreſs or his wife had adminiſtered. The morality of Lucretius is generally pure, but many of his deſcriptions are licentious. The abſurdities and impiety of his philoſophy cannot in this country, and in this age, be accounted dangerous; and perſons of high integrity and the greateſt reſpectability have become, in modern times, the editors and commentators of Lucretius's poem. The beſt editions are thoſe of Creech, 8vo. 1695, Oxon.; of Havercamp, Lugd. B. 4to. 1725, and of the celebrated Gilbert Wakefield, Lond. 3 vols. 4to. The laſt is exceedingly rare, on account of the fire which deſtroyed the greater part of the impreſſion. Mr. Good, the tranſlator of the poem, and whoſe work was publiſhed in 1805, has taken advantage of this circumſtance, and has given the entire text from Mr. Wakefield's edition, which had been collated and printed with the utmoſt care by that learned and much to-be-lamented claſſical ſcholar. In the tranſlation juſt referred to, there are, beſides elaborate annotations, a critical account of the principal editions and tranſlations of his author, a hiſtory of the poet, a vindication of his character and philoſophy from vulgar miſrepreſentation, and a comparative ſtatement of the rival ſyſtems of philoſophy that flouriſhed in the time of Lucretius. In this poem the tranſlator imagines he has diſcovered the inductive method of the illuſtrious Bacon; part of the ſublime phyſics of ſir I. Newton, and various chemical diſcoveries of our own days, in a ſurprizing degree anticipated, as to their principles and many important reſults.

LUCRINO, in *Geography*, a lake near Naples, anciently celebrated for its green oyſters and other fiſh, ſeparated from the ſea by an artificial bank. In the year 1538, an earthquake formed a mountain near two miles in circumference, and 200 feet in height; conſiſting of lava, burned ſtones, ſcoria, &c. which left no appearance of a lake, but a moraſs filled with graſs and ruſhes.

LUCULLEUM MARMOR, in the *Natural Hiſtory of the Ancients*, the name of a hard ſtony kind of marble, of a good fine black, and capable of an elegant poliſh, but little regarded from its want of variegations. When freſh broken, it is ſeen to be full of ſmall, but very bright ſhining particles, appearing like ſo many ſmall ſpangles of talc. It had its name from the Roman conſul Lucullus, who firſt brought it into uſe in that city. It is common in Italy, Germany, and France. We have much of it imported, and our artificers call it the *Namur* marble, the Spaniards call it marble of *Buga*.

LUCULLIAN GAMES, in *Antiquity*, were annual games decreed by the province of Aſia, about the year 70 before Chriſt, in honour of the exploits of Lucullus.

LUCULLUS, LUCIUS LICINIUS, in *Biography*, a Roman commander, who has been celebrated for his fondneſs for luxury, as well as for his military talents, was born about the year 115 before the Chriſtian era, and being well educated, he ſoon diſtinguiſhed himſelf by his proficiency in the liberal arts, particularly in eloquence and philoſophy. As a military man, he was firſt noticed with applauſe in the Marſian war, and was, on account of his good conduct, made an edile. He was employed by Sylla in many important concerns, and during the ſiege of Athens was ſent by that commander into Egypt and Lybia, to procure a ſupply of ſhips. With reſpect to king Ptolemy he was unſucceſsful, but he pleaded the cauſe of his employer with more effect in other places, and collected a fleet, with which he gave two defeats to that of Mithridates, and convoyed Sylla's troops from the Thracian Cherſoneſus. After the peace he was appointed quæſtor in Aſia, and prætor in Africa, in which offices he rendered himſelf illuſtrious by his love of juſtice, moderation, and humanity. He was raiſed to the conſulſhip when he was about forty years of age, and entruſted with the care of the Mithridatic war; his firſt proweſs was conſpicuous in reſcuing his colleague Cotta, whom the enemy had beſieged in Chalcedonia. This was ſoon followed by a celebrated victory over the forces of Mithridates, on the borders of the Granicus, and by the conqueſt of all Bithynia. His victories by ſea were as great as thoſe by land, and Mithridates was driven with great loſs towards Armenia, to the court of Tigranes, his father-in-law. His flight was quickly diſcovered, and Lucullus croſſed the Euphrates, and gave battle to the vaſt army which Tigranes had aſſembled to ſupport the cauſe of his ſon. It is not eaſy to give entire credit to the account of the numbers ſaid to have been ſlain on this occaſion, but the ſlaughter muſt have been prodigious, when Plutarch eſtimates that not leſs than 100,000 foot, and 55,000 horſe ſoldiers loſt their lives in this battle; and this at the expence of a very few Roman lives. Lucullus is repreſented by Plutarch as having paid much attention to dreams and auguries, yet he certainly exhibited, at the ſame time, an avowed contempt of vulgar ſuperſtition, for being admoniſhed by ſome of his officers not to give battle on that day, being the anniverſary of a great defeat ſuſtained by the Romans from the Cimbri, he replied to the monitor, "I alſo will make this a day to be remembered by after-ages." The taking of Tigranocerta, the capital of Armenia, was the conſequence of the victory, and Lucullus there obtained the greater part of the royal treaſures. This continued ſucceſs rendered the commander haughty and imperious, and his changed manners were offenſive to the ſoldiers, and diſpleaſing to thoſe who adhered to the cauſe of Rome. He was accuſed in the ſenate with deſignedly protracting the war for his own emolument, and diſcontents proceeded ſo far that he was ſuperſeded, firſt by the conſul Glabrio; after which Pompey was ſent to ſucceed him, and to continue the Mithridatic war. His interview with Lucullus began with acts of mutual kindneſs, and ended in the moſt determined enmity. Lucullus was however permitted to retire to Rome, and 1600 ſoldiers, who had ſhared his fortune and his glories, were allowed to accompany him. At Rome he was coldly received, and he obtained with difficulty a triumph which was claimed by his fame, his ſucceſſes, and his victories. This was the termination of his military glory, he retired to the enjoyment of eaſe and peaceful ſociety, and no longer intereſted himſelf in the commotions which diſturbed the tranquillity of Rome. He now adopted a life of luxurious profuſion, ſcarcely parallelled by a private citizen in any age or country, but under the direction of a refined taſte, and not excluding the rational pleaſures of literature. He collected a ſplendid library, which he threw open to all perſons of learning and curioſity. It was particularly the reſort of the Greeks who viſited Rome, and whom he treated with great hoſpitality, delighting to converſe with them on topics of philoſophy, with all the doctrines and ſects of which he was thoroughly converſant. He was himſelf principally attached to the doctrines of the old academy, the defence of which is put into his mouth by Cicero, in a dialogue entitled "Lucullus." Toward the cloſe of his life, Lucullus fell into a delirium, and he died in about the ſixty-eighth year of his age, and was much regretted by the Roman people, who doubtleſs had taſted the fruits of his munificence: they would willingly have given him an honourable funeral in the Campus Martius, but their offers were rejected, and he was privately buried by his brother at Tuſculum. Lucullus has been admired for his many accompliſhments, but he has been cenſured for his ſeverity and extravagance. The expences of his table were immoderate; his halls were diſtinguiſhed by the different names of the gods, and when Cicero and Pompey attempted to ſurpriſe him, they were aſtoniſhed at the coſtlineſs of a ſupper which had been prepared upon the word of Lucullus, who had merely ſaid to his ſervant that he would ſup in the hall Apollo. In his retirement Lucullus was fond of artificial variety; ſubterraneous caves and paſſages were dug under the hills on the coaſt of Campania, and the ſea-water was conveyed round the houſe and pleaſure-grounds, where the fiſhes flocked in ſuch abundance, that at his death they were ſold for a very large ſum of money. Lucullus may rank among the great men of Rome, both for his civil and military qualifications. He was alſo eſtimable in many points of moral character; he was generous, humane, mild, and equitable. He was a perfect maſter of the Greek and Latin languages, and employed himſelf ſome time in compoſing a conciſe hiſtory of the Marſi in Greek hexameters. Such are the characteriſtics of a man who meditated the conqueſt of Parthia, and who might have diſputed the empire of the world with a Cæſar or Pompey, if his fondneſs for retirement had not withdrawn him from the reach of ambition.

LUCUMA, in *Botany*, the Peruvian name of the Linnæan *Achras mammoſa*, which Juſſieu has ſeparated, under this appellation, as a diſtinct genus; chiefly, as it appears, on account of the flowers being pentandrous and five-cleft, and the corolla globoſe rather than bell-ſhaped. The ſeeds moreover are round or angular, not of that elliptical compreſſed form, with the peculiar long ſcar of attachment, which characterizes *Achras*; ſee that article. See alſo Juſſ. 152, and *Sapota Achras*, Gærtn. t. 104.

LUCY-le-Bois, in *Geography*, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of Avallon. The place contains 830, and the canton 7886 inhabitants, on a territory of 242½ kiliometres, in 16 communes.

LUCZAY, a town of Lithuania, in the palatinate of Wilna; 16 miles S. of Breſlaw.

LUCZYNCZ, a town of Poland, in the palatinate of Braclaw; 48 miles W.S.W. of Braclaw.

LUDAIA, a town and diſtrict of the iſland of Java, near the S. coaſt.

LUDAMAR, a Mooriſh country of Africa, bounded on the N. by the Great Deſert, on the E. by Bambarra and Beeroa, on the S. by Kaarta, and on the W. by Jaffnoo. It is governed by a Mahometan prince. The country is not fertile; the principal article of trade is ſalt, which they procure from the Great Deſert, and exchange for ſlaves, to be diſpoſed of to the Europeans. The capital is Benowm, or Benown. N. lat. 15° to 16°. W. long. 5° to 8°. The Moors of this, and the other ſtates adjoining the country of the negroes, reſemble in their perſons the Mulattoes of the Weſt Indies, to ſo great a degree as not eaſily to be diſtinguiſhed from them; and in reality, the preſent generation ſeems to be a mixed race between the Moors (properly ſo called) of the north, and the Africans of the ſouth; poſſeſſing many of the worſt qualities of both nations. By theſe Moors Mr. Park was taken captive, and confined for ſome weeks at Benowm. See Moors.

LUDDINGHAUSEN, a town of Germany, in the biſhopric of Munſter, on the Stever; 12 miles S.S.W. of Munſter. N. lat. 51° 45'. E. long. 7° 36'.

LUDE, Le, a town of France, in the department of the Sarthe, and chief place of a canton, in the diſtrict of La Flèche. The place contains 3018, and the canton 10,376 inhabitants, on a territory of 237½ kiliometres, in 10 communes.

LUDENSCHEDE, a town of Germany, in the county of Mark, the principal trade of which conſiſts in the manufacture of iron; 28 miles N.E. of Cologne. N. lat. 51° 8'. E. long. 7° 42'.

LUDER, a town of Germany, in the biſhopric of Fulda, the ſeat of a juriſdiction; ſix miles W.N.W. of Fulda.

LUDGERSHALL, or Luggershall, a market and borough town in the hundred of Ameſbury and county of Wilts, England. In the year 1800 this place contained 109 houſes, and 471 inhabitants, moſt of whom are employed in agricultural purſuits. Ludgerſhall is a borough by preſcription, and ſent members to all the parliaments in the reign of Edward I. The returns were afterwards irregular, till the ninth year of Henry V., ſince which time it has continued to be repreſented by two members. Like the generality of ſmall boroughs, this has occaſioned ſome parliamentary inveſtigation, and inſtances of bribery and corruption have been proved againſt its members. About ſeventy perſons, who are freeholders, or leaſe-holders, in the borough, have the privilege of voting. The principal object of curioſity, or hiſtorical intereſt, in this town, is its caſtle; a ſmall fragment of which only remains. According to a legendary account, but which is not entitled to much credit, this fortreſs was erected by king Lud, and thence obtained the name of Lud-gars-hall. Stow, in his Annals, relates that Richard I. gave this caſtle, with another at Marlborough, in the ſame county, to his brother John, in the firſt year of his reign. Gough, in his additions to Camden's Britannia, ſtates that it belonged to "Geofrey Fitz-Piers, the wealthy chief-juſtice of England, and earl of Eſſex." It was poſſeſſed by this family till the reign of Henry III., when Jollan de Nevill was appointed its governor. In the reign of Edward III. the manor, caſtle, &c. were veſted in John, lord Molins, who obtained a grant from that monarch to impark the woods with 100 acres adjoining. See Groſe's Antiquities of England, and Britton's Beauties of Wiltſhire, vol. ii. p. 156, &c. Weſt of this town is Chidbury, or Shidbury hill, ſaid to be the higheſt eminence in Saliſbury plain. Its ſummit is incloſed with an entrenchment, which is deep, and which Aubrey attributes to the Britons. From the top, a ditch extends down the northern ſlope, and terminates at the bottom, where the inequality of the ground ſhews that a permanent encampment, or town formerly exiſted. The open downs in this part of the county abound with barrows, or tumuli of various ſizes, and encampments. See Stukeley's Account of Stonehenge, and Hoare's Ancient Wiltſhire.

LUDHANA, a town of Hindooſtan, in the circar of Sirhind, on the Setledge; 18 miles N.W. of Sirhind. N. lat. 30° 2'. E. long. 74° 57'.

LUDHOA, a town of Sweden, in Eaſt Bothnia; 36 miles S.E. of Braheſtad.

Ludi *Trojans*. See Trojani.

LUDIA, in *Botany*, from *ludo*, to ſport. The name was given by Commerſon, as Juſſieu informs us, becauſe nature, to uſe a common expreſſion, *ſports* remarkably in the ſhape of the leaves; which in the young ſhrub are minute, with ſpinous teeth, but in the adult one much larger, and entire.—Juſſ. 343. Lamarck Dict. v. 3. 612. Illuſtr. t. 466 Willd. Sp. Pl. v. 2. 1129.—Claſs and order, *Polyandria Monogynia*. Nat. Ord. *Roſaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in from four to ſeven deep, nearly equal, roundiſh, ſpreading, fringed ſegments, permanent. *Cor.* none. *Stam.* Filaments numerous, thread-ſhaped, inſerted into the receptacle, twice or thrice the length of the calyx; anthers roundiſh, of two lobes. *Piſt.* Germen ſuperior, ſeſſile, ovate; ſtyle columnar, ſcarcely ſo long as the ſtamens; ſtigma obtuſe, three or four-cleft, more or leſs deeply. *Peric.* Berry dry, globoſe, tipped with the permanent ſtyle, and ſtanding on the reflexed, deformed, permanent calyx, of one cell. *Seeds* numerous, ſomewhat angular.

Eſſ. Ch. Calyx in ſeveral deep ſegments. Corolla none. Stigma three or four-cleft. Berry dry, ſuperior, of one cell, with many ſeeds.

Obſ. This genus is evidently moſt nearly allied to *Prockia*, and wherever the latter is placed, in a natural or artificial ſyſtem, this muſt go along with it. Both ſeem to belong to the *Icoſandria*, but they have been univerſally claſſed in *Polyandria*. Jacquin indeed aſſerts that the ſtamens of his *Ludia tuberculata* are inſerted into the receptacle; but, on the other hand, the *Prockia integrifolia*, Willd. Sp. Pl. v. 2. 1214, is as truly icoſandrous as the ſtrawberry or any other plant can poſſibly be, though Lamarck's figure, t. 465. f. 2, does not expreſs it. He has, moreover, made the ſerratures of the leaves too ſtrong, they being very ſhallow in the original.

1. L. *heterophylla*. Lamarck n. 1. t. 466. f. 1, 2.—Leaves of the adult ſhrub obovate, coriaceous, ſhining; of the young one ſharply toothed. Stigma ſlightly notched.—Gathered by Commerſon in the iſland of Mauritius, where it is called *Bois ſans ecorce*, or tree without bark. Lamarck deſcribes and figures the young ſhrub with ſmall roundiſh *leaves*, furniſhed with ſtrong ſpinous teeth, ſomewhat like *Quercus coccifera*, or *Malpighia coccifera*. Juſſieu alſo relates the ſame. We have ſeen no ſpecimens in this ſtate. Our's is an adult one, with coriaceous, obovate, obtuſe or emarginate, entire, alternate *leaves*, an inch or an inch and half long, broad, veiny, and ſhining, paler beneath, on ſtrong footſtalks, half an inch in length; ſee Lamarck's fig. 1. We find no *ſtipulas*. The *flowers* are axillary, ſolitary or in pairs, on ſhort, thick, ſcarred ſtalks, with numerous, minute, imbricated, roundiſh concave *bracteas* at the baſe of the ſtalks. The *calyx* is green, finely downy. *Stamens* long and ſlender. *Style* ſhort, erect and thick, with a ſlightly notched, very little enlarged, *ſtigma*.

2. L. *myrtifolia*. Lamarck n. 2. t. 466. f. 3.—Leaves ovate, nearly entire. Style ſomewhat curved. Stigma with three notches.—Native of the iſle of Bourbon.—This is what Juſſieu intends when he ſays the *leaves* of the increaſing ſhrub (in *Ludia*) are like myrtle or box, and entire; as however the ſpecimens are in flower, Lamarck judged them to be arrived at perfection, and a diſtinct ſpecies from the above; eſpecially as the *ſtyle* is ſomewhat incurved, and the *ſtigma* has only three notches, inſtead of four. We are totally unable to form any decided opinion on the ſubject. The *leaves* of the preſent plant are much ſmaller, thinner, and generally more pointed than in the former; but we perceive here and there among them rudiments of teeth, and minute ſpines, as if they were in a progreſſive ſtate from one ſhape to the other. Neither are the differences indicated in the *ſtyle* and *ſtigma* very ſtriking or decided. We are therefore moſt inclined to adopt the opinion of Juſſieu, that the preſent is only the advancing, or firſt-flowering, ſtate of the above very extraordinary ſpecies. We have moreover a ſpecimen, gathered by Commerſon in Madagaſcar, which is evidently intermediate in the form, margin, and texture of its leaves, betwixt this *myrtifolia* and the adult *heterophylla*.

3. L. *ſeſſiliflora*. Lamarck n. 3. (L. tuberculata; Jacq. Hort Schoenbr. v. 1. 59. t. 112.)—Leaves elliptic-lanceolate. Stigma deeply three-cleft.—Native of the iſland of Mauritius. It flowered under Jacquin's obſervation, in the ſtove at Schoenbrun, in June and July, and formed imperfect fruit, which he thought did not agree with Juſſieu's character, and which Willdenow has, from his figure, deſcribed as being, in this ſpecies, a berry of three cells, with ſolitary ſeeds. But we preſume nothing can be judged from ſuch an abortion. We ſhould have preferred Jacquin's ſpecific name to Lamarck's, as the flowers are rarely ſeſſile, had it not been equally applicable to both the former. This is a ſmall *tree*, with drooping, ſubdivided branches. *Leaves* ſcattered, ſtalked, more or leſs elliptical, but rather irregular in ſhape, coriaceous, veiny, ſmooth and ſhining, both ſides nearly of the ſame hue. *Flowers* axillary, ſolitary; in our ſpecimen nearly as much ſtalked as in the above. *Calyx* all over very downy. *Germen* large, and rather elevated. *Style* divided, almoſt half way down, into three blunt cloven ſtigmas.

LUDITZ, in *Geography*, a town of Bohemia, in the circle of Saatz.

LUDLOW, EDMUND, in *Biography*, a diſtinguiſhed leader of the republican party in the civil wars of Charles I., ſon of ſir Henry Ludlow, knight, was born about the year 1620, and received his academical education at Trinity college, Oxford, whence he removed to the Temple to ſtudy the laws and conſtitution of his country. His father was repreſentative for Wiltſhire in the Long parliament of 1640, and having joined the party in oppoſition to the court meaſures, Edmund adopted the ſame principles, and entered into a military aſſociation among the ſtudents of law, with whom he joined the army as one of the life-guards of the earl of Eſſex. In this ſituation he was preſent at the battle of Edgehill, in which it appears that he endured much perſonal fatigue and ſuffering. Speaking of the night after the battle, he ſays, "No man nor horſe got any meat that night, and I had touched none ſince the Saturday before; (this was Monday,) neither could I find my ſervant, who had my cloak, ſo that having nothing to keep me warm but a ſuit of iron, I was obliged to walk about all night, which proved very cold by reaſon of a ſharp froſt." And he farther adds, "when I got meat, I could ſcarcely eat it, my jaws, for want of uſe, having loſt almoſt their natural faculty." Soon after this, Ludlow raiſed a troop of horſe, which he commanded at the ſiege of Wardour caſtle. Of this fortreſs, when taken, he was made governor, and he held it ten months againſt all the efforts of the king's party, till it was battered to ruins. He was taken priſoner on its ſurrender, but was ſoon exchanged, and then appointed by the parliament ſheriff of the county of Wilts. He took a commiſſion under ſir William Waller, was preſent at the ſecond battle of Newbury, and at ſeveral other important actions, in which he diſplayed equal valour and good conduct. When the leaders of the preſbyterian party were thrown out of power by the ſelf-denying ordinance, Ludlow ſeceded with them, and remained without public employment till he was choſen, in 1645, knight of the ſhire for the county of Wilts, in the place of his father, who died two years before. At this period the plans of Cromwell began to be developed, and Ludlow was one of thoſe who oppoſed them with the greateſt firmneſs and openneſs. He appears to have acted with principle, and his meaſures were all the reſult of integrity and honour. He was one of the king's judges, and ſoon after that event, Cromwell, to keep him out of the way, cauſed him to be nominated lieutenant-general of horſe in Ireland, and one of the commiſſioners for civil affairs. After the death of Ireton, the chief command of the army devolved on Ludlow, but as he continued to oppoſe the ambitious projects of the protector, he was, in a very ſhort time, ſuperſeded. He was afterwards impriſoned, but being admitted into the preſence of Cromwell, he vindicated his own conduct and the republican principles on which he acted with great freedom and preſence of mind, and could not, by any means, be induced to make any engagement for future ſubmiſſion. When Richard was declared protector, Ludlow, with other republicans, joined the army party of Wallingford-houſe, and was inſtrumental in the reſtoration of the Long parliament, in which he took his former ſeat; was appointed one of the committee of ſafety, and had likewiſe the command of a regiment. He was again ſent to Ireland as commander-in-chief of the forces there, and his firſt care was to fix the officers in the intereſt of parliament. When he found things taking a decided turn towards monarchy, he haſtened to London with a view of preventing this change, and when he found the effort hopeleſs, and that the tide of public inclination in favour of a king was irreſiſtible, he began to conſider of his own ſafety. His name was not among the ſeven excepted in the bill of indemnity; nevertheleſs, the proclamation reſpecting the perſons who ſat in judgment on the late king Charles filled him with juſt apprehenſion, and notwithſtanding the remonſtrances of his friends to the contrary, he determined, as his ſafeſt courſe, to withdraw from the kingdom. He landed at Dieppe in 1660, whence he proceeded to Geneva, where he was joined by two other perſons who had likewiſe been judges of the late king, but thinking themſelves not ſufficiently ſecure they withdrew into Switzerland. Even here, the vengeance of the royal family purſued the regicides, ſome of whom were actually aſſaſſinated by the agents of the Engliſh government; an attempt was made againſt the life of Ludlow, but being diſcovered, he evaded the blow, and paſſed the remainder of his life in the neighbourhood of Berne, highly reſpected and eſteemed by the magiſtrates and people of that city, as well for his private virtues as his public character. In 1689 he ventured to come over to England, and appear openly in London; but a motion being made in the houſe of commons for an addreſs to the king to iſſue a proclamation for his apprehenſion, he returned to the continent, and cloſed his life in exile, at the age of ſeventy-three. A monument was erected to his memory, in the principal church at Vevay, by his widow, who had been the faithful and courageous partner in all his fortunes. Edmund Ludlow was undoubtedly one of the pureſt and moſt diſintereſted perſons who flouriſhed in thoſe times. He was equitable and humane, calm and ſedate, yet reſolute; virtuous without auſterity, and pious without fanaticiſm. His "Memoirs" were firſt printed at Vevay, in two vols. 8vo. 1698, to which, in the following year, another volume was added. They were reprinted in one volume folio, London 1751; to this edition was added "The Caſe of king Charles I.," drawn up by John Cook, ſolicitor to the high court of juſtice on his trial. In the ſame year, the work was printed in three vols. 12mo. at Edinburgh. An edition in 4to. was publiſhed in 1771. The "Memoirs" contain an account of the author's own tranſactions during the civil wars, and the ſubſequent period, together with many particulars relative to the general hiſtory of the times, written in a clear, intereſting, and unaffected ſtyle. Biog. Brit. Ludlow's Memoirs, three vols. 12mo.

Ludlow, in *Geography*, a market-town, ſituated in the hundred of Munſlow, and county of Salop, England. It ſtands on an eminence at the junction of the rivers Teme and Corve, in a fertile and pictureſque diſtrict, and commands a variety of beautiful proſpects. The ancient Britiſh name of this place was *Dinan Llys Tywſog*, or the *Prince's Palace*. Hence it is ſuppoſed to have been the reſidence of ſome prince of the country, prior to the ſubjection of Wales by Edward I. This town extends about a mile in length, and in its broadeſt part is ſomewhat more than half a mile in that direction. It was formerly ſurrounded by a wall, ſome part of which is ſtill ſtanding, but in a ſtate of great dilapidation. Towers were placed at certain diſtances, and there were formerly ſeven gates, of which only one now remains. The ſtreets are moſtly wide, and well paved, and lie in a diverging and inclined direction from the higheſt, or central part of the town. The houſes, in general, preſent rather an elegant appearance, and are more regularly diſpoſed than in moſt inland towns of the ſame antiquity. They are chiefly occupied by families of independent fortune, who are attracted by the healthful ſituation of the place. Gloves conſtitute the principal manufacture, beſides which, however, there is a conſiderable trade in the tanning, timber, and cabinet making lines. A number of perſons are likewiſe employed in the various branches of mechaniſm. There are four markets during the week, but the moſt important one is held on Monday, and is well ſupplied with every article neceſſary for the ſupport of man.

Ludlow, according to the parliamentary returns of 1801, contained 804 houſes, and 3897 inhabitants. It was incorporated by charter in the reign of Edward IV. The government is now veſted in a recorder, two bailiffs, two capital juſtices, twelve aldermen, twenty-five common councilmen, a town clerk, a coroner, and ſeveral other inferior officers. The election of the bailiffs is uſually attended with a degree of magnificence and ſplendour far ſurpaſſing the ſame ceremony in other towns of ſimilar extent. The quarter-ſeſſions are held here before the recorder and juſtices of the town, who, in former times, had the power of inflicting capital puniſhments, but all criminals liable to death are now removed to the county gaol at Shrewſbury. There is a court of record every week, in which the recorder and bailiffs ſit as judges. This place ſends two members to parliament, who are choſen by the common burgeſſes, amounting to about 500 in number.

Several of the public buildings of Ludlow are remarkably neat ſtructures. The church, ſituated in the higheſt portion of the town, is a very ſpacious and elegant edifice, in the form of a croſs, and ſeems to have been built in the reigns of Henry VII. and VIII. In the centre riſes a lofty ſquare tower, embattled at the top, and very handſomely embelliſhed. This tower adds in no ſmall degree to the beauty of many of the views from the neighbouring country. The principal entrance to the church is under a large hexagonal porch. The nave is divided from its aiſles by ſix lofty pointed arches on each ſide. The choir is of large dimenſions, and lighted by five lofty pointed windows on each ſide, and one at the eaſt end, which occupies the whole breadth, and nearly the whole height of the choir. This great window is entirely filled with painted glaſs, repreſenting chiefly the legend of St. Lawrence, the patron ſaint of the church. On each ſide of the choir ſtands a chantry chapel. That on the north exhibits ſome very ſplendid remnants of painted glaſs, pourtraying the ſtory of the ring preſented by ſome pilgrims to

Edward the confeſſor; which pilgrims the legend recites were *men* of Ludlow. The whole of this noble church is ceiled with fine oak, and embelliſhed with carving. It is 228 feet in length, and 73 in breadth. In the chancel are many fine monuments of the lords preſidents of the council of Wales, who reſided in the neighbouring caſtle. A variety of tombs likewiſe appear in the church-yard, adjoining to which ſtands an alms-houſe, founded in 1486, by Mr. John Hoſier, merchant, for aged widows and widowers, and rebuilt by the corporation in 1758. Another alms-houſe, ſituated at the bottom of Corve ſtreet, was founded in the year 1590. The grammar-ſchool, erected by Edward IV. in Mill-ſtreet, is a very excellent inſtitution, where both the ancient and modern languages are taught. Nearly in the centre of the town, at the top of Broad ſtreet, ſtands the croſs, a handſome ſtone building, with rooms over it uſed as a public ſchool. The market-houſe, in Caſtle-ſtreet, is a large building; beneath which is an area, ſerving as a corn-market, and the upper rooms, which are very extenſive, are uſed for corporation meetings, balls, aſſemblies, &c. The guild-hall, where the quarter ſeſſions, &c. are held, is a neat, commodious, modern ſtructure, and to the weſt of the church ſtands a range of buildings, called the College. There is likewiſe a priſon, named Goalford's tower.

But the object of greateſt intereſt in Ludlow, and that to which it owes its celebrity and importance, is its caſtle, which ſtands on a bold wooded rock at the north-weſt angle of the town. It was founded, according to the generally received opinion, by Roger de Montgomery, about the year 1130, though ſome writers maintain it to be of earlier origin. Much, however, was added by others at different periods, particularly by ſir Henry Sidney. Robert de Beleſme, grandſon of the founder, having engaged in rebellion againſt Henry I. it was ſeized by that monarch. The caſtle, now made a princely reſidence, was greatly augmented in the ſtrength of its fortifications, and ſupplied with a numerous garriſon. In the reign of king Stephen it was beſieged in conſequence of the governor, Gervas Paganel, having been induced to eſpouſe the cauſe of the empreſs Matilda. With reſpect to the event of the ſiege, different accounts are handed down to us by hiſtorians, ſome aſſerting that the king ſucceeded in reducing it, and others, that finding it impregnable, he was compelled to abandon the attempt. Speed ſays, that the governor, repenting of his conduct in withdrawing from his allegiance, propoſed a capitulation highly advantageous to the garriſon, which was joyfully accepted. During this ſiege, Stephen gave a ſignal proof of his perſonal bravery, in reſcuing prince Henry of Scotland, who had advanced too near the walls, and had been caught from his horſe by a grappling iron, faſtened to the end of a rope. In the troubleſome reign of Henry III. the ambitious Simon Montfort, earl of Leiceſter, ſeized upon this caſtle, in conjunction with Llewellin. From this period nothing remarkable happened till the time of Henry VI. when it was held by Richard duke of York, who laid claim to the crown. Having aſſembled an army of ten thouſand men in the Marches, he drew up a declaration of allegiance to the king, pretending that this large army was only raiſed for the ſecurity of the public peace. Time, however, diſcloſed the perfidy of his views; for no ſooner was he informed of the defeat of lord Audley at Bloreheath, but he threw off the maſk, avowed his pretenſions to the throne, and appointed the caſtle of Ludlow as a place of rendezvous for his adherents. Upon this, the king's forces advanced to Ludford, a vill at a little diſtance from hence. The king's troops preparing for the attack, the duke's forces began to diſband. Sir Andrew Trollop likewiſe went over to the royal ſtandard with a large body, whereupon the duke and his two ſons, with the earl of Warwick and other chiefs, fled with precipitation. Edward, his eldeſt ſon, obtained poſſeſſion of Ludlow in the courſe of the war, and upon his acceſſion to the throne repaired it, and made it the court of his ſon the prince of Wales. Here the latter, after his father's death, was proclaimed king before he removed to London, at the inſtigation of his uncle, Glouceſter, whoſe barbarous uſurpation is not paralleled in the annals of England. Arthur, ſon to Henry VII. fixed his reſidence at this caſtle, and held a court here with vaſt ſplendour and magnificence after his marriage with Catharine of Arragon, afterwards the wife of Henry VIII. At this time the court of the Marches for the principality of Wales was eſtabliſhed here, and continued for many years with much grandeur and ſolemnity. The power of this court was very extenſive, and conſiſted of a lord-preſident, as many counſellors as the prince pleaſed, a ſecretary, an attorney, a ſolicitor, and four juſtices for the counties of Wales. King Charles I., when prince of Wales, viſited this caſtle. It was next diſtinguiſhed by the repreſentation of the celebrated Maſque of Comus in 1634, during the preſidency of John earl of Bridgewater. This exquiſite effuſion of Milton's genius was founded on a real incident. The two ſons of the earl, and his daughter lady Alice, being on their way from a houſe belonging to their family in Herefordſhire to Ludlow,

> "To attend their father's ſtate
> And new intruſted ſceptre,"

were benighted in Haywood foreſt, where the lady was loſt for a ſhort time. The adventure being related to the earl on their arrival at the caſtle, Milton, at the requeſt of his friend Mr. Henry Lawes, who taught muſic in the family, wrote the Maſque. Lawes ſet it to muſic, and performed the character of the attendant ſpirit; the lady herſelf playing the part which ſhe had already acted in real life. The patronage afforded to the muſe of Milton, at this period, by the earl of Bridgewater, does great honour to that nobleman.

During the civil wars in the reign of Charles I. this caſtle was for ſome time kept as a garriſon for the king. In 1645, a ſmall part of the royal army was defeated in this neighbourhood, and on the 9th of June, in the following year, the fortreſs was ſurrendered to parliament. After the reſtoration, the celebrated Samuel Butler, ſecretary to the earl of Carbery, then appointed lord preſident, wrote here a great part of his incomparable poem of Hudibras. From this period nothing remarkable happened till the reign of William and Mary, when the court of the Marches was diſſolved by act of parliament, being, as therein recited, "a great grievance to the ſubject." After this event the caſtle gradually fell into decay, and was deſpoiled of its curious and valuable ornaments. In the days of its proſperity it ſeems to have been one of the moſt extenſive and ſuperb baronial fortreſſes in Europe. It commands grand and extenſive proſpects, and is ſtrongly environed by embattled walls of great height and thickneſs, with towers placed at convenient diſtances. That portion of it which lies neareſt the town, was likewiſe defended by a deep ditch. The whole was divided into two diſtinct parts or courts, one of which contained the palace and lodgings, and the other the court of judicature and records, ſtables, garden, and other offices. The former conſtituted what was properly denominated the Caſtle, and the latter was called the Green or Barbican.

bican. This noble fabric now preſents a maſs of magnificent ruins, retaining, however, ample aſſurances of its former glory. Of the chapel, a circular building, in the inner court, is all that remains. Over ſeveral of the ſtable doors the arms of Elizabeth and the earl of Pembroke are ſtill viſible, and over the inner gate of the caſtle are the arms of the Sidney family, with an inſcription beneath. Along the ſides of the eminence on which theſe ſplendid ruins are ſeated are ſome public walks, which were laid out in 1772, at the inſtigation of the counteſs of Powis. Part of Ludlow caſtle has been recently occupied by Lucien Buonaparte, his family, and ſuite, who are priſoners of war in this country.

The neighbourhood of Ludlow abounds with gentlemen's ſeats and agreeable villages. In the village of Bromefield are the remains of a cell of Benedictine monks, formerly belonging to the abbey of St. Peter, Gloceſter. Theſe ruins ſtand on a delightful ſituation within the grounds of Oakley park, the reſidence of the dowager lady Clive. Richard's caſtle lies about three miles from Ludlow. The town contiguous was originally called Gayton or Boytane, but the luſtre of the caſtle afterwards eclipſed that name, and it is now called by the ſame appellation as the caſtle. This was once a place of conſiderable importance, as is evident from ſeveral old records prior to the time of Henry II. when it began to decay, in ſpite of the exertions of the noble family of Mortimer to ſupport its declining ſtate. Some part of the keep and walls of the caſtle are ſtill remaining. About four miles N.W. of the town is Dowton caſtle, the ſeat of —— Knight, eſq., brother to R. P. Knight, author of a poem called "The Landſcape," and of ſeveral other literary productions. This gentleman built an irregular and ſingular manſion here, and called it a caſtle. He alſo laid out the grounds, immediately adjoining the houſe, in a ſtyle correſponding to his theoretical principles of the pictureſque. On this ſubject both Mr. Knight and his friend Mr. Price have publiſhed ſome eſſays. The grounds and woods of this demeſne are particularly bold, grand, and diverſified. See the Ludlow Guide by J. Price, 18mo. 1797. Alſo an Hiſtorical Account of Ludlow Caſtle, &c. by W. Hodges, 1794.

LUDLOW, a townſhip of America, in Hampſhire county, Maſſachuſetts, 90 miles W. of Boſton; incorporated in 1784, and containing 650 inhabitants.—Alſo, a townſhip on Black river, Windſor county, Vermont, containing 410 inhabitants, 10 or 12 miles W. of Weathersfield, on Connecticut river.

LUDOLF, JOB, in *Biography*, a learned orientaliſt, born in 1624 at Erfurt, in Thuringia, was educated in the univerſity of his native place, paying particular attention to the ſtudy of juriſprudence and of the learned languages, eſpecially thoſe of the Eaſt. With the view of farther improvement he travelled into foreign parts, and was from home during ſix years, when he returned to Erfurt, where he exerciſed the functions of a counſellor for nearly twenty years of his life. He frequently aſſiſted at the diets held upon the ſubject of the conteſts between the dukes of Saxony and the archbiſhops of Mentz. At length, weary of public buſineſs, he obtained leave to retire, and choſe for the place of his retreat the city of Frankfort on the Mayne: but ſcarcely had he ſettled his family, when the elector palatine placed him at the head of his finances. In his ſervice he made two journies to France, where he conſulted the libraries of Paris, in order that he might make ſome advances in his favourite ſtudies. At length he returned to Frankfort, and employed himſelf in finiſhing and reviſing the different works which he had compoſed. He died in 1704, univerſally eſteemed; he has been characterized as equally fitted for the diſpatch of public buſineſs, and the retired purſuits of the cloſet. He was author of a great number of works, of which the principal are, "Hiſtoria Æthiopica," folio; "A Commentary on the ſame;" and an "Appendix." In theſe works the hiſtory, religion, and manners of the Ethiopians are detailed at length. He alſo publiſhed an "Abyſſinian Grammar and Dictionary," folio; "Diſſertatio de Locuſtis," folio; "Faſti Eccleſiæ Alexandrinæ;" "De Bello Turcico feliciter Conficiendo." Moreri.

LUDOLF, HENRY WILLIAM, nephew of the preceding, was born at Erfurt in the year 1655. He was well educated, and was particularly inſtructed in the Oriental languages. He was a man well calculated for public buſineſs as well as deeply learned: he obtained the poſt of ſecretary to the envoy from Chriſtian V. king of Denmark to the court of Great Britain, who recommended him to prince George of Denmark, by whom he was appointed ſecretary in 1680. This ſituation he held ſome years, till a very violent fever rendered him incapable of diſcharging its duties, when he retired wit a handſome penſion. As ſoon as his health would permit he ſet out on his travels to foreign countries. He firſt went to Ruſſia, and having ſoon acquired its language, he met with a polite reception from the natives, and being a good performer in muſic, he had the honour of diſplaying his accompliſhments in this art before the czar of Moſcow, to the ſurprize and delight of that prince. The various knowledge which he diſcovered in his converſations with the Ruſſian clergy led them to conſider him as a prodigy of learning. He arrived in London in 1694, when he underwent an operation of cutting for the ſtone. Having recovered, he applied himſelf to the compoſition of "A Ruſſian Grammar;" intended for the uſe not only of traders and travellers, but of the natives themſelves, by exhibiting the principles of their language in a more regular form than had been laid down before. This work was printed at Oxford in 1696. Ludolf's curioſity led him next into the Eaſt, that he might obtain information concerning the ſtate of the Chriſtian church in the Levant. He arrived at Smyrna in November 1698, whence he went to Jaffa, from Jaffa to Jeruſalem, and from thence to Cairo. As ſoon as Ludolf had returned to England, his reflections on the deplorable ſtate of Chriſtianity among thoſe who profeſſed that religion under the Turkiſh government, induced him to undertake an impreſſion of the New Teſtament in the vulgar Greek, and to preſent it to the members of the Greek church. He was very deſirous that the Proteſtant powers of Europe ſhould eſtabliſh a kind of college at Jeruſalem, and that the perſons ſelected for ſuch an inſtitution ſhould not be devoted to the propagation of the peculiarities of any particular ſyſtems concerning which Proteſtants differ among themſelves, but united by an agreement in the fundamental principles of the goſpel, and by univerſal love and charity. In the year 1709, Ludolf was appointed by queen Anne one of the commiſſioners for managing the money collected for the relief of the Palatines, who had been driven from their native country. He died in 1710. He was author of ſeveral works beſides his "Ruſſian Grammar," which were collected and publiſhed in the year 1712. Gen. Biog.

LUDOLFIA, in *Botany*, a genus of Adanſon's, (Familles des Plantes, v. 2. 244.) named by him after Michael Matthias Ludolff, author of a catalogue of the plants of the garden at Berlin, where he was profeſſor of Botany and Materia Medica, and where his book was printed in 1746. He publiſhed alſo a German Pharmacopeia in 1734; and wrote on the ſubject of botanical claſſification, in the Mem. de l'Acad. de Berlin for 1745, where, according to Haller, he rejects the ſtamens as well as the cotyledons for the purpoſes of arrangement. We have not ſeen this treatiſe. What he offers relative to this matter and others, at the end of his work firſt mentioned, gives no exalted idea of his judgment. The above name has never been eſtabliſhed, the plant of Adanſon being eſteemed a *Tetragonia*. It is curious that Boehmer, in his diſſertation upon plants named after botaniſts, ſuppoſes the *Ludolfia* to have been called after Job Ludolf, author of the *Hiſtoria Æthiopica*, being ignorant, as it ſeems, of the exiſtence of the Berlin profeſſor; but we can have no doubt that Adanſon meant to commemorate the latter.

LUDSCHEN, in *Geography*, a town of Pruſſia, in Oberland; 7 miles E.S.E. of Marianwerder.

LUDSWIGSBURG, a town of Wurtemberg, containing two chapels, one for Roman Catholics and another for Lutherans, and a fine picture gallery, a pleaſant garden, and an old caſtle. The manufactures of this place are cloth, damaſk-linen, and marble paper; 16 miles S. of Heilbron. N. lat. 48° 54′. E. long. 9° 18′.

Though Stuttgard was in 1772 the nominal capital of the duchy of Würtemberg, it had not, for the preceding ten years, been the reſidence of its ſovereign. And though the operas and muſical eſtabliſhments of this prince uſed to be the moſt ſplendid in Europe, during the ſeven years' direction of Jomelli, they were, at the time juſt mentioned, but the ſhadow of what they *had* been. In Burney's German Tour, there is a liſt of his ſerene highneſs's muſical eſtabliſhments, at their moſt flouriſhing time, as well as at that of their declenſion.

In 1771 he had two new ſerious operas, the one compoſed by Jomelli, and the other by Sacchini, entirely at his own expence. The theatre is immenſe, and is open at the back of the ſtage, where there is an amphitheatre in the open air, which is ſometimes filled with people to produce effects in perſpective. It is built, like all other German theatres, on the Italian model.

The prince who reigned in 1772 was himſelf a good harpſichord player; Emanuel Bach dedicated to his highneſs the beſt book of ſix ſonatas which he ever compoſed, printed at Nuremburg. At one time this duke had in his ſervice three of the greateſt performers on the violin in Europe; Ferari, Nardini, and Lolli: on the hautbois, the two Plas, and Schwartz, a famous baſſoon, with Walther on the French horn, and Jomelli to compoſe, for the beſt ſerious and comic ſingers of Italy. At Solitude, a favourite country palace, a conſervatorio was eſtabliſhed for the education of two hundred poor and deſerted male children of promiſing talents; of theſe a great number were taught muſic, and from theſe his highneſs had already drawn ſeveral excellent vocal and inſtrumental performers for his theatre; ſome were taught the learned languagues and cultivated poetry; others were initiated into the practice of the ſtage, as actors and dancers. At Ludſwigſburg there was a conſervatorio for a hundred girls, who were educated in the ſame manner, and for the ſame purpoſes. The building conſtructed at Solitude for the reception of the boys, has a front of ſix or ſeven hundred feet. It uſed to be the favourite amuſement of the duke to viſit the ſchool, to ſee the children dine and take their leſſons.

LUDUS HELMONTII, ſo called from Van Helmont, who extolled its medicinal virtues, in *Natural Hiſtory*, an opaque foſſil of an irregular ſhape, but of a very regular and ſingular internal ſtructure. It is of an earthy hue, and always divided into ſeparate maſſes, by a number of veins of a different colour, and purer matter than the reſt. Theſe maſſes, into which it is divided, are ſometimes ſmall and pretty regularly figured; in which caſe, they are called *tali* or *ludi*, *dice*; but they are more frequently of no regular ſhape at all. There are others of them cruſtated, or compoſed of many coats, diſpoſed one over another about a central nucleus. In theſe the *ſepta*, or dividing veins, are very thin and fine, in the others thicker.

Theſe ſepta were uſed in medicine, being given in nephritic complaints, as it has been ſaid, with ſucceſs: the doſe from a ſcruple to a drachm.

LUDWIG, CHRISTIAN THEOPHILUS, in *Biography*, was born in Sileſia in 1709, and educated for the medical profeſſion. Having a ſtrong bias towards natural hiſtory, he was appointed to accompany Hebenſtreit in his expedition to the north of Africa. (See HEBENSTREIT.) Soon after his return in 1733, he became Profeſſor of Medicine at Leipſic. The firſt theſis defended there under his preſidency, in 1736, related to the manner in which marine plants are nouriſhed. Theſe he ſhewed to differ eſſentially from the generality of the vegetable kingdom, as not deriving their nouriſhment by the root. In 1737 he publiſhed a *Programma* in ſupport of the doctrine of the ſexes of plants, from his own obſervations upon the date palm. Two years afterwards he, nevertheleſs, advanced ſome objections to the Linnæan ſyſtem of arrangement by the organs of impregnation, under the title of *Obſervationes in Methodum Plantarum Sexualem Cel. Linnæi.* This work begins with much juſt commendation of Linnæus, and even with great admiration of his ſyſtem; accompanied however by an attempt at depriving him of the merit of originality, by inſinuating that this ſyſtem had been "indicated by others;" without ſaying by whom. Theſe words are underlined by Linnæus in his own copy of the diſſertation. They are as little to the purpoſe as the ſimilar charge of plagiariſm brought againſt the immortal Harvey. He proceeds to detail various difficulties and miſtakes, which occurred to him in his ſcrutiny of this ſyſtem, ſome of which relate to matters of opinion, others to anomalies or variations in Nature herſelf. His remarks however are free from aſperity or illiberality. He chiefly fails, in point of judgment, when he blames Linnæus for making any particular character important in one genus or family, and not in all; not perceiving that the very eſſence of ſkill, in technical diſcrimination and arrangement of natural productions, conſiſts in diſcovering, in each particular caſe, what is the moſt eſſential for the purpoſe in view. We do not ſee why his diſſertations, "*de minuendis plantarum generibus*," publiſhed in 1737, and "*de minuendis plantarum ſpeciebus*," in 1740, ſhould be deemed inimical to Linnæus, to whom he gives full credit for having eſtabliſhed the ſureſt principles for the advancement of botany, though he criticiſes him here and there in the detail of their application. He alſo wiſhes to indicate ſome ſources of diſcrimination, which Linnæus has leſs regarded, for the accompliſhment of the ſame objects; particularly mentioning the anatomy of plants. He points out the colours of flowers as ſometimes affording permanent ſpecific diſtinctions, though Linnæus has in general diſcarded them from his characters. It muſt be allowed that Ludwig, in this and other inſtances, ſeems prompted by a deſire to differ and to find fault; for Linnæus himſelf founds his primary diviſions of ſpecies in *Meſembryanthemum* and *Gnaphalium*, no matter whether judiciouſly or not, upon this very circumſtance. Such critics however are uſeful to ſcience, as they promote enquiry and examination. Ludwig juſtly blames Linnæus for confounding the bulbous *Fumariæ* as one ſpecies, and he may alſo be correct in ſome other remarks. The late lord Bute has well obſerved, that Ludwig, like Haller, was only a Linnæan in diſguiſe, having frequently applied principles in uniſon with his, if not imbibed from him, to build ſyſtems, and to exerciſe criticiſm, againſt him. Ludwig, in 1756, 1758, and 1759, publiſhed three diſſertations on the colours of flowers, tending to ſhew their variableneſs! If he has in one inſtance ſuggeſted an example to the contrary, he is in that ſurely moſt unfortunate. Haller ſays he points out the *Fraxinella* (*Dictamnus albus* of Linnæus) as a caſe in which colour makes a ſpecific difference. As this plant is frequently raiſed from ſeed, and the progeny differs, under every body's eyes, in having ſome white-flowered plants, perhaps in every crop, we preſume the queſtion may be readily decided; whether the leſſer White Fraxinella, figured in Rivinus, Fl. Pentap. Irr. t. 135, be a diſtinct ſpecies, of which we ſee little probability, or a variety in ſize as well as colour. Rivinus himſelf ſays the common one, t. 134, is either red or white.

Ludwig publiſhed in 1737 his *Definitiones Plantarum*, in 8vo. for the uſe of his pupils. In this the genera of plants are arranged in a method ſuppoſed to be natural, founded on the corolla in the firſt place, the ſubordinate characters being taken from the fruit. The generic diſtinctions are derived from the herbage, flower, ſmell, taſte, colour, or any thing that came in the author's way; certainly with no advantage whatever over the laws and practice of Linnæus, but rather evincing, at every ſtep, the ſuperiority of the latter to the vague ſcheme of his opponent. In another little volume of Ludwig, the *Aphoriſmi Botanici*, publiſhed in 1738, the aſſertion of his being "a Linnæan in diſguiſe" is ſtrongly juſtified. In vain does the writer try to forget the *Philoſophia Botanica*, and to ſeek originality, at any rate, by wandering from its light. In vain does he extol the ſyſtem of Rivinus in preference to all others. He is brought back by his own judgment, in ſpite of himſelf, at every ſtep; and as he could never give the leaſt degree of popularity to the ſyſtem he extolled, the ſlighteſt ſtudy of his works will ſhew it to have been a mill-ſtone about his own neck. Boehmer gave a new and improved edition of the *Definitiones Plantarum* in 1760. Whether any uſe is made of this work at preſent, among the various botanical ſchools on the Continent, we have never heard, but we believe it has fallen into oblivion.

In 1742, and again in 1757, our author publiſhed his *Inſtitutiones Hiſtorico-Phyſicæ Regni Vegetabilis*, in 8vo.; ſtill in purſuit of novelty rather than of truth, he rejects the Linnæan diſtinctions between animals and vegetables, founding the characteriſtic mark of the latter on the ſuppoſed propulſion of their fluids through a cellular texture, and not through a vaſcular ſyſtem as in animals. This diſtinction is now known to have no foundation. In this work at length even the diſguiſe of a Linnæan is almoſt laid aſide, a ſyſtem of arrangement being propoſed in which the ſtamens and ſtyles make an eſſential, if not a leading, feature. The favourite old ſyſtem of Rivinus ſtill takes precedence, though it ſerves only as an additional impediment in the way of natural affinities, which defect is in ſome meaſure concealed by the primary characters not being ſtrictly followed. Thus, though *Eryngium* is violently ſeparated by its infloreſcence from its natural allies, *Iberis* is ſilently left amongſt the *Tetrapetali regulares*. The *Umbellati* are kept together by their infloreſcence, in ſpite of the diverſity of their flowers, as to regularity or irregularity; a difficulty which Rivinus had previouſly been obliged to overlook. It is remarkable that our author, in thus profeſſedly adopting the principles of Rivinus and Linnæus combined, and diſclaiming as he does, p. 86, all pretenſions to originality, never mentions thoſe perſons from whom he had long ago aſſerted that Linnæus borrowed his ſyſtem. This volume may therefore be conſidered as a tacit tribute of reſpect to the illuſtrious Swede, ariſing from its author's progreſs in judgment and experience. He had no motive to withhold this tribute, as Linnæus never reſented nor repelled his attacks. The latter ſays in a letter to Haller, "I have read the Characters of Dr. Ludwig entirely through. He has given very great attention to the ſubject; but I wiſh the authors whom he chiefly follows may not have led him aſtray. All that comes from Boerhaave is not oracular. I every day augment or correct my own characters, which are nothing but generic deſcriptions, and therefore differ from thoſe of Ludwig and Tournefort, as a ſpecific name (or definition) differs from the deſcription of a plant. Both are neceſſary in Botany." *Epiſt. ad Hallerum* v. 1. 312. We give this paſſage entire, becauſe Haller in his index ſays Linnæus here "carps at Ludwig," than which ſurely nothing can be more unjuſt.

Our author began, in 1760, to publiſh impreſſions, chiefly of medicinal plants, taken from the dried ſpecimen with printer's ink, or with ſmoked paper, in folio, under the title of *Ectypa Vegetabilium*, which he continued from time to time. Such impreſſions give undoubtedly a correct outline, at leaſt if the plant be fully diſplayed, but the reſt is a maſs of confuſion; eſpecially as the more elevated parts, which ſhould be light, are neceſſarily the darkeſt. He wrote alſo occaſionally on medico-botanical ſubjects, as on the effects of extract of *Stramonium*, and of the *Belladonna*, or Deadly Nightſhade, in the epilepſy. His opinion ſeems not to have been favourable of either.

Ludwig died at Leipſic in 1773, aged 64. He left a ſon named Chriſtian Fredrick, born in 1751, who became Profeſſor of Natural Hiſtory in the ſame univerſity, and is the author of various tracts on Botany, Anatomy, and Phyſiology.—Ludwig's Works. Hall. Bibl. Bot. Dryandr. Bibl. Banks. S.

LUDWIGIA, in *Botany*, named by Linnæus in honour of Chriſtian Theophilus Ludwig, Profeſſor of Medicine in the univerſity of Leipſic. (See the preceding article LUDWIG C. T.) Linn. Gen. 60. Schreb. 83. Willd. Sp. Pl. v. 1. 672. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 1. 265. Juſſ. 319. Lamarck Illuſtr. t. 77. Gærtn. t. 31.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Onagræ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, permanent, cloven into four, lanceolate, widely ſpreading ſegments, equal in length to the corolla. *Cor.* Petals four, inverſely heart-ſhaped, flat, greatly ſpreading, equal. *Stam* Filaments four, awl-ſhaped, erect, ſhort; anthers ſimple, oblong, erect. *Piſt.* Germen inferior, quadrangular, clothed with the baſe of the calyx; ſtyle cylindrical, as long as the ſtamens; ſtigma ſlightly four-ſided, capitate. *Peric.* Capſule of four valves, the partitions oppoſite to the valves. *Seeds* numerous, ſmall. *Recept.* columnar, membranaceous, four-winged; wings at the angles of the partitions, bearing ſeed at each ſide.

Eſſ. Ch. Corolla of four petals. Calyx four-cleft, ſuperior. Capſule ſquare, inferior, of four cells, and many ſeeds.

1. L. *alternifolia*. Linn. Sp. Pl. 173. Trew. Rar. p. 2. t. 2. (Lyſimachia non pappoſa, flore luteo majore; Pluk. Alm. t. 203. f. 2.)—Leaves alternate, lanceolate. Stalks axillary, ſingle-flowered. Stem erect, angular. Calyx-leaves remarkably large.—Native of Virginia, and ſent from thence, to Miller, by Dr. Dale before 1752. It flowers in June and July.—*Root* annual. *Stem* about a foot high, upright, branching. *Flowers* ſolitary, ſmall and yellow, ſituated at the baſe of the leaf-ſtalks.

2. L. *hirſuta*. Willd. n. 2. Lamarck Dict. v. 3. 614.—

Leaves alternate, lanceolate. Flowers axillary, ſolitary, nearly ſeſſile. Stem round, diffuſe.—A native of South Carolina.—Lamarck obſerves that this is very nearly allied to the laſt ſpecies in the form and arrangement of its leaves. The whole plant however is hairy. *Stem* woody, cylindrical, branched. *Leaves* alternate, oblong-lanceolate, entire. *Flowers* ſolitary, axillary, on ſuch ſhort ſtalks as to be nearly ſeſſile, furniſhed at their baſe with two oppoſite, very long bracteas. *Fruit* leſs angulated than in the other ſpecies.

3. L. *juſſiæoides.* Willd. n. 3. Lamarck Dict. v. 3. 614.—Leaves alternate, linear-lanceolate. Flowers axillary, ſolitary. Germen very long.—A native of marſhy ground in the Iſle of France.—This is ſaid particularly to reſemble *Juſſiæa* in its habit, whence the ſpecific name.—*Stem* about a foot and half high, ſhrubby, branched. *Leaves* alternate, ſcattered, pointed, entire. *Flowers* ſolitary. *Petals* yellow, the length of the calyx.

4. L. *oppoſitifolia.* Linn. Syſt. Veg. ed. 14. 161. Willd. n. 4. (L. perennis; Linn. Sp. Pl. 173.)—Lower leaves oppoſite, lanceolate. Stem diffuſe.—A native of the Eaſt Indies.—*Stems* procumbent, ſix or eight inches long. *Branches* nearly all radical. *Leaves* ſmooth, entire, ſtriated, three or four pair of the lower ones only oppoſite, the reſt alternate. *Flowers* yellow. *Petals* ſhorter than the calyx.

5. L. *erigata.* Linn. Syſt. Veg. ed. 14. 161. Mant. 40. Willd. n. 5. (L. triflora; Lamarck Dict. v. 3. 615.)—Leaves oppoſite, lanceolate. Stem erect.—A native of the Eaſt Indies.—*Root* annual. *Stem* a foot high, herbaceous. *Leaves* on footſtalks, quite entire, ſmooth. *Flowers* ſo ſmall as to be ſcarcely viſible.

L. *repens,* Swartz. Ind. Occ. v. 1. 273, proves, by a ſpecimen from himſelf, to be *Iſnardia paluſtris* of Linnæus, as Willdenow mentions.

Michaux, in his Fl. Boreal-Amer. v. 1. 87, defines nine ſpecies as natives of North America, chiefly Carolina, of none of which we have any preciſe information. They are called *nitida, pedunculoſa, microcarpa, anguſtifolia,* (which he ſuppoſes to be *ramoſiſſima* of Walter,) *juſſiæoides,* (taken for *decurrens* of Walter,) *macrocarpa,* (which is the *alternifolia* of Linnæus,) *virgata, mollis,* and *capitata.* The laſt is ſaid to be *ſuffriticoſa* of Walter.

LUDWIGSBURG, in *Geography,* a town of Anterior Pomerania, on the coaſt of the Baltic; five miles E.N.E. of Griefswalde.

LUDWIGSTAT, a town of the principality of Culmbach; 13 miles S. of Saalfeld.

LUDWIGSTEIN, a town of the principality of Heſſe Rhinfels; 14 miles E. of Caſſel.

LUDWIGSTHAL, a town of Wurtemberg, famous for its iron forges; about one mile from Duttlingen.

LUDWIGWALL, a town of Pruſſia, in Natangen; four miles S. of Königſberg.

LUC, St., the chief town of the captainſhip of Petagues, in the north diviſion of Braſil.

LUES, in a general ſenſe, is uſed for a diſeaſe of any kind.

LUES, in a more particular ſenſe, is reſtrained to contagious and peſtilential diſeaſes.

LUES *Venerea,* the venereal diſeaſe; called alſo *morbus gallicus, ſyphilis, morbus neapolitanus, morbus aphrodiſius,* &c. In French, *la maladie vénérienne,* or *la verole,* or *grande verole;* in German, *luſtſ-euche franzoſen.*

The venereal diſtemper ariſes from a peculiar and ſpecific morbid animal poiſon, which, when applied to the human body, is capable of producing both local and conſtitutional effects, ſuch as primary ſores or chancres, buboes, ſpots on the ſurface of the body, nodes, ulcerations of the throat, pains in the bones, ſecondary ulcers, &c. Excepting chancres, none of theſe complaints can occur, unleſs ſome of the ſyphilitic virus has been taken up, and conveyed into the conſtitution by the abſorbents proceeding from the primary ſore, or ſurface originally infected. The venereal poiſon affects the human ſpecies alone, and has not the property of imparting the diſeaſe to any other animals. When applied to the human body, "it has the power of propagating or multiplying itſelf;" that is to ſay, it gives riſe to a ſore, from which is ſecreted matter containing a virus of the ſame ſpecific nature. Of its appearance in an unmixed ſtate we really know nothing; for we never ſee the poiſon in any other form than that in which it is blended with fluid matter. Its general properties are equally unknown; ſo that, if we put out of conſideration its peculiar and remarkable effects on the human body, our ignorance of its nature is complete. It is not contagious through the medium of effluvia, or any volatile inviſible matter in the air, the infection never being communicated, except by actual contact. The virus muſt be applied to a part of the body; the uſual local effect is a particular ſore, called a chancre; and ſome of the poiſonous matter at length being imbibed by the abſorbents, buboes, eruptions, &c. follow. Many caſes ſeem even to prove that the poiſon may be abſorbed from the ſkin, and buboes and conſtitutional ſymptoms take place, without the occurrence of any primary ſore at all in the part to which the infectious matter was firſt applied.

Before entering into a more detailed account of a diſtemper which, as being a kind of ſcourge to illicit pleaſure, and a curb to the moſt impetuous of paſſions, has made the generality of mankind very feelingly intereſted in the ſubject, we ſhall ſolicit the reader's attention to a point that is in the higheſt degree curious, and has afforded matter for numerous diſputations.

Of the firſt Origin of the Venereal Diſeaſe.—Several writers have endeavoured to prove the great antiquity of this diſtemper. The principal of theſe are, Mr. William Becket, whoſe papers are contained in the 30th and 31ſt vols. of the Philoſophical Tranſactions; Dr. Charles Patin, and Dr. Sanchez, authors of diſſertations on the origin of the diſeaſe. The opinion has even been maintained, that the venereal malady has exiſted from time immemorial, and paſſages in ſupport of this ſentiment are referred to in Hippocrates, Galen, Avicenna, Celſus, and likewiſe the holy ſcriptures. "The Lord ſhall ſmite thee in the knees, and in the legs, with a ſore botch, that cannot be healed, from the ſole of thy foot unto the top of thy head." (Deuteronomy, chap. xxviii. ver. 35.) This, and many other ancient quotations, however, cannot be received as proofs, that ſyphilis was the affliction alluded to, becauſe the leproſy, elephantiaſis, and ſeveral other diſeaſes, attended with ulcers, or eruptions, might be ſignified, as far as a judgment can be formed, from the words actually employed. (See Lombard ſur la Mal. Vénérienne, tom. i. p. 39.) That the Greeks and Romans were at all acquainted with the venereal diſeaſe ſeems extremely improbable, and is an aſſertion quite uneſtabliſhed. As Dr. Adams has well obſerved, the ancient phyſicians, being ignorant of the medical powers of mercury, muſt have been infinitely more familiar with every form of the diſeaſe than ourſelves. Yet, till near the cloſe of the 15th century, we have no deſcription of local appearances that can be miſtaken for venereal; and during the following century, the induſtrious Aſtruc enumerates more than one hundred writers on the ſubject. If other proofs are required, let us mark the difference between the licentious poets of former times and our own. Can a reader of common ſenſe ſuppoſe that Horace, Juvenal, Perſius, or Ovid, could have been ſilent on a ſubject ſo perpetually occurring in the ſatirical writings of Pope and Swift? On Morbid Poiſons, p. 88. edit. 2.

But though it muſt be owned that the attempts to trace the exiſtence of the venereal diſeaſe as far back as the times of Moſes, and of the Greeks and Romans, have entirely failed, we muſt not infer that the people of thoſe remote periods were not ſubject to maladies of the generative organs. Celſus has expreſsly treated of ſuch complaints, and they probably afflicted mankind at a much earlier period than the reign of Auguſtus. The ancients were certainly liable to ſores on the genitals; but theſe ulcers, like many which are met with at the preſent day in the ſame ſituation, were not ſyphilitic, notwithſtanding they might ſometimes put on a very bad aſpect.

Giving up the ſuppoſition of lues venerea being of ſuch antiquity, ſtill it is contended that the diſorder prevailed in Europe long before the return of Columbus from his voyage to America, or Charles VIII. beſieged Naples; two events which happened at the cloſe of the 15th century, when it is commonly thought that the diſeaſe firſt began its ravages in Spain and Italy, and thence ſpread to other parts of the old world. We are told that Gulielmus Salicetus, who practiſed at Verona in 1210, was well acquainted with the cauſe and effects of ſyphilis, and, in confirmation of this remark, we are referred to his work on ſurgery, where may be found a chapter, intitled, "De puſtulis albis, et ſciſſuris et corruptionibus quæ fiunt in virga et circa præputium, propter coitum cum meretrice, vel alia cauſa." Gordon, who lectured on phyſic at the univerſity of Montpelier in 1289, mentions, in chap. 5, "De paſſionibus virgæ," the affections originating from connection with women whoſe wombs are foul, virulent, ſanious, infectious, &c.; and he likewiſe ſpecifies a remedy for a chancre proceeding from ſuch a cauſe. See Lombard ſur la Maladie Vén. tom. i. p. 40.

In the 30th and 31ſt vols. of the Philoſophical Tranſactions, Mr. W. Becket publiſhed his papers in ſupport of the antiquity of lues venerea. In his firſt diſſertation, he labours to prove that a venereal gonorrhœa was known in England ſome ages before the year 1494, under the name of *ardor*, *arſura*, *incendium*, *&c.* in Engliſh, *brenning* or *burning*, of which, indeed, there is frequent mention made by Britiſh hiſtorians. In confirmation of this opinion, Mr. Becket produces authorities, of which ſome are earlier, and others later than the year 1494, the period when lues venerea is generally imagined to have firſt ſhewn itſelf in Europe.

The earlieſt of theſe authorities being the moſt material, will alone be noticed by us.

1. The firſt is a manuſcript treatiſe of John Arden, an eminent ſurgeon in England, about the cloſe of the 14th century. In this book mention is made of *burning*, which, according to Becket, is defined "a certain inward heat and excoriation of the urethra."

2. The ſecond authority reſts upon certain phyſical pieces ſuppoſed to have been written about the years 1390 and 1440. Theſe works are ſaid to contain ſome receipts for the cure of this *brenning*, both in men and women.

3. The third and laſt that we ſhall notice is founded upon the manuſcripts, rules, and ordinances of the ſtews, which were by public authority allowed to be kept at London, in the Borough of Southwark, under the controul of the biſhop of Wincheſter. Theſe documents are ſuppoſed to have been drawn up about the year 1430. One of them begins thus: "Of thoſe, who keep women having a wicked infirmity," and further, it is ordered, under a ſevere penalty, that no ſtew-holder keep any woman "wythin his hous that hath any ſyckneſs of brenning."

The celebrated Dr. Aſtruc, on the other hand, has deduced a different inference from theſe productions, without denying that they may be authentic; for he will not admit that this burning was the ſame diſeaſe as a venereal gonorrhœa, or that a venereal gonorrhœa was at any time expreſſed by ſuch a term. His arguments are ſupported by conſiderations of the following kind.

1. The leproſy of the Arabians, which was formerly a common diſeaſe in England, as well as in other parts of Europe, was exceedingly contagious and infectious; and, therefore, lepers were, by ſeveral ſevere edicts, prohibited from having intercourſe with the reſt of mankind.

2. In caſe any perſon had carnal knowledge of a leprous woman, the leproſy was communicated to him by almoſt immediate infection. That the diſeaſe was thus imparted, is proved by Foreſtus, Obſ. Chirurg. lib. iv. Obſ. 8. Palmarius de Elephantiaſi, cap 2. Paræus, Op. lib. xx. cap. 8. Fernelius de Partium Morbis et Symtomatis, lib. vi. cap. 19. Valeſius de Taranta, Philon. 7. cap. 39. Gordon's Lilii Partic. i. cap. 22.

3. When the caſe did not turn out to be leproſy in the worſt form, yet the pudenda were for the moſt part affected with an inflammation, eryſipelas, herpetic or miliary exulcerations, cuticular eruptions, &c.; whence aroſe a dyſuria, called, in old language, *ardor*, *arſura*, *incendium*, *calefactio*, and, in Engliſh, *brenning*.

4. In confirmation of this ſtatement, Aſtruc cites Theodoric's Chirurg. lib. vi. cap. 55; a manuſcript treatiſe on ſurgery, intitled Rogernia; Gilbert's Compend. Medicin.; Glanville's Breviarium Medicinæ, lib. ii. cap. 4; John of Gaddiſden's Roſa Anglica, cap. de infect. ex concubitu cum leproſo vel leproſa; and, laſtly, John Manardus, of Ferrara, in Epiſt. Med. lib. vii.

5. All theſe writers deſcribe the complaints caught by commerce with leprous women, and, on the whole, Aſtruc infers that the *burning*, or *brenning*, referred to by Mr. Becket, was the ſame diſorder as, according to the doctor's authorities, might ariſe from connection with a leprous woman, or one who had lately cohabited with a leprous man. As for the *nefanda infirmitas*, mentioned in the laws of the ſtews, Dr. Aſtruc conceives it muſt have been the leproſy itſelf. De Morb. Venereis.

We ſhall not follow theſe gentlemen through the whole of their arguments. The moſt important are ſet before the reader, and he muſt judge of them himſelf. That diſcharges from the urethra, attended with heat and pain in making water, muſt have exiſted from time immemorial, we decidedly believe; becauſe experience has well proved that ſuch complaints may often proceed from cauſes which are decidedly not venereal. Nay, it is even a queſtion among modern ſurgeons, whether any claps at all originate from the ſame poiſon as lues venerea. This point, though ſo highly intereſting, is far from being ſettled; and notwithſtanding the ſentiments of Mr. Hunter, we think the arguments and facts at preſent on record are rather more weighty in favour of the doctrine, that a gonorrhœa does not depend upon the ſame virus as ſyphilis. According to Fallopius, what has been called a venereal gonorrhœa did not ſhew itſelf among the ſymptoms of this diſeaſe before the year 1545, or 1546, that is, above fifty years after the period commonly aſſigned for the firſt eruption of ſyphilis. (Tract. de Morb. Gallico, cap. 23.) Suppoſing that a gonorrhœa really depended on the ſame infectious matter, is it credible that the complaint ſhould never occur for half a century, during all which time chancres, and other venereal affections, are known to have prevailed to a very great extent? As we ſhall be obliged to touch upon this ſubject again, and have already mentioned it in the article GONORRHŒA, we ſhall not purſue it at preſent. In our opinion, Becket has fully proved that inflammations, diſcharges, &c. exiſted long before the year 1494; but his evidence fails in eſtabliſhing that they were actually venereal.

Aſtruc himſelf has very ſenſibly remarked, "that the genitals are no leſs ſubject to violent diſeaſes than the other parts of the body, that they are equally expoſed to all the cauſes of indiſpoſition, and that they enjoy no prerogative above the reſt to guard them againſt the attack of diſtempers. From the very infancy of phyſic, and long before the venereal diſeaſe was known, ſeveral writers have treated at large of an abſceſs, ulcer, cancer, and mortification in the genitals." (See Galen, lib. vi. de locis affectis, cap. 6, and Cornelius Celſus, lib. ii. cap. 1. lib. v. cap. 20. and lib. vi. cap. 18.) Aſtruc alſo quotes the hiſtorian Flavius Joſephus, who, in his ſecond book againſt Apion, related, that that vile ſlanderer of the Jews was afflicted with an ulcer in the penis, of which diſeaſe, after ſeveral inciſions to no purpoſe, he died in exquiſite torments, the genital parts being mortified. And again, (Hiſt. Jud. lib. xvii. cap. 8.) he ſays, that Herod, king of the Jews, died conſumptive and convulſed, his private parts being putrefied and eaten up by worms. Aſtruc likewiſe quotes paſſages from Euſebius, Pliny, and other ancient authors, ſhewing, beyond all doubt, that complaints and diſeaſes of the generative organs exiſted and prevailed in the earlieſt times. The phimoſis, paraphimoſis, and hyperſarcoſis, or caruncle of the urethra, among other caſes, were undoubtedly known to the Greek phyſicians; but then, theſe diſorders proceeded from an ordinary cauſe, and not from any venereal contagion, as will be plain to any one who will take the trouble to conſult the old writers.

Diſmiſſing the idea of the venereal diſeaſe being ſo ancient as ſome have ſuppoſed, let us examine what grounds there are for believing that the cloſe of the fifteenth century was the era, when the diſorder firſt commenced its ravages in Europe.

The authorities in ſupport of the opinion, that the venereal diſtemper firſt made its appearance in this quarter of the world towards the latter end of the year 1494, are the united teſtimonies of all the medical writers who at that time flouriſhed in Italy, and who could not confound it with the leproſy, which, being then a common diſeaſe, was well known to them. The practitioners of that period were aſtoniſhed at the novelty of the malady; and finding, from experience, that the medicines, which were uſually given in analogous caſes, proved ineffectual, were at a loſs what method to purſue, and, for a time, gave up the treatment into the hands of quacks.

Joſeph Grunpech, a German phyſician, publiſhed, in the year 1496, "Tractatum de Peſtilentiali Scorræ, ſive Malade Frantzos," in which he affirms, that it was a diſeaſe ſo lately inflicted on mankind, that it ſeemed to be a plague ſent down from heaven; that it was a new kind of diſeaſe, hateful to nature, a moſt horrid and terrible prodigy, and altogether unknown to mortals before that time.

Alexander Benedict of Verona, who was phyſician in the Venetian army, which Charles VIII. of France deſtroyed in the battle of Fornova, in the year 1495, and therefore had the opportunity of obſerving the firſt appearance of this new diſeaſe, aſſerts in his work, "De omnibus Morbis," publiſhed in 1496, that, "by the venereal contact, a new French diſeaſe, or, at leaſt, one that was unknown to former phyſicians, owing to the peſtiferous aſpect of the ſtars, had burſt in upon them from the weſt;" and, in another part of his work, that "the French diſeaſe, a new plague which had ſprung up in the world, contracted by lying together and contact, was reckoned in his time incurable."

Nicolas Leonicenus of Vicenza, profeſſor of phyſic at Ferrara, in a treatiſe, which he wrote in 1496, "De Morbo Gallico," obſerves, that "new diſeaſes had appeared in Italy, which were unknown to former ages, after the manner of the lichenis, which, according to Pliny, Hiſt. Nat. lib. xvi. were never known before the time of Claudius." Then he continues: "Something like this has happened in this age; for now a new diſeaſe, of an unuſual nature, has attacked Italy, and ſeveral other countries: however, this diſeaſe has obtained no proper name hitherto by our preſent phyſicians, but they commonly call it the French diſeaſe; as if the contagion had been imported by the French into Italy, and that this country was infeſted both by the diſeaſe and the arms of France at the ſame time. I, for my part, am forced to believe, (nor, indeed, can I conceive the caſe to be otherwiſe,) that this infectious diſeaſe, which has lately ſprung up, has haraſſed this preſent age as it never did any former one."

Coradinus Gilinus, in his "Opuſculum de Morbo Gallico," begins thus:

"Laſt year (1496) a very violent diſeaſe attacked great numbers of people, both in Italy and on the other ſide of the mountains, which the Italians call the French diſeaſe, affirming that the French introduced it into Italy; which the French call the Italian or Neapolitan diſeaſe, becauſe, they ſay, they were firſt infected in Italy, and eſpecially at Naples, with this cruel plague; or, becauſe the diſeaſe appeared firſt in Italy, at the time of the paſſage of the French over the mountains. And as this diſeaſe is yet unknown to the moderns, and there have been, and ſtill ſubſiſt great debates about it amongſt phyſicians, I have therefore determined to write ſomething upon it."

Dr. Aſtruc further confirms the opinion, that the diſeaſe was regarded quite as a novelty at the cloſe of the fifteenth century, by numerous other citations from the works of the medical writers, who publiſhed within a moderate ſpace after that period: as, for inſtance, Bartholomew Montagnana, Gaſper Torella, Anthony Bonevenius, Wendelinus Hock de Brackenaw, Jacobus Cataneus, Peter Trapolinus, John de Vigo, Peter Maynard of Verona, Ulrich Utten, a German knight, who publiſhed his own cure by guaiacum, James à Bothincourt, Lawrence Phriſius, Peter Andrew Matthiolus, Alphonſus Ferrus, Jerome Fracaſtorius, Anthony Muſa Braſſavolus, Gabriel Fallopius, &c.

Not only is the foregoing ſtatement corroborated by medical writers, it receives additional teſtimonials from ſeveral hiſtorians; particularly Mark Anthony Coccius Sabellicus, in Rhapſod. Hiſt. lib. ix. firſt publiſhed at Venice in 1502; Baptiſt Fulgoſius, in his treatiſe on Memorable Actions, written in 1509; Jean de Bourdigné, in his Hiſtory of the Province of Anjou, publiſhed 1529; Guicciardini, in his Hiſtory of Italy, &c.

That the venereal diſeaſe firſt began to make ravages in Europe, and in particular that it afflicted many ſoldiers of the army of Charles VIII. at the ſiege of Naples, towards the cloſe of the fifteenth century, appears then to be proved beyond diſpute. But ſtill other queſtions remain for determination. Was the venereal infection originally produced in Italy? or, was it conveyed thither from America, which had been diſcovered a little before the breaking out of the diſtemper in Europe?

We learn from hiſtory, that the new world was firſt found out by Chriſtopher Columbus. In Auguſt 1492, he ſet ſail with three ſhips and 120 men, arrived at Hiſpaniola in December of the ſame year, and returned to Spain in March 1493. On the 25th of September following, he departed from Cadiz again with 17 ſhips and 1500 men, beſides mariners and workmen; and, in November, he arrived once more at Hiſpaniola. In the following year, 1494, he diſpatched 14 ſhips back to Spain. In April 1494, Barth. Columbus, the brother of Criſtopher, arrived at Hiſpaniola with three ſhips, which returned to Spain, about the concluſion of the ſame year, with Pedro de Margarit, a Catalonian gentleman, and father Bayl, a Benedictine monk: the former was, at that time, ſeverely afflicted with the venereal diſeaſe. In Auguſt 1494, four other ſhips arrived at Hiſpaniola from Spain, under the command of Antonio de Torrez, and returned at the ſame time as thoſe laſt ſpecified. Laſtly, in October 1495, John Aguado, the envoy of their Catholic majeſties, came to Hiſpaniola with four ſhips, to inquire into the crimes of which Chriſtopher Columbus ſtood accuſed; and, the year following, departed for Cadiz, where he arrived with Chriſtopher on the 11th of June 1496, and with 200 ſoldiers, who were infected with the venereal diſeaſe.

The firſt conveyance of this diſtemper from the Weſt Indies to Europe, by the followers of Columbus, is ſupported by numerous teſtimonies; among which are thoſe of Anthony Muſa Braſſavolus, John Baptiſta Montanus, Gabriel Fallopius, and Roderic Diaz. Theſe confirm the diſeaſe to have originated in the Weſt Indies, and to have been brought over by Columbus's men; that it appeared in Spain firſt in 1493, at Barcelona, and there ſpread immediately through the whole city; that, in Hiſpaniola and the adjacent Weſt India iſlands, the diſeaſe was very frequent and familiar to the natives, who had found out an antidote, called guaiacum wood; and, laſtly, that the diſtemper in America was milder than in Europe, where, on its firſt breaking out, it was undoubtedly more ſevere than at ſubſequent periods.

This laſt circumſtance is referred by ſome authors to the treatment being now better underſtood, and, in particular, to the efficacy of mercury, with which practitioners were formerly unacquainted. Others appear to think the diſtemper actually milder in its nature. Mr. Foot entertains the firſt of theſe opinions; while Aſtruc and Sydenham profeſs the latter. Our own obſervations have induced us to believe, that the diſeaſe has actually become ſomewhat milder within the laſt fifteen years: for, we are ſure, not half ſo many bad and fatal caſes are now met with in the London hoſpitals, as were ſeen about the cloſe of the preceding century. If this be a fact, it cannot be aſcribed to our more familiar acquaintance with mercury, though it may perhaps be imputed to better treatment; for there can be no doubt that many caſes have been exaſperated by the long, unremitting, and violent ſalivations, which the old ſurgeons, who were blinded by falſe fears and prejudices, deemed ſo eſſential to the radical cure of the diſtemper.

There is only one other ſentiment, which we have to notice, reſpecting the firſt origin of ſyphilis, namely, that it was not brought from the Weſt Indies, but began in Europe, as an epidemical affection. Mr. Hunter ſeems inclined to think, that the diſtemper did not originally come from the Weſt Indies; and he was led into this perſuaſion by reading a ſhort treatiſe, entitled, "A Diſſertation on the Origin of the Venereal Diſeaſe; proving, that it was not brought from America, but began in Europe from an epidemical Diſtemper. Tranſlated from the original Manuſcript of an eminent Phyſician. London, printed for Robert Griffiths, 1751."

In our opinion, however, Aſtruc has adduced abundant proofs of the diſtemper having exiſted in Hiſpaniola, before it was at all known in Europe; and he has explained, as ſatisfactorily as can reaſonably be expected, how the diſeaſe was conveyed from the Weſt Indies to Barcelona in 1493, and to Italy ſhortly afterwards.

The ſubject, which we are about to quit, is highly intereſting; though the time that has now elapſed, ſince the commencement of lues venerea in Europe, forbids any advantageous inveſtigations of the controverted points. That the ancient leproſy could not be ſyphilis, Dr. Aſtruc has entirely ſatisfied us; and we join him in the belief that the latter diſeaſe was originally imported into Europe from the Weſt Indies. It is unqueſtionably a matter of infinite curioſity, that the leproſy, common as it was in former times, ſhould ſcarcely ever have made its appearance after the venereal diſeaſe ſpread over Europe; but this may not be more curious and unaccountable than the departure of the plague, and the acceſs of the ſmall-pox. See Aſtruc De Morbis Venereis, and Foot on Lues Venerea.

General Obſervations.—As Mr. Hunter has remarked, in whatever manner the diſeaſe aroſe, it certainly began in the human race; for we know of no other animal that is capable of being infected with this poiſon. It is probable, too, that the parts of generation were the firſt affected; for if the diſorder had occurred in any other part of the body, it might probably never have gone further than the perſon in whom it firſt aroſe, and, therefore, never have excited public attention; but as it was ſeated in the parts of generation, where the only natural connection takes place between one human being and another, except that between the mother and child, it was in the moſt favourable ſituation for being propagated. Beſides, as no conſtitutional effect of the poiſon can impart the diſeaſe to others, we are obliged to conclude that the firſt effects were local.

We know little about the ſyphilitic poiſon, if we exclude from conſideration its effects upon the human body. It is commonly in the form of pus, or united with pus, or ſome ſuch ſecretion, and, when applied to parts, it has the peculiarity of giving riſe to a proceſs, in which is produced matter of ſimilar qualities to its own. In moſt caſes, it excites an inflammation in the parts contaminated: but there is not ſimply inflammation; a peculiar mode of action is ſuperadded, different from all other actions attending inflammation; and, according to Mr. Hunter, it is this ſpecific mode of action that produces the ſpecific quality in the matter. The peculiar mode of action, however, may exiſt without the preſence of inflammation: at leaſt, this inference is drawn, ſince the poiſon continues to be formed, and a healing chancre will communicate the diſeaſe to another perſon.

The formation of matter, alſo, though a very general, is not a conſtant attendant on this diſeaſe; for ſometimes the ſyphilitic poiſon produces a kind of inflammation, which does not terminate in ſuppuration. But, according to Mr. Hunter, no venereal poiſon can exiſt, unleſs matter is formed. A perſon, therefore, having the venereal irritation in any form, not attended with a diſcharge, cannot communicate the diſeaſe to another. To impart the diſorder, the venereal action muſt firſt have taken place; matter muſt have been formed in conſequence of that action; and ſuch matter muſt be applied to the perſon who is to be infected. We have no examples of this diſtemper being communicated by vapour, or effluvia, like many other diſeaſes.

Mr. Hunter believed, that the circumſtance of the virus being more or leſs diluted, in different caſes, is not the cauſe of any variety in the effects produced, provided the dilution is not ſo conſiderable as to prevent the poiſon from having any action at all. The ſame matter appears to affect very differently different people; and the diverſity of the ſymptoms is, therefore, attributed to cauſes exiſting in the conſtitution and habit.

In treating of GONORRHŒA, we have adverted to the long diſputed queſtion, whether the virus of that diſeaſe is of the ſame nature as that which gives riſe to lues venerea? We have there explained Mr. Hunter's reaſons for believing in the identity of the two poiſons, and mentioned the motives which have hitherto kept us from giving credit to the doctrine. Mr. Hunter declares that he has ſeen all the ſymptoms of lues venerea originate from gonorrhœa only; that he had even produced venereal chancres by inoculating with the matter of gonorrhœa; and that he had repeated theſe experiments in a manner in which he could not be deceived. (On the Ven. Diſeaſe, p. 293, &c.) He has referred the different effects of the virus, in theſe caſes, to the difference in the nature of the parts affected. He maintains that the matter of a chancre will produce either a gonorrhœa, a chancre, or the lues venerea. Suppoſing the poiſon to be the ſame both in the chancre and gonorrhœa, why do not theſe complaints always happen together in the ſame perſon? For one would naturally think that the gonorrhœa, when it has appeared, could not fail to become the cauſe of a chancre; and that ſuch ſore, when it happens firſt, muſt produce a gonorrhœa. Mr. Hunter believes that this ſometimes really occurs, although he confeſſes it is only ſeldom; and he ſuſpects that the preſence of one irritation in general becomes a preventive of the other.

The experiments made by Mr. Hunter with the matter of gonorrhœa and chancre, have been repeated with a different reſult. (See B. Bell on Lues Venerea, chap. 1.) On the other hand, the defenders of Mr. Hunter's opinion contend, that we cannot wonder at this contrariety, when we conſider from how many cauſes gonorrhœa may ariſe, and how impoſſible it is to diſtinguiſh the venereal from any other. See Adams on Morbid Poiſons, p. 91, edit. 2.

Having already touched upon this controverted ſubject, in ſpeaking of *Gonorrhœa*, we ſhall here refrain from commenting on the arguments adduced againſt the identity of the virus, from mercury being requiſite for the cure of chancres, and not neceſſary in the treatment of gonorrhœa. Neither ſhall we expatiate on the aſſerted experiment, that venereal matter, applied to the urethra, will produce a chancre in that canal, and not ſimply a diſcharge. We wiſh, however, in this place, to call the reader's attention again to the circumſtance of gonorrhœa not being deſcribed as a ſymptom of ſyphilis, till nearly half a century after the other ſymptoms of the venereal diſeaſe were known. Fallopius was the firſt who ſet down a clap as an effect of the ſyphilitic virus. The fact of gonorrhœa not having been remarked as a ſymptom of lues venerea till ſo long a time after this laſt diſeaſe had been known, has been brought forward as another argument againſt the identity of the poiſons from which theſe diſorders ariſe. A late writer endeavours to place this matter in a very different point of view, remarking, that if the venereal gonorrhœa remained unnoticed till fifty years after the other forms of the diſeaſe were deſcribed; what does this prove, but that contagious gonorrhœa was ſo common, as to be diſregarded as a ſymptom of the new complaint? Can there be a doubt (ſays Dr. Adams), from the caution given by Moſes, that gonorrhœa was conſidered as contagious in his days? During the claſſical age we find inconveniences of the urinary paſſages were imputed to incontinence, and the police of ſeveral ſtates, before the ſiege of Naples, made laws for preſerving the health of ſuch as would content themſelves with public ſtews, inſtead of diſturbing the peace of families.

In the opinion of the foregoing author, this is enough to leſſen our ſurpriſe that gonorrhœa ſhould be unnoticed for ſome time after the appearance of the venereal diſeaſe. But, according to his ſentiments, ſo far is it from proving the difference of the two contagions, that the faireſt inference we can draw is in favour of their identity. For, if fifty years after the breaking out of ſyphilis, this diſeaſe began to be ſo far underſtood, that ſecondary ſymptoms were found to be the conſequence of primary ones in the genitals, it is moſt probable that the firſt ſuſpicion of venereal gonorrhœa aroſe from the occurrence of ſuch ſecondary appearances, where no other primary ſymptoms could be traced. Adams on Morbid Poiſons, p. 95, edit. 2.

We are glad that this gentleman does not mean theſe obſervations to afford any material ſupport to an argument, which, as he acknowledges, reſts on the baſis of experiment. Every one will coincide with him that gonorrhœas muſt have prevailed from time immemorial, and hence, perhaps, were not regarded as a novelty, or even ſuſpected of being ſyphilitic for many years after the firſt breaking out of lues venerea in Europe. Nor ſhall we diſpute the probability of Dr. Adams's conjecture, that the occurrence of ſecondary venereal ſymptoms, where no primary ones could be traced, excepting a gonorrhœa, cauſed this laſt complaint to fall under the ſuſpicion of being itſelf ſyphilitic. In theſe points we rather agree with the author; but we cannot perceive how they at all warrant an inference in favour of the identity of the virus of the two diſeaſes. The antiquity of gonorrhœas certainly weighs againſt ſuch opinion, inaſmuch as it proves that ſome ſpecies of claps prevailed when the venereal diſeaſe was unknown, and could not poſſibly have any ſhare in their origin. The ſilence of medical writers for fifty years after the venereal diſeaſe was known, in regard to gonorrhœa being a ſymptom of it, undoubtedly militates againſt the identity of the virus producing theſe affections, ſince it tends at leaſt to prove that practitioners were unable all that time to diſcern any evidence in proof of the gonorrhœa depending upon the ſame poiſon as lues venerea. And when the occurrence of ſecondary ſymptoms, apparently unpreceded by any primary ones, excepting a gonorrhœa, firſt gave riſe to the ſuppoſition of this laſt affection being itſelf ſyphilitic, the notion might be erroneous, and the ſecondary venereal complaints admit of explanation in another way. Among the received doctrines concerning lues venerea, the poſſibility of the ſyphilitic virus being abſorbed from the ſurface of the body, without any ulceration of the ſkin, ſeems to have gained the general aſſent of modern practitioners. In this manner buboes, ſore throats, nodes, eruptions, and other ſecondary venereal ſymptoms, may be occaſioned. Such abſorption is the more likely to occur where the cuticle is moiſt and thin. Many caſes, where neither gonorrhœa nor chancre has exiſted, can be explained in no other way; unleſs, indeed, we ſuppoſe the ſore to have been ſo trivial, and to have healed ſo quickly, as to have eſcaped the patient's notice or recollection. Secondary venereal ſymptoms may be produced in either of theſe modes, and yet, though no chancre can be traced, and a gonorrhœa, as happening to be a previous malady, falls under ſuſpicion of being the original cauſe of the conſtitutional complaints, the notion may be on the above account entirely erroneous.

We are aware of the ſentiment entertained by Dr. Adams and many other practitioners, that it is the nature of a chancre to increaſe in all directions till mercury is exhibited. However true this may be as a general obſervation, few ſurgeons of extenſive experience will be perſuaded that there are no exceptions. We have heard it confeſſed by a ſurgeon, who has ſeen as much of the venereal diſeaſe as any man, that ſyphilitic ſores, inſtead of ſpreading to an unlimited extent, will ſometimes heal up without any mercury being given, the diſeaſe afterwards breaking out, however, in another form. Beſides, who can doubt that guaiacum, and ſome other remedies, have healed venereal ſores, though they may not have extirpated the diſeaſe in ſuch manner as to hinder the acceſs of future miſchief? We ſhall preſently find, on the authority of Mr. Pearſon, that even bark, and other articles, will make primary venereal complaints give way, without the aſſiſtance of mercury. Mr. Clutterbuck, in a letter addreſſed to Dr. Adams, makes the following remarks: "I have ſeen caſes which induce me to believe that the venereal diſeaſe, in ſome of its ſtages, and in certain circumſtances, may get well without mercury, or any other remedy. But this is contrary to the doctrine of Mr. Hunter, who ſuppoſed that venereal actions go on increaſing, without any tendency to wear themſelves out.

"That lues venerea is much modified by climate and other circumſtances, is generally allowed; that it has been cured by other means than mercury, we have alſo very ſufficient evidence in the older writers on the ſubject: not to mention the late ſucceſsful trials with acids and other ſubſtances." See Remarks on ſome of the Opinions of John Hunter, &c. by Henry Clutterbuck, p. 27.

Dr. Adams informs us, that according to the laws of morbid poiſons, when a chancre has exiſted and been cured, a perpetual memorial of the event muſt be left, becauſe the ſore heals without granulations. In practice, we have ſo frequently ſeen this obſervation contradicted, that we are ſomewhat ſurprized at its ever having been advanced. Chancres are not only often filled up by granulations before becoming covered with ſkin; but there is actually a redundance of ſuch new ſubſtance, and we are obliged to repreſs it with lunar cauſtic. Mr. Clutterbuck has remarked, in his letter to Dr. Adams, "With reſpect to what you ſuppoſe a law of morbid poiſons, that loſs of ſubſtance in their primary ulcers is never ſupplied, but that ſkinning takes place immediately, as ſoon as the poiſon ceaſes to act, whilſt, in the ſecondary ulcers of theſe diſeaſes granulations as conſtantly take place and ſupply the loſt ſubſtance; I ſuſpect the difference to be rather owing to the nature of the affected parts, according to the greater or leſs readineſs with which they take on and complete the healing proceſs. Thus, for inſtance, in the confluent ſmall-pox, the face alone ſuffers materially from pitting, though the ſkin on other parts has been equally crowded with puſtules, &c. The traces of previous chancre are much more viſible on the glans than on the prepuce." P. 71.

Theſe and other reflections, ſtated in the article GONORRHŒA, make us diſbelieve in the identity of the virus of this malady and lues venerea, as well as the poſſibility of ſecondary venereal ſymptoms ever in reality being the conſequence of any kind of gonorrhœa.

The Hunterian doctrines reſpecting lues venerea produced a ſudden and conſiderable revolution in the theories concerning the nature and treatment of this diſtemper; and, as they are ſtill highly intereſting, and continue to have vaſt influence over modern practice, we feel it our duty to enter a little further into the explanation of them.

The effects produced by the venereal poiſon appeared to Mr. Hunter to ariſe from its peculiar or ſpecific irritation, joined with the aptneſs of the living principle to be irritated by ſuch a cauſe, and the part ſo irritated acting accordingly. He therefore conſidered it as a poiſon, which, by irritating the living parts in a manner peculiar to itſelf, produced an inflammation peculiar to that irritation, and occaſioned the formation of a ſpecific kind of matter, that could alone ariſe from that particular ſort of inflammation. P. 19.

The following ſeems to us a very fair ſummary of the principal opinions promulgated by this philoſophical and original character, on the ſubject of lues venerea.

1. That the venereal poiſon, being taken into the ſyſtem, becomes univerſally diffuſed, and contaminates ſuch parts as are ſuſceptible of the venereal action; and that it is ſoon afterwards expelled the ſyſtem, along with ſome of the excretions.

2. That the parts contaminated do not immediately go into venereal action; but that they acquire a new ſtate, or condition, which is termed a *diſpoſition* to take on the venereal action.

3. That the number of parts contaminated does not depend on the quantity or ſtrength of the virus abſorbed.

4. That the *diſpoſition* once formed in a part, neceſſarily goes on to action at ſome future period.

5. That mercury can cure the *venereal action;* but cannot remove the *diſpoſition* which has been previouſly formed, and has not yet come into action.

6. That although mercury does not deſtroy the diſpoſition already formed, yet that it prevents it from forming.

7. That although the diſpoſition continues, it does not go into action during the uſe of mercury.

8. That the action, having once taken place, goes on increaſing, without wearing itſelf out.

9. That parts once cured never become contaminated again from the ſame ſtock of infection.

10. That the matter of the ſecondary ulcer is not infectious.

11. That the venereal action is as ſoon deſtroyed in a large chancre as in a ſmall one, the mercury acting equally on every part of the ſore.

We ſhall now endeavour to deſcribe the different forms in which ſyphilis preſents itſelf to our notice; we ſhall then introduce ſome general obſervations on the treatment of the diſeaſe; and afterwards conclude with ſuch remarks as ſeem neceſſary to convey the requiſite information reſpecting the management of each particular caſe.

Of Chancres.—Whatever may be the effect ariſing from the application of venereal matter to a ſecreting ſurface uncovered with cuticle, whether gonorrhœa, as Mr. Hunter repreſents, or a ſyphilitic ſore, as Mr. B. Bell has aſſerted, it is admitted by all parties, that when the venereal virus is applied to any part of the common ſkin, a peculiar ſore, called a chancre, is apt to be occaſioned. This, which is the primary venereal ulcer, is generally caught on the parts of generation, in conſequence of a connection between the ſexes; but any part of the body may be affected by the application of venereal matter, eſpecially if the cuticle is thin. In men, chancres uſually occur upon the frænum, glans penis, prepuce, or upon the common ſkin of the body of the penis, the moſt frequent ſituation being the frænum, or corona glandis. The reaſon why chancres commonly affect theſe parts depends upon the manner in which ſuch ſores are caught, and not upon any greater ſpecific tendency in the parts to catch the diſeaſe, than exiſts in other ſituations. They affect the frænum thus frequently, becauſe that part is irregular, and the infectious matter is apt to lie undiſturbed in the folds, by which means it has time to irritate and inflame the place where it lodges, and to produce there the ſuppurative and ulcerative inflammation. On the other-hand, ſince the matter is eaſily rubbed off prominent parts by every thing that touches them, they oftener eſcape the diſeaſe. In leſs common inſtances, chancres are ſeen on the ſcrotum, and even on the ſkin of the pubes.

In women, chancres moſtly take place on the labia and nymphæ. In a few examples they are met with on the perineum. They are generally formed on the inner ſurface of the labia, though ſometimes juſt on their edge, or even on their outſide. Chancres have been obſerved in the vagina; in theſe caſes Mr. Hunter ſuſpected, that the ſores never occupy ſuch ſituation originally; but ariſe there from the ſpreading of ulcers on the inſide of the labia. In women the ulcerations are apt to be more numerous than in men, becauſe the ſurface, for the occurrence of chancres, is more extenſive.

From what has already been obſerved, it muſt be obvious, that chancres may be caught in other ways beſides coition. Whenever venereal matter accidentally comes into contact with any part of the ſkin, where a ſore, cut, or ſcratch exiſts, or whenever ſuch matter is applied where the cuticle is thin and moiſt, a chancre is likely to be the conſequence. Mr. Hunter ſaw on the red part of the lip a chancre, which was as broad as a ſixpence, and caught the patient knew not how; it was attended with bubo under the jaw, and might have been the conſequence of infectious matter inadvertently conveyed to the part by the patient's own fingers. (P. 217.) In Dr. W. Hunter's lectures, mention uſed to be made of a midwife in extenſive practice, who, having caught a chancre on her right fore-finger in examining a pregnant woman that had the diſeaſe, infected no leſs than eighty other women in the courſe of her buſineſs. That ſurgeons occaſionally catch chancres by venereal matter lodging in a ſlight cut, or ſcratch, on their hands or fingers, is univerſally known.

It does not follow, as a matter of certainty, that becauſe venereal matter has been applied to the ſurface of the body, a chancre is ſure to enſue. The thickneſs of the cuticle, no doubt, frequently hinders infection, and the diſeaſe is often prevented by the matter being waſhed or rubbed away. It is believed, that ſome perſons cohabit with diſeaſed women with little riſk, and we are told they are, for the moſt part, ſtrong ſubjects, with a ſhort prepuce, and of courſe the glans always uncovered.

It is a circumſtance worthy of attention, that when a chancre is caught upon the hands or fingers, as related above, the virus ſeems conſtantly to operate more powerfully than when ſuch a ſore is formed in one of the uſual ſituations. "I know a midwife," ſays Swediaur, "who having been infected in this manner ſeveral years ago, ſtill ſuffers from the diſeaſe; and we have another inſtance in this metropolis of an eminent male practitioner in the ſame art, who, by delivering an infected woman got ulcers in his hand, and at this preſent time ſtill labours under the conſequences, though it is now three years ſince he received the infection. I know a gentleman, who wounding his finger by accident with a pen-knife, expoſed it the ſame evening to infection, without ſuſpecting any bad conſequences; the wound changed in two days to a very bad venereal ulcer, accompanied with a painful and obſtinate ſwelling of the whole arm, together with a bubo under the arm-pit, and ſymptoms of a general infection." Practical Obſervations on Venereal Complaints, p. 194, edit. 2.

The time, which elapſes between the application of the virus and the appearance of a chancre, is exceedingly different in different caſes, depending however, in ſome meaſure, on the nature of the part affected. According to Mr. Hunter, the diſeaſe generally begins earlier in the frænum, or termination of the prepuce in the glans, than on the glans itſelf, the ſcrotum, or the common ſkin of the penis. This celebrated ſurgeon was acquainted with examples, in which chancres made their appearance as early as twenty-four hours after infection; but on the other hand, he mentions inſtances in which ſuch ſores did not begin till ſeven or eight weeks after the application of the virus.

The inflammation which precedes a chancre, like moſt other inflammations which terminate in ulcers, begins firſt with an itching in the part. If it is the glans that is inflamed, a ſmall pimple generally appears full of matter, without much hardneſs, or ſeeming inflammation, and with very little tumefaction, the glans not ſwelling ſo much from inflammation as many other parts do, eſpecially the prepuce. Chancres on the glans are alſo leſs painful and annoying than thoſe on the prepuce. When, however, an ulcer of this kind affects the frænum, or in particular the prepuce, the inflammation is more extenſive and viſible. The itching gradually changes into pain. In ſome caſes the ſurface of the prepuce is firſt excoriated, and ulceration afterwards takes place; while, in other inſtances, a ſmall pimple or abſceſs is the forerunner of the ulcers as on the glans. The ſore becomes ſurrounded by a thickening, which, at firſt, and while of the true venereal kind, is very circumſcribed, and inſtead of diffuſing itſelf imperceptibly into the ſurrounding parts, has rather an abrupt termination. The baſe of a chancre is hard, and the edges ſomewhat prominent. When the ſore begins on, or near the frænum, it often happens that this part is quite deſtroyed, or elſe a hole is made through it by the ulceration. Hunter, p. 218, 219.

The indurated baſe, or ſurrounding thickening of a chancre, is a moſt remarkable ſymptom, and one to which ſurgical writers exhort us to pay conſiderable attention; for if the chancre heal, and a hardneſs remain, it will either break out again, when the conſtitution becomes infected, or the hardneſs will ſtill be increaſed, as ominous and indicative of a conſtitutional infection. "This ſymptom, therefore, will always explain, by its preſence, that the local infection is not radically removed; and by its abſence that it is." If, by embracing the part, which was the ſeat of the chancre, the appearance be thin, ſo that the finger and thumb do almoſt meet, the cure may then be concluded to be perfect; but if a hardneſs and thickneſs remain, although it be healed, and if there be a ſcale upon the part where the chancre was, then the caſe muſt be deemed as not cured, and as requiring much more to be done for it." Foot on Lues Venerea, p. 413.

When chancres occur on the ſcrotum, or body of the penis, they generally firſt appear in the form of a pimple, which turns to a ſcab, and this being rubbed off, is ſucceeded by a larger one. Chancres, thus ſituated, are attended with leſs inflammation than ſuch as take place on the frænum or prepuce; but with more than thoſe on the glans.

When the diſeaſe advances, it ſometimes partakes of the inflammation peculiar to the habit, and becomes more diffuſed, ſo as to produce phymoſis, paraphymoſis, and other diſagreeable complaints, which tend to retard the cure.

The local or immediate effects of the venereal diſeaſe are ſeldom wholly ſpecific, but partake of the conſtitutional inflammation. The firſt appearance and progreſs of chancres, therefore, ſhould be watched, as the nature of the conſtitution may thereby be aſcertained. If, ſays Mr. Hunter, the inflammation ſpreads faſt and conſiderably, it ſhews a conſtitution more diſpoſed to inflammation than natural. If the pain is great, it ſhews a ſtrong diſpoſition to irritation. A ſtrong tendency to mortification is alſo ſometimes betrayed by chancres beginning in an early ſtage to form ſloughs.

According to Mr. Hunter, venereal ulcers have no diſpoſition to heal, which, generally ſpeaking, is undoubtedly true. We may add, that the edges of a chancre are commonly jagged and vertical, inſtead of ſhelving, like thoſe of moſt other ſores; and its ſurface, before the adminiſtration of remedies, is ſmeared with a greyiſh viſcid matter, which is in very ſmall quantity, and ſaid to have a peculiar ſmell. If a bit of lint is applied to the ſore in this ſtate, it becomes adherent to the part, the matter ſecreted not being enough to moiſten and looſen the connection.

When there is a conſiderable loſs of ſubſtance, either from ſloughing or ulceration, a profuſe bleeding is no uncommon circumſtance, more eſpecially if the ulcer is on the glans, the blood eſcaping from the corpus ſpongioſum urethræ. The ulcers, or ſloughs, often go as deep as the corpus cavernoſum penis, and give riſe to ſtill more copious hemorrhages.

A ſurgeon ſhould never be too haſty in pronouncing ſores to be chancres; the genitals, the common ſeat of a chancre, are, "like every other part of the body, liable to diſeaſes of the ulcerative kind, and from ſome circumſtances rather more ſo than other parts, for if attention is not paid to cleanlineſs, we have often excoriations, or ſuperficial ulcers from that cauſe; alſo, like every other part that has been injured, theſe parts, when once they have ſuffered from the venereal diſeaſe, are very liable to ulcerate anew." Hunter, p. 215.

Until ſome of the virus has been abſorbed from the ſurface of a chancre, ſuch ſore is to be regarded as entirely a local affection. Unfortunately, the time when this abſorption happens can never be exactly known, ſo that, in the earlieſt ſtage of the ulcer, moſt practitioners are fearful of acting, altogether, as if there were no poſſibility of the conſtitution being already contaminated.

Some conſequences of chancres will be hereafter ſpoken of.

Of Buboes.—A venereal bubo is an inflammation of an abſorbent gland, and ariſes from the abſorption of the ſyphilitic virus, which, in being conveyed from the ſurface to which it was firſt applied, towards the trunk of the lymphatic ſyſtem, has to paſs through glands, and in doing this, it often makes theſe parts inflame and ſuppurate. Venereal matter may be taken up by the abſorbents under various circumſtances. The leaſt frequent way is where it has only been applied to ſome ſound ſurface, without having produced any local effect on the part, but has been abſorbed immediately upon its application. According to Mr. Hunter, another mode of abſorption is where ſome of the matter of a gonorrhœa is taken up by the lymphatics, and carried into the circulation. A third mode is the abſorption of the matter from an ulcer, and is by far the moſt common. A fourth way is the abſorption from a wound. Mr. Hunter, perhaps, with great propriety, uſed to call every abſceſs in the abſorbing ſyſtem, ariſing in conſequence of the abſorption of venereal matter, a bubo, whether in the veſſels or the glands themſelves.

As theſe veſſels and glands are immediately irritated by the ſpecific virus before it has undergone any change in its paſſage, the conſequent inflammation muſt, therefore, have the ſame ſpecific quality, and the matter ſecreted in the ſwelling be venereal.

In conſidering the ſubject of buboes, Mr. Hunter divided the abſorbent ſyſtem into the veſſels themſelves, and into their convolutions, or lymphatic glands.

The abſorbent veſſels are not ſo often inflamed as the glands, but when they are thus affected, in conſequence of a chancre upon the glans, or prepuce, they generally appear like a hard cord, running from the ſore along the dorſum of the penis. Such inflammations of the lymphatics ſometimes ariſe from a thickening of the prepuce in caſes of gonorrhœa, that part being uſually at the time in a ſtate of excoriation. Theſe cords often terminate inſenſibly near the root of the penis, or the pubes. In other inſtances they extend further to a lymphatic gland in the groin.

The lymphatics, thus inflamed in conſequence of imbibing venereal, or, at leaſt, irritating matter, often ſuppurate, and this ſometimes in ſeveral places, ſo as to produce as many buboes, or ſmall abſceſſes, on the body of the penis.

Inflammation of the lymphatic glands is much more frequent than the foregoing affection, and is cauſed by the venereal matter being carried into them. The ſtructure of theſe parts appears to conſiſt of the ramifications of lymphatic veſſels, which, after branching it, re-unite again. We may infer, from this kind of arrangement, that the fluid abſorbed is, in ſome meaſure, detained in the glands, and thereby has a greater opportunity of communicating the diſeaſe to them, than to the lymphatic veſſels, through which its courſe is probably more rapid.

Since the lymphatic glands are liable to inflame from many different cauſes, ſurgeons ſhould be careful to diſcriminate ſuch ſwellings as ariſe from the venereal poiſon, from others of a diverſe nature. They ſhould firſt enquire, whether there is any venereal complaint at a greater diſtance from the heart, as chancres on the penis, or, whether there has been any preceding diſeaſe in ſuch ſituation. They ſhould enquire, whether any mercurial ointment has been rubbed on the leg or thigh of the affected ſide, as mercurial frictions, thus practiſed for the cure of a chancre, will ſometimes give riſe to a glandular ſwelling in the groin, that may be erroneouſly taken for a venereal bubo. We are alſo adviſed by Mr. Hunter to obſerve, whether there has been any previous diſeaſe in the conſtitution, as a cold, fever, &c. He directs us, moreover, to pay attention to the quickneſs, or ſlowneſs, with which the tumour has formed, and warns us of the poſſibility of miſtaking a rupture, lumbar abſceſs, and an aneuriſm of the crural artery, for a bubo.

Some caſes ſeem to evince, that a bubo ſometimes does not begin till ſeveral days, and even longer, after the virus has been abſorbed, the chancres having been healed this length of time, before the gland begins to inflame.

The glands neareſt to the ſeat of abſorption are, in general, the only ones attacked. Thus, when venereal matter is abſorbed from a ſore on the penis, the glands in the groin are in danger of being affected. When the matter is abſorbed from the vulva in women, the glands liable to be inflamed, are thoſe ſituated between the labium and thigh, and the round ligament.

Mr. Hunter believed, that, commonly, only one gland is affected at a time by the abſorption of venereal matter, and he ſuggeſts this circumſtance as a diſtinguiſhing mark between venereal buboes and other diſeaſes of the lymphatic glands.

The abſorbent veſſels and glands, ſituated beyond the firſt order of glands, or ſuch as are neareſt to the ſeat of abſorption, are never affected. Hence, thoſe near the iliac veſſels and back always eſcape the effects ariſing from the abſorption of venereal matter from the genitals. It is alſo obſerved by Mr. Hunter, that when the diſeaſe has been contracted by a cut, or ſore upon the finger, the bubo takes place a little above the bend of the arm, upon the inſide of the biceps muſcle; and that, when ſuch bubo has occurred, none is, in general, produced in the arm-pit, which is the moſt common place for the glands to be affected by abſorption. This celebrated ſurgeon, however, mentions two rare exceptions, in which buboes occurred as well in the arm-pit as above the elbow.

Mr. Hunter once ſuſpected, that the reaſon of the ſecond and third ſeries of glands not being affected, might be owing to a change produced in the matter by the firſt glands, through which the virus paſſes. Reflecting, however, that the matter of a bubo is infectious, like that of a chancre, and that ſome of it can hardly fail to be taken up by the abſorbents, he perceived that the above explanation failed. He therefore altered his ſentiment, and concluded, that the internal ſituation of the glands, more remote from the ſeat of abſorption than the firſt order, might prevent the venereal irritation from taking place in them. We may remark, that this reaſoning will not account for the occaſional production of a bubo in the arm-pit above another at the bend of the arm. It is poſſible, however, that, in this laſt kind of caſe, ſome of the virus from the chancre on the finger may arrive at the axilla, without being conveyed at all through the abſorbent glands, which are ſituated at the inner ſide of the arm, a little above the internal condyle.

In men, buboes from a venereal complaint on the penis are ſituated in the groin. Mr. Hunter, we know, comprehended gonorrhœa among the cauſes, and, in this caſe, he thought, that both groins were equally expoſed to bubo. When the ſwelling in the groin originates from a chancre, it is generally on that ſide of the body to which the ſore is neareſt, though caſes happen which are exceptions to this obſervation, and admit of explanation by the anaſtomoſes of the lymphatics.

Mr. Hunterappriſes us, that the inguinal glands are not conſtantly arranged in one exact manner, and that, therefore, the courſe of the abſorbent veſſels muſt be ſubject to variety. Hence a bubo, from a venereal ſore on the penis, has been a conſiderable way down the thigh, or in front of Poupart's ligament, or near the pubes.

As, in men, chancres are almoſt always caught upon the penis, ſo buboes in them are commonly ſituated in the groins; but we have already noticed, that chancres occaſionally form in other parts of the body, and, of courſe, buboes are not neceſſarily confined to one ſituation, the neareſt external glands, between the heart and the ſeat of abſorption, every where in the body, being liable to ſhare the ſame fate as thoſe in the groin.

When buboes ariſe in women, unpreceded by any chancre, it is more difficult to find out whether they are venereal or not, than in men. For, in the latter examples, when they ariſe without any local complaint, it is known that no ſuch complaint exiſts, and, therefore, that the bubo cannot be venereal, except by immediate abſorption from a ſound ſurface. But, ſays Mr. Hunter, in women, it is often difficult to diſcover whether any infection is preſent or not; and the nature of the bubo can only be made out by paying attention to the way in which it began, its progreſs, and other circumſtances.

When chancres are ſituated near the meatus urinarius, nymphæ, clitoris, labia, or mons veneris, the abſorbed matter is carried along one or both of the round ligaments, and the buboes are formed in thoſe ligaments, juſt before they enter the abdomen. Mr. Hunter believed that they never extended further, and he ſuppoſed them to be inflammations of veſſels, and not of glands. When chancres are ſituated far back, near or in the perineum, the abſorbed matter is carried forwards, along the angle between the labium and the thigh, to the glands in the groin. Throughout this courſe ſmall buboes may occur; or the virus, entering the inguinal glands, a bubo in the groin is frequently produced.

The bubo, ſays Mr. Hunter, commonly begins with a ſenſe of pain, which leads the patient to examine the part, where a ſmall hard tumour is to be felt. This increaſes, like every other inflammation that has a tendency to ſuppurate; and, unleſs prevented, it goes on to ſuppuration and ulceration, the progreſs of the matter to the ſkin being very quick. There are, indeed, ſome caſes which are ſlow in their progreſs: in theſe, Mr. Hunter thought the inflammatory proceſs was kept back by mercury, or other means; or elſe retarded by a ſcrofulous tendency, ſuch a diſpoſition in the parts not ſo readily admitting the true venereal action.

At firſt, the inflammation is confined to the gland, which is moveable in the cellular membrane; but as the ſwelling increaſes in ſize, or as the inflammation, and, more eſpecially, the ſuppuration advance, the ſpecific diſtance is exceeded, the ſurrounding cellular membrane becomes more inflamed, and the tumour is more diffuſed. Some buboes become eryſipelatous, by which means they are rendered more diffuſed and œdematous, and do not readily ſuppurate.

The following is then, according to Mr. Hunter, the true character of a venereal bubo: it is confined to one gland; it keeps within the ſpecific diſtance, till ſuppuration has taken place, and then becomes more diffuſed. It is rapid in its progreſs from inflammation to ſuppuration and ulceration. In general, the ſuppuration is copious, conſidering the ſize of the tumour, and the abſceſs is ſingle. The pain is very acute, and the inflamed ſkin exhibits a florid red colour.

Where no local diſeaſe has exiſted, the nature of a bubo will always be attended with more uncertainty, than when there has been ſome diſeaſe on the penis. As, however, every inflammation of the inguinal glands is ſuſpected, the patient runs but little riſk of not being cured if his caſe is venereal; but, (continues Mr. Hunter,) "I am afraid, that patients have often undergone a mercurial courſe, when there has been no occaſion for it." P. 266.

The ſame diſtinguiſhed practitioner thought, that there were two ſorts of buboes ariſing without any viſible cauſe. One kind inflame and ſuppurate briſkly, as thoſe buboes uſually do which ariſe from chancres, or gonorrhœa. The manner of their progreſs made him always ſuſpect them to be venereal

The ſecond kind are generally preceded and attended with ſlight fever, or the common ſymptoms of a cold, and they are generally indolent and ſlow in their progreſs. If they are more quick than ordinary, they become more diffuſed than the venereal, and probably are not confined to one gland. When very ſlow, they give but little ſenſation; and though the ſenſation is more acute when they are quicker, yet it is not ſo ſharp as in the true venereal bubo. Beſides, they do not commonly ſuppurate; but become ſtationary. When they do ſuppurate, it is ſlowly, and often in more glands than one, the inflammation being more diffuſed, and yet not very ſevere, conſidering the ſize of the ſwelling. The matter makes its way to the ſkin ſlowly, unattended with much pain, and the colour of the ſwelling is ſomewhat purple, inſtead of the florid redneſs which the ſurface of the venereal bubo diſplays. Sometimes the abſceſſes are very conſiderable; but then they are not painful.

In judging of the nature of a bubo, Mr. Hunter recommends us firſt to conſider, whether or not there are any venereal complaints exiſting. If there are none, this is a preſumptive proof, that the glandular ſwelling is not venereal. If the tumour is only in one gland, very ſlow in its progreſs, and gives but little pain, it is likely to be ſcrofulous. If the ſwelling is conſiderable, diffuſed, and attended with ſome inflammation and pain, then, in all probability, a conſtitutional action prevails, attended with laſſitude, loſs of appetite, want of ſleep, ſmall quick pulſe, &c. Such ſwellings, (adds Mr. Hunter,) are ſlow in their cure, and are not affected by mercury, even when it is applied very early.

This gentleman likewiſe adverts to other caſes, which he terms mixed, when the venereal matter, like a cold, or fever, has only irritated the glands to diſeaſe, producing in them ſcrofula, to which they were prediſpoſed. In theſe examples, the ſwellings commonly ariſe ſlowly, give but little pain, and ſeem rather to be haſtened in their progreſs, if mercury is given with a view of deſtroying the venereal diſpoſition. Some ſuppurate under ſuch treatment, while others, which probably had a venereal taint at firſt, become ſo indolent, that mercury has no effect at all upon them, and in the end, they either get well of themſelves, or by other remedies. See Hunter on Ven. Diſeaſe.

With reſpect to the bubo which ariſes from gonorrhœa, we believe it is only ſympathetic, or the conſequence of irritation, though, as we have already ſtated, Mr. Hunter looked upon ſome of theſe caſes as actually venereal, and originating from the abſorption of the gonorrhœal matter.

Dr. Adams avers, that he is unacquainted with any inſtance in which the conſtitution has become affected in conſequence of a bubo, without a previous chancre, or gonorrhœa; for the reader ſhould underſtand, that even a venereal bubo does not imply a general contamination; the virus is only on its way towards the circulation, when it gives riſe to the ſwelling in the groin. Dr. Adams moreover aſſures us, that he has never ſeen reaſon to repent the not having treated ſuch buboes as venereal. "If," (ſays this gentleman,) "a bubo has been the conſequence of an ulcer on the penis, which healed ſpontaneouſly, we may be certain that it is not venereal. It may be the effect of a morbid poiſon, as probably many of Celſus's were; it may be aſſiſted by, and even heal under, the uſe of mercury; but this will be no proof of its venereal origin." On Morbid Poiſons, p. 128. 2d edit.

Some additional remarks on buboes will be introduced when we conſider the treatment.

Of Secondary, or Conſtitutional Symptoms.—By ſecondary, or conſtitutional ſymptoms, are commonly underſtood thoſe effects which ariſe from the ſyphilitic virus being abſorbed and carried into the common circulation. It is moſt likely, that in caſes of chancre, the contamination of the ſyſtem takes place about the beginning of the local complaints; for, in moſt inſtances, the chance of ſuch infection happening afterwards is greatly leſſened, by the patient having ſpeedy recourſe to the uſe of mercury, which generally acts as a preventive.

The abſorption of venereal matter into the ſyſtem moſtly ariſes from a chancre, and Mr. Hunter joined in the belief, that it may alſo ſometimes originate from a gonorrhœa. We have already adverted to the opinion, that the virus may poſſibly be obſerved, in ſome inſtances, without there being any ſore at all produced in the ſeat of abſorption, that is, where the matter is applied. Mr. Hunter thought, that this might happen upon a half-internal ſurface, like that of the glans penis, though, perhaps, not on the ſound ſkin. Venereal matter may likewiſe be received into the conſtitution by being applied to common ulcers, although not neceſſarily rendering theſe ulcers themſelves venereal. Wounds alſo afford a ſurface for ſuch abſorption, but Mr. Hunter believed, that ulceration was always firſt produced.

Some parts of the body are much leſs ſuſceptible of lues venerea than others; and many parts, as far as preſent evidence extends, ſeem quite incapable of being affected. Mr. Hunter never ſaw the brain, heart, ſtomach, liver, kidnies, &c. thus diſeaſed. This celebrated writer divides the parts which are capable of becoming contaminated, in conſequence of the abſorption of the virus into the circulation, into two orders. The firſt order conſiſts of the ſkin, tonſils, noſe, throat, inſide of the mouth, and ſometimes the tongue. Theſe are the parts commonly affected at an early period, after the paſſage of the virus into the conſtitution. The ſecond order conſiſts of the perioſteum, faſciæ, tendons, and bones; parts which become diſeaſed leſs early.

Mr. Hunter, with much appearance of reaſon, has endeavoured to account for this ſeeming greater ſuſceptibility in ſome parts than others, by the manner in which the former are expoſed to cold. Thus, he obſerves, the ſkin is continually ſubjected to more cold than the internal parts are; and the venereal diſeaſe always more readily affects parts ſo expoſed than others. This may be the reaſon why the mouth, noſe, and ſkin are affected with particular frequency, and alſo why the perioſteum, and moſt ſuperficial ſurfaces of the bones, are moſt liable to be diſeaſed. The diſtemper, however, ſeems to ſhew ſome preference to ſuch bones as are particularly hard.

In treating of chancres and buboes, we had occaſion to obſerve, that the matter, in both theſe caſes, partook of the ſpecific quality, and, of courſe, was capable of communicating the diſeaſe. We have now to notice, that this is not the caſe with the matter of ſecondary venereal ulcers, or ſuch as ariſe in conſequence of the introduction of the virus into the ſyſtem at large. Indeed, none of the ſecondary ſymptoms are infectious. As Mr. Hunter has ſtated, this form of the diſeaſe has not the power of contaminating parts, not already under its influence, even in the ſame conſtitution. Probably, the poiſon only irritates juſt after its abſorption, and is ſoon expelled with ſome of the ſecretions, inſtead of circulating with the blood during the whole time of the diſeaſe.

Mr. Hunter has concluded one of his moſt intereſting chapters with the following inferences.

Firſt; that moſt parts, if not all, that are affected in the lues venerea, are affected with the venereal irritation at the ſame time.

Secondly; that parts expoſed to cold are the firſt that admit the venereal action; then the deeper parts, according to their ſuſceptibility for ſuch action.

Thirdly; the venereal diſpoſition, when once formed in a part, muſt neceſſarily go on to form the venereal action.

Fourthly; that all parts of the body, under ſuch diſpoſition, do not run into action equally faſt, ſome requiring ſix or eight weeks, others as many months.

Fifthly; in the parts that come firſt into action, the diſeaſe goes on increaſing, without wearing itſelf out; while thoſe which are ſecond in time, follow the ſame courſe.

Sixthly; mercury hinders a diſpoſition from forming; or, in other words, prevents contamination.

Seventhly; mercury does not deſtroy a diſpoſition already formed.

Eighthly; mercury hinders the action from taking place, although the diſpoſition be formed.

Ninthly; mercury cures the action.

Secondary Venereal Ulcers.—Theſe are of a very different nature from chancres, or ſuch ſores as originate directly from the application of venereal matter to the ſkin. They are generally much leſs painful than the latter, attended with leſs inflammation, and do not ſecrete matter, that can communicate the diſeaſe to others, or cauſe buboes in the patient himſelf. They are more readily formed on mucous membranes, than on the common integuments, and therefore are very frequent on the tonſils, and other parts of the throat. Sores of this deſcription are often of a round ſhape, though, in certain examples, they eat away the parts, like herpetic or phagedenic ulcers, ſpreading from one part to another, deſtroying the ſkin, and healing on one ſide, while they are extending themſelves on another. Richeraud has ſeen ulcers of this kind, ſpread in this manner nearly all over the patient's body, producing one vaſt cicatrix; and he adverts to a particular ſpecies of ſecondary venereal ulcer, which is of a round ſhape, and begins to heal at its centre, ſo that towards the termination of the complaint the ſore repreſents an ulcerated circle, encompaſſing a round cicatrix. When this variety of the diſeaſe makes progreſs, the ulcerated ring becomes larger, while the cicatrix in the centre undergoes a proportional increaſe in ſize. (Noſ. Chirurg. tom. i. p. 331, 332. edit. 2.) It may be doubted whether the latter caſes are really ſyphilitic: they certainly yield to many remedies beſides mercury, as our own obſervation has convinced us. They may be cured by guaiacum, nitric acid, a decoction of ſarſaparilla, and elm bark, &c.

Venereal Eruptions.—On this ſubject Mr. Hunter has pointed out to us the following circumſtances.

The appearances on the ſkin generally occur all over the body. The diſcolourations make the ſkin appear mottled, and many of the eruptions diſappear, while others continue, and increaſe with the diſeaſe.

In other caſes, the eruption comes on in diſtinct blotches, which are often not obſerved till the ſcurfs have begun to form. At other times, the eruption aſſumes the appearance of ſmall diſtinct inflammations, containing matter, and reſembling pimples, not being, however, ſo pyramidal, nor ſo red at the baſe. Mr. Hunter alſo obſerves, that venereal blotches, on their firſt coming out, are often attended with inflammation, which gives them a degree of tranſparency, which is generally greater in the ſummer than the winter, eſpecially if the patient be kept warm. In a little time this inflammation diſappears, and the cuticle peels off in the form of a ſcurf. The latter occurrence often miſleads the patient and the ſurgeon, who look upon this dying away of the inflammation as a decay of the diſeaſe, till a ſucceſſion of ſcurfs undeceives them. Mr. Hunter adds, that the diſcolourations of the cuticle ariſe from the venereal irritation, and are to be ſeldom regarded as a true inflammation, ſince they rarely have any of its characteriſtics, ſuch as tumefaction and pain. However, he explains that in parts which are well covered, or which are conſtantly in contact with other parts, there is more of the true inflammatory appearance, eſpecially about the anus.

The parts affected next begin to alter their appearance, and form a copper-coloured, dry, inelaſtic, cuticle, called a ſcurf. This is thrown off, and new ones are formed. Mr. Hunter relates, that theſe appearances ſpread to the breadth of a ſixpence, or ſhilling; but ſeldom more extenſively, at leaſt for a conſiderable time. In the mean while, every ſucceeding ſcurf becomes thicker and thicker, till at laſt it becomes a common ſcab. Then the diſpoſition for the formation of matter takes place in the cutis underneath, and a true ulcer is formed, which commonly ſpreads, although in a ſlow way.

Theſe appearances ariſe firſt from the gradual loſs of the true ſound cuticle, which the diſeaſed cutis cannot re-produce. As a kind of ſubſtitute for this want of cuticle, an exudation takes place, and forms a ſcale. The matter afterwards acquiring more conſiſtence, at laſt forms a ſcab. However, before the diſeaſe has attained this condition, the cutis has ulcerated, after which the diſcharge is more like true pus. When this form of the lues venerea attacks the palms of the hands and ſoles of the feet, where the cuticle is thick, this latter part firſt becomes ſeparated, and peels off. A new one is immediately formed, which alſo ſeparates. In this manner, a ſeries of new cuticles take place, in conſequence of ſcurfs not being ſo readily formed as on the common ſkin. When the diſeaſe is confined to the palms of the hands, or ſoles of the feet, Mr. Hunter mentions, that there is difficulty in determining whether it is venereal or not: becauſe moſt diſeaſes of the cutis, in theſe ſituations, produce a ſeparation of the cuticle, attended with the ſame appearances in all, and having nothing characteriſtic of the venereal diſeaſe.

When the affected part of the ſkin is oppoſed by another portion of ſkin, which keeps it in ſome degree more moiſt, as between the nates, about the arms, between the ſcrotum and the thigh, in the angle between the two thighs, on the red part of the lip, or in the arm-pits, the eruptions, inſtead of being attended with ſcurfs and ſcabs, become accompanied by an elevation of the ſkin, which is ſwollen with extravaſated lymph into a white, ſoft, moiſt, flat ſurface, which diſcharges a white matter.

A venereal eruption often attacks that part of the fingers on which the nail is formed. Here the diſeaſe renders that ſurface red, which is ſeen ſhining through the nail; and if allowed to continue, a ſeparation of the nail takes place, ſimilar to that of the cuticle in the above caſes. However, Mr. Hunter ſtates, that there cannot be the ſame regular ſucceſſion of nails, as of cuticles in other inſtances.

Such ſurfaces of the body as are covered with hair may alſo be attacked, and the hair ſeparates, and cannot be produced as long as the diſeaſe laſts.

Venereal Affections of the Parts about the Throat.—According to Dr. Adams, the venereal ulcer in the throat is always, what may be termed, a foul ulcer. Though its edges are defined, its ſurface is always ragged and uneven, of a complexion which can never be miſtaken for a clean or healthy ſore, that is, for a ſore diſpoſed to heal. The pus is of various colours, from the aſh-colour to the duſky brown. From the nature of the parts, a ſcab cannot be formed, ſo that the ulcerous appearance is never interrupted. Its progreſs is more rapid than on the ſkin, as every action of inflammation, ulceration, or healing, is always more rapid in theſe very ſanguiferous parts. It is rarely attended with pain. On Morbid Poiſons, p. 167. edit. 2.

When the throat, tonſils, or inſide of the mouth, are affected, it is the nature of the diſeaſe to make its appearance at once in the form of an ulcer, without much previous ſwelling.

The venereal ſore-throat ſhould be moſt carefully diſcriminated from others, a thing that is not always at firſt very eaſy; for ſores in this ſituation, which are really ſyphilitic, ſometimes have much the ſame appearance as others which are not ſo. It is the character, however, of a venereal ſore-throat to begin with ulceration of the ſurface of the parts. Now, as Mr. Hunter has explained, it is the nature of ſeveral other diſeaſes, in the ſame ſituation, not to produce directly this kind of ulceration. One of theſe is common inflammation of the tonſils. The inflamed place often ſuppurates in the centre, ſo as to form an abſceſs, which burſts by a ſmall opening; but never looks like an ulcer, that has begun upon the ſurface, like a true venereal ſore. The caſe, juſt now mentioned, is always attended with too much inflammation, pain, and ſwelling of the parts, to be venereal. Alſo, when it ſuppurates and burſts, it ſubſides directly, and it is generally attended with other inflammatory ſymptoms in the conſtitution.

Notice is likewiſe taken, by this moſt celebrated ſurgeon, of an indolent tumefaction of the tonſils, which is peculiar to many perſons of a ſcrofulous conſtitution. The complaint occaſions a thickneſs of ſpeech.

Sometimes coagulable lymph is thrown out on the ſurface of the parts affected, and produces appearances which are by ſome called ulcers, by ſome ſloughs, and occaſionally by others, putrid ſore-throats. The caſe is attended with too much ſwelling to be venereal; and, with a little care, it may eaſily be diſtinguiſhed from an ulcer, or loſs of ſubſtance. However, when this difference is not obvious at firſt ſight, it is proper to endeavour to remove ſome of the lymph, and if the ſurface of the tonſil underneath ſhould appear to be free from ulceration, we may conclude, with certainty, that the diſeaſe is not venereal. Mr. Hunter ſtates, that he has ſeen a chink filled with coagulable lymph, ſo as to appear very much like an ulcer; but, on removing that ſubſtance, the tonſil underneath was found perfectly ſound. He adds, that he has ſeen caſes of a ſwelled tonſil, having a ſlough in its centre, which ſlough, before its detachment, looked very like a foul ulcer. The ſtage of the complaint, he ſays, is even more puzzling, when the ſlough has come out; for then the diſeaſe has moſt of the characters of the venereal ulcer. Whenever he met with the diſeaſe in its firſt ſtage, he always treated it as if it had been of the nature of eryſipelas, or a carbuncle. When the complaint is in its ſecond ſtage, without any preceding local ſymptoms, he recommends the practitioner to ſuſpend his judgment, and to wait a little, in order to ſee how far Nature is able to relieve herſelf. If there ſhould have been any preceding fever, the caſe is ſtill leſs likely to be venereal. Mr. Hunter informs us, that he has ſeen a ſore-throat of this kind miſtaken for venereal, and mercury given till it affected the mouth, when the medicine brought on a mortification of all the parts concerned in the firſt diſeaſe.

Another complaint of theſe parts, which Mr. Hunter repreſents as being often taken for a venereal one, is an ulcerous excoriation, which runs along their ſurface, becoming very broad and ſometimes foul, having a regular termination, but never going deeply into the ſubſtance of the parts, as the venereal ulcer does. No part of the inſide of the mouth is exempted from this ulcerous excoriation; but Mr. Hunter thought, that the diſeaſe moſt frequently occurred about the root of the uvula, and ſpread forwards along the palatum molle. He remarks, that the complaint is evidently not venereal, ſince it does not yield to mercury. He has ſeen theſe ulcerous excoriations continue for weeks, without undergoing any change, and a true venereal ulcer makes its appearance on the ſurface of the excoriated part. He ſays, that the excoriations in queſtion have been cured by bark, after the end of the mercurial courſe, which cured the ſyphilitic ſore.

This author deſcribes the true venereal ulcer in the throat as a fair loſs of ſubſtance, part being dug out, as it were, from the body of the tonſil; it has a determined edge, and is commonly very foul, having thick white matter, like a ſlough, adhering to it, and not admitting of being waſhed away. Ulcers in ſuch ſituations are always kept in a moiſt ſtate, and the matter cannot dry and form ſcabs, as it does on ſores upon the ſkin. The ulcer is alſo much more rapid in its progreſs, and generally has thickened edges. Hunter on Venereal Diſeaſe.

Dr. Adams, after reminding us not to conſider every ragged ulcer of the throat as certainly venereal, takes occaſion to remark, that he has ſeen more than one of this deſcription, which has healed whilſt he has been making up his mind, whether he ſhould ſalivate his patient. He ſays, "the only diſtinction I know between theſe and true venereal ulcers, is that the former are uſually attended with more pain, the edge is alſo for the moſt part leſs defined, and the ſurface itſelf is more irregular; the fever too, if any attends, is not ſuch as we have deſcribed in ſyphilis. But the venereal ulcer is not always entirely free from pain, and there is generally ſome irregularity in its ſurface; the fever too, we have remarked, is often ſlight. Happily, this intricacy does not often occur, but often enough to teach us not to value ourſelves on a haſty deciſion, when a little delay will be unattended with danger, and perhaps ſave our patient a tireſome and unneceſſary proceſs. By watching the ulcer attentively, we ſhall be able to obſerve whether it continues to ſpread regularly, though ſlowly, ſtill retaining its character, and not healing in any part. If this ſhould continue a few days, we ſhall have no reaſon to doubt its ſyphilitic character; but if the progreſs is ſlow, there can be no harm in a further delay, the only inconvenience attending which, will be the importunity of your patient. If, as is ſometimes the caſe, from the nature of the part, and the irritability of the conſtitution, the progreſs of the ulcer ſhould be quicker, the character in all other reſpects well defined, and the hiſtory of the caſe leading to a ſimilar concluſion, we may, by uſing every poſſible means of introducing mercury, eaſily accelerate our courſe. This will rarely be very difficult, becauſe the ſame irritability of conſtitution which produces an ulceration more rapid than uſual, is for the moſt part attended with quicker ſuſceptibility of the mercurial irritation.

"The ſame directions are applicable, whether the ulcer is ſeated on the tonſils, uvula, or palatum molle, or any of the neighbouring parts, excepting the tongue, in which caſe the progreſs is ſlower, the edges conſequently thicker from the ſtructure of the part, and the pain and inconvenience greater from the ſame cauſes, and alſo from its particular offices." (Adams on Morbid Poiſons, p. 167, 168.) According to Mr. Hunter, lues venerea ſometimes produces a thickening and hardening of the tongue. We have ſeen a caſe or two, in which this part has been ſtudded over with largiſh tubercles, or hard lumps, which yielded to mercury. We doubt, however, whether theſe inſtances were really ſyphilitic.

Venereal Affections of the Bones, Perioſteum, Faſciæ, and Tendons.—Nodes-ſyphilitic Pains.—Theſe complaints are nodes and pains in the bones. A ſwelling of the parts enumerated, originating from a ſyphilitic cauſe, receives the appellation of a node. We have already obſerved, that Mr. Hunter divided the parts in which ſecondary ſymptoms manifeſt themſelves into two orders; the firſt comprehending the ſkin and parts about the throat and mouth; the ſecond, the bones, perioſteum, faſciæ, and tendons. Theſe latter ſtructures do not in general become affected till the diſeaſe has troubled the patient a conſiderable time, nor before it has made its attack on the firſt order of parts. Mr. Hunter, however, had ſeen a few caſes which were exceptions to this obſervation, the malady affecting the bones before any complaints of the ſkin or throat had happened.

When the deeper-ſeated, or ſecond order of parts become affected, the progreſs of the diſeaſe is more gradual than in the firſt. The complaints produced bear a great reſemblance to ſcrofulous ſwellings, and the effects of chronic rheumatiſm, excepting, however, that the joints are leſs ſubject to be affected. At a time when there has been no poſſible means of catching the infection for many months, a ſwelling will be formed on a bone, and having given little pain, will not be taken much notice of till it is of conſiderable ſize. In other inſtances the pain may be ſevere, and yet no ſwelling occur at all, or be perceptible for ſome time afterwards. The ſame remarks are equally applicable to ſwellings of the tendons and faſciæ. As it is the character of nodes to increaſe by ſlow degrees, they are not attended with much inflammation. When they attack the perioſteum, the tumour being cloſely connected with the bone, ſeems in fact to ariſe from it.

The malady continuing to grow worſe and worſe, ſuppuration takes place in the node; but the matter which is produced is not good pus. Some nodes, both of the tendons and bones, laſt for years, before they form any matter at all. Theſe caſes, Mr. Hunter ſuſpected, might not invariably be venereal.

In caſes of nodes the pain is ſometimes very conſiderable, while at other times it is hardly ſuch as to deſerve notice. In certain inſtances, the tendinous parts, when inflamed, occaſion a heavy kind of pain; and in other examples, they will ſwell very much, and yet excite no pain worth mentioning.

The pains ariſing from a ſyphilitic affection of the bones, are uſually periodical, having exacerbations moſtly in the night. Rheumatic pains, which the venereal much reſemble, are alſo generally worſt in the night. See Hunter on Venereal Diſeaſe, p. 328, 329.

Having deſcribed the ſecondary ſymptoms of lues venerea, as occurring in the firſt and ſecond orders of parts, it remains for us to notice a few other diſeaſes frequently ſuppoſed to be ſyphilitic.

Warts, Excreſcences, &c.—Parts acquire, from the irritation of venereal matter, a diſpoſition to form excreſcences, or cutaneous tumours, called warts. Theſe are moſt prone to grow where chancres have been ſituated, which ſores, indeed, not unfrequently heal into warts. Such excreſcences are liable to be hurt by bodies rubbing againſt them, and often a ſimilar cauſe will make them exceedingly painful, and bleed very profuſely. They are conſidered, by the generality of ſurgeons, not ſimply as a conſequence of the venereal poiſon, but as poſſeſſed of its ſpecific diſpoſition, and, therefore, have recourſe to mercury for the cure of them. Mr. Hunter obſerves, however, that he never ſaw mercury have ſuch an effect, although given in ſufficient quantity to cure, in the ſame perſon, recent chancres, and ſometimes ſecondary ſymptoms. We cannot ſay that our experience is in ſupport of this laſt obſervation, though we join in the belief, that warts are never venereal. In St. Bartholomew's hoſpital, it is the common practice to give mercury for the cure, and it is done with unequivocal ſucceſs. But then the ſame excreſcences might be cured much more judiciouſly either with the knife, ligature, or eſcharotics, according to the ſhape, ſize, and ſituation of them. In all theſe ways we have ſeen a laſting cure accompliſhed, without any employment of mercury. On the whole, therefore, we think with Hunter and Dr. Adams, that ſuch complaints never partake of the ſpecific nature of the venereal diſeaſe.

With reſpect to other excreſcences, thoſe called rhagades, fici, and condylomata, were deſcribed long before lues venerea was ever heard of. The firſt are common in warm climates, particularly about the ends of the fingers, and are never venereal. "There are (ſays Dr. Adams) a number of ſoft excreſcences about the anus, to which various names have been given. They ariſe ſometimes in conſequence of a diſcharge from the rectum, ſtimulating the neighbouring parts to ulceration. If ſuch ulcers are prevented from healing by the diſcharge continuing, or by the friction of the parts, they muſt either ulcerate deeper and wider, or the cuticle will ſend out proceſſes to defend them. Theſe, on account of the preſſure they receive, grow in various ſhapes, from which they have acquired their names.

"They will ariſe from a venereal origin in two ways. If a ſecondary ulcer is ſeated in theſe parts, that ulcer having no power of healing itſelf, will take the character above deſcribed, from the nature of the parts. Sometimes, alſo, the matter of gonorrhœa, by falling from the vagina along the perineum, will produce ulceration, and the ſame conſequences follow. In either of theſe caſes, the remedy which cures the firſt diſeaſe will cure theſe local complaints; or, if they afterwards remain, they will no longer retain their ſyphilitic property, and may readily be cured by topical remedies." (On Morbid Poiſons, p. 173, edit. 2.) On this ſubject we muſt obſerve, that we have never ſeen more reaſon for conſidering ſuch excreſcences about the anus, as really ſyphilitic, than for regarding warts on the genitals in the ſame light. We ſpeak of the excreſcences alone, and not of any ulcers which may exiſt with them. Theſe tumours may always be extirpated without any bad conſequences, and mercury is unneceſſary in the cure.

Among the ſecondary ſymptoms of ſyphilis, the venereal ophthalmy might be conſidered; but as we ſhall have an article expreſsly on the various ſpecies of inflammation affecting the eye, we ſhall poſtpone this ſubject till a future opportunity. See OPHTHALMY.

General Obſervations on the Treatment of Lues Venerea.—From the remarks already delivered, the reader muſt be appriſed, that mercury is the grand remedy for all complaints unequivocally venereal. This is ſo much the caſe, that this medicine is uſually regarded as a ſpecific, and the only one to be depended upon for a cure. That mercury is powerfully efficacious in checking and curing ſyphilitic affections, is a truth as well eſtabliſhed as any in the practice of ſurgery. But whether there may not be other ſubſtances which poſſeſs anti-venereal qualities ſufficiently to be of ſervice, and even preferable to mercury, under particular circumſtances, and whether ſuch remedies alone can ever be confided in for a permanent and radical cure, are queſtions of more difficulty and uncertainty. As long as many diſeaſes preſent themſelves, having nearly the ſame appearance as ſyphilitic complaints, and as long as mercury cures not one, but a hundred diſorders, there will always be obſtacles in the way of an eaſy ſettlement of theſe conteſted points. All men muſt firſt agree, that the caſes in which the trial of any medicine is made, are decidedly venereal, or elſe the experiment will avail nothing.

If it be ſuppoſed that mercury is the only medicine to be truſted in the treatment of the venereal diſeaſe, of courſe we can have little more to do than relate the various plans of uſing this renowned remedy, and explain the principles by which its adminiſtration ought to be regulated. We mean, however, to be more impartial, and not totally ſilent reſpecting other medicines.

When lues venerea firſt invaded Europe, towards the concluſion of the fifteenth century, the conſternation which the new diſtemper excited may be more eaſily conceived than depicted. The mode in which the malady was moſt commonly communicated, the unrelenting fury with which it proceeded from one order of painful and diſguſting ſymptoms to another, and above all, the inefficacy of the ſeveral methods of treatment which were adopted by the phyſicians and ſurgeons of that period, furniſhed reaſons but too cogent for regarding it as one of the moſt deſtructive ſcourges that had ever-viſited the human race. See Pearſon on Lues Ven. Introduction.

The diſeaſe, however, had not raged long in this quarter of the world, when the efficacy of mercury in curing it was aſcertained. The Arabian phyſicians had long been in the habit of applying mercury to the purpoſes of medicine. Rhazes, the Arabian author, by whom moſt of the oriental practice was communicated to European practitioners, recommended an ointment, in which quickſilver was an ingredient, for the cure of cutaneous eruptions. It was probably, therefore, from analogy, that Vigo, Berengarius Carpus, Fallopius, and others who practiſed at the time when the venereal diſeaſe firſt made its appearance in Europe, were induced to try the effect of mercury in the form of ointments and plaſters, for the cure of cutaneous complaints proceeding from a ſyphilitic cauſe.

That the diſeaſe was unknown to Europeans before the return of Columbus from America, appears to derive material confirmation from the conſternation, deſpair, and ignorance of the diſtemper, which are confeſſed by all the moſt learned practitioners of that time. Many of them at firſt refuſed to have any thing to do with the unfortunate patients, ſome of whom were expelled from human ſociety, and compelled to ſeek refuge in the fields and woods. Fortunately, things did not long go on in this wretched manner. The analogical application of mercury was ſoon tried, and found ſtrikingly beneficial. Berengarius of Carpi, who was the firſt that tried the effects of mercury in the cure of ſyphilis, ſoon made an ample fortune by the practice of the ſecret, according to the report of Fallopius. Berengarius and Vigo were almoſt the only practitioners who were acquainted with the important diſcovery of mercury being a cure for the new and dreadful diſtemper, and it was from their ſucceſs, and the candid repreſentations of Vigo and Fallopius, that mercury became the accepted and eſtabliſhed antidote for the venereal diſeaſe. The old practitioners employed mercury in the form adviſed by Rhazes; they uſed it as an ointment, and, without knowing that the mineral was taken into the conſtitution by means of the abſorbents, they continued the practice entirely from the beneficial conſequences demonſtrated to them by experience. When patients were afflicted with pains in the bones, the plan of applying mercurial plaſters to the parts affected ſoon became a cuſtom. The phyſicians and ſurgeons, at the time when mercury firſt began to be uſed for the cure of the lues venerea, were not acquainted with many chemical preparations of that mineral, and indeed, as it was regarded as a poiſon when internally taken, external ointments and plaſters were alone deemed juſtifiable. The hydrargyrus nitratus ruber, however, was known to John de Vigo, who has recommended it as an application to chancrous ulcers. The internal exhibition of mercury was at firſt generally condemned; and ſo fearful were practitioners of the effects of this mineral, that even its external employment was conducted with the moſt extreme caution. In fact, the ointment which was at firſt uſed only had in its compoſition one-fortieth part of quickſilver; the proportion was afterwards increaſed to one-fourteenth, and laſtly, to one-eighth. Beſides ointments and plaſters, fumigations were ſoon introduced into practice; for as it was ſuppoſed that mercury produced a cure altogether by coming into contact with the part affected, it was judged neceſſary to contrive ſome mode of introducing mercury to ſores in the throat, and for that purpoſe fumigations were adopted.

At length the chemiſts ſet themſelves to work in making numerous mercurial preparations, to ſome of which ſuperior efficacy was imputed. It was as early as the year 1553 that lotions of ſublimated mercury were firſt employed by Angerius Ferrerius. Two ounces of it were diſſolved in ſix pounds of diſtilled water. With this mixture the whole body was waſhed and rubbed, excepting the head, breaſt, ſtomach, and arm-pits; and this method was continued once, twice, or thrice a day for ten days, according to the ſtrength of the patient, and other circumſtances. The patient was at the ſame time ſweated moſt profuſely; for ſweating was conceived to aſſiſt in the cure, becauſe the diſtemper was more eaſily overcome in the Weſt Indies, where diaphoretic means had long been uſed in aid of guaiacum. Quickſilver girdles for the loins and wriſts were alſo in faſhion. The fumigations were made with mercury extinguiſhed in turpentine, or elſe with cinnabar blended with inflammable ingredients.

John de Vigo was the firſt who avowed giving mercury internally, about the year 1535. The medicine that he exhibited in this manner was the hydrargyrus nitratus ruber, which had been previouſly praiſed both by Vigo himſelf and Nicholas Maſſa, as a moſt beneficial application to venereal ulcers. The violent effects of this preparation, when adminiſtered internally, ſoon brought it into diſrepute, and then pills of crude mercury came into uſe.

If, however, the firſt employment was generally conducted with extreme caution and timidity, there were many exceptions, and afterwards, when the profeſſion became more familiar with the method, they became of courſe bolder. For we learn that, after a time, the flagrant evils ariſing out of the improvident uſe of the medicine, and the frequent inſtances of death from its poiſonous action, excited an univerſal clamour againſt it, and many preferred enduring the diſeaſe to the mercurial remedy. It is no wonder, therefore, that guaiacum, when brought into Europe in 1517, China-root in 1535, ſarſaparilla about the ſame time, and ſaſſafras a little afterwards, were received with wonderful applauſe, as delivering the afflicted from a dreaded diſtemper, and a more dreaded remedy. (See Foot on Lues Ven. lect. 19.) What degree of merit ſuch medicines poſſeſs, we ſhall preſently enquire.

As ſoon as it was aſcertained that pharmaceutical preparations of mercury might be internally given, without the degree of danger formerly apprehended, myriads of ſecret formulæ began to be obtruded upon every town and every country of Europe. Among the moſt famous remedies were the mercurius dulcis; the common Æthiops; mercurius alkalizatus ground with oyſter-ſhells; mercurius antithiſicus with dry balſam of Peru; mercurius antiſcorbuticus with gum guaiacum; mercurius dulcis with manna; mercurius diureticus with juniper gum; and mercurius catharticus with ſcammony. Afterwards rougher preparations were made uſe of, ſuch as mercurius precipitatus albus; a ſolution of red precipitate in aquafortis corrected, red precipitate, turbith mineral, green precipitate, beſides numerous high ſounding panaceæ. Even a ſolution of corroſive ſublimate, mixed with barley-water, or water-gruel, was long ago execrated as "the vile practice of London quacks" by our countryman Wiſeman.

With ſuch a farrago of mercurial preparations it is hardly to be expected that any regular and rational plan of treatment could be purſued by the generality of the old practitioners.

tioners. The common methods were chiefly empirical, and it was not until towards the beginning of the eighteenth century, that the treatment of the venereal diſeaſe began to be regulated by ſcientific principles.

In the elegant edition of Aphrodiſiacus by Boerhaave, a full account may be ſeen of circumſtances confirming the preceding ſtatement.

Whoever will conſult Wiſeman, one of the moſt reſpectable authors we have in ſurgery, will find that the ſymptoms of the venereal diſeaſe were in general much more ſevere in his time than they are at preſent, and at the ſame time that the mode of practice was ſtill much ſeverer. In claps, large and repeated doſes of draſtic purges, calomel, and turpeth mineral were the medicines employed, even in the inflammatory ſtate of the diſeaſe, and ſome turpentine remedies were given to complete the cure. Venereal ſores were powdered with red precipitate, and dreſſed with the moſt acrid and ſtimulating applications. In confirmed ſyphilis, the hot ſalivating method of treatment was adopted; the patient was crammed into a ſmall room heated with a ſtove; the admittance of freſh air was prevented by blankets put up at the door and windows; and the patient himſelf was ſurrounded with a ſcreen. There he ſat, half ſuffocated in his own hot putrid atmoſphere, and was rubbed with mercurial ointment, until his tongue generally lolled out, and the inſide of his mouth was covered with ſloughs. In this hideous pickle it was cuſtomary for him to lie from twenty-five to thirty days.

It is no wonder, as Mr. Deaſe has obſerved, that many fell victims to this prepoſterous mode of treatment, few conſtitutions being able to endure it, and no conſtitution eſcaping without material and permanent injury.

Our Engliſh Hippocrates, the great Sydenham, lays it down as an axiom, that, as the venereal virus is of a very inflammatory nature, the principal end to be aimed at in the treatment ought to be evacuation. In gonorrhœa he adviſes ſtrong draſtic purges, which are to be perſiſted in for a long time. The firſt fourteen days of the diſeaſe he purges the patient every day; then every ſecond day; and, towards the latter end of the caſe, twice a week. Should the cure advance but ſlowly, eight grains of turpeth mineral, given twice or thrice, at due intervals, Sydenham reckons extremely effectual. Where purgatives are rejected by the mouth, he ſubſtitutes clyſters. Balſam of Mecca, or Cyprus turpentine cloſes the cure. He thinks injections do much more miſchief than ſervice; and is averſe, in theſe caſes, to the uſe of mineral waters, and decoctions of the woods.

As Sydenham does not account mercury a ſpecific, in the cure of lues venerea, only inaſmuch as it is poſſeſſed of a ſuperior efficacy in exciting ſalivation, he conſiders as uſeleſs and hurtful all preparation, as bleeding, purging, or bathing, before putting the patient into a ſalivation. He thought that the leſs the patient was weakened, the greater was the probability of a cure. His whole attention, in the treatment, is to keep up a high degree of ſalivation. If the rubbing does not have this effect, he gives turpeth mineral, or calomel; and, of the latter medicine, he gives a doſe once a week, for ſome months after the cure is apparently effected, for fear of a relapſe. He is againſt carrying off, by purging, any remains of the ſpitting after the courſe is over; and, during the whole treatment, allows the patient ſuch light meats as may be deſired.

The methods of treating lues venerea, as laid down by Wiſeman and Sydenham, were for a long time followed, throughout Europe, with no material variation. At length the celebrated Aſtruc gave one of the moſt elaborate treatiſes on this diſtemper ever publiſhed.

The treatment of a gonorrhœa he conſiders at three different periods. In the firſt, or inflammatory ſtage, he directs us to employ large and repeated bleedings; and thinks, that the indication for copious bleeding is as ſtrongly pointed out in this caſe, as in that of a peripneumony, or dyſentery. He orders large quantities of cooling emulſions to be frequently drunk, the bowels to be kept open with emollient glyſters, opiates, if the ſymptoms are violent, cooling injections, fomentations, poultices to the penis and perineum, and a very ſlender regimen. In the ſecond ſtage, when the inflammatory ſymptoms have ſubſided, after purging two or three times with jalap, diagredium, or calomel, he has recourſe to mercurial frictions every ſecond day, to be more immediately employed about the parts of generation and perineum. He continues the ſame ſevere regimen. In the third ſtage, he completes the cure by ſome of the turpentines, mineral, acidulated, vitriolic, or ſteel waters, or the common aſtringents. He reprobates aſtringent injections. In what he terms the dry gonorrhœa, he puſhes the antiphlogiſtic treatment much farther; for he even bleeds every fourth hour.

In the cure of ſyphilis, Aſtruc prefers ſalivation by mercurial frictions. He enters into a long deſcription of the neceſſary previous preparation; bleeding, purging, warm bathing, medicated broths, and ſlender regimen. He ſays, it is ſeldom we can diſpenſe with leſs than ten baths; more generally, he orders twenty. After this courſe of bathing, the bleeding and purging muſt be repeated. He then has recourſe to the mercurial frictions, which he ſo directs as to keep up unremittingly a full regular ſpitting, from two to three pints in twenty-four hours, until the cure is completed. The patient is then cleanſed in a warm bath, and purged.

Not long after Aſtruc's work made its appearance, practitioners became extremely divided in opinion as to the method of adminiſtering the mercurial frictions, for the cure of lues venerea. Some of the moſt reſpectable followed the plan laid down by Aſtruc; while the greater number of practitioners in France followed the Montpelier method of extinction; that is, after having firſt made the patient take twenty or thirty warm baths, and kept him for ſome time on a very ſlender regimen, the frictions were ſo adminiſtered as not to raiſe any ſpitting, and thus continued for three or four months, until the venereal virus was totally eradicated.

The celebrated Van Swieten, in the fifth volume of his Commentaries on Boerhaave's Aphoriſms, adopts, in a great meaſure, the opinion of his illuſtrious maſter in treating of this diſeaſe. In the treatment of gonorrhœa, if we except his diſapprobation of bleeding, which he thinks is very ſeldom neceſſary, we find nothing new: for he follows the general mode of practice, and effects a cure chiefly by purgatives.

In the treatment of ſtrictly venereal caſes, he gives a preference to ſalivation raiſed by internal mercurials, inſtead of employing the unction. He thinks that the quantity of mercury, introduced into the ſyſtem, is much better aſcertained, when mercurius dulcis three times ſublimed, or white precipitate, is made uſe of, in lieu of frictions with mercurial ointment. He conſiders that the quantity of mercury, introduced in this latter method, muſt be uncertain; and that as it does not paſs out of the ſyſtem as readily as ſaline mercurials, it may accumulate, and be depoſited in dangerous quantities, in different parts of the body, and be productive of the worſt conſequences. But, above all other methods of curing the diſeaſe, Van Swieten prefers the well known ſolution of corroſive ſublimate in brandy, or ſpirits. By this medicine, which was in general uſe in St. Mark's hoſpital, Vienna, four thouſand eight hundred and eighty perſons are ſaid to have been perfectly cured of the venereal diſeaſe, in the courſe of eight years, without undergoing any tedious preparation, or having any dangerous ſymptom intervene.

The ingenious author of the Parallel of the different Methods of treating the Venereal Diſeaſe (ſuppoſed to have been the phyſician Petit) is extremely ſevere in cenſuring this method of treatment, and aſſerts that, from repeated experience, he has found the adminiſtration of the ſolution to be very precarious, and by no means productive of the good effects ſo laviſhly promiſed by the Vienna practitioners. See Obſ. on the different Methods of treating the Venereal Diſeaſe, by W. Deaſe, 1779, the Introduction.

From theſe obſervations on the mercurial remedies employed, and plans adopted, by the old ſurgeons, in the treatment of ſyphilitic affections, let us paſs on to the conſideration of the practice of modern times, which has been vaſtly influenced by the doctrines promulgated by Mr. Hunter. The leading points of his theory having been already ſtated in the foregoing columns, we ſhall not repeat them at large in this place. Suffice it to ſay, that this ſurgeon inculcated, that when the venereal poiſon was abſorbed, it contaminated the ſyſtem at once, leaving only a diſpoſition behind it, which is brought forth into action in various parts at various times; that the local cauſe of this diſpoſition, and its effects, may be cured by mercury, but that the diſpoſition itſelf cannot; and that parts, once cured, cannot be contaminated again from the ſame ſtock of infection.

It muſt not be diſſembled, that the theories of Mr. Hunter, reſpecting lues venerea, are in ſome reſpects obſcure and queſtionable. Much difficulty has been experienced in rightly comprehending his exact meaning; and he has even been accuſed of inconſiſtency and contradiction. Dr. Adams, in his Commentary on Hunter's Treatiſe, has publiſhed the ſubſtance of a converſation, which he once had with this famous character, with regard to the difficulty attending the comprehenſion of the doctrines in queſtion. On this occaſion, Mr. Hunter related the following caſe, to ſhew how eaſily his opinions might be underſtood, even by a perſon altogether unaccuſtomed to ſuch inquiries.

"A gentleman," ſaid Mr. Hunter, "who had been cured of a chancre at a diſtance from home, called to conſult me whether he might conſider himſelf as perfectly free from the diſeaſe. Whilſt he was taking great pains to explain to me how he had been ſalivated, and how long he had continued the uſe of mercury, after the chancre was healed, I interrupted him by obſerving, that if he had continued the uſe of mercury till now, I could not pretend to ſay whether he was free from the diſeaſe.—How then, ſaid the gentleman, am I to aſcertain my real ſituation?—If, replied I, you find no ſymptoms in the courſe of three months, the probability is that you will remain well, till you expoſe yourſelf to a new ſource of infection.

"In about ſix weeks he returned, with a ſore throat and copper ſpots. I explained to him, that he ſhould not blame his ſurgeon, who, even if he had known what was to happen, could not have prevented it. The patient went through a very neceſſary courſe of mercury, till he was cured of every ſymptom, and then demanded, with ſome impatience, whether he was then ſecure.—You are ſecure, replied I, from every return on your genitals, and on your ſkin and throat; but as it is impoſſible for me to know whether your bones are contaminated, I cannot pretend to ſay whether you will have nodes in a few weeks' time. He now began to comprehend the doctrine, and ſubmitted to await the reſult. In about ſix weeks he actually had nodes; after the cure of which, by a ſevere ſalivation, I made no ſcruple to aſſure him that he was perfectly free from the diſeaſe."

According to Mr. Hunter's principles, then, if mercury were exhibited for ten years, it could not prevent the diſpoſition, after it is once formed, from proceeding to action ſome time or another; and although this author admits that this remedy may altogether hinder the diſpoſition from taking place at all, yet that it has no power of eradicating any forms of the diſeaſe, except what is poſitively in action, and conſequently more or leſs palpable. As it was likewiſe a poſition in Mr. Hunter's theory, that the parts contaminated, or thoſe to which the diſpoſition was imparted, became thus infected all about the ſame time, and very ſoon after the firſt abſorption of the virus into the conſtitution, the inference neceſſarily followed, that mercury could ſeldom avail in hindering the formation of the diſpoſition, except in an early ſtage of the caſe. According to the Hunterian opinions, mercury given as a *preventive*, on any other principle, was entirely uſeleſs. The parts contracted the diſpoſition ſoon after the virus had been abſorbed into the ſyſtem, unleſs, by good luck, mercury had been employed ſo early and efficiently as entirely to prevent ſuch diſpoſition from taking place. If it had not been uſed early enough, and with ſufficient effect to prevent the formation of the diſpoſition in the parts ſuſceptible of contamination, theſe could not fail of falling afterwards, but at an uncertain period, into a palpable ſtate of ſyphilitic action, and in that ſtate alone were capable of being cured by mercury. The diſpoſition, though it might have been prevented, could not be cured by mercury. That part of the doctrine, alſo, which inculcates that parts, which have been once cured, cannot be contaminated again from the ſame ſtock of infection, tends ſtrongly to ſhorten a mercurial courſe; becauſe, as the foregoing caſe illuſtrates, when one order of parts have been cured by mercury, there is no danger of a recurrence of the diſtemper in them: and though the diſpoſition may exiſt in another order of parts, and, of courſe, muſt come into action, it would be abſurd to continue mercury on that account, both becauſe this mineral abſolutely has not the power of deſtroying the diſpoſition, and it can never be known, *à priori*, whether theſe other parts are contaminated or not.

The employment of the term *diſpoſition* has led to much diſputation. Many have not been able to underſtand the word, and others have raiſed ſeveral objections to it. The critical examiners of Mr. Hunter's doctrine aſk, how is it poſſible to prove that a venereal diſpoſition has, or has not, exiſted at any particular time? If, after a certain courſe of mercury, and the conſequent removal of a chancre, blotches ſhould appear, then, ſays Mr. Hunter, a diſpoſition had been formed, which no quantity of mercury could have deſtroyed. But, obſerve the critics, may we not, with at leaſt equal probability ſay, that in ſuch caſes mercury had been inſufficiently uſed? If, on the other hand, after ſuch a courſe, no blotches ſhould occur, the friends of the doctrine tell us, the ſecondary order of parts had not been contaminated; but, in this caſe, it may be contended by the oppoſite party, that the mercurial courſe had been judicious and efficient. It is inſiſted by Mr. Hunter's opponents, that the exiſtence of this incurable diſpoſition cannot be proved; nor by his friends can it be juſtly and conſiſtently aſſumed; for if it be action, then its coincidence with other actions is admitted contrary to their principles; if it be not action, then the diſeaſe which follows is motion without impulſe, and effect without a cauſe. This opinion, indeed, with regard to the difference of diſpoſition and action, it is maintained, was not ſteadily and uniformly contemplated by Mr. Hunter himſelf in his practice, or even in his theories; for he ſometimes talks of the cure of lues venerea in the ſtate of diſpoſition, and generally continued the exhibition of mercury, after the diſappearance of the ſymptoms. (See London Medical Review, No. 11, p. 248, 249.) For our own part, without undertaking to defend the inconſiſtencies into which Mr. Hunter has undoubtedly fallen, we have no heſitation in declaring our belief, that his opinions and doctrines in general concerning lues venerea, and the power of mercury over it, are the beſt and moſt rational that have ever been promulgated. In particular, we cannot concur with the anonymous critic quoted above, when he thinks it as reaſonable to refer the perfection, or imperfection of the cure, to mercury having been ſufficiently, or inſufficiently uſed. We have known inſtances in which patients have been almoſt conſtautly employing mercury for twelve and eighteen months for the cure of local complaints, ſucceeded by ſore throats and eruptions, and yet, after all this time, and after all this perſeverance in the uſe of mercury, nodes on the cranium, ſkin, or ulna, have ariſen. Certainly, when a patient has been for many months in a ſtate of ſalivation, and has thereby got rid of all his palpable ſymptoms, we are not juſtified in concluding that becauſe future complaints begin, theſe might have been hindered by a further continuance of the mercurial courſe. Mercury is ſo often uſed in immoderate quantities, and for ſo unreaſonable a length of time, without preventing a ſucceſſion of ſecondary ſymptoms, that we cannot bring our minds to believe, that the recurrence of the diſeaſe, in ſuch caſes, can be hindered by any judicious or practicable perſeverance in the employment of this mineral. At the ſame time we are not ſuch bigots to the Hunterian theory as to ſuppoſe, that the uſe of mercury ought not to be continued an inſtant after a chancre, or bubo, is either healed or apparently converted into a common ſore. It is generally impoſſible to aſcertain, with preciſion, the exact moment when venereal action ceaſes. The diſpoſition, or contamination of other parts, may poſſibly ſometimes happen later than Mr. Hunter ſuppoſed, and we have every reaſon to conclude that ſuch diſpoſition may be imparted at any time, while the venereal action in a chancre, or bubo, is not completely ſubverted. Mr. Hunter ſuppoſed, that the ſyphilitic poiſon could only be abſorbed when blended with pus. Perhaps the virus may exiſt, and be taken up by the abſorbents in other forms. The induration left after a chancre is healed is not always free from the venereal action, though not a drop of matter is now ſecreted; yet as there are ſo many inexplicable circumſtances in certain caſes of the preſent diſeaſe, it ſeems almoſt warrantable to believe that the virus may exiſt, and be imbibed by the abſorbents, ſo as to impart the diſpoſition to the diſtemper at later periods than Mr. Hunter conjectured, and under an additional number of ſtates and circumſtances. According to Mr. Hunter, the matter of ſecondary ulcers is not poſſeſſed of the ſpecific venereal quality, and cannot produce the diſeaſe, when abſorbed, as the matter of a chancre or bubo does. Suppoſing this to be true, whatever opinions may be entertained reſpecting the continuance of mercury, after the venereal action of a chancre or bubo has apparently ceaſed, there can be no diverſity of ſentiment in regard to the inutility of perſevering in that medicine, after ſecondary ſores are either healed or have had their character entirely altered.

Having detailed the ancient practice, mentioned the forms in which mercury was formerly exhibited, and endeavoured to give ſome idea of the degree of power which this medicine poſſeſſes over ſyphilitic affections, it is our place to make a few obſervations on the mercurial preparations, to which modern practitioners generally give the preference.

As long ago as the days of Berenger of Carpi, who, as we have recited, was the firſt perſon that aſcertained the efficacy of mercury in the treatment of ſyphilis, it has been well known that this metal, in its reguline ſtate, poſſeſſes no medicinal virtue. Its power of acting againſt diſeaſe only exiſts when it is in the ſtate of a ſalt, or oxyd. Its preparations have alſo very different degrees of efficacy.

The moſt active of all the preparations of mercury is the oxygenated muriate, the oxymurias, or, as it is generally called, the corroſive ſublimate, which is, in fact, a violent poiſon. We have already ſtated, that the celebrated Van Swieten was exceedingly partial to this medicine in ſyphilitic caſes. He diſſolved it in brandy, or alcohol, and diluting this mixture with a certain proportion of water, preſcribed the remedy in a fluid ſtate. The ordinary doſe is a quarter of a grain every day; but the quantity may, in particular inſtances, be increaſed to half or three quarters of a grain every 24 hours. Sublimate is, even at the preſent time, uſually preſcribed after the manner directed by Van Swieten, the ſolution in alcohol being ordinarily taken, either in ſome warm milk, a decoction of ſarſaparilla, or blended with ſome ſyrup, which vehicles are ſuppoſed to prevent the ſublimate from diſordering the ſtomach and bowels. Notwithſtanding theſe correctives, this preparation of mercury often produces conſiderable ſickneſs and griping pains, and it is reckoned extremely improper for patients labouring under pulmonary affections. It ſhould only be tried in caſes where the conſtitution is ſtrong and free from much irritability. But the moſt important truth to be attended to is the deciſion of many experienced ſurgeons, that the corroſive ſublimate, though a powerful medicine, has not ſo much efficacy in accompliſhing a radical cure of ſyphilitic diſeaſes, as ſeveral other more ſimple and mild preparations of mercury. Hence it is ſeldom exhibited by ſurgeons of the preſent time for the cure of primary venereal ſymptoms, except when particular circumſtances are in the way of other more approved methods. The convenience and ſecrecy with which a ſolution of the corroſive ſublimate may be taken, and the circumſtance of a ſmall phial of it being in ſome inſtances ſufficient for the cure, may, perhaps, be reaſons why it has been more extenſively adminiſtered, than its comparative efficacy appears to juſtify.

The ſubmurias hydrargyri, or calomel, is far leſs active than the oxymurias, or corroſive ſublimate, and though not now very much employed in this country for the cure of unequivocal ſyphilitic complaints, it is, like every other preparation of mercury, anti-venereal, and was at one time commonly given. Whenever it is exhibited at preſent, it is almoſt always in the form of pills, containing from one to three grains. When the doſe is larger, purging is generally excited, and little ſpecific effect on the diſeaſe is the conſequence. Hence, when calomel is preſcribed with a view of producing a ſalivation, opium muſt generally be conjoined with it. Calomel has alſo been mixed with ointment, ſo as to form a dreſſing for venereal ſores, or admit of being introduced into the ſyſtem by being rubbed upon the ſkin. Attempts have likewiſe been made to cure ſyphilis by frictions with calomel on the gums, and inſide of the lips and cheeks. However, violent and dangerous ptyaliſms having, in this manner, been ſometimes produced, without the diſeaſe being radically cured, the method has fallen into diſrepute. In the article FUMIGATION, we have deſcribed a powder, made with calomel, for the purpoſe of being applied to the ſurface of the body in the form of a vapour, or a ſubtile powder raiſed by heat.

Sometimes, when patients cannot rub in mercurial ointment, or frictions alone have not ſufficient effect, a grain of the hydrargyrus calcinatus, now called hydrargyri oxydum rubrum, is preſcribed, and to prevent bad effects on the bowels, half a grain of opium is generally directed to be taken at the ſame time. The grey oxyd of mercury, formed by the trituration of quickſilver with fat, is the moſt common, ſafe, and effectual preparation for the cure of ſyphilitic complaints. A piece of this ointment, about as large as a nutmeg, is ordinarily rubbed into the ſurface of the body, for about half an hour before the fire. When there is a bubo in the groin, the leg and thigh, on the affected ſide, are generally preferred for the frictions; but when this is inconvenient, the ointment may be rubbed upon any other part of the body. Mercurial ointment, provided the fat is not rancid, which it is very apt to be, makes an eligible application to both primary and ſecondary venereal ulcers, when it is ſpread upon lint. The introduction of mercury into the conſtitution, by frictions with ointment, is one of the oldeſt and beſt methods. When the patient cannot rub in himſelf, the buſineſs may be done by an attendant, who muſt be provided with gloves, made of oil-ſkin, or pig's bladder, leſt he ſalivate himſelf. The frictions are ſaid to have the moſt effect when made along the inſide of the limbs, where anatomy ſhews that the largeſt lymphatics are ſituated. It is always a prudent maxim to begin a courſe of mercury in a very gentle way, only ſmall quantities of the ointment being at firſt ventured upon. Perhaps half a dram is enough to begin with. Nor need the frictions be made every day until the ability of the conſtitution to bear the medicine has been tried. Thus, the patient may commence with rubbing half a dram of the ointment on the inſide of the leg. After letting one day intervene, he may make the ſecond friction on the inſide of the thigh. When another intervening day has elapſed, the third application of the ointment may be made to the hip and lower part of the abdomen. The fourth friction may be made on the arms, unleſs the patient ſhould prefer beginning again on the leg. During ſuch employment of the ointment, the patient, if convenient, ſhould waſh himſelf now and then in a warm bath, and have coſtiveneſs obviated by mild purgatives. The preceding method is generally commendable, becauſe it removes all chance of too ſudden and violent a ſalivation, as well as diminiſhes the peril, with which the adminiſtration of mercury is liable to be accompanied in particular conſtitutions. Though ſuch is the moſt prudent plan to be followed in the generality of caſes, it muſt ſtill be remembered, that there are certain inſtances in which the affection of the ſyſtem with mercury ought to be expedited, for the purpoſe of preventing the ſerious conſequences, which might ariſe from the ſpreading of venereal ulceration in particular ſituations, as where a chancre threatens to deſtroy the whole glans, or an ulcer in the throat to eat away all the velum pendulum palati. In every caſe it is highly proper, that the patient ſhould have ſome tenderneſs of the gums, and a copper taſte in his mouth, as teſts of his conſtitution being under the influence of mercury; but all violent ſalivations, attended with extreme ſoreneſs and ſloughing of the mouth, and vaſt ſwelling of the face, are condemned as unneceſſary, and in every reſpect blameable, by all the moſt judicious practitioners of the preſent time.

The grey oxyd of mercury, made by triturating quickſilver with ſugar or honey, compoſes the common pil. hydrarg. or blue pill, which, in ordinary caſes, is the beſt mercurial medicine for internal uſe. It is given, either to aſſiſt the action of the ointment, or when the frictions cannot be executed. The common doſe is ten grains every night, opium being added when any griping or purging is excited.

Such are the preparations of mercury ordinarily uſed by Britiſh ſurgeons in the treatment of ſyphilis.

In addition to the foregoing directions, reſpecting the management of a mercurial courſe, there are many other circumſtances to be obſerved. Every ſurgeon ſhould be impreſſed with the importance of the patient keeping himſelf warm, and avoiding all expoſure to damp and cold, during the employment of mercury. He ſhould be recommended to keep to his room, and wear worſted ſtockings, and flannel drawers and waiſtcoat. Experience has proved, that expoſure to the damp cold air ſometimes determines the action of mercury violently either to the mouth, or the bowels, and materially leſſens its effect upon the diſeaſe.

According to Mr. Hunter, when a courſe of mercury is about to be undertaken, we are to conſider two things; firſt, the preparation and mode attended with the leaſt trouble or inconvenience to the patient; and ſecondly, the preparation and mode of adminiſtering it, that moſt readily conveys the neceſſary quantity into the conſtitution. Mercury is carried into the conſtitution in the ſame way as other ſubſtances, either by being abſorbed from the ſurface of the body, or that of the alimentary canal. It cannot, however, in all caſes be taken into the conſtitution in both ways; for ſometimes the abſorbents of the ſkin will not readily receive it, at leaſt no effect is produced, either on the diſeaſe, or conſtitution, from this mode of application. In this circumſtance, mercury muſt be given by the mouth, although the plan may be very improper in other reſpects, and often inconvenient. On the other hand, the internal abſorbents ſometimes will not take up the medicine, or at leaſt no effect is produced on the diſeaſe, or the conſtitution.

In ſuch caſes, all the different preparations of the medicine ſhould be tried; for ſometimes one ſucceeds when another will not. In ſome caſes, mercury ſeems to have no effect, either applied outwardly, or taken into the ſtomach. Many ſurfaces ſeem to abſorb mercury better than others; ſuch are probably all internal ſurfaces and ſores. Thirty grains of calomel, rubbed in on the ſkin, have not more effect than three or four taken by the mouth. Dreſſing ſmall ulcers with red precipitate ſometimes cauſes a ſalivation. Hunter on the Venereal Diſeaſe, p. 335, 336.

Beſides the practicableneſs of getting the medicine into the conſtitution in either way, it is proper to conſider the eaſieſt for the patient, each mode having its convenience and inconvenience, depending on the nature of the parts to which it is applied, or on certain ſituations of life at the time. Hence, it ſhould be given in the way moſt ſuitable to ſuch circumſtances.

In many, the bowels can hardly bear mercury at all, and it ſhould then be given in the mildeſt form poſſible, conjoined with ſuch medicines as will leſſen, or correct its violent local effects, although not its ſpecific ones on the conſtitution.

When mercury can be thrown into the conſtitution with propriety by the external method, it is preferable to the internal plan, becauſe the ſkin is not nearly ſo eſſential to life as the ſtomach, and, therefore, is capable in itſelf of bearing much more than the ſtomach. The conſtitution is alſo leſs injured. Many courſes of mercury would kill the patient, if the medicine were only given internally, becauſe it proves hurtful to the ſtomach and inteſtines, when given in any form, or joined with the greateſt correctors. Every one, however, has not opportunities of rubbing in mercury, and is therefore obliged, if poſſible, to take it by the mouth. Hunter, p. 338.

Mercury has two effects, one as a ſtimulus on the conſtitution and particular parts; the other as a ſpecific on a diſeaſed action of the whole body, or of parts. The latter action can only be computed by the diſeaſe diſappearing.

In giving mercury in the venereal diſeaſe, the firſt attention ſhould be to the quantity, and its viſible effects in a given time, which, when brought to a proper pitch, are only to be kept up, and the decline of the diſeaſe to be watched; for by this we judge of the inviſible, or ſpecific effects of the medicine, and know what variation in the quantity may be neceſſary. The viſible effects of mercury affect either the whole conſtitution, or ſome parts capable of ſecretion. In the firſt, it produces univerſal irritability, making it more ſuſceptible of all impreſſions. It quickens the pulſe, increaſes its hardneſs, and occaſions a kind of temporary fever. In ſome conſtitutions it operates like a poiſon. In ſome it produces a kind of hectic fever, that is, a ſmall quick pulſe, loſs of appetite, reſtleſſneſs, want of ſleep, and a ſallow complexion, with a number of conſequent ſymptoms; but ſuch effects commonly diminiſh on the patient becoming a little accuſtomed to the medicine. Mercury often produces pains like thoſe of rheumatiſm, and nodes of a ſcrofulous nature. Hunter, p. 339, 340.

The quantity of mercury to be thrown into the conſtitution, for the cure of any venereal complaint, muſt be proportioned to the violence of the diſeaſe. However, we are to be guided by two circumſtances, namely, the time in which any given quantity is to be thrown in, and the effects it has on ſome parts of the body, as the ſalivary glands, ſkin, or inteſtines. For mercury may be thrown into the ſame conſtitution in very different quantities, ſo as to produce the ſame ultimate effect; but the two very different quantities muſt alſo be in different times; for inſtance, one ounce of mercurial ointment, uſed in two days, will have more effect upon the conſtitution, than two ounces uſed in ten. The effects of one ounce, uſed in two days, on the conſtitution and diſeaſed parts, are conſiderable. A ſmall quantity, uſed quickly, will have equal effects, to thoſe of a large one employed ſlowly; but if theſe effects are principally local, that is, upon the glands of the mouth, the conſtitution at large not being equally ſtimulated, the effect upon the diſeaſed parts muſt be leſs, which may be known by the local diſeaſe not giving way in proportion to the effects of mercury on ſome particular part. If it is given in very ſmall quantities, and increaſed gradually, ſo as to ſteal inſenſibly on the conſtitution, a vaſt quantity at a time may at length be thrown in, without any viſible effect at all. Hunter, p. 341.

Theſe circumſtances being known, mercury becomes a much more efficacious, manageable, and ſafe medicine, than it was formerly thought to be; but, unluckily, its viſible effects upon the mouth and the inteſtines are ſometimes much more violent, than its general effect upon the conſtitution at large. Theſe parts muſt therefore not be ſtimulated ſo quickly, as to hinder the neceſſary quantity of mercury from being uſed.

The conſtitution, or parts, are more ſuſceptible of mercury at firſt than afterwards. If the mouth is made ſore, and allowed to recover, a much greater quantity may be thrown in, a ſecond time, before the ſame ſoreneſs is produced. However, anomalous caſes occur, in which, from unknown cauſes, mercury cannot at one time be made to produce any viſible effects; but afterwards, the mouth and inteſtines are all at once affected. Hunter, p. 342.

Mercury occaſionally attacks the bowels, and cauſes violent purging, even of blood. This effect is remedied by intermitting the uſe of the medicine, and exhibiting opium. At other times, it is ſuddenly determined to the mouth, and produces inflammation, ulceration, and an exceſſive flow of ſaliva. To obtain relief in this circumſtance, purgatives, nitre, ſulphur, gum-arabic, lime-water, camphor, bark, kali ſulphuratum, bliſters, &c. have been adviſed. Mr. Pearſon, however, does not ſeem to place much confidence in the efficacy of ſuch means, and the mercury being diſcontinued for a time, he recommends the patient to be freely expoſed to a dry cold air, with the occaſional uſe of cathartics, Peruvian bark, and mineral acids, and the aſſiduous application of aſtringent gargles. "The moſt material objection, (ſays Mr. Pearſon,) which I foreſee againſt the method of treatment I have recommended, is the hazard, to which the patient will be expoſed, of having the ſaliva ſuddenly checked, and of ſuffering ſome other diſeaſe in conſequence of it.

"That the haſty ſuppreſſion of a ptyaliſm may be followed by ſerious inconveniences, has been proved by Dr. Sylveſter, (Med. Obſ. and Inq. vol. iii.) who publiſhed three caſes of perſons who had been under his own care; two of whom were afflicted with violent pains; and the third ſcarcely retained any food in her ſtomach for the ſpace of three months. I have ſeen not only pains, but even general convulſions, produced from the ſame cauſe. But this ſingular kind of metaſtaſis of the mercurial irritation does not appear to me to owe its appearance to ſimple expoſure to cold and dry air; becauſe I have known it occur in different forms, where patients continued to breathe a warm atmoſphere, but uſed a bath, the water of which was not ſufficiently heated. Cold liquids, taken in large quantity into the ſtomach, or expoſure of the body to cold and moiſture, will alſo prove extremely injurious to thoſe who are fully under the influence of mercury; whereas breathing a cool air, while the body is properly covered with apparel, has certainly no tendency to produce any diſtreſſing or dangerous conſequences.

"If, however, a ſuppreſſion of the ptyaliſm ſhould be occaſioned by any act of indiſcretion, the remedy is eaſy and certain; it conſiſts only in the quick introduction of mercury into the body, ſo as to produce a ſoreneſs of the gums, with the occaſional uſe of a hot bath." Pearſon on the Effect of Various Articles in the Cure of Lues Venerea, edit. 2. p. 163, 164.

Mercury, when it falls on the mouth, produces, in many conſtitutions, violent inflammation, which ſometimes terminates in mortification. In theſe habits great caution is neceſſary. The ordinary operation of mercury does not permanently injure the conſtitution; but, occaſionally, the impairment is very material; mercury may even produce local diſeaſes, and retard the cure of chancres, buboes, and certain effects of the lues venerea, after the poiſon has been deſtroyed. Hunter, p. 342.

When an immoderate and violent ſalivation is ſuddenly produced, the means in repute for leſſening this accident are, bathing the feet in warm water, clyſters, cathartics, and bliſters. The application of pounded ice to the jaw, and waſhing the mouth and throat with cold acidulated gargles, are, perhaps, meaſures as ſerviceable as any that can be adopted.

In the article ERETHISMUS, we have deſcribed a dangerous ſtate of the ſyſtem, ſometimes occaſioned by the uſe of mercury, and producing death in the moſt ſudden and unexpected manner. This is a ſubject urgently requiring the attention of the practitioner; but as we have treated of it elſewhere, we ſhall here be content with referring to the above-mentioned part of the preſent publication.

Mercury occaſionally gives riſe to a moſt ſevere and extenſive raſh all over the body, attended with alarming indiſpoſition. This complaint is noticed in the article ERYTHEMA, and is one with which every ſurgeon ſhould be well acquainted.

The preciſe manner in which memory acts in checking and curing ſyphilitic diſeaſes, has been the ſubject of various conjectures. Some writers fancy that it muſt operate by neutralizing the virus, juſt as an alkali deſtroys an acid. Others, ſeeing that mercury only exerted an anti-venereal quality, when combined with oxygen, have endeavoured to account for the action of this mineral, by the quantity of oxygen which it conveys with it into the ſyſtem. Againſt the firſt of theſe ſuppoſitions it is argued, that mercury cannot act by neutralizing the virus, ſince its effect would then always correſpond with the quantity introduced into the ſyſtem. This experience contradicts, and the Hunterian doctrines lead us to conclude, that the virus does not long remain in the conſtitution, after contaminating the parts, and communicating to them the diſpoſition which is afterwards to come into action. Againſt the ſecond opinion it may be obſerved, that though mercury has no effect in its ſimple ſtate, yet thoſe mercurial preparations which have the moſt power over ſyphilis, are ſuch as are combined with the ſmalleſt quantity of oxygen. Beſides, there are other ſubſtances which contain infinitely more oxygen than mercurial medicines, and yet have not gained the celebrity and confidence which ſurgeons place in mercury, as an antidote for ſyphilis. There can be no doubt, however, that the nitric and nitrous acids, the oxygenated muriatic acid, and the oxygenated muriate of potaſſa, ſubſtances which largely abound in oxygen, are in a certain degree anti-ſyphilitic, though they cannot be depended upon ſo much as mercury. With reſpect to the *modus operandi* of mercury, it was Mr. Hunter's belief, that this mineral produced in the conſtitution an irritation which counteracted the venereal and entirely deſtroyed it. Treatiſe on Ven. Diſeaſe, p. 365.

The indiſcrete and immoderate employment of mercury ſometimes gives riſe to diſeaſes, which are very liable to be miſtaken for continuations of the ſyphilitic affection, for which that remedy was at firſt preſcribed. Mr. Hunter himſelf confeſſes that theſe caſes puzzle conſiderably, it being difficult to ſay when the venereal action is abſolutely deſtroyed. He obſerves, that ſuch complaints are moſt common in the throat; for while a mercurial courſe is going on, and the ulcer on the tonſils healing, or even healed, theſe parts will ſometimes ſwell, and excoriations occur and ſpread over the whole palatum molle. Mr. Hunter believed that ſuch excoriations, as well as other appearances of diſeaſe coming on during the uſe of mercury, were ſeldom or never venereal. Hence he recommended mercury to be continued no longer than was ſufficient to overcome the original ſyphilitic diſeaſe. In theſe caſes, he thought that bark was often of ſervice, and that it might be uſefully given, either with the mercury, or after the mercurial courſe was over.

Frequently venereal abſceſſes will not heal up, though they have become conſiderably better; for while the ſyphilitic actions remained in the part, mercury diſpoſed that part to heal; but under the mercurial courſe, the conſtitution and part had acquired another diſpoſition, proceeding (to uſe Mr. Hunter's language) from a venereal and mercurial irritation, affecting a particular habit of body, or part, at the time which new diſpoſition differs from the venereal, mercurial, and natural, being a fourth diſpoſition ariſing out of all the three. Mercury, when continued under ſuch circumſtances, acts as a poiſon, and makes the local diſeaſe grow worſe and ſpread. Some of the ſores, formed in this way, not only reſiſt all means of cure, but often inflame, ulcerate, and produce hard callous baſes, ſo as to put on a cancerous appearance. New diſeaſes may ariſe from mercury alone, as ſwelling of the tonſils, unattended with any ſyphilitic diſeaſes, thickenings of the perioſteum, and œdema, and ſoreneſs of the parts over the bones. Theſe complaints, ariſing under a courſe of mercury, are too often regarded as venereal, and that mineral puſhed to the utmoſt extent. If mercury has already been given ſufficiently to cure the original diſeaſe, it ought to be now immediately left off, and not continued for theſe incidental affections, which will be rendered worſe by it. If, after the cure of ſuch maladies, the venereal diſeaſe ſhould begin to come into action again, mercury muſt be given a ſecond time. Mr. Hunter ſuſpected that the diſorders of the tonſils and perioſteum, above alluded to, originated from ſcrofula, and he entertained a favourable opinion of bark and ſea-bathing for their relief. P. 369—371. The terrible forms of diſeaſe, which we every day ſee ſyphilitic complaints converted into by raſh local and mercurial treatment, are really deplorable. The worſt phagedenic buboes, and deſtructive ſloughing chancres, and other ulcers, are often more owing to the wrong continuance and immoderate exhibition of mercury, and bad local treatment, than any original fault in the habit.

From mercury, we proceed to notice a few of the other principal remedies which have obtained repute for their anti-ſyphilitic virtues.

Guaiacum is the medicine with which the natives of the Weſt Indies are ſaid to have cured ſyphilitic affections before theſe diſeaſes made their appearance in Europe. Many writers of the 16th century contended that guaiacum was a true ſpecific for the venereal diſeaſe; and the celebrated Boerhaave, in the 18th, maintained the ſame opinion. We learn from Mr. Pearſon that he was firſt entruſted with the care of the Lock hoſpital in 1781. Mr. Bromfield and Mr. Williams were in the habit of repoſing great confidence in the efficacy of a decoction of guaiacum wood. This was adminiſtered to ſuch patients as had already employed the uſual quantity of mercury; but who complained of nocturnal pains, or had gummata, nodes, ozæna, and ſuch other effects of the venereal virus connected with ſecondary ſymptoms, as did yield to a courſe of mercurial frictions. The diet conſiſted of raiſins and hard biſcuit; from two to four pints of the decoction were taken every day; the hot-bath was uſed twice a week; and a doſe of antimonial wine and laudanum, or of Dover's powder, was commonly taken every evening. Conſtant confinement to bed was not deemed neceſſary; neither was expoſure to the vapour of burning ſpirit, with a view of exciting perſpiration, often practiſed, as only a moiſt ſtate of the ſkin was deſired. This treatment was ſometimes of ſingular advantage to thoſe whoſe health had ſuſtained injury from the diſeaſe, long confinement, and mercury. The ſtrength increaſed; bad ulcers healed; exfoliations were completed; and theſe anomalous ſymptoms, which would have been exaſperated by mercury, ſoon yielded to guaiacum.

Beſides ſuch caſes, in which the good effects of guaiacum made it to be regarded as a ſpecific for lues venerea, the medicine was alſo formerly exhibited by ſome practitioners on the firſt attack of the venereal diſeaſe. The diſorder, being thus benefited, a radical cure was conſidered to be accompliſhed; and though frequent relapſes followed, yet as theſe partly yielded to the ſame remedy, its reputation was ſtill kept up. Many diſeaſes, alſo, which got well, were probably not really venereal caſes. Mr. Pearſon ſeems to allow, that, in ſyphilitic affections, it may, indeed, operate like a true antidote, ſuſpending, for a time, the progreſs of certain venereal ſymptoms, and removing other appearances altogether; but he obſerves, that experience has evinced that the unſubdued virus yet remains active in the conſtitution.

Mr. Pearſon has found guaiacum of little uſe in pains of the bones, except when it proved ſudorific; but that it was then inferior to antimony or volatile alkali. When the conſtitution has been impaired by mercury and long confinement, a thickened ſtate of the ligaments, or perioſteum, or foul ulcers, ſtill remaining, Mr. Pearſon ſays, theſe effects will often ſubſide during the exhibition of the decoction. He ſays, it will often ſuſpend, for a ſhort time, the progreſs of certain ſecondary ſymptoms of the lues venerea; for inſtance, ulcers of the tonſils, venereal eruptions, and even nodes. Mr. Pearſon, however, never knew one inſtance in which guaiacum eradicated the virus; and he contends, that its being conjoined with mercury, neither increaſes the virtue of this mineral, leſſens its bad effects, nor diminiſhes the neceſſity of giving a certain quantity of it. Mr. Pearſon remarks, that he has ſeen guaiacum produce good effects in many patients having cutaneous diſeaſes, the ozæna, and ſcrofulous affections of the membranes and ligaments. See Pearſon on the Effects of various Articles in the Cure of Lues Venerea, edit. 2. 1807.
